The * Scarlet graine growing vpon the Oke-holm, is very good to be laid to fresh wounds with vinegar. It is applied with water for the flux of watery humors vnto the eies: & dropped likewise into them when they be bloud-shotten. Now there is a kind of it growing commonly in the region of Attica and throughout Natolia, which very quickly turneth to be a grub or Magot (wherupon it is called *Scolecion*) and is rejected, as being of no worth. Many more sorts there be of it, whereof the chiefe and principall I haue shewed already.

As touching the Gal-nuts, I haue likewise made of it as many kinds: for some be solid and massie, others full of holes, as if they were bored through. You shall haue of them white, and black: some great, & others small: but how different soeuer they be in substance, colour, or quantity, they be all of like nature. The best are those of Comagene. Galls are good to eat away the superfluous excrescences in the body. They serue very wel for the infirmities of the gums and vula; for the cankers & exulcerations breeding in the mouth. Being first burnt, & then quenched in wine, they are singular for the fluxes occasioned by a feeble stomach. Applied in maner of a liniment, they help the bloody flux. Incorporat in hony, they cure whitflaws, risings, & partings of the flesh and skin about the naile roots; the roughnesse of the nailes; the running scales and

* The great Holm-Oke. * Coccum Illic. our Kermes or Kutcheneel, as some thinke.

reth an inueterat cough, shortnesse, and difficultie of winde, ruptures, crampes, and convulsions. G Outwardly applied, it is singular for the Sciatica, pleurise, or pains of the side, angry biles, and fellons. It is good also to be vsed, in case the flesh (corrupted by meanes of corrosiue vlcers, as wolues and such other) is departed and eaten from the bone: moreover, for the wens called Scrophules or the kings euill: the knots and nodosities growing vpon the ioints: and the tooth-ach: it serueth also in a liniment with hony for to annoint scald heads. With oile of Roses or with Nard, it is good to be infused or dropped into ears that run with matter: the very perfume alone or smell thereof is good to raise them who are taken with the epilepsie or falling sicknesse: also to recouer women, lying as it were in a trance or dead, vpon a fit of the mother: & to bring them again who are gon in a swoone. If a woman fall to trauell before her time, it is good to fetch out that vntimely fruit of hers (if it be loth to come away) either by way of cataplasme or suffumigation. The same effect it hath, if the branches or small roots of Ellebore be well annointed therewith, and so put up as a pessary. The smoke of it frying in the fire (as I said before) driueth serpents away: and more than so, serpents will not come neere to them that are besmeared with Galbanum. And say that one be stricken with a scorpion, a plaster of Galbanum will heale the wound. If a woman haue bin long in labor of childbirth, and cannot be deliuered, let her drinke in one cyath of wine, as much Galbanum as the quantity of a Bean, she shal fall to her busines and be deliuered anon. The same is a good medicine to reduce the mother into the right place, if it be vnsetled or turned. If Galbanum be taken in wine with Myrrhe, it sendeth out the dead infant in the mothers womb. Also with Myrrh and * wine, it is good against all poisons, and especially those which be called Toxica. Incorporat Galbanum with oile and * Spondylium together, it will kill any serpents, if they be but touched therewith. Howbeit, there is an opinion of Galbanum, that * in difficultie of vrine it is not good to be vsed.

CHAP. VI.

¶ Of Gum Ammoniack: of Storax: Spondylium: Spagnos: Terebint: Chamæpitys: of Pituy-
sa: of Rosius: of the Pitch tree: and the Lentiske.

Since we are fallen into the mention of Gums, it will not be amisse to treat of Ammoniack; being as it is so like in nature (as I haue said) to Galbanum: for it hath vertue to mollifie, to heat, discusse, and dissolue. Vsed in collyries, it is a proper medicine to clarify the sight: and serueth wel to take away the itch, the spots or cicatrices, the pin and web also of the eyes. It K allaieth the tooth-ach, but more effectually, if it be set a burning, & the fume receiued into the mouth. Taken in drinke, it helpeth those who hardly fetch and deliuer their winde. It cureth the pleurise, Peripnewmony or inflammation of the lungs, the infirmities of the bladder, pissing of blood, the swelled spleen, and the Sciatica. And in that manner it easeth the belly, and maketh it soluble. Boiled with the like weight of pitch or wax and oile rosat together, and so reduced into an ointment, it is good for all gouts, and especially that which lieth in the feet. It ripeneth the biles called Pani, if it be applied to them with honey: and fetcheth away any corns by the roots. In which sort it doth soften any hardnesse. Incorporat with vinegar and Cyprian wax, or els with oile rosat, it maketh an excellent plaster for to mollifie the hard spleen. Moreover, if it be reduced into an ointment with vinegar, oile, & a little sal-nitre, it is singular to annoint those L that haue a lassitude or wearinesse vpon them.

Touching Storax and the nature thereof, I haue said enough in my Treatise of strange and forraine trees. But ouer and aboue the qualities or properties before required, I take that for the best Storax, which is fatest, pure, and cleane, and whereof the pieces or fragments do break white. This drug cureth the cough, the sorenesse of the throat, and the accidents of the breast: it openeth the obstructions of the matrice, & mollifieth the hardnes therof. Whether it be taken inwardly in drinke, or outwardly applied, it prouoketh womens fleurs, & moueth to the siege. I read in some authors, that if one drinke Storax Calamita, in small quantity, it will procure gladnesse and mirth of heart: but if it be taken in greater quantity, it breedeth heauinesse of the mind. Instilled or poured into the ears, it riddeth away all the singing therein: and in a liniment it resoluth the wens called the Kings euill, and the nodosities of the sinews. Soueraign it is against those poisons which hurt by meanes of their coldnesse, and therefore it is good for them that haue drunk the juice of Hemlock.

Likewise

A Likewise of Spondylium, a kind of wild Parsnep or Madnep, I haue spoken thereof heretofore, together with Storax. An embrochation made of it, to be infused vpon the head, is excellent for such as be in a frensie or lethargy: also to cure the inueterat pains of the head. Taken in drinke with old oile, it helpeth the infirmities of the liuer, the jaundise, the falling sicknesse, the straitnesse of breath (whereby one cannot take his winde but sitting vpright) and the rising or suffocation of the mother; in which cases, a suffumigation thereof is good. This Spondylium is effectual to mollifie the belly, and make the body soluble. Reduced into a liniment with rue, it serueth fitly to be applied vnto vlcers that spread and eat as they go. The juice of the floures is of great effect, if it be poured into the ears that run with filthy matter: but when this juice is a pressing or drawing forth, it had need to be kept well couered, for feare of flies and such like, B which are very greedy thereof, and loue a life to settle vpon it. The root of Spondylium, or a piece therof scraped, if it be put in maner of a tent into a fistula, eateth away all the hardnes and callositie thereof. Being dropped into the ears, together with the juice, it is exceeding good for them. The root giuen alone in substance, cureth the jaundise, the infirmities of the liuer & matrice. If the head be all ouer annointed therewith, the haire will curl and frizle.

Concerning the sweet Mosse, called of the Greeks * Sphagnos, Sphacos, or Bryon, growing (as I haue shewed before) in France, it is good for the naturall parts of women to sit ouer the decoction of it, in manner of a bath: likewise if it be mingled with cresses, and so stamped together in salt water, it serueth well to be applied as a cataplasme to the knees and thighs, for any tumors or swellings in those parts. Taken in wine with dry per-rofin, it causeth one most speedily to make water. Stamped with Iuniper, and drunk with wine, it doth euacuat the aquosities in the dropsie.

The leaues and the root of the Terebint tree, applied in form of a cataplasme, are good for the collection of humors to an impostumation. A decoction made with them, doth comfort and fortifie the stomach. In case of head-ache, of stopping and difficultie of vrine, it is passing good to drinke the seed or grains of the Terebint tree in wine. The same gently easeth and softneth the belly; it prouoketh also carnal lust. The leaues of the * Pitch tree & * Larch tree bruised and sodden in vinegar, do ease the tooth-ache, if the mouth be washed with the decoction. The ashes made of their barks, skin the places that be chafed, fretted, and galled betweene the thighs, and heale any burn or scald. Taken in drinke, they bind the belly, but open the passages of the vrin. A perfume or suffumigation therof, doth settle the matrice, when it is loose and out D of the right place. But to write more distinctly of these two trees; the leaues of the Pitch tree haue a particular property respectiue to the liuer, and the infirmities thereof; if one take a dram weight of them and drinke it in mead and honied water. It is well known and resoluend vpon, that to take the aire of those woods and forests only where these trees be cut, lanced, and scraped, for to draw pitch and rosin out of them, is without all comparison the best course which they can take who either be in a consumption of the lungs, or after some long and languishing sicknes, haue much ado to recouer their strength. Certes, such an aire is far better, than either to make a long voiage by sea into * Egypt, or to goe among the cottages in summer time for to drinke new milk comming of the fresh and green grasse of the mountains.

E As for Chamæpitys, it is named in Latine by some Abiga, for that it causeth women to slip their conception beforetime: of others, *Terra terre* [i. ground Frankincense:] this herb putteth forth branches a cubit long; and both in floure and savor resembleth the * Pine tree. A second kind there is of Chamæpitys, lower than the other, seeming as though it bended and stooped downward to the ground. There is also a third sort of the same odor that the rest, and therefore so named. This last Chamæpitys, riseth vp with a little stalk or stem of a finger thicknesse; it beareth rough, small slender, and white leaues, and it groweth commonly amongst rockes. All these three be herbs indeed, and no other, and should not be ranged among trees: yet for names sake, because they carry the denomination of Pitys [i. the Pitch-tree] I was induced the rather to treat of them in this present place, & to stay no longer. Soueraigne they bee all against the F pricks or stings of Scorpions: applied in manner of a liniment with dates and quinces, they be wholsome for the liuer: their decoction together with barley meale, is good for the infirmities of reins and bladder. Also the decoction of these hearbes boiled in water, helpeth the jaundise and the difficultie of vrine, if the Patient drinke thereof. The third kind last named, taken with hony, is singular against the poison of serpents: and in that maner only applied as a cataplasme,

R

it

* Picea.

* or rather, the
Pitch tree.

it clenseth the matrice & natural parts of women. If one drink the same herbe, it will dissolue and remove the cluttered thick bloud within the body; it prouoketh sweat, if the body be therewith annointed; and it is especially good for the reins. Being reduced into pills, together with figs, it is passing wholsome for those that be in a dropic; for it purgeth the belly of waterish humors. If this herb be taken in wine to the weight of a victoriat piece of silver, i. halfe a Roman denier, it wariseth for euer the pain of the loins, and stoppeth the course of a new cough. Finally, if it be boiled in vinegar, and so taken in drink, it is said that it will presently expel the dead infant out of the mothers wombe.

* i. Spurges.

* In *balanistiv* lesse we read, *Cum Phenico-balanis*, i. a kind of Date, as some think *Tamarinds*.

* Which is thought to be ou Terpent-tine.

For the like cause and reason, I will do the herb *Pityusa* this honor as to write of it among trees, since that it seemeth by the name to come from the Pitch tree: this plant some do reckon among the * *Tithymals*: a kind of shrub it is, like vnto the Pitch tree, with a small floure, and the same of purple color. If one drink the decoction of the root, to the quantity of one hemina, it purgeth downward both fleame and choler: so doth a spoonfull of the seed therof, put vp into the body * by suppositories. The decoction of the leaues in vineger, doth cleanse the skin of dandruffe and scales: & if the decoction of rue be mingled therewith, it is singular for sore breasts, to appease the wrings and torments of the cholick, against the sting of serpents, and generally for to discusse and resolute all apostemations and bitches a breeding.

But to returne againe to our former trees; how *Rosine* is ingendred in them, of their seuerall kinds, and the countries where they grow, I haue shewed before, first in the treatise of wines, and afterwards in the discourse and histories of Trees. And to speak summarily of rosins, they may be diuided into two principal kinds; to wit, the dry and the liquid rosin. The dry is made of the Pine and the Pitch trees; the liquid commeth from the Terebinth, Larch, Lentisk, & Cypresse trees; for these beare rosin in Asia and Syria: & whereas some there be of opinion, That the rosins of the Pitch and Larch trees be all one, they be much deceived; for the Pitch tree yeeldeth a fatty rosin, and in maner of frankincense, vnctuous; but from the Larch tree there issueth * a subtill and thin liquor, running like to life hony, of a strong and rank vnpleasant smell. Physicians seldome vse any of these liquid Rosins, and neuer prescribe them but to be taken or supped off with an egge. As for that of the Larch tree, they giue it for the cough and exulceration of some noble parts within: neither is that per-rosin of the Pine tree much vsed: as for the rest, they be not of any vse vnlesse they be boiled. Touching the diners manners of boiling them, I haue shewed them sufficiently.

But if I should put a difference between these rosins according to the trees from whence they come, the right Terpentine indeed which the Terebinth yeeldeth, liketh and pleaseth me best, being of all others lightest and most odoriferous. If I should make choice of them in regard of the countries where they are found, certes they of Cypresse and Syria be best, and namely those that in colour resemble Attick hony: and for the Cyprian rosin, that which is of a more fleshie substance and drier consistence. Of the dry per-rosins, those are in most request, which be white, pure, transparent or cleare, quite through. In generall, those that come from trees growing vpon mountains, be preferred before them of the plains: also regarding the Northeast, rather than any other wind. For salues to heale wounds, as also for emollitiue plasters, rosins ought to be dissolved in oile: for drinks or potions, with bitter almonds. As touching their medicinable vertues, L they be good to cleanse and close vp wounds: to discusse and resolute any apostemes which bee in gathering. Moreover, they be vsed in the diseases of the brest (and namely true Terpentine) by way of liniment; for then it is singular good, especially if it be applied hot: also for the pains of the lims, and for those that be plucked with the cramp, in case the grieved parts bewel rubbed therewith in the sun; which they know well enough who buy slaues and sell them for gain, after they haue trimmed and fet them out for sale: for they especially are very curious to annoint their bodies al ouer with this Terpentine, for to loosen the skin when they be hide-bound, lank, and carrion lean, to giue more liberty and space for euery part to receiue nutriment, and so to make their bodies seeme fat and faire liking. Next vnto the right Terpentine, is the rosin of the Lentiske Tree: this hath an astringent or binding qualitie; but of all others it prouoketh vrine most: all the rest doe mollifie the belly and make it soluble, concoct and digest all crudities, M stent the inueterate cough, and draw downe all the superfluous burdens of the matrice: for which purpose last named, their fume receiued by a fummigation, is very effectually. They are more particularly as good as a counterpoison against the venomous gum *Ixia*, growing vpon the

A the plant *Chamaeleon*. Incorporat with buls tallow and hony, they cure the biles called *Pani*, and such risings in the flesh. The *Lentisk* rosin, is singular good for to lay euen and streight the haire of the eie-lids when they grow into the eies. In fractures and broken bones, it is most necessary, as also for the ears running with filthy matter: likewise to kil the itch in the priuy members. Finally, the per-rosin of the Pine tree, is a most soueraigne medicin to cure all the wounds of the head.

CHAP. VII.

¶ Of Stone-pitch: of Tarre: of Pitch twice boiled: of Pissaspphalt or Mummie: of Zopif: sa: of Torch-wood, and the Lentiske.

B From what tree Pitch commeth, and the sundry waies of making it, I haue declared heretofore: also that there be two principall kinds thereof; to wit, the thick or fast Pitch, and the thin or liquid: of the former (or, the best for vse in Physick is the Brutian Pitch, for that (being of all others fattiest & fullest of gum) it yeeldeth a twofold commodity both for medicines, and also to trim and rosin wine-vessels, for which purposes, that which inclineth to a reddish yellow is counted the chiefe. But whereas some do say moreouer, that the better Pitch commeth from the male tree, I cannot conceiue what they should mean thereby, neither doe I think it possible to discern any such difference. True it is, that Pitch by nature is hot, & a good incarnatiue: a speciall and particular property it hath against the venom inflicted by the sting C or tooth of the horned serpent *Ceraustes*, if it be made into a cataplasme with fried barley groats: and being applied with honey, it healeth the squirancy, cureth catarrhs, and restraineth sneezing: with oile of roses, it serueth well to be poured into running ears, out of which there doth ooze filthy matter: or being applied in manner of a liniment with wax, it is passing good: it healeth the ill-fauored tetters called *Lichenes*, and it looseth the belly: licked or let downe leasurely in maner of a loch, it is a good means to void and reach vp from the brest, tough fleame: and to annoint the tonsils or almonds in the mouth with it and hony together, is a proper medicine: being in that manner prepared and vsed, it clenseth vlcers: and if it be incorporat with raisins and swines grease, it doth incarnat and fill them vp again with new flesh: carbuncles also it doth mundifie; so doth it fores that begin to putrifie & gather corruption: but if they be such D as spread & be corrosiue withal, then there would be an addition of the Pine tree bark, or brimstone. Some haue prescribed, for the consumption of the lungs, and a cough of long continuance, to drinke the quantity of one cyath in Pitch. The fissures and chaps as wel about the feet, it cureth: for the flat biles named *Pani*, it is very good: as also to take away the rough nails that be so troublesome. The very odor or perfume thereof, helpeth the hardnesse of the matrice; and setleth it again, being either sajd down, or turned out of the due place: likewise it helpeth such as be surprisid with the lethargy. Moreouer, if it be boiled in the vrine of a yong boy vnder 14 yeares of age with barley meale, it is a good maturatiue, and bringeth the wennes called the Kings euill to suppuration. As for dry pitch or stone pitch, it helpeth much to make the haire grow again, where it is shed by some disease. The Pitch called Brutia, or of Calabria, E boiled in wine to a waulm or two, with the fine floure of the bearded wheat Far, and so applied in a cataplasma as hot as may be suffered, is singular good for womens paps. Concerning liquid Pitch or Tar, as also the oile which they call *Pissaspphalt*, and how it is made, I haue already written at large. Some boile it a second time, and then they name it *Palimpiffa*. With this liquid Pitch it is good to annoint the squinzy that groweth inwardly; as also the vula within the mouth: the same is singular for the pain in the ears, to clarifie the sight, to clenfe the mouth furred as it were, so as it hath no tast of meat: likewise for those who are short winded: for women who are diseased in their matrice: to ripen & rid away old coughs; and to ease them that can doe nothing but spit & reach out of the chest: for spasmes, cramps, shaking, and trembling: moreover, it helpeth them whose heads or bodies are drawn backward: it cureth palsies, and any pains F or griefs of the sinews. There is not a better thing to kill either the mange in dogs, or the scab and farcines in horses asses, and such like traouelling beasts.

Moreouer, as touching *Pissaspphalt*, which is of a mixt nature, as if pitch and Bitumen were mingled together, it groweth naturally so, in the territory of the Apolloniars, yet some there be who make an artificial pissaspphalt, and meddle the one with the other, and hold it for a remedy

to cure the farcins and scabs of cattell; as also when the young sucklings doe hurt the teats of their dams. Of this kind, that is best which is of it selfe, and come to maturity and perfection: the same in boiling swimmeth aloft. * Zopissa, is that Pitch, which (as I said heretofore) is scraped from ships, and is confectioned of wax well foked in the salt water of the sea: the best is that which commeth from ships that haue bin at sea and made some voiajes: it goeth into emolliente plasters, for to resolute the gathering of impostumes. As for Tæda or Torch-wood, if it bee foddren in vineger, it maketh a singular collution for to wash the teeth withall when they ake.

Let vs come now to the Lentisk tree: the wood, the seed or fruit, the bark and gum thereof, do prouoke vrine, and bind the belly: a fomentation made with their decoction, is excellent good for eating and corrosiue vlcers: it serueth in a liniment for all sores in moist & flegmatick parts: likewise to cure S. *Anthonyes* fire, and to wash the gums withall: chew the leaues thereof and crush them well between the teeth, the same will ease their ach: wash them with their decoction, and they will set them fast in the head. The same are good to colour the haire black: the gum which this tree doth yeeld, is soueraign for the infirmities of the feet, especially such as require either drying or heating. The very decoction of Mastick is comfortable to the stomach, it causeth it to rift, & is besides diuretical. Applied vnto the head as a liniment, incorporat with the fried groats of barley, it cureth the ach or pain thereof: the tender leaues be applied to right good purpose, for the inflammation of the eies. Moreouer, this Mastick, which is the gum of the Lentisk tree, is vsed ordinarily to lay the hairs of the eyelids euen, & to extend or make plaine and smooth the riueld skin of the face: therefore it is vsed in sope, and wash-bals. Moreouer, there is a good vse thereof, for spitting and reaching vp of bloud, & for an old cough. In one word, it serueth all those turns whereto the gum Ammoniacke is vsed. It healeth all places galled and chaufed, where the skin is rubbed or fretted off: and if the cods and members of generation be fomented either with the oile made of the seed of the mastick tree mixed with waxe, or with a decoction of the leaues boiled in oile or els in water, it will skin any raw part thereof. To knit vp this discourse, I am not ignorant that *Democritus* the Physitian, who had in cure *Considia*, the daughter of *M. Seruilus* late Consul of Rome, for an * infirmity or malady of hers (for that this damofell could not abide to heare of any vnpleasant Physick) caused her to be fed a long time with the milk of goats which were kept with the Lentisk tree leaues, and did eat nothing els, and so he cured her of her malady.

* It should seeme the vicer of the legs or kidneys, or els some outrageous flux of bloud,

CHAP. VIII.

¶ Of the Plane tree, the Ash, and Maple: of the white Poplar and Elme, the Tillet or Linden tree, the Elder, and the Iuniper.

THE Plane tree is an enemy to Bats or Reremice: their little bals which they beare, if they be taken to the weight of foure Roman deniers in wine, do cure all poisons of serpents and scorpions: likewise they heale any burn. Being braied or stamped with strong & sharp vineger (which if it be Squilliticum is the better) they stanch any bleeding whatsoeuer. Incorporat in hony, they mundifie and cleanse all cancerous vlcers, the red pimples and specks, with all black spots and marks in the skin which haue remained a long time. The leaues and bark reduced into a liniment, their decoction also, help to rid away any gathering of humors to an head, and namely if they matter and run. The decoction of the bark foddren in vineger, is a singular remedy for the tooth-ach; like as the tendrest leaues boiled in white wine, for the infirmities of the eyen. The ashes which come of the foresaid little bals, do heale vp any burn, occasioned either by fire or extreame cold. The bark taken in wine, represseth the venome of the scorpions sting, so that it shall go no farther.

As touching the Ash tree, of what effectuall operation it is against serpents, I haue declared heretofore: it beareth a * seed inclosed within certain * cods, which being taken in wine, is an ordinary remedy for the obstructions & infirmities of the liuer, as also for the pain in the sides. The same also do euacuat the aquosities or waterish humors spread between the skinned flesh in the dropie Leucophlegmatia: the leaues do take down by little & little and make lean a body ouer-grosse, and do ease it of the troublesome carriage that it hath of so much fat, if the same be stamped and giuen in wine: but herein good regard ought to be had of the strength of the party, after this proportion: If it be a child, five leaues of the ash are sufficient to be infused in

* Called Lin-gua-suis. Which are named Keyes,

A in three cyaths of wine; but elder folk and of a stronger complexion, may abide seuen well enough in five cyaths, and drink the infusion. But before I do leaue this tree, it would not be forgotten that the small chips and shavings, yea, and the saw dust or filed powder of this wood, are thought to be hurtfull vnto some, and they are forbidden to meddle withall. The root of the Maple tree, stamped into a cataplasme, is singular to be applied for the griefs of the liuer, and worketh mightily.

As touching the white Poplar or the trembling Asp, I haue shewed heretofore how the perfumers vse the berries or * grapes thereof in their sweet ointments. The barke infused and taken in drink, is good for the sciatica and the strangury. The iuice drawn out of the leaues, dropped hot into the ears, easeth their pain. Whofoeuer carieth a twig of Poplar in their hands, shall not need to feare any furbating of the feet, or galling between the legs. The best blacke Poplar and of greatest operation in Physick, is that reputed which groweth in the Island Creta; the fruit or grain thereof if it be drunk in wine, is singular for those who be taken with the falling sicknesse. This Poplar yeeldeth a certain small gum or rosin, which is much vsed by Physitians in emolliente plasters: the leaues foddren in vineger, make a proper cataplasme to be applied vnto the gout: the liquor or humor that issueth out of the pores or concavities of the blacke Poplar, taketh away warts and wheals, it skinneth also galled & raw places in any part of the body: these Poplars as well white as black, beare vpon their leaues certain warts like to drops of water standing vpon them, out of which the Bees do gather that cereous substance named Propolis. The drops also of water, which the said Propolis doth yeeld, if they be mingled with water, is a very effectuall remedy for many things.

Now for the Elme: the leaues, the bark, and the woody substance of the branches, haue a glutinous nature to consolidat, vnite, and heale wounds: the thinner rind or tunicle verily which lieth between the outward bark and the tree, doth assuage the leprosie, called of some S. *Magnus* euill: so do the leaues also, applied with vineger. The barke of the Elm puluerized and taken to the weight of a Roman denier in one hemine of cold water, is a very purgatiue, and doth euacuat flegmatick and waterish humors particularly. The liquor that issueth from the tree as a jelly, is singular good for apostemations, wounds, and burnes; but if the places were fomented before with the decoction, it would be the better. The Elm beareth certaine small bladders or huskes, wherein there is ingendred and contained a waterish humour, which is very proper to imbelish the skin, & beautifie the face. The first tender sprouts of the leaues boiled in wine, do assuage all tumors, & * draw filthy matter and corruption forth of fistulous sores: the same do the inward thin rinds within the bark. Many are of opinion, That the very bark chewed only, and applied to green wounds, is singular good to heale them. They affirme moreover, That the leaues bruised and applied to the feet, allay their swelling, so there be water sprinkled among. Furthermore, the water or liquor which runneth from the heart or pith of the wood when the tree is looped or disbranched (as I haue said before) if the head be annointed or bathed withall, causeth the haire to grow again if it be lost, and keepeth it on if it be ready to shed and fall.

As touching the Tillet or Linden tree, the very wood thereof is vsed for all things in a manner that the wild oliue is imploied vnto, if the same be lightly bruised or stamped: howbeit, the leaues only are occupied, which, if they be chewed and so applied, do cure the cankers breeding in the mouth of small infants. Being boiled and their decoction inwardly taken, they prouoke vrine: outwardly applied, they do stay the inordinat and excessiue flux of womens fleurs, but giuen in drink, they euacuat the same superfluous bloud.

There is a second kind of Elder more wild of nature, which some of the Greeke writers call * Chamææde, others Helion, and it groweth much lower than the other. The decoction of the leaues as well of VVallwoort as Elder, boiled in old wine, is contrarie and noysome to the stomach, and purgeth downward waterie humors: euen so doth the decoction either of the seed or the root, if it be taken inwardly to the quantity of two cyaths: the same is excellent to coole any inflammation; and namely, to take out the fire of any new burn or scald. The yong and tender leaues, as well of Elder as VVallwoort, reduced into a cataplasme and laied too with barley groats, doe cure the biting of a dogge. The iuice both of the one and the other, infused and conuighed accordingly into the head, is a soueraigne lenitiue for all impostumes of the braine, and especially those which are growing in the fine membrane or pellicle called Pia Mater, which immediately lappeth and enfoldeth the braine. The fruit or berries of the Elder or

* And yet heretofore he hath said that the one nor the other.

* Extrahuntur pias fistulas.

* Ground Elder, Wallwoort, or Dane wort,

of Walwort, are weaker in operation than the other parts of the tree or plant: howbeit, they serue wel to colour the haire of the head black. The same also taken in drinke, to the measure of one acerbale, be diureticall and prouoke vrin. The softest and tenderest leaues are eaten ordinarily in a salad with oile and salt, for to purge flegm and choler. In summe, the lesser plant, which is the VValwort, is in all things more effectually than the elder it selfe; for if the root thereof be foddren, and a draught of two cyaths be giuen to them who are in a dropsie, it will purge mightily and euacuat watery humors. A decoction of the roots and leaues of Danewort, is singular to mollifie the matrice and naturall parts of a woman, if she sit ouer the same and take the vapour thereof into her body. The tender sprigs of the milder Elder, boiled between two platters, do make the body soluble, and moue to the seege. The leaues drunke in wine, resist and kil the poisoned sting of serpents. The tendrons of the elder, incorporate with goats tallow, and reduced into a liniment, are singular good for the gout, if they be applied to the grieved place: the water of their infusion, if it be cast or sprinkled in any room of the house killeth fleas: and if the place be likewise sprinkled with the decoction of the leaues, it will not leaue a flie aliue. There is a kind of disease [much like to purples or meazles] when the body is bepainted all ouer with red blisters: a branch of the Elder tree is excellent good to lash the said wheales or risings, for to make them fall again and go down. Take the inner bark or rind of the Elder, beat it into powder, and so drinke it in white wine, it is a sufficient purgation.

The Iuniper of all other trees, passeth either for to heat any part, or to extenuate & make subtil any humors: in operation much like to the Cedar. Of it there be two kinds; the greater, and the lesse: a perfume made with the one as well as the other, drieth away serpents: the seeds or berries of Iuniper, assuage the pains of stomach, breest, & sides: the same serue wel to break wind and resolute all ventosities, yea and to euaporate all cold and chilnesse: they ripen any cough, and mollifie all hardnesse: a liniment made thereof applied outwardly, causeth any tumor to go down and represseth the rising thereof: likewise if the berries be drunke in some grosse or thick red wine, it will stay a lask: like as they will abate the swelling of the belly, if they be laid too by way of a cataplasme or liniment. The Iuniper berry is reckoned among the ingredients which go into antidotes, or preseruatiues against poison, such I mean, as be penetratiue and of quick operation. It is diureticall and moueth vrin. In case the eies do water much by reason of a continuall rheum taking to them, it is good to apply a liniment vnto them made therewith. Foure Iuniper berries are giuen in white wine, or 20 of them boiled in wine, for convulsions, crampes, ruptures, wrings, and torments in the belly, for the griefes of the matrice and the Sciatica. To conclude, some there be, who fearing to be stung with serpents, vse ordinarily to rub or annoint their bodies with a liniment made of Iuniper seed or berries.

CHAP. IX.

¶ Of the Sallow, Willow, or Withy: of the twig Withy or Oisier Amerina. Of twigs or binding rods. Of Heath or Lings.

The fruit which the willow or Sallow yeeldeth, if it be suffered to hang, before it doth ripen is conuerted into a certaine substance resembling a cobweb, but being gathered ere it be thus transformed, it is singular good for such as reach or cast vp blood. The ashes of the rind pilled from the first branches that the willow putteth forth, and tempered with water, taketh away corns and callosities of the feet: they serue also to rid the spots and specks which disfigure the visage, the rather if they be incorporat with the juice of the willow. Now there be found in the said willow, 3 sorts of juice: the first sweateth out of the tree it self in manner of a gum: the second issues forth by way of incision, when the tree is in the bloom; provided alwaies that the cut or gash in the bark, be made three fingers broad: this liquor is singular good to cleanse the eies, and to rid away such impediments as hinder the sight; likewise to incrassate or thicken where need requireth, to prouoke vrin, and draw forth all inward impostumes outwardly: the third juice is that which distilleth from the branches presently after the bill or cutting: hook, when the tree is lopped, or the boughs cut from the body. Take any one of these juices, and heat the same well with oile of Roses in the rind of a Pomegranat, excellent it is for to be dropped into the ears: likewise the decoction of Sallows, or the leaues stamped and incorporat with wax, and so applied, do the like: as also laid too in maner of a cataplasme, they ease the pain of

A of the gout. The decoction of the leaues and bark boiled in wine, is passing wholsom to foment the nerues withall. The blooms or charbons of the willow, stamped together with the leaues, cleanse the branny scales that appeare in the face. The leaues of the willow punned and taken in drinke, do coole them that are giuen too much vnto lasciuious lust, and ouer hot in the action of Venus: and if they vse to take the same often, they will disable them altogether for the act of generation. The seed of the black Oisier or willow called Amerina, mixed in like weight with white litharge of siluer, and brought into a liniment, is a depilatory, and fetcheth off the haire if the place be annointed therewith presently after the baine.

There is a kind of tree named Vitex, not much different from the willow, in regard of the vse that the twigs be put vnto, and also of the leaues which resemble those of the willow in outward shew, but that their smell is more pleasant and odoriferous: the Greeks, some call it Lygos others Agnos, i. chaff; for that the dames of Athens, during the feast of the goddesse Ceres, that were named Thesmophoria, made their pallets and beds with the leaues thereof, to coole the heat of lust, and to keep themselves chaste for the time. And two sorts there be of it. The greater riseth vp to a tree in maner of a willow: the other, which is lesse & lower, brancheth thick, bearing white leaues, and those full of down and cotton. The former of these two, which is called the white Agnus Castus, putteth forth white floures & purple one with another: whereas contrariwise, all the floures of the lesse, which is called the black, be purple only. Both the one and the other loue to grow in plains and moors. The seed of Agnus Castus, if it be taken in drinke, hath a certain rellish or tast of wine, and it is commonly thought that it cureth feuers: & whoeuer is annointed therewith, being incorporat into a liniment with oile, shall soon sweate: and by that means it is good to rid away wearinesse. Agnus Castus, as well the one as the other, prouoketh vrin, and the monthly terms of women. Both of them fume vp into the head as wine doth: and no maruell, for they haue the very smell of wine. They be singular to fend all ventosities downward. They stop the flux of the belly, and be excellent good for those who are in a dropsie, or troubled with the spleen. They haue this speciall property besides, to breed good flore of milk in milch nurces. Aduerse they be to all poisons of serpents, such especially as doe mischief by their cold quality. The lesse is more effectually against serpents. And for this purpose they vse to giue either one dram of the seed to drinke in wine or Oxycrat, which is vineger and water; or els two drams of the most tender leaues. There is neither of them both, but as well the seed as the leaues, reduced into a liniment, be singular good for the pricke of spiders. And there is not any venomous creature that wil come neere those who are but annointed therewith: nay they wil fle from the very perfume thereof, or the couch which is made of the leaues: they abate the heat of wanton lust: and in that regard especially they be contrary to the venomous spiders Phalangia, which by their sting do prick a man forward that way, and cause his flesh to rise. The floures and yong tendrils of Agnus Castus incorporat in oile rosat, do allay the headach, occasioned by drinking ouerliberally: but if the said headach be exceeding great, it is good to foment the head in a decoction of the seed of the said Agnus: for it will resolute & dispatch the extremity thereof. The same likewise by way either of suffumigation or cataplasme, mundifieth and cleanseth the matrice. And being taken as a drink with penyroial and hony, it is a purgatiue, and scoureth the belly. Mixed with Barly meale, and applied pulsethessewise, it mollifieth those botches & byles which hardly grow to ripenesse. The seed tempered with salt petre and vineger, healeth tetters, ringwormes, and red pimples: and with hony cureth the cankers or sores of the mouth, yea, and any wheals and breaking forth whatsoeuer. The same reduced into a liniment with butter and vine leaues, wariseth the infirmities incident to the cods: and if the seat be annointed with it & water medled together, it taketh away the chaps & fissures in that part. Brought into a cerot with salt, nitre, & wax, it is singular good for all dislocations: both the seed and leaues of Agnus, enter into many cataplasmes or mollitiue plasters, deuised for the sinewes and the guts: the seed boiled in wine, maketh a good decoction, which if it be dropped vpon the head by way of embracation, is right soveraign for lethargy and frensie both. It is said, that whoeuer beareth in his hand a twig of Agnus, or gird himselfe about the middle therewith, shall not be galled or fretted between the legs.

As touching Heath or Lings, which the Greeks call Erice, it is a shrub not much different from Tamariske, in colour and forme of leafe, such as it is, resembling Rosemary. The leafe of this plant (they say) is an enemy to serpents.

*For they call
it *Sparton*, as
well as the
plant.

As for Broom, it serueth also very well to make halters and cords of. The floures please bees G
passing well. I am in doubt and not able to say, whether this Genista or Broome, be that which
the ancient Greek writers called *Sparton*; for I haue shewed, that they vsed therof to make their
fishing nets: and I wot not well whether *Homer* meant it, when he said, that the ship-sparks were
vntwisted and loose. For this is certain, that neither the spart of Africk, ne yet the Spanish spart
it was as yet in any vse: and at what time as barges and vessels were sowed together with seams, it
is wel known, that the stiches were made with linnen thred, & not with spart. The seed that it
beareth, which the * Greeks giue one and the same name to, growing within smal cods in maner
of Phascols, is as strong a purgatiue [of Melancholy] as Ellebore; if it be taken when one is fa-
sting, to the weight of a dram and halfe, in four cyaths of honied water: the branches & leaues H
(such as they be) of Genista or Broome, being stamped after they haue lien infused in vineger,
yeeld a certain iuice singular good for the Sciatica, if it be drunk to the quantity of one cyath.
Some chuse rather to steep it in sea-water, and to draw forth the iuice, and so minister it with a
clyster for the said purpose. The said iuice incorporat with oile, serueth for an ointment also to
be applied outwardly for the Sciatica. Some vse the seed for the strangury. The substance of
Broom stamped with swines greafe, helpeth the ach or pain in the knees.

To come now to Tamarisk, which the Greeks call *Myrice*, *Lenaus* affirmeth, That it is vsed
in maner of the Amerian willow for beecomies: and more than so, that if it bee foddren in wine,
stamped and reduced into a liniment with hony, it healeth cankerous vlcers: and in very truth,
some hold, That the *Myrice* and *Tamariske* be both one. But doubtlesse, singular it is for the
spleen, in case the patient drinke the iuice pressed out of it in wine. And by report, there is that
wonderfull antipathy and contrariety in Nature betwene *Tamariske* and this one part alone I
of all the other bowels, that if the troughs out of which swine drinke their swil, be made of this
wood, they will be found when they are opened, altogether without a spleen. And therefore some
Physitians do prescribe vnto a man or woman also diseased in the spleen, and subiect to the opi-
lations therof, both to drinke out of cups or cans of *Tamarisk*, and also to eat their meat out of
such treen dishes as be made of that wood. One renowned writer about the rest, and for know-
ledge in great credit and authority among Physitians, hath affirmed and aouched constantly,
That a twig of *Tamarisk* slipped or broken from the plant, so as it touched neither the ground, K
nor any yron tooles, affluageth all belly ache, in case the patient weare it about him so, as that his
girdle and coat hold it fast and close to the body. The common people call it The vnlucky tree,
as I haue heretofore said, because it beares no fruit, & is neuer with vs set or planted. In Corinth
this *Tamarisk* in Egypt and Syria beareth in great plenty a certain fruit, in substance hard and
wooddy, in quantity bigger than the gal-nut, of an vnpleasant and harsh tast, which the Physiti-
ans do vse in stead of the Gal-nut, and put into those compositions which they name *Antheras*.
Howbeit, the very wood of this plant, the floure, leaues, and barke also, be vsed to the same pur-
pose, although they be not so strong in operation as the said fruit. The rind or barke beaten
to powder, is giuen with good successe to them that cast vp blood: also to women who haue a great
mist of their flours: likewise to such as be troubled with a continual flux, occasioned by the im-
becility of the stomack. The same bruised and applied as a cataplasme, represseth and smiteth L
backe all impostumations a breeding. The iuice pressed out of the leaues, is good for the same
infirmities: moreover, they vse to boile the leaues in wine, for the same intent. But of themselves
alone being brought into a liniment with some hony among, they are good to be applied vnto
gangrenes. The foresaid decoction of the leaues being drunke in wine, or the leaues applied
with oyle of Roses and wax, mitigat the said gangrenes, namely, when the flesh tendeth to mor-
tification. And in this manner they cure the night-foes or chilblanes. Their decoction is whol-
some for the paine of teeth or eares: for which purpose serueth the root likewise and the leaues.
ouer and besides, the leaues haue this property, That if they be brought into the form of a ca-
taplasme with barley groats and so applied, they keep down and restrain corrosiue vlcers. The M
seed if it be taken to the weight of a dram in drinke, is a preseruatiue and counterpoison against
spiders, and namely those called *Phalangia*. And if the same be incorporat with the tallow or
grease of any fatlings or beasts, kept vp in stall, stie, or mow, into a liniment, it is singular good
for any vncom or fellon. Of great efficacy it is also against the sting of all serpents, except
the

A the *Aspis*. The decoction likewise of the seed clysterized, is singular for the jaundise, it kills lice
and nits, and staiteth the immoderat flux of womens months. The ashes of the very wood of the
tree, is good in all those cases before said: which if they be mingled in the stale of an oxe, and so
taken of man or woman, either in meat or drink, it will disable them for hauing any mind to the
sports of *Venus* euer after. And a burning cole of this wood, when it is quenched in the stale or
beasts pisse, they vse to saue & lay vp in the shade for that purpose: but if one list to kindle lust,
* then they set it on fire againe. To conclude, the Magitians say, That it would do as much if
the vrine only of a gelded man were taken for the said purpose. *Russum vnde tur.

CHAP. X.

B

¶ Of the Bloud-rod. Of *Siler*. Of *Prinet*. The *Alder tree*, and *Ivy*. Of *Cisthus* and
Cissos. Of *Erithrano*. Of *Chamaecifos* or *Ground-Ivie*. Of *Smitax* or
Bindweed. Of *Clematis*.

THE Plant called the Sanguin-rod, is as vnhappy as the foresaid *Tamariske*. The inner bark
thereof is singular good to open again those vlcers, which are healed aloft only and skinned
before their time.

The leaues of * *Siler*, brought into a liniment and applied as a frontall to the forehead, allay
the paine of the head. The seed thereof driuen into powder and incorporat with oile, is good for
the lousie disease, and keepeth the body from lice. The very serpents cannot abide this plant or
shrub, but flie from it: which is the cause, that the peasants of the country make their walking
stauies thereof.

Our *Ligustrum* or *Prinet*, is the very same tree that *Cypros* is in the East parts. To good vse
it serueth among vs here in Europ: for the iuice of it is wholsome for the finewes, the toynts,
and any extreme cold. The leaues applied with some corns of salt, heale all inueterat vlcers in
any part whatsoeuer, and particularly the Cankers in the mouth. The graines or berries that it
beareth, are good to kill lice: also for any gal, where the skin is fretted off between the legs: and
so be the leaues likewise. The foresaid berries do cure the pip in Hens and Pullen.

As for the *Alder tree*: the leaues if they be applied hot as they be taken out of scalding wa-
ter, do cure without faile any tumor or swelling.

As touching the *Ivy tree*, 20 kinds therof and no fewer I haue already shewed; and of al these
there is not one, but the vse of it in Physick is doubtfull and dangerous. For first and formost,
Ivy, if it bee drunke in any quantity, how soeuer it may purge the head, surely it troubleth the
brain. Taken inwardly, it hurtheth the finewes: applied outwardly, it doth them much good. Of
the very same nature it is, that vineger. All the sorts of *Viues* be refrigeratiue. In drinke they pro-
uoque vrin. But the soft and tender leaues, foddren in vineger and oile of rose, and then stamped, and
so tempered with more oile of rose put too afterwards, vntil they be reduced into an ointment,
are a singular remedy for the pains of the head; and especially for the braine and the thin pelli-
cle *Pia mater*, which inwrappeth the brains: to which effect the forehead ought to be annoin-
ted with the foresaid liniment, the mouth to be fomented and washed with the decoction, and
the whole head afterwards well rubbed also with the abovesaid vnguent. They are good for the
spleene, both taken inwardly in drinke, and outwardly applied as a liniment. The decoction of
the same leaues may be drunke very well against the fit of an ague, to driue away the shaking
cold: also for the smal pocks and meazles: for which turn likewise they serue, if they be pulueri-
zed and taken in wine. The berries of the *Ivie* cure the oppilation and hardnesse of the liuer, ei-
ther giuen in drinke, or applied outwardly. So do they open also the obstructions of the liuer, if
a liniment be vsed only. Applied accordingly to the naturall parts of women, draw down their
monthly sicknesse. The iuice of *viue* (and specially of the white, which is planted in gardens)
clenseth the nostrills of the foule vlcers and vermine therein breeding, it rectifieth also the fil-
thy smell proceeding from thence. If the same be conueighed vp into the nose, it purgeth the
F head: but more effectually, if sal-nitre be put therto. Moreover, it is to right great purpose drop-
ped into the ears with oile, in case they either run matter, or be pained. It reduceth cicatrices or
wounds and vlcers newly skinned, to the naturall colour of the other skin: the iuice of the white
Ivy is of more force and better operation for the oppilations of the spleen, & the swelling hard-
nesse thereof, if it be made hot with a red hot yron, than otherwise: whereof fixe berries in two
cyaths

*Some think
it is the broad-
leaved *Oleifer*.

* Golden berry Ivy.

cyaths of wine, is a sufficient dose. Moreouer, three berries of the same white Ivi drunke at a time in Oxymell, do expell the worms in the belly: during which cure, it were not amisse to apply them outwardly also. As for the Ivi, which I called * Chrylocarpus, if one take twelue of the golden yellow berries thereof beaten to powder, and put them to a sextar of wine, three cyaths therof giuen to drink, according to *Erasistratus*, purge by vrine the watery humors between the skin and the flesh, which ingender the dropsie. The same *Erasistratus* was wont to take fise such berries stamped into powder and mixed with oile of rose, which after they were made hot in the rind of a Pomgranat, he vsed to drop into the eare of the contrary side, for the tooth-ach: the berries of Ivy which yeeld a iuice as yellow as Safron, if a man take before he sit down to drink, may be assured, that he shal not be drunk at that sitting. Likewise, they ease them much who are giuen to cast and reach vp blood, or be subiect to the collick and wrings of the belly. The white berries of the black Ivi if a man take in drinke, dull the vigor of his generall seed, and disable him for getting children: any Ivy whatsoever, being boiled in wine, & sobrought to a liniment and applied, doth cure all vlcers, euen morimals, and such as be vntoward for to be healed. The liquor issuing out of Ivy, is depilatory, but as it taketh away haire, so it riddeth lice and vermin. The floures of any kind of Ivy, taken (as much as a man may comprehend with 3 fingers) twice a day in some green and hard wine, help the dysentery or bloody flux; yea, and any other laske. The same reduced into a liniment with wax, are very good to skin and heal burns or scaldings. The berries of Ivy, colour the haire of the head black. The iuice of the Ivi root drawn with vinegar and taken in drinke; is singular against the poison of the venomous spiders Phalangia. Moreouer, I find in some writers, That the drinking out of a cup or dish of Ivy wood also, as well as of Tamarisk, cureth those who haue hard Spleens. The same authors prescribe to bruise the berries, afterwards to burn them, and with the ashes to dresse and bestrew the place that is burnt or scalded, so that it be first washed & bathed in hot water. There are Physitians who giue order to cut and lance the Ivy tree, for to draw a iuice or liquor from the place of the incision, which is to be vsed for rotten and worm-eaten teeth: and by their saying, the faulty teeth will breake and crumble into pieces if they be annointed therewith: provided alwaies, that the sound and good teeth standing next, be wel defended with wax for catching harm by this medicine: moreouer, they seek and lay for the gum of Ivy, which they would perswade vs assuredly vpon their word to be singular for the teeth, being applied thereto with vinegar.

For the vicinity and likeness of the name of Ivy in Greek, which is Cissos, I may take occasion to speak in this place of another shrub or plant called Cisthos, bigger than Thyme, & leaved like Basil. Of it be two kinds, namely, the male, with a red Rose colored floure; the female with a white: both sorts are good for dysenteries or bloody fluxes, and all loofeness of the belly, if there be drunk twice a day in some green & hard wine, as much of their floures as may be held at three fingers ends: which if they be made into a cerot with wax, heale old vlcers, burnes, and scaldings: and alone of themselves cure the cankers or sores in the mouth.

Vnder this plant specially grows Hypocisthis, wherof I haue written in my treatise of Ivi. Likewise, there is another plant like vnto the Ivy, and the Greeks call it Cissos Erythranos: which being taken in drinke, helpeth the Sciatica, and is good for the loins: but they say it is so vehement and forcible in operation, that together with vrine it will euacuat blood.

Moreouer, there is an Ivy which creepeth and traileth alwaies close by the ground, and the same the Greeks call Chamæcissos. This herb being stamped and taken in wine to the quantity of one Acetabell, cureth the infirmity of the spleen. The leaues incorporat with swines grease serue to cure burns.

Furthermore, the Bindweed Smilax, known also by the name of Nicephoros, resembleth Ivy, but that it hath smaller leaues. They say, that a chaplet or guirland made of this Smilax, is singular for the headach; provided alwaies, That the leaues which goe to the making of it, bee in number odde. Some haue said that Smilax is of 2 sorts: the one, which continueth a world of yeres, grows in shadowie vallies, climbing trees, & tufted in the head with clusters (as it were) of berries in manner of grapes; a soueraigne plant against all poisons, in so much, as if the iuice or liquor of the berries be oftentimes dropped into the ears of yong babes or little infants, no poisons (by report) will euer hurt them afterwards. As for the other Smilax or Bindweed, it loo- ueth places well toiled and husbanded, wherein it vsually groweth: but of no vertue it is & operation: the former Bindweed is that, the wood wherof we said would giue a sound, if it were held close

A close to the eare. Another herb there is like to this, which some haue called Clematis. This plant creepeth & climbeth vpon trees, hauing many ioints also or knots. The leaues are good to mundifie the foule leprosie. The seed drunk to the measure of one acetabell, in a hemin of water or mead, maketh the belly loofe. The decoction thereof is giuen likewise to the same effect.

CHAP. XI.

¶ The vertues and properties of Canes or Reeds, of the Papyr reed, of Ebene, Oleander, Sumach, otherwise called Rhus Erythros, Madder, Alysson, Sopewort or Fullers-weed, Apocynon, Rosemary, Cachrys, Sagine, Sclago, and Samulus. Also of Gummes.

B Heretofore haue wee shewed 29 sundry kinds of Reeds, all indued with their medicinable vertues: and in no plants more appeareth the admirable power of dame Nature, the only subject matter handled in all these books of ours. For in the first place, there presenteth it selfe vnto vs the root of Reeds or Canes, which being bruised and applied accordingly, draweth forth of the body any spills of Fearne sticking within the flesh: so doth the Fearn root by the Reed. And forasmuch as we haue set downe many sorts of Canes, that amongst the rest, which cometh out of India and Syria, and whereof perfumers haue so great vse in their sweet ointments and odoriferous compositions, hath this property besides, That if it be boiled with the grasse called Dent de Chien [i. Quioich grasse, or Parsley seed] it is diureticall and prouoketh vrine. Applied outwardly, it draweth down the desired sicknesse of women. Taken in drinke to the weight of two oboli, it cureth those who are subiect to convulsions or cramps: it helpeth the liuer and the reines: it is a remedy also for the dropsie. As for the cough, a very perfume thereof will stay it, and the rather, if it be mixed with Rosin. The root foddren in wine with Myrrh, clen- seth scurfe and dandruffe, it healeth also the spreading vlcers & running scabs of the head: there is a iuice besides drawn from it, which becommeth like to Elaterium, or the iuice of the wilde Cucumber. Moreouer, in any Reed, the best and most effectual part thereof is that holden to be, which is next to the root. The ioints also and knots be of great efficacy. The Cyprian Cane is named Donax, the rind whereof, if it be burnt and brought into ashes, is singular for to bring haire againe in places where it is shed: it healeth likewise vlcers growing to putrefaction. The leaues thereof are vsed, to draw forth any pricks or thorns. The same be of great vertue against S. Antonies fire, the shingles, and such like, yea & against all impostumations: the common and ordinary Reeds haue an extractiue or drawing faculty, if they be stamped greene: which is not meant of the root only, but also the very substance of the reed it self, which they say is of great operation. The root being reduced into a liniment, and applied with vinegar, cureth all dislocations, and easeth the pains of the chine bone. The same punned green and new, stirreth to lust, if it be drunk in wine. The down or cotton growing vpon the cane, if it be put into the ears, causeth hardnesse of hearing.

There groweth in Ægypt a certain plant named Papyrus, which resembleth much the Cane or Reed: a thing of great vse and commodity, especially when it is dry; for it serueth as a sponge both to suck vp the moisture in Fistulaes, and also to enlarge them. For twelling as it doth, it keepeth the vicer open, and maketh way for the medicines to enter accordingly by that means. The paper made thereof when it is burnt, is counted to be caustick. The ashes of it being drunk in wine, cause sleep: and applied outwardly, taketh away hard callosities.

Touching Ebene, it groweth not (as I haue already said) so neare vnto vs, as in Ægypt. And albeit my meaning and purpose is not to deale with any medicinable plants growing in the strange & vknown countries of another world: yet in regard of the wonderfull properties that Ebene hath, I will not passe by it in silence. For first and foremost, the fine dust or powder filed from it, hath the name to be a singular medicine for the eies: as also, that the wood thereof being ground vpon an hard stone, together with wine cuit, dispatcheth away the cloudy mist which ouercasteth the eies. As for the root, if it be vsed likewise and applied with water, it consumeth the pin and web, and other spots in the eies. The same being taken with equall quantity of the herb Dragon in hony, cureth the cough. In sum, Physitians repute and range Ebene among the medicines which be corrosiue.

Oleander, called in Greek Rhododendros, which some name Rhododaphne, and others Nerion,

As concerning gums, I haue heretofore declared how many kinds thereof are to be found. G To speak of them in generall, The better that any gum is, the more effectually be the operations thereof: hurtfull they are to the teeth: they haue a property to thicken or coagulate blood, and therefore be good for those who cast and reach vpon blood: likewise they be singular for burns, as also for the windpipe and instruments of respiration. The superfluous and corrupt vaine within the body, they prouoke and giue passage vnto. They dul & diminish the bitterness of other medicines wherein they be mingled, howsoeuer otherwise they be astringent & do fortifie other qualities. That which commeth from the bitter almonds, and is of a stronger operation to thicken and incrassate, hath vertue also to heat the body. The best gums be those of Plum-trees, cherry trees, and vines: they haue all of them a drying and astringent quality, if any part be annointed with them: and dissolved in vineger, they kill the tetter or ringwormes in children, & heale them vpon. Being drunk to the weight of foure oboli, in * new wine, they be good for any inueterate cough. Moreover, they be thought to make the colour more fresh, liuely, & pleasant; to procure and stir vpon the appetite to meat; also to help those who be pained with the stone, in case they be drunk in sweet wine cuir. And to conclude with some particularity, The * gum of the Egyptian thorne is soueraigne for wounds, and all accidents of the eyes.

* Musto, or
Mistio, in
some made or
compound
wine.
* Thought to
be Acacia.

* Our ladies
thistle,

CHAP. XII.

¶ Of the Arabian Thorne: of * the white Thistle Bedegnar: of Acanthium and Acacia.

Toucing the Arabian Thorne or Bush, and the commendable qualities thereof, I haue sufficiently spoken in the treatise of perfumes and odoriferous confections: yet thus much moreover I haue to say of the medicinable vertues, that it doth thicken and incrassate thin and rheumatick humors, it restraineth all catarrhes and distillations, it represseth the reaching vpon blood, & staeth the immoderate flux of womens monthly terms: for which purposes the root is more effectually than any other part of the plant.

The seed of the white Thistle is singular for the sting of scorpions: a garland made of it and set vpon the head, assuageth the paine thereof. Much like vnto this, is that Thistle which the Greeks call Acanthion, but that the leaues be much smaller, and those are sharpe pointed and prickly all about the edges, and couered with a downe resembling a cobweb; which the people of the East countries do gather, and thereof make certain cloth for garments, resembling silke. K The leaues or roots drunk in substance, are supposed to be a singular remedy for the crampe or convulsion which draweth the neck and body backward.

Moreover, there is a kind of Thorne, whereof commeth Acacia, and it is the juice thereof. It is found in Egypt to issue from certain trees, which be white, black, and green: howbeit, the best Acacia by far, is that which the former (that is to say, the white and the black) do yeeld. There is made likewise a kinde of Acacia in Galatia, which is most soft and tender; and the tree that affordeth it, is more prickly and thorny than the rest. The seed or fruit of all these trees, is like vnto Lentils, but only that the grain is lesse, and the cod or huske wherein it lieth, smaller. L The right season to gather this fruit is in Autumn; for if it be taken before, it is too too strong. For to draw this juice which we call Acacia, the cods wherein the grains lie, ought to be thoroughly steeped first in rain water: soone after, when they be punned or stamped in a mortar, the sayd juice is pressed forth with certaine instruments seruing for the purpose: which done, they let it remaine within mortars in the sun, and there take the thickening; and so at length reduce it into certain trochisks, and reserue them for vse. There is a iuice likewise drawne out of the leaues, but the same is not so effectual as the other. The curiours vse to dresse their skins with the seed or grains thereof, in lieu of Galls. The juice which the leaues of the Galatian thorne abouesaid doth yeeld (and namely, the blackest) is rejected for naught, like as that also which is of a deepe red colour. Contrariwise, that which is either purple or ash-colored and russet to see too, as also that which will be soone dissolved, is of exceeding efficacy to thicken and coole withall; and is preferred before all other in colyries or eye-salues: now for these vses, some are wont to wash the troshes aforesaid, others torrifie and burn them. They are good to colour the haire of the head black: they heale S. Anthones fire and corrosiue sores; yea and all grieuances of the body that consist in moisture: they cure any impostumes, joints that are bruised, kided heels, and the turning

A ring vpon the skin and flesh from the naile roots. They repress the exceeding flux of womens monthly fleurs: the matrice and tiwell if they be slipt and fall out of the body, they reduce into their place again. In sum, for the eyes, for the sores and infirmities of the mouth, and naturall parts seruing for generation, they be soueraigne.

CHAP. XIII.

¶ Of the common Thorne: of the wilde or wood Thorne: of Erysipteron: of Spina Appen- dix: of * Pyxanthus, and * Palurus: of Hulver or Holly: of Teugh: and Brambles: with the medicinable vertues of them all.

* Box-thorne:
* Some call it
Christs thorn.

THe common Thorn also, wherewith the Fullers vse to fill their vats and caudrons, hath the same operation that * Struthium, and is put to the same vse. Many there be verily in all parts of Spaine, who vse it both in sweet Romanders, and also in ointments, calling it A. palathus: and without all doubt, there is a kind of wild white thorne of this race growing in the easterly countries (as I haue said) among the woods, and riseth to the full height of a good tree. Yea and a shrubby plant there is, lower than the other, but as full of prickles, growing in Nisyrus and the Islands of the Rhodians, which some call Erysipteron; others, Adipsatheon, or Dipficon, or Dracheton: the best is that which groweth nothing like to the Ferula, and being despoiled of the rinde, is of a reddish colour inclining to purple. It is found in many places, but not euery where odoriferous. Of what force it is, when the rainebow seemeth to rest vpon it, I haue shewed already. It healeth the filthy cankers or sores of the mouth, and the stinking vlcers or alepocks in the nostrills: likewise the sores, botches, and carbuncles in the priuy parts, the crenises also and clifts in the fundament, or else where, applied vnto the place affected: but if it be drunk, it abateth all swelling of ventosities: the bark or rinde thereof, disperseth those obstructions and impediments which cause the strangury or pissing by drop-meale. The decoction is a singular remedy for them that either pisse or vomit blood. The foresaid rinde stoppeth the flux of the belly. The like effects is that thought to work which groweth in the woods [and is called Aspalathus of the Leuant.]

There is a kind of thorny bush called * Appendix, for that there be red berries hanging there, which be likewise named Appendices. These berries, either raw by themselves, or else dried and boiled in wine, do stay the flux of the belly, and besides assuage the torments and wrings thereof. As for the berries of Pyxanthus, they be drunk to right good purpose against the sting of serpents. Palurus also is a kind of thorny bush: the people of Africk call the seed of it Zura, which is found to be most effectually against scorpions; and for those who are troubled with the stone, and the cough. The leaues haue an astringent or binding qualitie. The root resolueth and dispatcheth biles, impostumes, and botches: and if the same be taken in drink, it procureth vrin: if it be soddin in wine, and the decoction drunk, it stoppeth a laske, and is a defensatiue against the poison of serpents: the root especially is giuen in wine: some there be who stamp the leaues, putting salt thereto, and being reduced into the forme of a cataplasme, apply the same to the gout. The leaues be good to stay the immoderate flux of womens termes, the loosenesse of the belly occasioned by a feeble stomack, the bloody flux, and the inordinat motions of cholerick humors both vponward and downward. The root boiled and brought to a liniment, draweth forth whatsoeuer sticketh within the body. Soueraign it is and of exceeding great operation, in case of dislocations and swellings.

* Some take it
for the Barbery
bush.

As touching the Holly of Hulver tree, if it be planted about an house, whether it be within a city, or standing in the country, it serueth for a countercharm and keepeth away all ill spels or enchantments. Pythagoras affirmeth, that the floure of this tree wil cause water to stand all vpon an yce: also that a staffe made thereof, if a man doe sling it at any beast whatsoeuer, although it change to light short for default of strength in his arms who slung it, wil notwithstanding etch forward and roll from the place where it fell vpon the earth, and approach neere to the beast afore said, of so admirable a nature is this Holly tree.

The fume or smoke of any Yeugh tree, killeth mice and rats. Neither hath Nature produced brambles for nothing els but to prick and do hurt; for such is her bounty, that the berries which they beare are mans meat, besides many other medicinable properties: for they haue a desiccative and astringent vertue, and serue as a most appropriate remedy for the gums, the inflammation

tion of the Tonfils, & the priuy members: the flours also as well as the berries of the brambles, be singular against the Hemorrhoid and the Prester, which are the two wickeddest and most mischievous serpents that be. The wounds inflicted by scorpions, they close & heale vp againe without any danger of rankling or apostemation: and withall, they haue a property to prouoke vrine. The iuice drawne and pressed out of the tendrons or yong sprouts of brambles stamped, and afterwards reduced vnto the consistence of honey by standing in the Sun, is a singular medicine either taken inwardly or applied outwardly, for all the diseases of the mouth and eies, for them that reach vp bloud, for the squinancy, the accidents of the matrice and fundament, finally, for the immoderat flux of the belly occasioned by the weaknesse of stomack. As for the sores and infirmities of the mouth, the very leaues alone of the bramble if they be but chewed, are passing good: but if they be reduced into a liniment and so applied, they heale running sores, or any scals whatsoeuer in the head: & euen so being laid alone vpon the left pap, they be wholesome for such as are giuen to the fainting & trembling of the heart, and subject to fall into cold sweats: likewise being applied accordingly, they ease the pain of the stomack, and such as haue their eies ready to start out of their head: and to help the infirmities of the ears, their iuice is excellent to be dropped into them. The same iuice incorporat with the cerot of roses, healeth the clifts and swelling knubs in the fundament: & for the said infirmity, the decoction of yong tendrils in wine, is a present remedy, in case the place be bathed and fomented therein. The same yong springs eaten alone by themselves in a salad, in manner of the tender crops and spurts of the Colewort; or boiled in some harsh, grosse, and greene wine, do fasten the teeth which be loose and shake in the head: they stop a lask, and restrain an vnaturall issue or flux of bloud, and besides, are good in the bloody flux. Being dried in the shade, and afterwards burnt, their ashes are singular to stay the vula for falling. The leaues also being dried and beaten to powder, are excellent good for the farcines and sores in horses, and such like beasts. As for the blacke berries which these brambles do beare, there is a kind of Diamoron made of them, which is far better for the infirmities of the mouth, and more effectual, than the other of the garden mulberries. The same being so prepared in that stomacall composition aforesaid, or drunk only with Hypocistis and hony, be singular to repress the fury of choler prouoking both waies: they be cordiall likewise, in case of faintings and cold sweats: and lastly, a preseruatiue against the poison of the venomous spiders. Among those medicines which they cal Styptick or astringent, there is not a better thing than to boile the root of this blackberry bramble in wine to the thirds, and namely to make a collution therewith to waih the cankers or sores breeding in the mouth, or to foment the vlcers growing in the fundament. And verily of such a binding and astringent force is this bramble, that the very spongyous bals that it beareth, will grow to be as hard as stones.

Another kind of brier or bramble there is, vpon which groweth a rose: some cal it Cynosbatos, others Cynospastos: it beareth a leafe like to the print or sole of a mans foot. A little bal or pill it breedeth, furred or bristled much after the maner of the Chestnut, which serueth as a speciall remedy for those that be subiect to the stone. As for Cynorhonos, it is another plant different from this; wherof I will speak in the next book.

CHAP. XIV.

¶ Of * Cynosbatos, and the Rasps: of the Rhamnos, and of Lycium and Sarcocolla. Of a certaine composition in Physicke called Oporice.

* i. the Cane-brier or Canker brier.

* *Rubus canis.*

* Obserue how confusedly Pliny scroth down the story of Cynosbatos and Chamæbates, i. the Cane-brier, & the blackberry bramble.

AS for the bramble named Chamæbatos, it beareth certain black berries like grapes, within the kernell wherof it hath a certain string like a sinew, whereupon it came to be called Neurospastos: it is a different plant from the Caper, which the Physitians haue named al-Nowspastos. Now the tender stems of the foresaid * Cynosbatos or Chamæbatos condite in vineger, are good for them to eat who are troubled with the opilation of the spleen, & with ventosities; for it is a singular remedy for those infirmities. The string or sinew thereof chewed with Mastick of Chios, purgeth the mouth. The wild roses that grow vpon this brier, being incorporat with swines grease, are excellent for to make the haire grow againe, when it is shed by some infirmity. * The berries of these brambles if they be tempered with oile oliue made of green and vnripe oliues, colour the haire black. The proper season to gather the floures of these brambles that cary berries like to mulberries, is in haruest time: the white kind of them drunk in wine, is a soueraign remedy for the pleurisie, & the flux of the stomack: the root foddren to the thwads, stoppeth

A Stoppeth a lask, and staieth the flux of bloud: likewise a collution made therewith, fastneth loose teeth, if they be washed withall. The same decoction or liquor is good to foment the vlcers of the seat priuy parts. The ashes of the root burnt, keep vp the vula from falling.

The Rasps is called in Latin Rubus Idæus, because it groweth vpon the mountain Ida, and not elsewhere* [so plentifully.] Now is this bramble more tender, & lesse in growth: it putteth forth also fewer stalkes vpright, and those more harmelesse and nothing so prickly as the other brambles before named: besides, it loweth well to grow vnder the shade of trees. The floures of this bramble reduced into a liniment with hony, restrain the flux of rheumaticke humors into the eies, and keepeth down the spreading of S. Antonies fire: and giuen in water to drink, it cureth infirmities of the mouth. In all other cases, it hath like operations to the former brambles

* Ex Dioscor.

B Among the diuers kinds of brambles, is reckoned the Rhamne, which the Greeks cal Rhamnos, notwithstanding that it is whiter & more branching than the rest. This Rham beareth many flours, spreading forth his branches armed with prickles not crooked or hooked as the rest, but streight and direct, clad also with larger leaues. A second kind there is of them growing wilde in the woods, blacker than the other, & yet inclining in some sort to a red colour: this carieth as it were certain little cods. Of the root of this Rham boiled in water, is made the medicine that is called Lycium. The seed of this plant draws down the after-birth. The former of these two, (which also is the whiter) hath a vertue more astringent and cooling than the other, & therefore better for impostumations and wounds: howbeit the leaues of both, either green or boiled, are vfed in liniments with oile for the said purpose. But as touching Lycium, the best of all other is

C (by report) made of a certain Thorne tree or bush, which they cal Pyxanthos Chironia, the form wherof I haue described among the Indian trees: & indeed the most excellent Lycium, by many degrees, is that Indian Lycium thought to be. The manner of making this Lycium, is in this wise: they take the branches of this plant, together with the roots which be exceeding bitter, & after they be well punned and stamped, seeth them in water within a brazen pan, for three daies together or therabouts: which don, they take forth the wood, & set the liquor ouer the fire againe, where it taketh a second boiling, so long till it be come to the consistence or thicknes of hony: howbeit sophisticated it is many times with some bitter iuices, yea and with the lees of oile & beasts gall. The very froth & scum, in maner of a story that it casteth vp, some vse to put into colyries & medicines for the eies. The substance of the iuice besides is absterfue, it mundifieth the face, healeth scabs, cureth the exulcerations or frettings in the corners of the eies: it represseth old rheumes & distillations, clenseth ears running with filthy matter, represseth the inflammations of the almonds in the mouth, called Tonfille, & of the gums, staieth the cough, restraineth the reaching & casting of bloud, if it be taken to the quantity of a bean: being spread in maner of a plaster or liniment and so applied, it drieth vp running and watery sores; it healeth the chaps and clifts in any part of the body, the vlcers of the secret parts seruing for generation, any place fretted or galled, new and green vlcers, yea and such as be corrosiue and withall growing to putrefaction: it is singular for the calosities, werts, or hard corns, growing in the nostrills, and all impostumations: moreover, women find great help by drinking it in milke; for any violent shift or immoderat flux of their monthly sickness: the best Indian Licium is known by this,

D That the masse or lump therof is black without forth, red within when it is broken, but soon it commeth to a black colour. An astringent medicine this is, and bitter withall, and hath the same effects which the other Lycium is reported to haue, but specially if it be applied to the priue members of generation. As touching Sarcocolla, some be of opinion that it is the gum or liquor issuing from a certain thorny plant or bush: and they hold, that it resembleth the crums of frankincense, called Pollen or Manna Thuris, & in tast seemeth to be sweetish, & yet quick and sharpe withall. This Sarcocoll stamped with wine, and so applied, represseth all fluxes: & in a liniment good it is for yong infants. This gum also by age and long keeping, waxeth black; but the whiter is the better, & thereby is the goodnesse knowne.

E But before I depart from this treatise of Trees, and their medicinable vertues, I must needs say, we are beholden to them yet for one excellent medicine more, which is called Oporice by the Greeks, as one would say, made of fruits. This composition is singular for the bloody flux or exulceration of the guts; also for the infirmities of the stomack. The manner of making it, is in this wise: Take 5 quinces, with their kernels, seeds & all, as many pomgranats likewise, let them boil gently ouer a soft fire in one gallon of new white wine, put therto the weight or measure or

one sextar of Seruises, and as much in quantity of the Sumach which is called Rhus Syriacum, G together with halfe an ounce of saffron, seeth all these together to the height or consistence of hony. Thus much concerning the properties of trees seruing in Physicke. It remaineth now to annex hereunto a discourse of those plants which the Greeke writers (by giuing them names in some analogie respectiue vnto trees) haue left an ambiguity, and made vs doubt of them whether they be trees or herbs.

CHAP. XV.

¶ Of * Chamædrys, i. Germander : * Chamædaphne, i. Lawrell : * Chamæla : * Chamæsyce : * Chamæcissos, i. Alc-boone : * Chamæleuce, i. Fole-foot : * Chamæpeuce : * Chamæcyparissos, i. Lauander-cotton : * Ampeloprasos : Stachys : Clinopodium, Centunculus, and Clematis Egyptia, with the medicines that they afford.

* ground-oke, or petite oke.
* ground-bay, or petty Lawrell.
* ground-oliue, &c.
* ground fig-tree, &c.
* ground Iuic.
* ground Poplar.
* ground-pine, or Patch tree.
* ground Cypress.
* Portet vine, or i. ceeke vine.

Germander is an herb, called in Greeke Chamædrys, and in Latine Triffago: some haue named it Chamædrope, others Teucrion: it beareth leaues for bignes resembling mints, in colour like vnto the oke leaues, cut and indented also after the same maner. Of some it is called Serrata; and they affirme that the first pattern of a saw was taken from the leafe of this herb, whereupon it should be so called. The floure beareth much vpon the purple colour: it lo- ueth to grow in stony places, and would be gathered while it is full of iuice: and thus gathered in due season, whether it be taken in drink, or taken outwardly in a liniment, most effectuall it is in due season, whether it be taken in drink, or taken outwardly in a liniment, most effectuall it is I against the poison of serpents: likewise it is wholesome for the stomack, good against an inueterat cough; singular to cut, dissolue, and raise the tough fleam sticking in the throat: a special remedy for ruptures, convulsions, and pleurisies: it waneth away the ouergrown spleen: it prouokes vrine, and womens fleurs: in which regard, a bundle or handfull of Germander boiled in 3 he- mines of water, vntill a third part be consumed, maketh a soueraigne decoction or drinke for those who are newly faine into a dropsie. Some there be, who stamp this herb and sprinkle water among, and so reduce it into trochs.ouer and besides the vertues before rehearsed, it is good to heale botches newly broken and full of matter; yea old vlcers, though they be filthy and pu- trified, if it be applied thereto: for the spleen, it is vntually taken with vineger: & this iuice doth chaufe and heat those parts which be annointed therewith.

As touching Lawrell, called by the Greekes Chamædaphne, it ariseth vp with one only stem of a cubit high or thereabout: the leaues are but smal, howbeit like to those of the Lawrell: it bringeth forth a reddish seed appearing among the leaues, which being vsed in a liniment fresh and green, caseth the head-ach. The same cooleth all excessive heats: and if it be drunk in wine, appeaseth the wrings and torments of the belly. The iuice thereof taken in drink, drawes downe womens fleurs, and prouokes vrine: the same applied in wooll to the naturall parts of a woman, causeth her to be soon deliuered when she is in hard trauell or child-birth.

* otherwise called Merg- reon, Widow wail.

As for * Chamæla, it hath leaues like vnto those of the oliue: the same be bitter in tast, and in smell odoriferous. This plant groweth in stony grounds, and exceedeth not in heighth a hand- breadth or span at most; a purgatiue herb it is; for thereof is made an excellent syrrop to eua- L breath or span at most; a purgatiue herb it is; for thereof is made an excellent syrrop to eua- breath or span at most; a purgatiue herb it is; for thereof is made an excellent syrrop to eua- breath or span at most; a purgatiue herb it is; for thereof is made an excellent syrrop to eua-

As for * Chamæsyce beareth leaues resembling those of the Lentil, but they alwaies creep along the ground and rise not vp. This herbe groweth in drie and stony grounds: the same boiled in wine and vsed as a liniment vnto the eies, cleareth their sight; for it is singular to dispatch and re- moue catarracts, suffusions, and cicatrices, growing therein: as also to rid away the misty clouds and films that ouercast the sight. Being put vp into the matrice within a linnen cloath in man- ner of a pessarie, it allaieth the paines thereof. VVarts of all sorts it taketh away, if they be an- nointed

A nointed therewith. It is a soueraigne remedy also for those who cannot take their wind but sit- ting vpright.

* Chamæcissos groweth vp spiked with an ear like vnto wheat, and ordinarily putteth forth fiue branches, and those full of leaues. VVhen it sheweth in the floure, a man would take it to be the * white Violet or Gilloffe. The root is but small. They that are troubled with the Sciat- ca, vse to drinke the leaues thereof to the weight of three oboli in two cyaths of wine, for seuen daies together: but it is an exceeding bitter potion.

As for Fole-foot, it is called in Greeke Chamæleuce: but we in Latine name it Farranum or Farfugium. It loueth to grow by riuers sides. The leaues somewhat resemble those of the Pop- lar, but that they be larger. If the root of Fole-foot be burnt vpon the coles made with Cypres wood, the smoke or perfume thereof receiued or drunk through a pipe or tunnell into the B mouth, is singular for an old cough.

Touching * Chamæpeuce, in lease it is like vnto the Larch-tree: a plant very appropriat to the paine of the back and the loins. The herb Chamæcyparissos, if it be drunk in wine, is singu- lar good against all the venomous stings of serpents and scorpions.

The herb Ampeloprasos groweth in vineyards, bearing leaues resembling Porret: but it cau- seth them to belch soure that eat thereof. Howbeit, of great power it is against the sting of ser- pents. It prouoketh vrine & womens monthly terms. And yet whether it be drunke or applied outwardly, it is passing good for them that pisse blood, & represteth the issue & eruption there- of. Our midwives vse to giue it vnto women newly deliuered and brought to bed: likewise it is found to auail much vnto them that be bitten with mad dogs.

C Morcouer, the herb called Stachys hath a resemblance also to * Porret, but that the leaues be longer and more in number: it yeeldeth a pleasant smell, and the leaues be of a pale colour, in- clining somewhat to yellow. The nature of this plant is to moue the monethly purgation of wo- men. As for Clinopodium (called otherwise Cleonicion, Zopyron, & Ocymoeides) like it is to running wilde Thyme, and full of branches, growing vp a span or handfull high at the least. It groweth in stony places, with a spoky tuft of floures shewing in a round compasse, and for all the world resembleth the feet or pillars that * beare vp a table or bed. This herb taken in drinke is good for convulsions, ruptures, strangueries, and serpents stings. So is the syrrop or juleb that is made thereof, by way of decoction. Thus much of those herbs, which in name carry a shew and resemblance of trees.

D It remaineth now to write of some other herbs, which I must needs say are of no great name and reckoning, howbeit such as be indued with wonderfull vertues. As for the famous and nota- ble herbs indeed, I will reserve the treatise of them for the books following. And first I meet with that which we in Italy call Centunculus, but the Greekes Clematis, with leaues pointed like the beak of a bird, or resembling the cape of a cloke, growing close to the ground in toiled corn fields. This herbe is most effectuall and singular about all other, for to stay a laske, if it be drunk in some red or green hard wine. The same beaten into powder, and taken to the weight of one denier Roman, in fiue cyaths of Oxy mell or hot water, stancheth bleeding: and yet in that fort it is of great effect to fetch away the after-birth of women lately deliuered.

E But there be other herbes among the Greeke writers, going vnder the name of Clematides, and namely one, which some call Echites, others Lagines, and there are besides who name it Pe- ty Scammonie, and in very truth, branches it hath a foot long, full of leaues, and not vnlike vnto those of Scammonie, but that the leaues be more black or dusky and smaller. This herbe is found as well in vineyards as corne lands. People vse to eat this herb with oile and salt, as they do Beets, Coles, and other such pot-herbs: and so eaten, it maketh the body soluble. And yet ne- uertheless, those who be troubled with the bloudy flux, are wont to take it in some asfringent wine with Lineseed, and find it to work with good successe. The leaues applied to the eies with parched Barly groats, do re straine the waterish humors which fall thither, so there be a fine lin- nen cloth wet * between. The same applied in a pulstesse to the wens called the kings euil, bring- ing them first to suppuration, and afterwards hauing hogs greafe put thereto, heale them throughly. F Incorporat with green oile Oliue, they ease the hemorrhoids: and with honey, helpe those that be in a Phthisicke or Consumption. If nourses eat them with their meat, they shall haue good store of milke in their breasts. And if they annoint therewith the heads of their young infants, the haire will come the thicker. A collution made with them and vineger, assuageth the tooth- ach,

* It is not our ground Iuic or Alchove.
* Viola alba.

* Some take it for Chamæ- pity.

* ocymoeides, i. Por- ri: but it seems that Pliny should haue read ocymoeides, i. Marryb, or Horehound, out of Diosco- rides, as Ronde- leius hath ob- serued.

* Whereupon it took the name Clinopodium.

* Suppositio: some reade contrariwise, Superpositio.

is a most excellent wound-hearb. And it is auouched by the people of that country, That if an Oxe chance to haue his strings or sinews cut quite atwithe the plough-share, this hearb will conglutinat and soulder them againe, if it be made into a saluie with swines greafe.

Concerning bastard Navew, called in Greeke Pseudo Bunion, it hath the leaues of Navew gentle, and brancheth to the height of a hand bredth or span. The best of this kind groweth in the Isle Candy, where they vse to drink five or six branches thereof for the wringing torments of the belly, for the strangury, the pain of the sides, midriffe, and precordiall parts.

Myrrhis, which some call Smyrrhiza, others Myrrha, is passing like vnto Hemlocke, in stalle, leaues, and floure; only it is smaller and slenderer, and hath no ill grace and vnpleasant tast to be eaten with meats. Taken in wine, it hasteneth the monthly course of womens fleurs if they bee too slow, and helpeth them in labour to speedy deliuerance. It is said moreouer, that in time of a plague it is wholsom to drink it for feare of infection. A supping or broth made of it helpeth those who are in a Phrysicke or consumption. This good property it hath besides, to stir vp a quick appetite to meat. It doth extinguish and kill the venome inflicted by the sting or pricke of the venomous spiders Phalangia. The juice drawn out of this herb after it hath been infused or soaked three daies together in water, healeth any sore breaking out either in face or head.

Finally, Onobrychis carierh leaues resembling Lentils, but that they are somewhat longer: it beareth also a red floure; but refeth vpon a small and slender root. It groweth about springs and fountains. Being dried and reduced into a floure or powder, it maketh an end of the strangury, so it be drunk in a cup of white wine well strewed and spiced therewith. It stoppeth a lask. To conclude, the juice thereof causeth them to sweat freely who are annoiued all ouer with it.

CHAP. XVII.

¶ The medicinall vertues of Coriacesia, Callicia, and Menais, with three and twentie other herbes, which some hold to be Magicall. Moreouer, of Considia, and Aproxis, besides some other which are renewed and in request againe, hauing been long time out of vse.

TO discharge and acquit my selfe of the promise which I made of strange and wonderfull herbs, I cannot chuse but in this place write a little of those which the Magitians make such reckoning of. For can there be any more admirable than they? And in very truth, Democritus and Pythagoras, following the traicts of the said wise men and Magitians, were the first Philosophers, who in this part of the world set those herbs on foot, and brought them into a name.

And to begin with Coriacesia and Callicia. Pythagoras affirmeth, That these two herbes will cause water to gather it to an yce. I find no mention at all in any other authors, of these hearbes, neither doth he report more properties of them.

The same author writes of an herb called Menais, known also by the name of Corinthas, the juice whereof (by his saying) it be sodden in water, presently cureth the sting of serpents, if the place be fomented with the said decoction. He affirmeth moreouer, that if the said juice or the liquor be poured vpon the grasse, whosoever fortuneth to go thereupon, and touch it with the sole of the foot, or otherwise chance to be but dashed or sprinkled therewith, shall die therupon remediless, and no way there is to escape the mischief. A monstrous thing to report, that this juice should be so rank a venome as it is, vnlesse it be used against poison.

The selfe same Pythagoras speaketh yet of another herb which hee calleth Aproxis: the root whereof is of this nature, to catch fire a tarre off, like for all the world to Naphtha, concerning which, I haue written somewhat already in my discourse as touching the wonders of Nature: and he reporteth moreouer, That if a man or woman happen to be secke of any disease, at what time he reporteth moreouer, That if a man or woman be thoroughly cured of it, yet shall they haue as this Aproxis is in the floure, although he or she be throughly cured of it, yet shall they haue a grudging or minding thereof as often as it falleth to floure againe yeare by yeare. And of this opinion he is besides, That Frumenty corne, Hemlock, and Violets, are of the same nature and property. I am not ignorant, that this booke of his wherein these strange reports are recorded, some haue ascribed vnto Cleompurus, a renowned Physitian: but the currant fame or speech holdeth still so constantly, time out of mind, that we must needs beleue Pythagoras to be the author of the said booke. True it is indeed, that the name of Pythagoras might giue authority and credit

A dit vnto other mens books attributed to him, if haply any other had laboured and trauelled in compiling some worke, which himselfe judged worthy of such a man as he was: but that Cleompurus should so do, who had set forth other books in his owne name, who would euer beleue? No man doubteth verily, but that the book intituled * Chirocineta, was of Democritus his making: and yet therein be found more monstrous things by a hundred fold, than those which Pythagoras hath deliuered in that worke of his. And to say a truth, setting Pythagoras aside, there was not a Philosopher so much addicted to the schoole and profession of these Magitians, as was Democritus.

In the first place he telleth vs of an herb called Aglaophotis, worthy to be admired & wondered of men, by reason of that most beautifull colour which it had: and for that it grew among the quarries of marble in Arabia, confining vpon the coasts of the realme of Persia, therefore it was also named Marmaritis. And he affirmeth, that the Sages or VVise men of Persia called Magi, vsed this herb when they were minded to coniure and raise vp spirits.

He writeth moreouer, That in a country of India inhabited by the Tardistiles, there is another herb named Achæmenis, growing without leafe, and in colour resembling Amber: of the root of which herb there be certain Trochisks made: whereof they cause malefactors and suspected persons to drink some quantity with wine, in the day time, to the end they should confesse the truth: for in the night following they shall be so haunted with spirits and tormented with fundry fantasies and horrible visions, that they shall be driuen perforce to tel all, and acknowledge the fact for which they are troubled & brought in question. The same writer calleth this plant

C * Hippophobas, because Mares of all other creatures are most fearfull and wary of it.

Furthermore, he reporteth, That 30 Schoenes from the riuier Choaspes in Persia, there groweth an herb named Theombrotion: which for the manifold and sundry colours that it hath, resembleth the painted taile of a Peacocke, and it casteth withall a most sweet and odoriferous sent. This herb (saith he) the Kings of Persia vse in their meats & drinks: and this opinion they haue of it, That it preferueth their bodies from all infirmities and diseases, yea, and keepeth their head so staied and settled, that they shall neuer be troubled in mind and out of their right wits: in such sort, that for the powerfull maiestie of this plant, it is also called Semnion.

He proceedeth moreouer to another, knowne by the name Adamantis, growing onely in Armenia and Cappadocia: which if it be brought neare vnto Lions, they will lie all along vpon their backs, and yawne with their mouths as wide as quer they can. The reason of the name is this, because it cannot possibly be beaten into powder.

He goeth on still and beareth vs in hand, that in the realme Ariana, there is found the herbe Arianis, of the colour of fire. The inhabitants of that country vse to gather it when the Sun is in the signe Leo: and they affirme, that if it do but touch any wood besmeared and rubbed ouer with oile, it will set the same a burning on a light fire.

What should I write of the plant Therionarca, which whensoever it beginneth to come vp and rise out of the ground, all the wilde beasts will lie benumbed and (as it were) dead: neither can they be raised or recovered againe, vntill they be sprinkled with the vrine of Hyæna.

The herb Æthiopis, by his report groweth in Meroe, for which cause it is called also Merois: In leafe it resembleth Lettuce: and being drunk in mead or honied water, there is not such a remedy againe for the drop sicke.

ouer and besides, he speaketh of the plant Ophiusa, found in a country of the same Æthiopia, named Elephantine: of a leaden hue it is, and hideous to see to: whosoever drinke thereof, shall be so frighted with the terrors and menaces of serpents represented vnto their eies, that for very feare they shall lay violent hands on themselves: and therefore church robbers are enforced to drink it. Howbeit, if a man take after it a draught of Date wine, he shall not be troubled with any such fearfull visions and illusions.

Moreouer, there is found (saith Democritus) the herbe Thalassiegle about the riuier Indus, and thereupon is knowne by another name Potamantis: which if men or women take in drink, transporteth their senses so far out of the way, that they shall imagine they see strange sights.

As for Theangelis, which by his saying groweth vpon mount Libanon in Syria, and vpon Dicte, a mountain in Candy, also about Babylon and Susis in Persia; if the wise Phylosophers (whom they term Magi) drinke of that herb, they shall incontinently haue the spirit of prophesie, and foretell things to come.

There

There is besides in the region called Baetiana & about the riuer Borysthenes, another strange plant named Gelotophyllis, which (by his report) if one do drink with Myrrh and wine, it will cause many fantastical apparitions: and the party shal therupon fall into a fit of laughter without ceasing and intermission, and neuer giue ouer, vnlesse it be with a draught of Datewine, wherein were tempered the kernels of Pine nuts together with pepper and honey.

Touching the herb of good fellowship, Syssitieteris, found in Persis, it tooke that name because it maketh them exceeding mery who are met together at a feast. They call the same herb likewise Protomedia, for that it is so highly esteemed among kings and princes. And another name it hath besides, to wit, * Acafignete, because it commeth vp alone & no other herbs neere vnto it: yea, and one more yet, namely, Dionysymphas, because wine and it fort so well together, and make as it were a good mariage.

The same Democritus talketh also of Helianthe: an herb leaued like to the Myrtle, growing in the country Themiscyra, and the mountains of Cilicia, coasting along the sea. And he giues out, that if it be boiled with Lions greafe, and then together with Saffron and Date wine reduced into an ointment, the foresaid Magi and the Persian kings therewith annoint themselves, to seem thereby more pleasant and amiable to the people: which is the reason, that the same herb is called Heliocallis.

Ouer and besides, he maketh mention of Hermefias (for so he termeth not an herb but a certain composition) singular for the getting of children, which shall proue faire, and of good nature besides. Made it is of Pine nut kernels, stamped and incorporat with hony, Myrrh, Saffron, and Date wine, with an addition afterwards of the hearbe Theombrötium and milke: and this confection he preferibeth to be drunk by the man a little before the very act of generation; but by women vpon their conception, yea, and after their deliuey all the while they be nourses and giue suck: and in so doing they may be assured, those children of theirs, thus gotten, bred, and reared, shall be passing faire and well fauoured, of an excellent spirit and courage: and in one word, euery way good. Of all these herbes before specified, he setteth down also the very names which the said Magi call them by. Thus much for the Magicke herbes found in Democritus his booke.

Apollodorus, one of his disciples and followers, comes in with his two herbes to the other before named. The one he calleth *Æschynomene*, because it draweth in the leaues, if one come neare vnto it with the hand: the other *Groëis*, which if the venomous spiders *Phalangia* do but touch, they will die vpon it.

Crates writeth of an herb called *Oenotheris*, which being put in wine, if any sauage beasts be sprinkled therewith, they will become tame, gentle and tractable.

A famous * Grammarian of late daies made mention of another herb *Anacamperos*, of this vertue, That if a man touched a woman therewith, were she departed from him in all the hatred that might be, she should come again and loue him entirely. The same benefit also should the woman find thereby, in winning the loue of a man. This may suffice for the present to haue written of these wonderfull Magicke herbes, considering that I meane to discourse more at large of them and their superstition, in a more conuenient place.

CHAP. XVIII.

¶ Of *Eriphia*, *Lanaria*, and *Stratiotes*, with the medicines which they yeeld.

Many writers haue made mention of *Eriphia*. This herb hath within the straw of the stem a certain flie like a beetle, running vp and down, and by that meanes making a noise like vnto a yong kid, whereupon it tooke the foresaid name. There is no a better thing in the world for the voice, than this herb, as folk say.

The herb *Lanaria*, giuen to ewes in a morning when they are fasting, causeth their vdders to strouit with milk. Lactoris likewise is a common herb and as well known, by reason that it is full of milk, which causeth vomit, if one tast thereof neuer so little. Some there be who say, that the herb which they call * *Militaris*, is all one with this *Lactoris*: others would haue it to be very like vnto it, and that it should haue that name, because there is not a wound made with sword or edged weapon, but it healeth it within five daies, in case it be applied thereto with oile.

Sensibly, the Greek writers make great reckoning of their * *Stratiotes*: but this hearbe groweth

groweth onely in Egypt, and namely in floten grounds where the riuer Nilus hath ouerflowed: and like it is vnto Sengreen or Houlleek, but that it hath bigger leaues. It is exceeding refrigeratiue; and a great healer of green wounds, being made into a liniment with vinegar: moreover it cureth *S. Anthones* fire, and all apostumes which are broken and run matter: if it be taken in drinke with the male Frankincense, it is wonderfull to see how effectually it is to repress the flux of blood from the reins.

CHAP. XIX.

¶ Of the herbes that grow vpon the head and chapter of Images and Statues. Of herbes found in riuers. Of the herb called *Lingua*. Of herbes growing through a sieve, and vpon dung-hills. Of *Rhodora* and *Impia*, two herbes. Of *Pecten Veneris*. Of *Nodia*. Of *Clauers*, or Goose-grasse, called otherwise *Philanthropos*. Of the little *Bur nam*. d *Canaria*: of *Tordile*. Of the ordinarie *Goich-grasse*, *Stitchwort*, or *Dent-de-chien*. Of the hearbe *Dactylus*, and *Fenigreeke*: with their medicinal vertues.

It is commonly said, That the herbes or weeds growing vpon the head of any statue or Image, presently allay the head-ach (if they be gathered in the lappet or any part of some garment)

so as the Patient weare them tied about the necke, by red linnen thread, or infolded within some red linnen clout. Any herb whatsoever gathered out of some riuer, brook, or great riuer, before the Sun rising, so as no man see the party during the time of the gathering, provided alwaies that it be tied to the left arm of the sick Patient, and he or she not know what it is, driues away any tertian ague, if it be true which is commonly said. There is an herbe growing about fountains, called *Lingua*, i. a Tongue: the root therof being burnt into ashes, & incorporat with the grease of a swine (but you must look, say they, that the swine be black and barraine) causeth haire to come againe, in case the place which is bare & bald, be annointed therewith in the sun. Cast a sieve or riddle forth into any beaten path or high way, the grasse or weeds comming vp vnderneath, and growing through the same, if they be gathered and bound about the neck or any other part of women with childe, doe hasten their trauell and deliuey. Those herbes which be found growing vpon muckhills, about country farms, are passing good and effectual for the squinancy, if they be drunk with water. The grasse or hearb neere vnto which a dog lifts vp his leg and pisseth, if it be plucked out of the ground without touching knife or yron instrument, cureth any dislocation or bone out of joint, most speedily.

Touching the tree (in manner of an *Opiet* or *Poplar*) called *Rumbotinus*, I haue described it in my treatise of Hortyards and Tree-plots. Neare to one of these (and namely, when there is no vine coupled or married to it) there groweth a certain herb, which in France they call *Rhodora*: it riseth vp with a stem pointed and knotted in manner of a fig tree rod or wand; beareth leaues resembling nettles, somewhat whitish in the mids, but the same in proesse of time become red all ouer; and a floure of siluer colour: this herb stamped and mixed with old hogs greafe, makes a soveraigne liniment for all swellings, inflammations, and impostumes gathering to an head; provided alwaies that no edge toole come neare to touch it, and that the party who is dressed or annointed therewith turn the head to the right hand, and spit thrice vpon the ground on that side. And the operation of this medicine will be the more effectual, if three sundry men of three diuers nations, stand on the right hand when they annoint the Patient.

Concerning the herb *Impia*, which is of a hoary colour and white withall, it resembleth in shew the *Rosemary*, rising vp with a main stem, leaved and headed in manner of a *Cole-stocke*: from which principall body, there grow forth other small branches, every one bearing little tufts or heads rising and mounting about the mother stocke (whereupon they called it in Latine *Impia*, for that the children ouer-topped their parents) yet there be others who haue thought it rather so called because there is no beast wil touch or tast it. This herb, if it be ground between two stones, waxeth as hot as fire, & yeeldeth a iuice which is excellent for the squinancy, if the same be tempered with milke and wine. But this is strange that is reported moreover, namely, That whosoever hath once tasted of this hearb, shall neuer be troubled with that disease; and therefore they vse to giue it in wash and swill, to swine: but look which of them refuse to drinke of this medicine, shal die of the said squinancy. Some are of opinion, That in birds nests there is some of this hearbe commonly set and twisted among other stickes, whereby it commeth to

T

passe

* As one would say, without brother or sister.

* Apion called also *Plethionics*.

* The foulders hearbe.

* All one with *Militaris*.

pasſe that the yong birds neuer be choked, gobble they their meat as greedily as they will.

As touching the herb called Veneris Peſten, which took that name of the reſemblance that the long cods thereof hath to combe or rake teeth: the root, if it be ſtamped with mallowes, and ſo reduced into a cataplaſme, draweth forth all ſpils, thornes, or what ſoeuer ſticketh within the fleſh. The herb * Exedum, is ſingular to cure the lethargy, and all drowſineſſe.

* It ſeemeth by name and effect, to be of ſome therpe and ſtrengthening quality.

* Groſſe-graſſe, or Cluſters.

As for Nodia, it is an herb well knowne in curriers ſhops. They call it alſo Mularis, & other names beſides they haue for it: but tearme it how you will, it healeth corroſiue vlcers: and I find that it is of ſingular operation againſt the poiſon of ſcorpions, if it be drunk in wine or oxycrat, (i.) vineger and water mingled together. There is a certaine rough and prickly herbe, which the Greeks call by a pretty name * Philanthropos, for that it ſticketh to folks cloaths as they paſſe by. A chaplet or guirland made of this herb, and ſet vpon the head, eaſeth the pain thereof. As for the little Bur called Lappa Canaria, if it be ſtamped with Plantaine and Millefoile, and together with them conſecrated in wine, it healeth all cancerous ſores, ſo it be applied vnto the place, and removed once in three daies. The ſame herb digged forth of the ground without any ſpade or yron inſtrument, cureth ſwine, if it be put into the trough where they bee ſerued with draſſe and ſwill, or giuen them in milk and wine. Some adde moreouer, that this charm muſt be ſaid in the digging, *Hæc eſt herba Argemon, quam Minerva reperit ſuis remedium, qui de illa uſauerint*: (i.) This is the herb Argemon, which Minerva inuented as a remedy for diſeaſed ſwine, as many as taſted thereof.

As for Tordile, ſome haue ſaid that it is the ſeed of Sefeli, or Siler of Candy: others take it to be an herb by it ſelfe, which alſo they called Syreon: for mine own part, I find by my reading nothing of it, but that it delighteth to grow vpon mountains; and that being burnt, it is good to be drunke for to prouoke womens monethly terms, and to expectorat the ſuperfluous ſleame out of the breſt: for which purpoſes (they ſay) that the root is more effectually in operation: alſo that the iuice thereof taken in drink to the weight of three oboli, is ſingular for the reins: finally, that the root is one of the ingredients which go to the making of emolliuue plaſters or cataplaſmes.

The Quich-graſſe, otherwiſe named Dent-de-chien, or Dogs-graſſe, is the commoneſt herbe that groweth: it runneth & creepeth within the earth by many knots or ioints in the root, from which, as alſo from the branches and top-ſprigs trailing aboue ground, it putteth forth new roots and ſpreadeth into many branches. In all other parts of the world, the leaues of this graſſe grow ſlender and ſharp pointed toward the end: only vpon the mount Pernaſſus (whereupon it is called Gramen Pernaſſi) it brancheth thicker than in other places, and reſembleth in ſome ſort Ivie, bearing a white floure, and the ſame odoriferous. There is not a graſſe in the field whereon horſes take more delight to feed, than this, whether it be greene as it groweth, or dry and made into hay, eſpecially if it be giuen them ſomewhat ſprinkled with water. Moreouer, it is ſaid, that the inhabitants about the ſoſeſaid mount Pernaſſus, do draw a iuice out of this graſſe, uſed much to increaſe plenty of milk; for ſweet and pleaſant it is: but in other parts of the world, in ſtead thereof, they uſe the decoction of the common graſſe, for to conglutinate wounds: [and yet the very herb it ſelfe in ſubſtance will do as much, if it be but ſtamped and ſo applied: and beſides, a good deſenſatiue it is to keep any place that is cut or hurt, from inflammation.] To the ſaid decoction, ſome put wine and hony: others adde a third part in proportion of Frankincenſe, Pepper, and Myrrhe: and then ſet all ouer the fire againe, and boile it a ſecond time in a pan of braſſe: which compoſition they uſe as a medicine for the tooth-ach and watering eies, occaſioned by the flux of humors thither. The root ſodden in wine, appeaſeth the wrings & torments of the guts; openeth the conduits of the vrine, and giueth it paſſage; beſides, it healeth the vlcers of the bladder, yea, it breaketh the ſtone. But the ſeed is more diureticall, and with greater force driueth downe vrine than the root. And yet it ſtoppeth a laſke, and ſtaieſh vomit. A peculiar vertue it hath againſt the ſting of dragons or ſerpents. Moreover, ſome there be, who giue direction in the cure of the kings euil, and other flat impoſtumes called Pani, to take nine knots or ioints of a root of this graſſe: and if they cannot find one root with ſo many ioints, to take two or three roots, vntill they haue the ſoſeſaid number: which done, to enwrap or fold the ſame in vnwaſhed or greaſie wooll which is black [with this charge by the way, that the party who gathered the ſaid roots be faſting] and then to goe vnto the houſe of the patient that is to be cured, waiting a time when hee is from home: and be ready at his returne to receiue him with theſe

A theſe words three times pronounced, *Ieiunus ieiuno medicamentum do*, [i. I being yet faſting, giue thee a medicine alſo whiles thou art faſting:] and with that, to bind the ſoſeſaid knots & roots vnto the parts affected, and ſo continue this courſe for three daies together. Furthermore, that kind of graſſe which hath ſeuene ioints in the root, neither more nor leſſe, is ſingular for the head ach, and worketh great effects if the Patient carrieth it tied faſt about him. Some Phyſitians do preſcribe for the intollerable pain of the bladder, to take the decoction of this graſſe boyled in wine vnto the conſumption of one halfe, and giue it to drinke vnto the Patient, preſently vpon the coming out of the baine or hot houſe.

Touching the graſſe, which by reaſon of the pricks that it beares is named Aculeatum, there be three ſorts of it: the firſt is that which ordinarily hath ſue ſuch pricks in the head or top thereof, and thereupon they call it Penta Daſtylon, the five finger graſſe: theſe pricks when

B they be wound together, they uſe to put vp into the noſthrills, and draw them downe again, for to make the noſe bleed. The ſecond is like to * Sengreen or Houſleek: ſingular good it is for the whitſlows, and excreſcences or rungs vp of the fleſh about the naile roots, if it be incorporat into a liniment with hogs greaſe: and this graſſe they call Daſtylus, becauſe it is a medicine for the fingers. * The third kind named likewise Daſtylos, but ſmaller than the other, groweth vpon old decayed wals or tyle houſes: this is of a cautick & burning nature, good to repreſſe the canker in running and corroſiue vlcers. Generally, a chaplet made of the herbe Gramen or Dogs-graſſe, and worn vpon the head, ſtancheth bleeding at the noſe. The Gramen that groweth along the high waies in the country about Babylon, is ſaid to kill camels that graſe vpon it.

C Fenigreeke cometh not behind the other herbs before ſpecified, in credit and account for the vertues which it hath: the Greeks call it Telus and Carphos: ſome name it Buceras and Aegoceras, for that the * ſeed reſembleth little hornes: we in Latine tearme it Silicia or Siliqua. The manner of ſowing it, I haue declared in due place ſufficiently. The vertues thereof, is to dry, mollifie, and reſolue: the iuice drawne out of it after the decoction, is right ſoueraigne for many infirmities and diſeaſes incident to women, and namely in the naturall parts, whether the matrice haue a ſchirre in it and be hard or ſwolne, or whether the necke thereof be drawne too ſtreight and narrow: for which purpoſes, it is to be uſed by way of fomentation, inſeſſion, or bath; alſo by inſuſion or inſeſſion with the metrenchyte. Very proper it is to extenuate the ſcurf or ſcales like dandruffe, appearing in the viſage: being ſodden and applied together with ſalnitre, it helpeth the diſeaſe of the ſpleen. The like effect it hath with vineger: and being boyled therein, it is good for the liuer: for ſuch women as haue painful trauel in child-birth, & be hardly deliuered. Diocles appointed Fenigreek ſeed to the quantity of one acetable, to be giuen in nine cyaths of wine cuit for three draughts: with this direction, that the woman firſt ſhould take one third part of this drink, and then go to a hot bath, and whiles ſhe were ſweating therein, to drink one halfe of that which was left: and preſently after ſhe is out of the bain, ſup off the reſt. And he ſaith there is not the like medicine to be found in this caſe, when all others will take no effect. The floure or meale of Fenigreek ſeed boyled in mead or honied water, together with barley or Linſeed is ſingular for the paine of the matrice, either applied to the ſhare in manner of a cataplaſme, or put vp into the naturall parts as a peſſary, according as the abouenamed Diocles ſaith: who was wont likewise to cure the leproy or S. Magnus euil; to clenſe & mundifie the ſkin, of freckles & pimples, with a liniment made with the ſoſeſaid floure incorporat with the like quantity of brimſtone: with this charge, to prepare the ſkin by rubbing it with ſalnitre, before the ſaid ointment were uſed, and then to annoint it oftentimes in a day. Theodoros uſed to mixe with Fenigreek a fourth part of the ſeed of garden creſſes wel clenſed, & to temper them in the ſtrongeſt vineger that he could come by, which he took to be an excellent medicine for the leproſie. Damion ordained to make a drink with half an acetable of Fenigreek ſeed put into 9 cyaths of cuit or ſheere water, and ſo to giue it ſo prouoking of womens flours: & no man doubts but the decoction of Fenigreeke is moſt whoſome for the matrice and the exulceration of the guts: like as the ſeed it ſelfe is excellent for the ioints & precordial parts about the heart. But in caſe it be boyled with Mallows, it is good for the matrice & guts, ſo there be put to the ſaid decoction ſome honied wine, & then giuen in drink: for euen the very vapor or ſume of the ſaid decoction doth much good to thoſe parts. Alſo the decoction of Fenigreeke ſeed rectifieth the ſinking rank ſmel of the arm-pits, if they be waſhed therewith. The floure made of Fenigreeke ſeed, incorporat with nitre & wine, quickly clenſeth the head of ſcurf, ſcales, & dandruffe. But

* Some take this to be *Paronychia*, *Dioſ.* or rather a kind of *Azizoon*, *Monic*, *tail*, or *Prick*, *madam*.

* This is thought to be *Riva* *Stone*, *crep.* w d *Purcellane*, or *Wall-pepper*. * Or rather the cods wherein the ſeed is enclosed.

boiled in hydromell (i. honyed water) and brought into a liniment with hogs grease, it cureth the swelling and inflammation of the members seruing to generation: likewise it is singular for the broad and flat apostems called Pani, the swelling kernels and inflammations behinde the ears, the gout as well of the feet as of the hands and other joints; also the putrifaction of the flesh ready to depart from the bone: and being incorporat in vineger, it helpeth dislocations: being boiled in vineger and hony only, it serueth as a good liniment for the spleen: and tempered with wine, it clenfeth or mundifieth cancerous sores; but put thereto hony, it healeth them thoroughly in a short time. The said floure of Fenigreeke feed taken in a broth or supping, is an approued remedy for an vlcer within the brest, and any inueterat cough; but it asketh long seeing, euen vntill it haue lost the bitteresse: and afterwards hony is put thereto, and then it is a singular grewell for the infirmities before said. Thus you see what may be said of those hearbes which are in comparifon but of a mean account: it remaineth now to discourse of those which are of more account and estimation than the rest.

THE TWENTY FIFTH BOOKE OF THE HISTORIE OF NATVRE,

WRITTEN BY C. PLINIVS
SECVNDVS.

CHAP. I.

¶ The nature and properties of Hearbes growing wild and of their owne accord.

NHEN I consider the excellency of such hearbes, whereof now I am to treat, and which the earth seemeth to haue brought forth onely for the vse of Physick, I cannot chuse but grow withall into a wonderfull admiration of the great industry and careful diligence of our Antients before time, who haue made experiments of all things, and lest nothing vntried: neither reserued they afterwards this hidden knowledge to themselves, nor concealed ought, but were willing to communicate the same vnto posteritie for their good and benefit: but we contrariwise in these daies, are desirous to keep secret and to suppress the labors of other men; yea and to defraud the world of those commodities which haue been purchased by the sweat of other mens browes: for verily we see, it is an ordinary course, that such as haue attained to some knowledge, envie that little skil vnto their neighbours: and to keepe all forsooth to themselves and teach none their cunning, they thinke the onely way to winne a great name and opinion of some deepe and profound learning. And so far be we off from deuising new inuentions, and imparting the same to the generall profit of mankind, that for this long time men of great wit and high conceit haue studied and practised to compasse this one point, That the good deeds of their Ancestours might with themselves die and be buried for euer. But certes, wee see and know, that the seuerall inuentions of some one thing or other, haue caused diuers men in old time to be canonized as gods: in such sort, as their memoriall hath bene eternized by the names euen of hearbes which they found out: so thankefull was the age in insuing, as to recognize and acknowledge a benefit from them received, and by this meanes (in some measure) to make recompence. This care and industrie of theirs, if it had bene employed in Domestickall Plants neere home, which either for pleasure and delight, or else for the Kitchen and Table, are set and sowed, could not haue bene so rare and wonderfull: but they

A they spared not to climbe vp the top of high mountaines, and to rocks vnaccessible; to trauell through blind and vnpeopled deserts, to search euery veine and corner of the earth, & all to find and know the vertues of herbs: of what operation the root was, for what diseases the leaues were to be vsed; yea, and to make wholsom medicines for mans health of those simples, which the verry four-footed beasts of the field neuer fed vpon, nor once touched.

CHAP. II.

¶ The Latine Authors who haue written of herbs, and their natures. At what time the knowledge of Simples began to be practised and professed in Rome. The first Greeke writers who trauelled in this Argument. The inuention of herbs. The antient Physicke, and the manner of curing diseases in old time. What is the cause that Simples are not now so much vsed for remedies of diseases as they haue bin. Finally, of the sweet Brier or Eglantine, and the herb Dragons, with their medicinal vertues.

WHE Romans haue bin more slack and negligent in this behalfe than was becoming vs, considering how otherwise, there was not a nation in the world more apprehentive of all vertues and things profitable to this life, than ours. For to say a truth, M. Cato (that famous clerke and great professor, so well seen in all good Arts and Sciences) was the first (and for a long time the only author) who wrote of Simples: and howsoever he handled that argument but briefly and summarily, yet he omitted not the leech-craft belonging also to kine and oxen. Long after him, C. Valgius (a noble gentleman of Rome, & a man of approued literature) compiled a treatise of Simples, which he left vnperfect, howbeit he dedicated the book to Augustus Caesar the Emperor, as may appeare by a preface by him begun, wherein (after a religious and ceremonious manner of supplication) he seemeth to beseech the said prince, That it might please his Majesty especially, to cure all the maladies of mankind. And before his time, the only man among our Latines (as far as euer I could find) who wrote of Simples, was Pompeius Lenaxus, the vassall or freed man of Pompey the Great. And this was the first time that the knowledge of this kind of learning was set on foot and professed at Rome. For Mithridates (the most mightie and puissant king in that age, whose fortune notwithstanding was to be vanquished and subdued by Pompey) was well knowne vnto the world not only by the fame that went of him, but also by good prooffe and euident arguments, to haue bin of all other before his time, a prince most addicted to the publick benefit of all mankind: for the only man he was who deuised to drinke poison euery day (hauing taken his preseruatiues before) to the end that by the ordinary vse and continuall custome thereof, it might be familiar vnto his nature, and harmlesse. The first he was also who deuised sundry kinds of antidotes or counterpoisons, whereof one retaineth his name to this day: he it was also and none but he, as men thinke, who first mingled in the said antidotes and preseruatiues, the blood of Ducks bred in his own realme of Pontus, for that they fed and liued there, of poisons and venomous hearbs. Vnto him, that famous and renowned professor in Physicke Asclepiades, dedicated his books now extant: for this Physitian being solicited to repaire vnto him from Rome, sent the rules of Physick digested into order, and set downe in writing, instead of comming himselfe. And Mithridates it was (as it is for certaine knowne) who alone of all men that euer were, could speake two and twentie languages perfectly; so as for the space of six and fiftie yeares (for so long he reigned) of all those Nations which were vnder his dominion, there neuer came one man to his court, but he communed and parled with him in his own tongue without any truchman or interpreter for the matter. This noble Prince (amongst many other singular gifts that he had, testifying his magnanimitie and incomparable wit) addicted himselfe particularly to the earnest studie of Physicke: and because he would be exquisite and singular therein, he had intelligencers from all parts of his dominions) and those took vp no small part of the whole world) who vpon their knowledge, exhibited vnto him the particular natures and properties of euery simple: by which means, he had a cabinet full of an infinit number of receipts and secrets set down together with their operations & effects, which he kept in his said closet, and left behind him with other rich treasure of his. But Pompey the Great, hauing vnder his hands the whole spoile of this mighty Prince, & meeting in that sackage with those notes abovesaid, gaue commandement vnto his vassall or infranchised seruant the abouenamed Lenaxus (an excellent linguist & most learned grammarian) to translate the same into the

Latine tongue: for which a *St of Pompey*, the whole world was no lesse beholden vnto him, than the common wealth of Rome for the foresaid victorie.ouer & besides these, what Greeke authors haue trauelled in Physicke, I haue declared heretofore in conuenient place. And among the rest, *Euax* a King of the Arabians, wrote a booke as touching the vertues and operations of Simples, which he sent vnto the Emperour *Nero*. *Cratæus* likewise, *Dionysius* also, and *Metrodorus*, wrote of the same Argument after a most pleasant and plauitable manner (I must needs say,) yet so, as a man could picke nothing almost out of all their writings, but an infinit difficultie of the thing: for they painted euery herb in their colors, and vnder their pourtraicts they couched and subscribed their feuerall natures & effects. But what certainty could there be therein? pictures, you know, are deceitfull; also, in representing such a number of colours, and especially expressing the lively hew of Hearbs according to their nature as they grow, no maruell if they that limned and drew them out, did fail and degenarat from the first pattern and originall. Besides, they came far short of the mark, setting out hearbs as they did at one only season (to wit, either in their floure, or in seed time) for they change and alter their form and shape euerie quarter of the yeare. Hereof it came, that all the rest labored to describe their forms & colours, by words only. Some without any description at all of their figure or colour, contented themselves (for the most part) with setting downe their bare names, and thought it sufficient to demonstrate and shew their power and vertue afterwards, to who: ouer were desirous to seeke after the same: and verily the knowledge thereof is no hard matter to attain vnto. For mine own part, it hath bin my good hap to see growing in the plant, all these medicinable herbes (excepting very few) by the meanes of *Antonius Castor* (a right learned and most renowned Physitian in our daies) who had a pretty garden of his own well stored with simples of sundry sorts, which he maintained and cherished for his owne pleasure and his friends, who vsed to come and see his plot, as indeed it was worthy the sight: this Physitian was then about a hundred yeeres old, & in all his life neuer found what sicknesse meant, neither for all this age of his, was his wit decayed, or memory any whit impaired, but continued as fresh still as if he had bin a yong man. But to proceed forward with our discourse: Certes we shall not find a thing as aine which our Ancestors so much admired and were more raiused withall, than the knowledge of simples. True it is, I confesse, that the inuention of the Ephemerides (to fore-know thereby not onely the day & night, with the celypfes of Sun & Moon, but also the very hours) is antient howbeit, the most part of the common people haue bin and are of this opinion (received by tradition) from their forefathers) That all the same is done by inchantments, & that by the means of some forceries and herbes together, both Sun and Moone may be charmed, and inforced both to lose and recover their light: to doe which feat, women are thought to be more skilfull and meet than men. And to say a truth, what a number of fabulous miracles are reported to haue bene wrought by *Medea* queen of Colchis, and other women; and especially by *Circe* our famous witch here in Italy, who for her singular skill that way, was canonized a goddesse. And from hence it came (I suppose) that *Æschylus* a most antient Poet, made report of * Italy to be furnished with herbes of mighty operation: and many others haue spoken much of the mountaine *Circæos* bearing her name, wherein the said Lady sometime dwelt & kept her residence. And for a notable proof of her singular skill in that kind, the same knowledge in some measure continueth vnto this day in the *Marfians* (a nation descended from a son of hers) who are well knowne to haue a naturall power by themselves to tame and conquer all serpents, and not to be subiect to any danger from them. As for *Homer* verily (the father and prince of all learning & learned men, and the best author that we haue of antiquities) howsoeuer otherwise he was addicted to extoll and magnifie dame *Circe*, yet he attributeth vnto Egypt the glory and name for good herbes; yea though in his time there was not that base Egypt watered as now it is, with *Nilus*: for afterwards it grew by the mud left there by the inundation of the said riuer. Truly this Poet maketh mention of many singular herbes in Egypt, which the * Kings wife of that country gaue to that lady of his, *Helena*, of whom he writeth so much; and namely, the noble *Nepenthes*, which had this singular vertue and operation, To work obliuion of melancholy & heauinesse, yea and to procure easement and remission of all sorrowes: which, I say, the queene bestowed vpon *Helena* to this end, That she should communicate and impart it to the whole world for to be drunke in those cases abouesaid. But the first man knowne by all records to haue written any thing exactly and curiously of simples, was *Orpheus*. As for *Museus*, and *Hesiodus* after him, in what admiration they

ἡ τοῦ βασιλέως.
ἡ τοῦ βασιλέως.

A held, and how highly they esteemed the herb *Polion* about the rest, I haue shewed already. *Cerres*, *Orpheus* and *Hesiodus* both haue highly commended vnto vs perfumes and suffumigations. And *Homer* likewise writeth expressly of certain herbes by name, of singular vertue, which I will put downe in their due places. After him came *Pythagoras*, a famous Philosopher, who was the first that composed a booke, and made a treatise purposely of sundry herbes, with their diuers effects; ascribing wholly the inuention and originall of them to the immortall gods, and namely, to *Apollo* and *Æsculapius*. *Democritus* compiled a volume of the same argument. But both hee and *Pythagoras* had trauelled before al ouer Persis, Arabia, Ethiopia, and Egypt, and there conferred with the Sages and learned Phylosophers of that country, called *Magi*. In summe, so far were men in old time raiused with the admiration of herbes and their vertues, that they bashed not to auouch euen incredible things of them. *Xanthus* an antient Chronicler, writeth in the first booke of his histories, of a Dragon, which finding one of her little serpents killed, raised it to life again by a certain herbe, which he nameth *Balis*: and with the said herbe, a man also named *Thyle*, whom the Dragon had slaine, was reuiued and restored to health againe. Also King *Tuba* doth report, That there was a man in Arabia, who being once dead, became aliue againe by the vertue of a certain herbe. *Democritus* said, and *Theophrastus* gaue credit to his words, That there is an herb, with which a kind of soule (whereof I haue made mention before) is able to make the wedge or stopple to flie out of the hole of her neast, into which the shepheards had driuen it fast, in case she bring the same herbe, and but once touch the foresaid wedge therewith. These be strange reports and incredible, howbeit they draw men into a wonderfull opinion of the thing, and fill their heads with a deep conceit, forcing them to confesse, That there is some great matter in hearbs, and much true indeed which is reported so wonderfully of them. And from hence it is, that most are of this opinion and hold certainly, That there is nothing impossible, but may be performed by the power of herbes, if a man could reach vnto their vertues: many few there be who haue attained to that felicity: and the operation of most simples is vnknowe. In the number of these, *Herophilus* the renowned Physitian may be reckoned, who was of this mind and gaue it out in his ordinary speech, That some hearbs there were, which were effectuall and did much good, if a man or woman chanced but to tread vpon them vnder their feet. And verily, this hath bin knowne and found true by experience, that some diseases would be more exasperat and angry, yea, and wounds grow to fretting and inflammation, if folk went but ouer certain herbes in the way as they passed on foot. Lo what the Physick in old times was! and how the same lay wholly couched in the Greek language, and not elswhere to be found. But what might be the reason, that there were no more simples knowne? Surely it proceeds from this, That for the most part they be rusticall peasants, and altogether vnlettered, who haue the experience and triall of herbs, as those who alone liue and conuerse among them where they grow. Another thing there is, Men are carelesse and negligent, and loue not to take any paines in seeking for them. Again, euery place swarmeth so with Leeches and Physitians, and men are so ready to run vnto them for to receiue some compound medicine at their hands, that little or no regard there is made of herbes and good Simples. Furthermore, many of them which haue bin found out and knowne, haue no name at all: as for example, that herb which I spake of in my Treatise concerning the cure and remedies of corne growing vpon the lands: and which we all know, if it be entered or buried in the foure corners of the field, will skar away all the foules of the aire, that they shal not settle vpon the corne, nor once come into the ground. But the most difficult and shamefull cause why so few simples in comparison be knowne, is the naughtie nature and peeuish disposition of those persons who will not teach others their skill, as if themselves should lose forever that which they imparted vnto their neighbor. ouer and besides, there is no certain meanes or way to direct vs to the inuention and knowledge of hearbes and their vertues: for if we looke vnto these hearbs which are found already, we are for some of them beholden to meere chance & fortune: and for others (to say a truth) to the immediat reuelation from God. For prooffe hereof, mark but this one instance which I will relate to you. For many a yeare vntill now of late daies, the biting of a mad dog was counted incurable: and looke who were so bitten, they fell into a certain * dread & feare of water: neither could they abide to drink, or to heare talk thereof, and then were they thought to be in a desperat case: it fortun'd of late, that a souldier, one of the gard about the * Pretorium was bitten with a mad dog, and his mother saw a vision in her sleep, giuing (as it were) direction vnto her for to send the root vnto her sonne for

* Τῆς φοβίας.

* ἢ τοῦ πριγκίπου.

*or Lusitania.

*Our common
Dragons.

to drink, of an Eglantine or wild rose (called Cymorrhodon) which the day before she had espied growing in an hortyard, where she took pleasure to behold it. This occurred fel out in * Lacetania, the nearest part vnto vs of Spain. Now, as God would, when the fouldier before said vpon his hurt receiued by the dog, was ready to fall into that symptome of Hydrophobie, and began to feare water; there came a letter from his mother, aduertising him to obey the wil of God and to do according to that which was reuealed vnto her by the vision. Whereupon he dranke the root of the said sweet brier or Eglantine, and not only recovered himselfe beyond all mens expectation: but also afterwards as many as in that case tooke the like receipt, found the same remedy. Before this time, the writers in Physick knew of no medicinable vertue in the Eglantine, but only of the sponge or little ball, growing amid the prickly branches therof, which being burnt and reduced into ashes, and incorporate with honey into a liniment, maketh haire to come againe where it was shed by any infirmity. But seeing I am fallen into the mention of Spain, it cometh to my mind, what I my selfe knew and saw in the same prouince, within the lands and domaines belonging to an host of mine; namely, a certaine plant or herb there lately found called * Dracunculus, which carried a main stem or stalk an inch or thumb thick, beset with spots of sundry colors, resembling those of vipers and serpents: and I was told, that it was a singular remedy against the sting or biting of any serpents. This Dracunculus differeth from another herb of that name, wherof I spake in the book going next before, for this hath a distinct form from that; and besides, another strange and wonderful property, namely, to shew two foot or thereabout aboue ground in the Spring time, when serpents first doe cast their sloughes or skins: & the same is no more seen, at the very time that serpents also retire into their holes and take vp their Winter harbor within the ground. Let this plant be gone once into the earth and hidden, you shal not see a Snake, Adder, or any other serpent stirring abroad. VVherby we may see what a kind and tender mother Nature is vnto vs (if there were nothing els to testifie her loue) in giuing vs warning beforehand of danger: and pointing vnto vs the very time when wee are to be afraid and to take heed of serpents.

CHAP. III.

¶ Of a certain venomous fountaine in Germany: of the hearb Britannica. What diseases they be that put men to the greatest paine.

SO vnfortunat is our condition, and so much exposed are we to manifold calamities, that the search is not pestered with wicked beasts only for to doe vs harme: but also there be otherwhiles venomous waters and pestilent tracts to work vs more wo and misery. In that voiage or expedition which prince *Cesar Germanicus* made into Germany, after he had passed ouer the riuier Rhene, and had giuen order to aduance forward with his army, he incamped vpon the seacoasts along Friseland, where there was to be found but one spring of fresh water; and the same so dangerous, that whosoever drunk of that water, within two yeres lost all their teeth, and were besides so feeble and loose iointed in their knees, that vnneth they were able to stand. These diseases the Physitians termed * Stomacace and Scelytyrbe: as one would say, the malady of the mouth, and palfie of the legs. Yet they found a remedy for these infirmities, and that was a certain herb called * Britannica, which is very medicinable, not only for the accidents of the stomach and mouth, but also for the squinancy and stinging of serpents. It hath leaues growing somewhat long, and those inclining to a brownish or dark greene colour, and the root is blacke; from which, as also from the leaues, there is a juice drawne or pressed. The floures by a peculiar name be called Vibones: which being gathered before any thunder be heard, and so eaten, do assure and secure the parties altogether from that infirmity. The Frisians, nere vnto whom we lay incamped, shewed our men this herb. But I muse much and wonder what should be the reason of that name, vnlesse the Frisians bordering vpon the narrow race of the ocean, which lieth only between them & England (called in those daies Britanica) should therupon for the neighborhood & propinquity of that Island, giue it the name Britannica. For certain it is, that it took not that name because there grew such plenty therof in that country of England, that it should be transported our from thence to our camp; for as yet that Island was not wholly subiect to vs and reduced vnder the Roman seignorie. For an ordinary thing it was in old time practised by those that found out any herbs, to affect the adoption (as it were) of the same, & to call them

* Some thinke this disease to be the Schor-buck or Scorbut, which raiseth yet at this day. * Which is taken to be our Cechlearia, is, soonwert, commonly called Scorbut-grasse or Scorby-grasse.

A by their own names, wherein verily men took no small contentment: according as I purpose to shew by the example of certain kings and princes, whose names liue and continue yet in their herbs: so honorable a thing it was thought in those daies to find and it were but an hearbe that might do good vnto man. Whereas in this age wherein we now liue, I doubt not but there be some who will mock vs for the pains taken in that behalfe, and think vs very simple for writing thus as we do of Simples; so base and contemptible in the eyes of our fine fooles and delicate persons, are euen the best things that serue for the benefit & common vtility of mankind: howbeit, for all that, good reason it is and meet that the authors and inuentors of them, as many as can be found, should be named and praised with the best; yea, and that the operations & effects of such herbs should be digested and reduced into some method, according as they be appropriate to every kind of disease. In the meditation whereof, I cannot chuse nor contain my selfe, but deplore and pity the poore estate and miserable case of man: who ouer and besides the manifold accidents and casualties which may befall vnto him, is otherwise subiect to many thousands of maladies, which we haue much ado to deuise names for, every houre of the day happening as they do, and whereof no man can account himselfe free, but every one is for his part to feare them. Of these diseases so infinit as they be in number, to determine precisely and distinctly which be most grieuous, might seeme meere folly, considering that every one who is sicke for the present, imagineth his owne sicknes to be worst & fullest of anguish. And yet our forefathers haue giuen their judgement in this case, and by experience haue found, That the most extreme pain & torment that a man can indure by any disease, is the Strangury or pissing dropmeale, occasioned by the stone or grauell in the bladder. The next is the grieve and anguish of the stomack and the third, Head-ach: for setting these three maladies aside, lightly there are no pains that can kill a man or woman so soon. And here by the way, I cannot for mine owne part but maruell much at the Greeks, who haue published in their writings venomous and pestilent herbs, as well as those that be good and wholesome. And yet there is an appearance and shew of reason, why some poisons should be knowne: for otherwhiles it falleth out that men liue in such extremity, as better it were to die, than so to lie in anguish and torment; insomuch, as death is the best port and harbor of refuge that they haue. Certes, *Marcus Varro* reporteth of one *Servius Glodius* a gentleman or knight of Rome, who for the extreme pain of the gout, was forced to annoint his legs and feet all ouer with a narcotick or cold poison, whereby hee so mortified the spirits of the muskles and sinews, that he became paralyticke in that part: and euer after vnto his dying day, was rid as well of all fence, as of the paine of the gout. But say, that in these cases it might be tollerable to set down in their books some poisons: what reason, nay what leaue had those Greeks to shew the means how the brains and vnderstanding of men should be intoxicated and troubled? what colour and pretence had they to set downe medicines and receipts to cause women to slip the vntimely fruit of their womb, and a thousand such like casts & deuises that may be practised by herbs of their penning: for mine owne part, I am not for them that would send the conception out of the body vnnaturally before the due time: they shall learne no such receipts of me, neither will I teach any how to temper & spice an amatorious cup, to draw either man or woman into loue, it is no part of my profession. For wel I remember, that *Lucullus* a most braue General, and a captain of great execution, lost his life by such a loue potion. Much lesse then shall ye haue me to write of Magick, witch-craft, charmes, enchantments and forceries, vnlesse it be to giue warning that folk should not meddle with them, or to disproue those courses for their vanities, and principally to giue an Item, how little trust and assurance there is to be had in such trumpery. It sufficeth me and contenteth my mind, yea and I think that I haue done wel for mankind, in recording those herbs which be good and wholesome, found out by men of wit and learning for the benefit of posterity.

CHAP. IIII.

¶ Of Moly, and Dodocatheas: of Paeony, otherwise called Pentorobus or Glycyfide. Of Panaces, *Asclepium*, *Heracium*, and *Chironium*. Of Panaces *Centarium* or *Pharmaceum*. Of *Heracium*, *Siderium*. Of *Henbane* called *Hyojcyamus*, *Apollinaris*, or *Altercagenus*.

Homer is of opinion, That the principall and soueraigne hearb of all others, is Moly; so called (as he thinketh) by the gods themselues. The inuention or finding of this hearbe hee

* ascri-

* *Odysseus*.

* ascribeth vnto *Mercury*; and sheweth that it is singular against the mightiest witchcraft & incantments that be. Some say, that this herb *Moly*, euen according to *Homer's* description, with a round and black bulbous root to the bignesse of an onion, and with a leafe or blade like that of *Squilla*, groweth at this day about the riuer or lake *Peneus* and vpon the mountain *Cylleum* in *Arcadia*; also that it is hard to be digged out of the ground. The Grecian *Simplists* describe this *Moly* with a yellow floure, whereas *Homer* hath written, that it is white. I met with one physician, a skilful Herbarist, who affirmed vnto me, That this *Moly* grew in *Italy* also: and in verie truth he brought and shewed me a plant which came out of *Campaine*, about the digging yf whereof among hard and stony rocks, he had bin certain daies: but get he could not the entire root whole and sound, but was forced to break it off, and yet the root which he shewed mee was thirtie foot long.

Next vnto *Moly* in account and reputation, is that plant which they call *Dodecatheos*, for that it doth represent & comprehend the maiesty of all the chiefe gods. They say if it be drunk in water it is a soueraign medicine for all maladies. Seuen leaues it hath, resembling very much those of *Leſtuce*, and the same spring from a yellow root.

* *Pæon*, who was equall in time to *Hercules*, and lived long before the *Troian* warre.

* *Sesquipedali*. Doſt, i. a foot and halfe.

* I suppose he meaneth the diseases called *Ephialtes* or *Incubus*, i. the night-Mare. * *and*, and *and*, i. a medicine for all griefs; a one would say, All-heale.

As touching *Pæony*, it is one of the first herbs that were euer known and brought to light, as may appeare by the author or inuentor thereof, whose name it beareth still. Some call it *Pentorobos*: others *Glycyde*. [where by the way I am to aduertise the Reader, of the difficulty in the knowledge of herbs by their names, considering that the same herbe hath in sundry places diuers appellations.] But to proceed forward with our *Pæony*: it groweth among bleake and shady mountains, rising vp with a stem between the leaues, * 4 fingers high, and bearing in the top 4 or 5 heads, fashioned somewhat like to *Filberds*, within which there is plenty of seed both red and black. This herb is good against the fantastick illusions of the * *Fauni* which appeare in sleep. It is said, that this herb must be gathered in the night season: for if the *Rainbird*, wood-peck or *Hickway*, called *Picus Martius*, should chance to spie it gathered, he would flie in the face, and be ready to peck out the eyes of him or her that had it.

The herb * *Panace*, promisseth by the very name a remedy of all diseases. A number there be of herbs so called: and all ascribed to some god or other for the inuention of them: for one of them hath the addition of *Aſclepius*, for that *Aſculapius* had a daughter named also *Panacea*. As touching the coneret juice named *Opopanax*, it is drawn from the root of this plant (beeing of the *Ferula* or *Fennell* kind, such as I haue heretofore shewed) by way of incision, the which root hath a thick rind, and of a saltish sauer. When the root is pulled out of the ground, there is a religious ceremony obserued to fill vp the hole again with all sorts of corn, as it were in satisfaction to the earth for the violence offered in tearing it vp. As for the said juice *Opopanax*, where and how it should be made, and which is the best kind thereof and not sophisticat, I haue declared already in my Treatise of forrain and strange plants. That which is brought out of *Macedony*, they call *Bucolicum*, because the Neat-herds of the country mark when the liquor breakes forth and runneth out of it selfe, and so receive and gather it from the plant: this wil not last, but of all the rest sooneſt loseth the force. Moreouer, in all sorts of it, that is rejected principally, which is black and soft; for these be markes to know that it is corrupted; and sophisticat with wax. A second kind there is of *Panaces*, which they call *Heraclium*: the inuention of the vertues and properties whereof is attributed vnto *Hercules*. Some there be who call it *Origanum Heracliticum* the wild, because it is like to *Origan*, whereof I haue heretofore written: but the root of this *Panaces* is good for nothing. A third kind of *Panaces* took the name of *Chiron* the Centaur, who was the first that gaue intelligence of the herbe and the vertues thereof. The leafe is like vnto the *Dock*, but that it is bigger and more hairy: the floure is of a golden yellow color: the root but small: it loueth to grow in rich, fat, and battle grounds. The floure of this *Panaces* is most effectual in Physick: in which regard there is more vse and profit thereof than of all the former kinds. A fourth *Panaces* there is besides, found out also by the same *Chiron*, whereupon it hath the denomination of *Centaureum*: called also it is *Pharnaceum*: the occasion of this two-fold name is this: because there is some controuersie in the first inuention thereof, whiles some attribute to it the Centaur *Chiron*, others to *K. Pharnaces*. This *Panaces* is vsually set and planted, bearing leaues indented in the edges like a saw, and those longer than any of the rest. The root is odoriferous, which they vse to drie in the shadow, and therewith to aromatize their wine, for a pleasant and delectable taste it giueth vnto it. Hereof they haue made two speciall kinds:

* *Crosswort*, *madegon*, & *Thunbrest*.

A kinds: the one with a * thicker leafe: the other with a thinner and smaller.

As for *Heraclion Siderion*, a plant it is also fathered vpon *Hercules*. It riseth vp with a slender stalk to the height of foure fingers, bearing a red floure, and leaues in manner of the *Coriander*. Found it is growing neare to pooles and riuers: and for a wound herb there is not the like, especially if the body be hurt by sword, or any edged weapon made of yron and Steele.

There is a wild Vine, named *Ampelos Chironia*, for that *Chiron* was the first author thereof. Of this plant I haue written in my discourse of Vines [vnder the name of *Vitis Nigra*] like as also of another * herb, which hath the goddesse *Minerva* for the inuentresse.

* *Matricaria* or *Tarthenium*, i. Motherwort.

Moreouer, vnto *Hercules* is ascribed *Henbane*, which the Latines call *Apollibaris*; the Arabians, *Altercum* or *Altercangenon*; but the Greeks, *Hyoscyamus*. Many kinds there be of it: the one beareth black seed, floures standing much vpon purple, and this herb is full of prickles. And in very truth, such is the *Henbane* that groweth in *Galatia*. The common *Henbane* is whiter, and brancheth more than the other: taller also than the *Poppy*. The third kinde bringeth forth seed like vnto the graine of *Iris*. All the sort of these already named, trouble the brain, and put men besides their right wits: besides that, they breed dizziness of the head. As touching the fourth, it carrieth leaues soft, full of down, fuller and fatter than the rest: the seed also is white: & it groweth by the sea-side: Physicians are not afraid to vse this in their compositions, no more than that which hath red seed. Howbeit, otherwhiles this white kinde especially, if it be not thoroughly ripe, proueth to be reddish, and then it is reiected by the Physicians. For otherwise none of them all would be gathered, but when they be fully drie. *Henbane* is of the nature of

C * wine, and therefore offensive to the vnderstanding, and troubleth the head: howbeit, good vse there is both of the seed it selfe as it is in substance, and also of the oile or iuice drawn out of it apart. And yet the stalks, leaues, and roots, are imploied in some purposes. For mine owne part, I hold it to be a dangerous medicine, and not to be vsed but with great heed and discretion. For this is certainly knowne, That if one take in drink more than foure leaues thereof, it will put him beside himself. Notwithstanding the Physicians in old time were of opinion, that if it were drunk in wine, it would driue away an ague. An oile (I say) is made of the seed thereof, which if it be but dropped into the ears, is enough to trouble the brain. But strange it is of this oile, That if it be taken in drink, it serues for a counterpoison. See how industrious men haue bin to proue experiments, and made no end of trying all things, inſomuch as they haue found means and forced very poisons to be remedies.

CHAP. V.

¶ Of *Mercury*, called *Linozostis*, *Parthenium*, *Hermupoa*, or rather, *Mercurialis*: of *Achilleum*, *Panaces*, *Heraclium*, *Sideritis* and *Millefoile*: of *Scopa regia*, *Hemionium*, *Tuccinum*, and *Splenium*: of *Melampodium* or *Elleboe*, and how many kinds there be of it: of the black or white *Elleboe*, & their medicinable vertues: how *Elleboe* is to be giuen, how to be taken, to whom, and when it is not to be giuen: and how it killeth *Mice* and *Rats*.

E THe herb *Mercury*, called by the Greeks *Linozostis* and *Parthenion*, was thought to be first found out by *Mercury*: whereupon many of the Greeks call it *Hermupoa*: and wee all in Latine name it *Mercurialis*. Of it be two kinds, the male and the female: howbeit, the female *Mercury* is of better operation than the other. It riseth vp with a stem a cubit high, which otherwhile brancheth in the top: the leaues be like vnto *Basil*, but that they are narrower: full of knots or joints the stalk is, and those haue many hollow concavities like arme-pits. The seed hangeth down from those ioints. In the female the same is white, loose, & in great plenty: in the male it standeth close vnto those joints, but thinner: and the same is small and as it were wreathed. The leaues of the male *Mercury* be of a dark and blacker green: whereas in the female they be more white. The root is altogether superfluous, and very little. Both the one and the other delight to grow in plains and champion fields well ordered and husbanded. It is wonderful if it be true, that is reported of both these kinds; namely, That the male *Mercury*, cauſeth women to beare boies: and the female, girls. For which purpose the woman must presently after that shee is conceiued, drink the iuice of which *Mercury* she will, in sweet wine cuit, and eat the leaues either foddren with oile & salt, or els Greene & raw in a sallad with vineger. Some there be who boyle

boile it in a new earthen vessell neuer vsed before, together with the hearbe Heliotropium or G Turnsol, and 2 or 3 cloues of Garlick, vntill it be thoroughly sodden. VVhich decoction they prescribe to be giuen to women, as also the herb it self to be eaten the second day of their monthly sicknes, and so to continue for 3 daies together: & then vpon the fourth day, after they haue bathed, to company with their husbands. Hippocrates giueth wonderfull praise vnto Mercury, as wel the male as the female, for all those accidents which follow women: but the maner of vsing it, which he prescribed, there is no Physitian hath skil of. He appointed to make pessaries thereof with hony, oile of Roses, oile of Ireos or Lillies, and so to put them vp into the secret parts: and in this manner he saith that the herb is excellent good for to prouoke the monthly termes of women, and to fetch away the after-birth. Hee affirmeth also, that a potion or fomentation therewith wil do as much. Moreover, by his saying, the iuice of Mercury infused into the ears, or applied by way of liniment with old wine, is singular for them when they runne with stinking matter: he ordained likewise a cataplasme of Mercury to be laid to the belly, for to stay the violent flux of humors thither: for the strangury also and infirmities of the bladder. In which cases he gaue the decoction thereof with Myrrhe and Frankincense. And verily for to loosen the belly, although the Patient were in a feuer, there is a potion of Mercury singular good, made in this wise: Take a good handfull of Mercury, seeth the same in two sextars of water, vntill one halfe be consumed, let the party drink the same with salt and hony mixed therewith: but the said decoction if it be made with an hogs foot, with a hen, capon, or cock boiled withal, is the wholeformer. Some Physitians were of opinion, That for to purge the body, both Mercuries, as wel the male as the female are to be giuen, either boiled alone by themselves or els with Mallows: they cleanse the breest parts, and euacuat choler, but they hurt the stomacke. Touching all the other properties of Mercury, I will write in place conuenient.

As Chiron the Centaure found out the medicinable vertues of certaine herbes, so we are beholden to his scholler Achilles for one, which is singular to heale wounds, and of his name is called Achilles. This is that wound-herb, wherewith (by report) he cured prince Telephus. Some haue thought that hee deuised first the rust of brasse or verdegreece, which is so excellent for salues and plaisters: & therefore you shall see Achilles commonly painted scraping off the rust of his speare head with his sword into the wound of the said Telephus. Others say, that he tooke both the said rust or verdegreece, and also the herb Achilles to worke his cure. Some would haue this Achillea to be Panaces Heracleon; and others Sideritis: we in Latine call it Millefolia. An herb it is growing with a stalk or stem to the height of a cubit, spreading into many branches, clad from the very root vp to the top, with leaues smaller than those of Fenell. Others confesse indeed that this herb is singular good for wounds; but the true Achilles (say they) hath a blewish stalk a foot high & no more, bare and naked without any branches at all, howbeit finely deckt and garnished on euery side with round leaues, standing one by one in excellent order, and making a faire sight. There be again who describe it with a four square stem, bearing heads in the top in manner of Horehound, and leaued like vnto an Oke. And this they say is of that efficacy, that it wil conglutinat & vnite sinews again, if they were cut quite afunder. Moreover, you shall haue some who take it for Achillea that kinde of Sideritis growing vpon mud walls, which if it be brused or stamped, yeeldeth a stinking sent. Moreover, there is another going vnder the name Achilles, like to this last described, but that the leaues be whiter and fatter, the little stalks or sprigs more tender, & it groweth in vineyards. Last of al, there is one more called Achilles, which riseth vp to the height of 2 cubits, bearing pretty fine & slender branches, and those three square, leaues resembling Fearn hanging by a long stele, & the seed is much like to that of the Beet. In one word, they be al of them most excellent for healing wounds. And as for that especially, which hath the largest leaues, our countrimen in Latine haue called it Scopa Regia. And the same is holden to be good for to heale the Squinancy or Gargle in swine.

In the same age wherein Achilles liued, prince Teucer also gaue the first name and credit to one speciall herb, called after him Teucion, which some nominat Hemionium: this plant putteth forth little stalks in maner of rushes or bents, and spreadeth low: the leaues be small: it loneth to grow in rough and vntoiled places: a hard and vnpleasant sauer it hath in tast: it neuer flourereth, and feed it hath none. Soueraigne it is for the swolne and hard spleene: the knowledge of which property came by this occasion, as it is credibly and constantly reported. It fortuned on a time when the inwards of a beast killed for sacrifice, were cast vpon the ground where this herb grew,

A grew, it took hold of the spleen or milt, and claue fast vnto it, so as in the end it was seen to haue consumed and wasted it clean: hereupon some there be that call it Splenion, i. Spleenwort: and there goeth a common speech of it, That if swine doe eat the root of this herbe, they shall be found without a milt when they are opened. Some there be, who take for Teucrium and by that name do call, another herb full of branches in manner of hyssop, leaved like vnto beans; and they giue order, that it should be gathered whiles it is in floure, as if they made no doubt but that it would floure. The best kind of this herb they hold to be that which commeth from the mountains of Cilicia and Pisidia.

Who hath not heard of Melampus that famous diuiner and prophet? he it was of whom one of the Ellebores tooke the name, and was called Melampodium: and yet some there be who attribute the finding of that herb vnto a shepheard or heardman of that name, who obseruing wel that his she goats feeding therupon, fell a scouring, gaue their milk vnto the daughters of king Prætus, whereby they were cured of their furious melancholy, and brought again to their right wits. This herb then being of so excellent operation, it shall not be amisse to discourse at once of all the kinds of Ellebore, whereof this maketh one. And to begin withal, two principal sorts there be of it; namely, the white and the black: which distinction of colour, most writers would haue to be meant and vnderstood of the roots only, and no part else: others there be, who would haue the root of the blacke Ellebore to be fashioned like vnto those of the Plane-tree, but that they be smaller and of a more darke & dusky green, diuided also into more jags and cuts; but those of the white Ellebore, to resemble the yong Beet new appearing about the ground, saue onely that they be of a more blackish colour, and along the back part of their concauitie inclining to red. Both the one and the other bringeth forth a stalke in fashion like the Ferula or Fenel-geant, a span or good hand-breadth high, and the same consisteth of certain tunicles or skins folded one within another in manner of bulbous plants, rising from the like root; and the said root is full of strings or fringes, as is the head of an onion. The blacke Ellebore is a very poison to horses, kine, oxen, and swine, for it killeth them; and therefore naturally these beasts beware how they eat of it, whereas confidently they feed vpon the white. The right season of gathering the Ellebores, is in haruest time. Great store thereof groweth vpon the hill Oeta, but the best is that which is found in one only place thereof neere about * Pyra. The black Ellebore commeth vp euery where; but the best is in Helicon, a mountaine much renowned and praised for other herbs beside it, wherewith it is well furnished. As touching the white, that of the mount Oeta is counted the principall: in a second degree, is the white Ellebore of Pontus: in the third place is to be ranged, that which commeth from Elæa, which (they say) groweth among vines: in the fourth and last place, for goodnesse, is that of the mount Parnassus, which is sophisticated with the Ellebore of Ætolia neare by. The blacke Ellebore is called Melampodium, wherewith folk vse to hallow their houses for to driue away ill spirits, by strewing or perfuming the same, and vsing a solemne praier withall: it serueth also to blesse their cattell after the same order. But for these purposes they gather it very deuoutly and with certain ceremonies: for first and foremost, they make a round circle about it with a sword or knife, before they go in hand to take it forth of the ground: then the party who is to cut or dig it vp, turneth his face into the East, with an humble prayer vnto the gods, That they would vouchsafe to giue him leaue with their fauor to do the deed; & with that he markes and obserueth the flight of the Eagle; for lightly while they be cutting vp of this root, ye shall see an Eagle foring aloft in the aire: now in case the said Eagle flie neere vnto him or her that is cutting vp Ellebore, it is a certaine presage and foretoken, that he or she shall surely die before that yeare go about. Much ado also there is about the gathering of the white Ellebore, for vnlesse the party do eat some garlick before, and estfoones in the gathering sup off some wine, and withall make hast to dig it vp quickly, it wil stufte and offend the head. The blacke Ellebore some call Eutomon, others Polyrrhizon; it purgeth downward; the white, by vomit, vpward, and doth euacuat the offensive humors which cause diseases. In times past it was thought to be a dangerous purgatiue, and men were afraid to vse it: but afterwards it became familiar and common, in so much as many students tooke it ordinarily for to cleanse the eies of those fumes which troubled their sight, to the end that whiles they read or wrote, they might see the better or more clearly. It is wel known, that Carneades the Philosopher purposing to answer the bookes of Zeno, prepared his wits and quickened his spirits, by purging his head with this Ellebore. And Drusus our Countrey-man, one of the most famous and

* Where Hercules tried to death as he were, in a funeral fire, which the Greekes call Pyra.

renowned Tribunes of the Commons that were euer knowne at Rome (a man who about all others woon the fauour and applause of the comminallty, howsoeuer the nobility charged him to haue bin the cause of the Marfians war) was perfectly cured of the falling sicknes in the Isle Anticyra, by this only medicine: and indeed those Islanders haue a way by themselves to prepare their Ellebore with the mixture of Sefamoeides (as I haue said before) whereby the taking of it is most safe. Ellebore is called in Latine * Veratrum: the poudre as well of the one as the other snuffed vp into the nostrils, either alone by it selfe, or mixed with the poudre of the Fullers heade Radicula, wherewith they wash and scoure their woollen cloth, * prouoketh sneezing; and yet both of them procure sleep. Now for vse in Physicke, there would be chosen the smallest roots of Ellebor, such as be short also, and as it were cuttelled, and not sharp pointed in the bottome: and the best part is that which is toward the nether end; for the vppermost part of the root which is the thickest and bulbous like to an onion head, is good for dogs onely, and giuen vnto them for to make them scummer. In old time they vsed to chuse the Ellebore root by the bark, and took that for the best which had the most fleshy or thickest rind, to the end that they might take out the finer pith or marrow within; which they vsed to lap and couer with moist sponges, and when it began to swell, they diuided or sliced it longwise into smal filaments with the point of a needle or bodkin. These filaments or strings, they dried in the shade, & laid them vp to serue as need should require. But now adaies they cut the small shoots or slips branching from the root, such as are most charged with bark, and those the Physitians giue vnto their Patients. The best white Ellebore is that, which in tast is hot and biting at the tongues end, and in the breaking seemeth to smoke or send dust from it: it is commonly said, that it will continue in force thirty yerres. The black is good for the palse, for those that be lunaticke and bestraght in their wits, for such as be in a dropsie (so they be cleare of a feuer) for inueterat gouts as well of feet and hands as other joints: it purgeth downward by the belly, both choler and flemme: being taken in water, it gently mollifieth and loosneth the body: and from foure oboli (which is a small or mean dose) you may rise to a full dramme, so you exceed not that weight. Some were wont to mingle Scammonium therewith; but the safer way is to put salt only thereto: being giuen in any sweet liquor to some great quantity, it is dangerous: and yet a fomentation therewith is good to rid away and dispatch the mistinesse that troubleth the eies: and therefore some vse to beat it into pouder, and when it is reduced into a liniment or eie salue, therewith to annoint them for the said purpose. This property moreouer it hath, to bring to maturation the swelling wens called the kings euill, to mollifie any hard tumors, to mundifie also the foresaid wens and any botches or impostumes that be suppurat and broken. It clenseth likewise the hollow vlcers called fistuloes, provided alwaies that it be not taken out of the sore in 2 daies and 2 nights, but the third day it ought to be remoued. Incorporat with the scales of brasse and red orpiment, it taketh away warts. Made into a pulteffe or cataplasme with barley meale and wine, it is singular good for the dropsie, if it be applied vnto the belly: take a slining or slip of the root and draw it through the eare of sheep or horse in manner of rowelling, and the morrow after take it forth again at the same houre; this healeth the gid or wood-euill in sheep, and cureth the glandres in horses: incorporat with frankincense or wax, together with pitch or oile of pitch, it is singular good for the farcins or scab in any foure-footed beast. Touching white Ellebore, the best is that which most speedily prouoketh sneezing: it is without comparison far more terrible than the blacke, especially if a man reade what ado and preparation there went vnto it in the old time, when they were to drink it against shiuering and shakings, against the rising of the mother and danger of suffocation; in case also of immoderate and extraordinary drowlinesse, of excessive hicquers and yexing without intermission, and of continuall sneezing: moreouer, when they were troubled with weakenesse and feeblenesse of stomacke: in like manner in case of vomits, when they came either too fast or ouer-slow, either too little or too much: for this was a rule obserued among them, to giue with Ellebore some other drugs, for to cause it work the sooner, and to hasten vomit more speedily: also they vsed means to fetch away the very Ellebore again if it lay ouer-long in the body, either by other purgatiue medicines, or by clysters: oftentimes also by opening a veine or bloud-letting. And say that Ellebore taken in manner aforesaid, wrought very well, yet they vsed to obserue euery vomit, the diuers colors of humors that came away, which many times were fearful to behold: yea and when the Patient had done casting, they considered also the ordure and excrements that passed away by the belly: they gaue order

besides,

* A veratrum, vnde
de veratris &
veraculis: and

in the charges
& such drow-
sie diseases.

A besides, for *bathing either before or after the taking of Ellebore, as occasion best required; yea and they took great heed and regard of the whole body besides; and yet, did what they could, the terrible name and report that went of this medicine, passed all their care and circumspection whatsoeuer: for it was an opinion generally held and receiued, That Ellebore doth eat away and consume the flesh seething in the pot, if it be boiled therewith. But herein were the antique Physitians much too blame and greatly in fault, in that they were ouer timorous, and for feare of such accidents insuing vpon this medicine, gaue it in too small a dose: whereas indeed the greater quantity that one taketh of it, the more speedily it worketh, and the sooner passeth out of the body, when it hath once done the errand. Themison vsed to prescribe two drams, and not aboute. The Physitians who followed after, allowed the dose of foure drammes; grounding vpon a notable and famous apothegme or speech of Herophylus, who was wont to say, that B Ellebore was like vnto a valiant and hardy captain: for when (quoth he) it hath stirred all the humors within the body, it self issueth forth first and maketh way before them. Moreouer, there is a strange and singular deuise, To clip the root of Ellebore with small fizzers or sheares into little pieces; then, to sift them through a seer, that the bark or rind may remain still; and when it is clenfed and purged from the pith or marrow within, the same may fall thorow and passe away: which is passing good to stay vomits, in case the Ellebore doe worke too extreamely: furthermore, if we looke for good successe in our cure by ministering of Ellebore, in any wise wee must take heed and be carefull, how we giue it in close weather, and vpon a darke and cloudie day; for certainly it putteth the Patient to a jumpe or great hazzard, and causeth most grieuous and intollerable pains and torments. For that it should be taken in summer rather than in winter, no man doubteth thereof. Ouer and besides, the bodie ought to be prepared a feuen-night before; during which time, the Patient is to eat tart and * sharp meats and poignant sauces, to abstaine from wine altogether; and the fourth and third day before, to assay by little and little to vomit gently: last of all, to forbear supper ouer-night, when hee is to take his Ellebore the morrow. As touching the manner of giuing Ellebore: the white may be drunke in some sweet wine; but the best and chiefe way of taking it, is in milke, grewell, or portage. Of late dayes there is come vp a pretty inuention, To slit or cut Radish roots, and within those gashes to stick or enterlace pieces of white Ellebore, which don, to bind them close vp again, that the strength and vertue thereof may be incorporat in the foresaid roots: and thus by the means of this kind temperature with the Radish, to giue it vnto the Patient. Ordinarily this medicine of Ellebore continueth not aboute foure houres within the body, but it commeth vp againe, and within feuen it hath done working. And thus being vsed as is before said, it is a most soueraigne remedie for the falling sicknesse, the swimming or dizziness of the head: it cureth melancholicke persons troubled in mind; such as be brain-sick, mad, lunaticke, phrantick, and furious: it is singular good for the Elephantie, the foule and dangerous morphew called Leuce, the filthy leprosie, and the generall convulsion whereby the body continueth stiffe and starke, as it were all one peece without any joynt. It helpeth those that be troubled with trembling, shiuering, and shaking of their lims, with the gout, and the dropsie, and namely such as bee entering into a tympanie: singular it is for those that haue weake and feeble stomackes and can keepe nothing that they take; for such as are giuen to spasmes or crampes, lie * bed-rid of the dead palse or such chronicke diseases, encumbered with the Sciatica, haunted with the quartaine Ague, which will not be ridde away by any other meanes; troubled with an old cough, vexed with ventosities and griping wrings and torments which be periodically, and vse to come and goe at certaine set times: howbeit, Physitians forbid the giuing of Ellebore vnto old folk and yong children: Item, to such as be of a foeminine and delicate bodie; as also to those that be in minde effeminate: likewise to those who are thinne and slender, soft and tender: in which regards, wee may not be altogether so bold to giue it vnto women as vnto men. In like manner, this is a medicine that would not bee ministered inwardly to fearefull, timorous, and faint-hearted persons; neither to those who haue any vlcere in the precordiall region about the midriffe, ne yet vnto F such as usually bee giuen to swell in those parts; and least of all vnto those that spit or reach vp bloud; no more than to sickely and crasie persons who haue some tedious and lingering maladie, as phthisicke, &c. hanging vpon them; and namely, if they be grieued and diseased in their sides or throat. Neuerthelesse, applied without the bodie in manner of a liniment with salted hogs greafe, it cureth the breaking forth of flegmaticke wheals and pimples; as also healeth old

fores remaining after imposthumes suppurate and broken: mixed with parched or fried braley-groats it is a very rats-bane, & killeth both them & mice. The Gauls or Frenchmen when they ride a hunting into the chase, vse to dip their arrow heads in the juice of Ellebore, & they have this opinion, that the venison which they take will eat the tenderer; but then they cut away the flesh round about the wound made by the foresaid arrows. Furthermore it is said, That if white Ellebore be beaten to powder and strewed vpon milk, all the flies that tast thereof will die. To conclude, the said milke is good to rid away lice, nits, and such like vermin out of the head and other parts of the body.

CHAP. VI.

¶ Of the herbe Mithridation. Of Scordotis or Scordium. Of Polemonia, and Philetaria, otherwise called Chilibodina. Of Eupatorie or Agrimonie. Of great Centaurie, otherwise named Chironia. Of the little Centaurie, named also Libadion and Fel terra. Of Triorchis: and the medicinable vertues vpon these Simples depending.

Crateus hath ascribed the inuention of one herb to K. Mithridates himselfe, called after his name Mithridation: this plant putteth forth no more than two leaues, and those directly and immediatly from the root, resembling the leaues of Branc vrsin: there riseth vp a stem between them both in the mids, carrying an incarnat floure in the head like a rose.

Pompeius Lenaxus (who by the commandement of Pompey the Great translated into Latine the Physick notes and receipts of K. Mithridates) saith moreover, that the said prince found out another herb named Scordotis or Scordium; and that among other his writings hee met with the description of the said herb, set down vnder the kings own hand in this manner; namely, That it grew a cubit high, with a main stem four square, and the same full of branches garnished with downy or furred leaues, indented and cut like to those of the oke. This herb is found ordinarily growing within the region of Pontus, in battle and moist champian grounds, and in taste is very bitter. There is another kind of Scordium, with larger and broader leaues, and like it is vnto wild Minth or Calamint: both the one & the other be of great vse in Physicke, either by themselves alone, or els put into opiats and antidots among other ingredients.

Touching * Polemonia, which others call Philetaria, it tooke the name vpon occasion of the strife and controuersie betweene certaine princes which debated about the first inuention thereof. The Cappadocians know it by the name Chilibodina, i. as one would say, endued with a thousand vertues. This plant hath a thicke and grosse root, but smal & slender branches, from the tops whereof there hang down certaine berries in tufts and clusters, inclosing within them black seed: in all other respects it resembles rue, & groweth commonly vpon mountaines.

As for Agrimony, called otherwise Eupatoria, it hath gotten credit & reputation by a * king, as it may appeare by the name. The stalk or stem of this herb is of a woody substance, blackish in colour, hairy, and of a cubit in height, or rather more. The leaues grow disposed and distant by certaine spaces asunder, much like vnto those of cinquefoile or hempe, snipped & cut about the edges ordinarily in fve parts, the same are of a blackish or dark green, and full of a kinde of plume or downe. The root is superfluous for any operation that it hath in Physick: the seed of this herb drunk in wine, is a singular remedy for the dysentery or bloody flux.

The greater * Centaury is that famous herbe wherewith Chiron the Centaure (as the report goeth) was cured, at what time as hauing entertained Hercules in his cabin, hee would needs be handling & tempering with the weapons of his said guest, so long vntill one of his arrows light vpon his foot and wounded him dangerously: wherupon some there be who name it Chironion. The leaues grow large, broad, and long, indented or cut rather, like a saw round about the edges: neare vnto the root they come vp very thick: the stems run vp three cubits high, full of knots and joints all the way: knobbed in the top like vnto Poppie heads: the root is of a mighty bignesse, inclining to a red colour, howbeit tender and easie to break or knap in sunder: two cubits it beareth in length; full of a liquid juice: bitter in taste, and yet sweet withal: it loneth to grow vpon banks and pretty hills, where the ground is fat and battle. The best Centaury of this greater kinde, commeth out of Arcadie, Elis, Messenia, Pholoe, and mount Lycæus: and yet there is good found vpon the Alpes, and in many other places. Some there be, who out of this plant

draw

A draw a juice in manner of Lycium. Of such efficacy it is to incarnat wounds, that (by report) if it be put into the pot to seeth among many gobbers or pieces of flesh, it wil cause them to grow together and vnite. The root only is to be giuen inwardly, and namely in drinke, to the weight of two drams, in such cases as I will shew hereafter: with this charge, That if the Patient haue an ague hanging vpon him, it be stamped and taken in water: others may drink it well enough in wine. Also the juice drawn forth of it when it is boiled, is good for the diseases or rot of sheep.

Another Centaury there is, surnamed also in Greeke Lepton (i. Small) for that it hath little leaues in comparison of the other: soine name it Libadion, for that it loneth to grow neere to springs or fountains: it is somewhat like to Origan, saue that the leaues be narrower and longer: the stalk is cornered, rising vp to a smal height; to wit, a hand-breadth or a span at most: the same also putteth forth little branches: the floure hath some resemblance of the * red-Rose * I. ychnidis. **B** The root is small, & needlesse for any Physicke vse: but the juice of the herb it selfe, is of singular operation. This herb would be gathered in Autumne, when it is fresh, full of leaues, and floures, for then it yeeldeth best juice. Some take the stalks and branches, tread them smal, let them lie infused in water 18 daies, and then presse forth the juice. This is that * Centaury, which we here in Italy call Fel Terra, i. the Gal of the earth, by reason of the exceeding bitterness which it hath: the Gauls terme it Exacos, because if it be drunk it sendeth downeward by feege out of the body, any hurtfull poison whatsoeuer.

There is a third Centaury named Centauris, knowne by the addition Triorchis: whosoever commeth to cut this herb, he quits himselfe wel and escapeth faire, if he wound not himselfe. **C** This plant yeeldeth forth a certaine red juice like vnto blood. Theophrastus hath delivered in his history of Plants, that the hawkes * Triorchides protect and defend this herbe, & are ready to incounter and fight with them that come to gather it; wherupon it took the foresaid name Triorchis. But many ignorant and vnskilfull persons there be, who write confusedly of all these Centauries, and attribute this last property and name, to the first Centaury the great.

Our Buzzards (as Turner thinketh)

CHAP. VII.

¶ Of Clymenos, Gentian, Lyfimachia, Parthenis or Artemisia, Ambrosia, Nymphaea, Heracium, and Euphorbium, with their operations in Physicke.

D The herb Clymenos beareth the name of K. Clymenus, the first inuenter and finder out thereof: Leafed it is like vnto Ivie, full of branches: the stalkes or stems be hollow and empty within, diuided by joints and partitions: of a strong and vnepleasant smell: the seed resembleth the grains or berries of Ivie; and it taketh pleasure to grow in wilde woods and among mountains. As touching the operations which it hath, & namely what diseases it cureth being taken in drinke, I will shew hereafter: mean while, I will not put off any longer, but aduertise the Reader, euen in this place, That this herb as it doth good one way, so it hurteth another; for if they be men that drink it, wel may it cure them of the maladies for which it is giuen, but surely it killeth their naturall seed and disableth them for getting children, so long as they vse it. **E** The Grecian writers described it to be like in leaf vnto Plantain: in stem four square, bringeth forth certain little cods full of seed, infolded and interlaced one within another after the manner of the tufted and curled haire about the Pourcuttle fishes called Polypi. But be it what it will, the juice of the herb is refrigeratiue, and of great vse in Physicke.

As for the herb Gentian, we must acknowledge Gentius king of the Illyrians for the Authour and parron thereof, for he brought it first into name & credit: and howsoeuer it grow in al places, yet the best is that which is found in Illyricum or Sclauonia. The leaues come neare in fashion and forme to those of the Ash tree, but that they be small in manner of Lettuce: the stem is tender, of a thumo thicknesse, hollow as a kex and void within: leafed here and there with certain spaces betweene, growing vp other while 3 cubits high. The root is pliable and will winde euery way, somewhat blacke or dusky, without any smell at all: it groweth in great plenty vpon waterish hillocks that lie at the foot of great mountains, such as the Alps be. The juice of the herb is medicinable, like as the root it selfe also, which is very hot of nature and not to be giuen in drinke to women withchilde.

Lyfimachia, the herbe so much commended by Erasistratus, beareth the name of king Lyfimachius,

machus, who first gaue light of the vertues that it hath: greene leaues it beareth like vnto those of the willow: the floures be purple: giuen much it is to branch from the roor, and those stalkes grow vpright: a * sharp smell it carrieth with it, and delighteth to liue in watery places. Of so effectuall vertue it is, that if it be laid vpon the yoke of two beasts which will not draw gently together, it staith their strife and maketh them agree well enough.

Not men only and great kings, but women also and queens haue affected this kind of glory, To giue names vnto herbs. Thus quene *Artemisia* wife to *Mausolus* king of Caria, eternized her owne name by adopting (as it were) the herb Mugwort to her selfe, calling it *Artemisia*, whereas before, it was named *Parthemis*. Some there be who attribute this denomination vnto *Diana* (called in Greek *Artemis* *Ilithya*) because it is of speciall operation to cure the maladies incident to women. It brancheth and busheth thick much like to wormwood, but that the leaues be bigger, fat and wel liking withal. Of this Mugwort there be two kinds: the one carrieth broad leaues, the other is tender and the leaues smaller: this grows nowhere but along the sea coasts. There be writers who call by this name *Artemisia*, another herb growing in the midland parts of the main and far from the sea, with one simple stem, bearing very small leaues and plentie of floures, which commonly break forth and blow when grapes begin to ripen, and those cast no vnpleasant smel, which herb some thereupon name * *Botrys*, others *Ambrosia*: and of this kind there is great store in *Cappadocia*.

* *Nenuphar* is called in Greeke *Nymphæa*, the originall of which herb and name also, arose by occasion of a certain maiden Nymph or yong lady, who died for ialousie that she had conceived of prince *Hercules* whom she loued: and therefore by some it is named also *Heraclion*, of others *Rhopalos*, for the resemblance that the roor hath to a club or mace. But to come againe to our first name *Nymphæa*; this quality it hath alluding and respectiue thereunto, That whoeuer do take it in drink, shal for 12 daies after find no prick of the flesh, no disposition (I say) to the act of venery or company of women, as being depriued for that time of all naturall feed. The best *Nemphar* or *Nymphæa*, is found in the lake *Orchomenus*, and about the plain of *Marathon*. The people of *Bœotia*, who also vse to eat the seed thereof, commonly call it *Madon*. It taketh great contentment to grow in waters: the leaues floating vpon the face of the water, be broad and large, whiles others put forth from the roor. The floure resembleth the Lillie, which when it is once shed, there be certain knobs remaining like vnto the bolls or heads of *Poppie*. The proper season to cut the stems and heads of this plant, is in Autumne. The roor is blacke, which being gathered and dried in the Sunne, is counted a soueraigne remedy for those that be vexed with the flux or fretting of the belly. A second * *Nemphar* or *Nymphæa* there is, growing in *Theffaly*, within the riuer *Peneus*, with a white roor, but a yellow floure in the head about the bigneſſe of a rose.

No longer ago than in our forefathers daies, *Iuba* king of *Mauritania*, found out the herb *Euphorbia*, which he so called after the name of his own Physitian *Euphorbus*, brother to that learned *Musa* Physitian to *Augustus Caesar*, who saued the life of the said Emperor, as heretofore I haue declared. These two brethren Physitians, ioined together in counsell, and gaue direction for to wash the body all ouer in much cold water, after the hot baine or stouue, thereby to knit and bind the pores of the skin: for before their time, the maner was to bathe in hot water only, as we may see plainly in the Poet *Homer*. But now to return vnto our herb *Euphorbia*, the foresaid *K. Iuba* wrote one entire booke (at this day extant) wherein he doth nothing els but expressly set forth the commendable vertues and properties of this one herb. He found the same first vpon the mountain *Atlas*, where it was to be seen (saith he) bearing leaues resembling *Branc-vrsin*: so strong and forcible it is, that those who receiue the juice or liquor issuing from it, must stand a good way off; for the manner is to launce or wound it first, and then presently to retire backe, and so at the end of a long pole to put vnder it a pail or trey made of kids or goats leather for a receptory, into which there runneth forth out of the plant, a white liquor like vnto milke: which when it is dried and growne together, resembleth in shew a lumpe or masse of *Frankincense*. They that haue the gathering of this juice called *Euphorbium*, find this benefit thereby, M That they see more clearly than they did before: an excellent remedy this is against the venom of serpents, for what part soeuer is stung or wounded by them, make a light incision vpon the * crown [of the head] and apply therto this medicinable liquor, it wil surely cure it. But in that country, the *Getulians* (who commonly do gather *Euphorbium*, for that they border vpon the mount

* *Odores acri*: Surely our herb Willow or *Lyfmaebia* hath a kind of sharp coole scent vnpleasant: although *Pliny* vs the word (*acri*) for hot and biting in other places. Hereupon it might well be called *Lyfmaebia*, (h) Locustile, and not of *K. Lyfmaebus*.
* Or rather *Botrys* (i) oke of *Ierusalem* is of some called *Artemisia*, of others *Ambrosia*, as *saith Dioſcorid.*
* Water lilly.

* Water-roſe.

* Or the vpper part of the hart place.

A mount *Atlas* sophisticate it with goats milke. Howbeit, fire will soon dete& this impofure of theirs, for that which is not right but corrupt, when it burneth, doth yeeld a lothſome fume and stinking sent. The juice or liquor which in France is drawn out the herb *Chamaelea* (the same that beareth the red grain, named by the Latines *Coccum*) commeth far short of this *Euphorbium*. The same being grown thick and hard, if a man break it, resembleth gum *Ammoniacke*. Taſt it neuer ſo little at the tongues end, it setteth all the mouth on a fire, and ſo continueth it a long time hot, but more by fits, vntill in the end it parcheth and drieth the chaws and throat alſo far within.

CHAP. VIII.

B ¶ Of *Plantain*, *Bugloſſe*, and *Borrage*. Of *Cynogloſſa* or *Hounds tongue*. Of *Buphtalmus*, i. *Oxe eie*, or *Many-weed*. Of *Scythica*, *Hippice*, and *Iſchæmon*. Of *Pettonica* and *Cantabrica*. Of * *Conſiligo* and *Hiberia*. Of *Celandine* the great, *Canaria* and *Elaphoboscos*. Of *Diſtammum*, *Ariſtolochie* or *Hervort*: That fiſh are delighted ſo much therewith, that they will make haſt vnto it, and be ſoon taken. Alſo the medicinable vertues of thoſe herbs aboue named.

T *Hemiſon*, a famous Phyſitian, ſet forth a whole booke of the herbe *Way-bred* or *Plantaine*, wherein he highly praiſeth it: and challengeth to himſelfe the honor of firſt finding it out, notwithstanding it be a triuiall and common herb, trodden vnder euery mans foot. Two kinds of it be found: the one which is the leſſer, hath alſo narrower leaues, and inclining more to a blackiſh green, reſembling for all the world ſheepe * or lambs tongues, the ſtalke is cornered bending downward to the ground, & it grows ordinarily in meadows. The other is greater, with leaues encloued (as it were) within certain ribs reſembling the ſides of our body: which being in number ſeuẽ, gaue occaſion to ſome herbariſts for to call it *Heptapleuron*, as a man would ſay, the ſeuẽ ribbed herb. The ſtem of this *Plantain* riſeth to a cubit in height, much like to that of the *Naphew*. That which groweth in moiſt and waterie places, is of greater vertue than the other. Of wonderfull power and efficacy it is by the aſtringent quality that it hath, for to dry and condenſate any part of the body, and ſerueth many times in ſtead of a cautery or ſearing yron. And there is nothing in the world comparable vnto it, in ſtaying of fluxes and deſtillations, which the *Greeks* call *Rheumatismes*.

To *Plantain* may be ioined the herb * *Bugloſſos*, ſo called, for that the leaſe is like an *Oxe tongue*. This herb hath one ſpeciall property aboue the reſt, that if it be put into a cup of wine it cheareth the heart, and maketh them that drink it, pleaſant and merry; whereupon it is called *Euphroſynon*.

Vnto this for affinity of name, it were good to annex *Cynogloſſos*, i. *Hounds tongue*, for the reſemblance that the leaues haue to a dogs tongue: a proper herb for vinet-works and knots in gardens. It is commonly ſaid, That the roor of that *Cynogloſſos* which putteth forth 3 ſtems or stalks, and thoſe bearing ſeed, if it be giuen to drink, cureth tertian agues: but the roor of that which hath ſoure, is as good for the *Quartains*. Another * *Cynogloſſos* there is like to it, which carrieth ſmall burs: the roor whereof being drunke in water, is a ſingular counterpoiſon againſt the venome of toads and ſerpents.

E An herb there is with flours like vnto *oxe eies*, whereupon it took the name in Greek * *Buphtalmos*: the leaues reſemble *Fennel*: & it groweth about town ſides: it ſhutteth forth ſtalles from the roor plentifully, which being boiled, are good to be eaten. Some there be who call it *Cachla*. This herb made into a ſalue with wax, reſolueth all * ſchirrous and hard ſwellings.

Other plants there be, which beare the names not of men but of whole nations, which firſt found them and their vertues out. And to begin withall, beholden we are to *Scythia* for that which is called *Scythica*. It groweth notwithstanding in *Bœotia*, and is exceeding ſweet in taſt. Alſo there is another of that name, ſingular good for the cramps, called by the *Greeks* *Spasmata*. An excellent property it hath beſides, for that whoſoeuer holds it in their mouth, ſhall for the time be neither hungry nor thiſty. Of the ſame operation there is another herb among the *Scythians* or *Tartars*, called * *Hippice*, becauſe it workes the like effect in horſes, keeping them from hunger and thiſt. And if it be true that is reported, the *Scythians* with theſe herbs wil endure without meat or drink for twelue daies together.

Touching the herbe *Iſchæmon*, the *Thracians* firſt found out the rare vertue that it hath in ſtanching

Stetterwoort, or Bears foot, as ſome thinke.

Whereupon it ſeemeth to be called in Greeke *aphroſynon*.

Our Borrage.

This is our common Houſe-tongue with little burs.

Some call them Moones. *Schirromata*, otherwiſe *Sicomata*, which be bunches of ſwellings in the fiſh full of a greaſe matter.

* *Theophrastus* writeth the like of the ſweet roor or Liquorice and *Hippice*, that is, cheefe made of mares milke, but not of any herb *Hippice*.

stanching blood, according as the very name implies. For (say they) it will stop the flux of blood running and gushing out of a veine not only opened, but also if it were cut through. It coucheth and creepeth low by the ground, and is like unto Millet, but that the leaues be rough and hairy. The manner is to stuffe the nostrils therewith for to stay the bleeding at nose. And that which groweth in Italy stancheth blood, if it be but hanged about the neck, or tied to any part of the body.

The people in Spaine named Vetrone, were the first authors of that herb, which is called in France * Vetroneca, in Italy Serratula, and by the Greeks Cestron or Psychotrophon: Surely an excellent herb this is, and above all other simples most worthy of praise. It commeth forth of the ground, and riseth vp with a cornerd stalk, to the height of two cubits, spreading from the very root leaues of the bignesse of Sorrell, cut in the edges, or toothed in manner of a saw, with floures of a purple color growing in a spike, & seed correspondent thereto. The leaues dried and brought into powder, be good for very many vses. There is a wine and vinegar made or condite rather with Betony, soueraign for to strengthen the stomack, and clarifie the eyesight. This glorious prerogative hath Betony, that look about what house soeuer it is set or sowed, the same is thought to be in the protection of the gods, and safe enough for committing any offence, which may deserue their vengeance and need any expiation or propitiatory sacrifice.

In the same Spain groweth * Cantabrica, lately found by the people Cantabri, and no longer since than in the daies of *Augustus Caesar*. This herb is to be seen euery where, rising vp with a benty or rusty stalk a foot high, vpon which you may behold small long floures, like to cups or beakers, wherein lie enclosed very small seeds. Certes, to speak the truth of Spain, it hath bin alwaies a nation curious in seeking after simples. And euen at this day in their great feasts where they meet to make merry Sans-nombre, they haue a certain wassell or Bragat, which goeth round about the table, made of honied wine or sweet mead, with a hundred distinct herbs in it: and they are perswaded that it is the most pleasant and wholsome drink that can be deuised: yet there is not one amongst them all who knoweth precisely what speciall herbs there be in all that number, in this only they be all perfect, that there go a hundred severall kinds thereof, according as the name doth import.

In our age we remember well, that there was an herb discovered in the Marsians country: and yet it groweth also amongst the people named *Aequicole*, neare vnto the borough Neruesia, and they call it * Confiligo: this is a soueraigne plant, as we shall shew hereafter in place convenient, for those that be so farre gone in a Phthisicke or consumption, as no man would hight their life and recovery.

Of late daies *Serapion Damocrates*, a famous practitioner in Physick, brought to light an herb which he termed *Hiberis*, a deuiled and fained name for his own pleasure, and nothing significant, as may appeare by a certain * Poem that he made as touching the discovery of that herbe. It commeth vp most willingly about old tombes and sepulchres, decayed wals, and ruinated buildings, in vntoiled and neglected places, and namely, common high waies. It beareth floures at all times, and is leaved like to Cresses: the maine stalk is a cubit high: but the seed so fine and small, that hardly they can discerne it. The root also hath the very smel of Cresses: it serueth to many good purposes, but with most successe in Summer time, & neuer but when it is green and fresh gathered. Much ado and trouble there is about the punning and stamping of it. Being tempered and incorporate with a little hogs greafe, it is singular to be applied to the paine of the hucklebone called *Sciatica*, as also to the gout of any ioints whatsoeuer. If the patient be a man it must lie bound fast vnto the place four houres at the most: but women may abide it but half so long, provided alwaies, that presently vpon this medicine they go down into an hot bain, and after they haue bathed, annoint their bodies all ouer with wine and oile. Thus must the patient doe once euery 20 daies, so long as there remaineth any grudging or minding of the foresaid pain. And surely in this sort it drieth vp and cureth all inward and secrete rheums running neare vnto the bones. Howbeit, this caueat would be given, not to lay this plaster too in the very heat and fury of the pain or disease, but the time must be waited when the extremity is somewhat slackened and ouer past.

Moreover, other liuing creatures also there be besides men, to which we are to attribute the inuention of herbs: as first and principally, the great * Celendine, called in Greek *Chelidonia*, for that the old Swallows with the helpe of this herbe helpe their young ones to see again, yea though

A though their eyes were plucked out of their head, as some are of opinion. Of this herb there be two kinds: the greater, which putteth forth many stems, & those full of branches, beareth leaues like vnto the wild * Parsnep, but that they be larger. The herb it selfe groweth vp to the height of two cubits. The leaues be whitish or hoary, like as the whole plant it selfe, al saue the floure, which is yellow. The whole herb yeeldeth a biting and fretting juice, of the colour of Saffron: and it bringeth forth seed resembling that of Poppy. The lesse * Celendine is seen with leaues fashioned much after the Ivy, but that they be rounder. Both Celendines do floure in the spring about the time that the swallows come abroad and shew themselves vnto vs, and those floures begin to fade again vpon the departure of that bird from vs. The onely time to draw or presse their juice from them, is whiles they be in the floure: which if it be put into a brasen pan, and seeth gently vpon hot embers or ashes only, together with the best Atticke honey, is a singular medicine to discusse and scatter the cloudy films that dim the eyesight. The said juice alone without any other preparations, goeth to the making of many collyries or eyefalues, which be called *Chelidonia*, by reason of that ingredient.

Touching the Dogs grasse *Canaria*, it took that name in Latin, because dogs vse therewith to discharge their gorge & whet their stomackes when their appetite to meat is gone. A strange thing of these dogs: we see them chew this herb in our sight ordinarily euery day, yet so, as we neuer can tel which * herb it is that they haue bitten: for we may perceiue it only when it is eaten down. But no marvel if this creature be so spightful as to concale from vs a purgative herb, considering a greater malice that he sheweth in another: for it is said, that if a dog be bitten by a serpent, he hath recourse by and by to a certaine herb that cureth him presently; but he will be sure that no man shall see him when he croppeth that herb.

Yet the poore hinds (simple and harmlesse creatures they) are not so coy and dainty of their knowledge, for they haue shewed vs the plant * *Elaphosodon*, whereof I haue already written: like as the herb * *Seseli* also, which presently after they haue calued, they feed vpon in our sight, & make it not strange. Nay, they haue not thought much to impart to vs the vertue of the herb *Dictamnus* (as I haue partly declared heretofore) for we may evidently see them after they be shot or wounded, to go forthwith vnto this herbe, and no sooner haue they eat of it, but immediately the arrows or darts wherewith they were hurt and sticking in them, fall out of their bodies. This plant is found growing no where but in the Island Candy. The branches be exceeding fine and slender: it resembleth in some sort *Penryol*. At the tongues end hot it is and biting. And the leaues only are in vse: for * neither floure nor seed it hath, ne yet any stem or stalk.

As for the root, as it is smal and little, so is it * needlesse for any good it doth in Physick: a rare plant this *Dictamnus* is, for euen in Candy, the naturall place thereof, it grows not euery where, but within some small compasse of ground within that Isle: and there Goats haue a wonderful desire to be feeding vpon it. Mary in lieu of this true *Dictamnus*, there is a bastard kind found in many countries, called *Pseudodictamnus*: in leafe it resembleth the other, the branches be lesse: and some there be who name it *Chondris*. That it is of weaker operation, and nothing so effectual as the former, a man shall soone find by the taste: for take neuer so little of the right *Dictamnus* into the mouth, it setteth it presently on a fire. They that vse to gather these *Dictamnes*, bestow them close strappd within the stems of *Ferula* or reeds, & then bind them fast together, for feare that their vertue & strength should exhale & vanish away. Writers there be who affirm, that both the one & the other *Dictamnus* do grow in many countries: but the worst is that which commeth vp in rich and fat grounds: therefore they that would meet with the right *Dictamnus*, must seek it in rough places, for no where els it loues to grow. A third kind there is of *Dictamnus*, and so called: but neither in shape answerable, nor in effect comparable to the other. In leafe it resembleth water Mints, but that the branches be greater. Moreover, this settled and deep persuasion men haue of Candy, that what Simples soeuer grow there, they be infinitely better than all others of the same kind whatsoeuer. Next vnto which Island there goeth a great name and opinion of the mountain *Pernaas*, for excellent herbes: how soeuer otherwise mount *Pelios* in *Thessaly*, the hill *Telechrius* in *Euboea*; and generally, all *Arcadia*, & the country of *Laconica* throughout, be renowned much for plenty of good simples. And yet the *Arcadians* verily vse no other Physicke but milke onely, and that about the spring, at what time all herbs there, be in their best verdure and fullest of sap, so as the vdders of beasts be their Physicians, yeelding them medicines out of their pastures. But above all, they vse to drink cow milk for

for that those kind of cattell, feed indifferently in manner of all kind of herbs. Certes, of what G power and efficacy herbs are, and namely, what effects they may work euen by the milk of four-footed beaſts graſing and paſturing thereupon, appeareth manifeſtly by two notable examples which I will report vnto you. About Abdera, and along the ſtreet or high way called *Diomedes* cauſey, there lie certain paſtures, wherein all the horſes that feed, become inrag'd, & ſtark wood thereby. Semblably, the herbage belonging to *Pornia*, a towne in *Magnesia*, driueth *Aſſes* to a kind of madneſſe.

Leauing now thoſe herbes which took their appellations of beaſts, let vs proceed to others. Among which, *Aristolochia* deſerueth to be ranged with the beſt and principal: an herb which ſeemeth to haue had that name giuen it by great bellied women, for that it is * *ἄριστον γαστρίσιν*. Our Countrey men of Italy call this herbe in Latine *Malum terræ*, which is as much to ſay, as the * *Apple of the earth*: and they do make foure kinds thereof. The firſt hath a round root ſwelling and bunching out: leaues reſembling the Mallow, and partly thoſe of luy, but that they be of a more browne and duſky colour, and withall, ſofter in the hand. The ſecond *Aristolochia* or Birthwort is taken to be the male, and hath a root as thicke as a good Baſton or ſtaffe, growing longwiſe to the length of foure fingers. The third, which by ſome is called *Clematis*, by others, *Aristolochis of Candy*, hath a root exceeding long and ſlender, like to that of a young Vine: and this is reputed of all others for the beſt and moſt effectually. The roots of them all be of a Box colour, the ſtalks ſmall, and the floures purple. They beare little pretty berries, much like to capers. But it is the root alone which is medicinable. A fourth kinde there is alſo, which they call *Piſtolochia*, ſmaller and ſlenderer than the laſt before, named *Clematis*. A root it hath diuided into many fibers or ſtrings, growing thicke one by another, to the thickeſſe of big and well growne ruſhes: whereupon ſome haue giuen it the name of *Polyrrhizon*. All the ſort of theſe *Aristolochies* yeeld an aromaticall odour: but the long and ſmaller root is that which is moſt pleaſant to ſmell vnto: for it hath a fleſhie rind, and is one of the principall ingredients which enter into thoſe odoriferous perfumes and ointments which ſtand moſt vpon *Nard*: theſe Birth-worts delight all of them to grow vpon plaines and barrell grounds. The right ſeaſon to digge or draw them out of the earth, as in harueſt time: and then after they be rid and ſcaled as it were, from the earth or mould ſticking vnto them, they vſe to lay them vp ſafe. Howbeit the beſt ſimply are thoſe which come out of *Pontus*. And take this for a generall rule, That in euery kind, the weightieſt is alwaies moſt medicinable. The round rooted *Aristolochie* hath a ſpeciall property againſt the poiſon of ſerpents. Yet there goeth the greateſt name of the long, for this excellent qualitie, if it be true, that is reported thereof: namely, that if a woman newly conceiued with childe, applie the root thereof to her naturall parts within a morcell of raw boeufe, it will cauſe her to breed and forme in her wombe a man childe. Our Fiſhers heere by in *Campaine*, doe tearme the round root, The poiſon of the earth. In very truth I haue ſcene them with mine owne eyes to ſtampe the ſaid root, and incorporat it with lime into a paſte, and ſo to caſt it into the ſea in ſmall pellets or gobbets, for to catch fiſhes: and I aſſure you they will ſkud amaine, and make haſte to this bait, and be very eager of bit: but no ſooner haue they taſted thereof, but they will turne vp their bellies, and lie floating aloft vpon the water ſtarke dead. As for that *Aristolochie*, which for the manifold rootes that it hath is called *Polyrrhizon*, it is thought to be ſoueraigne for conuulſions or crampes, contuſions, or bruifes: for ſuch alſo as haue fallen from ſome ſteepe and high place, if the root be drunke in water. Likewise, the ſeed of this kinde, is ſuppoſed ſingular good for the pleuriſie: and to corroborate, ſtrengthen and heat weake and diſtemper'd ſinewes. The ſame likewiſe may be reckoned for a * *Satyron*.

It remaineth now to knit vp this diſcourſe with a rehearſall of all the operations and effects of the plants before named. To begin then with the moſt dangerous accident of al other, to wit the ſting of ſerpents, theſe hearbes following are very medicinable and effectually in that caſe: namely, *Britannica*, and the roots of all the kinds of *Panaces* taken in wine. The floure & ſeed beſides (of *Chironium* eſpecially) if it be drunke, or otherwiſe applied as a liniment with wine and oile. Alſo the wild *Origan* or *Marjoram* called *Cunila Bubula*, hath a ſingular property by it ſelf that way: like as *Polomonina*, otherwiſe called *Philetoeria*, if one take 4 drams weight of the root in wine. Semblably, *Teucrium*, *Sideritis*, & *Scordoris* giuen in wine. But more particularly againſt ſnakes, aders, & the like, the ſaid herbes be right ſoueraigne, either inwardly taken or out-

* Excellent good for women in child-bed. Wherein *Phryis* ſome what overſeen but the error is not great, ſeeing that women with child vſe ordinarily alſo to be brought a bed and lie in. * Meant by *Aristolochie* or Birthwort the round.

* Any herbe good to provoke ſluggiſh luſt. For al- though there be a ſpeciall herbe of that vertue, ſe called by a kind of Synecdoche, all others of like operation may be termed *Satyria*.

A outwardly applied vpon the wound, be it in iuice, ſubſtance of leaſe, or decoction, it ſkillesh not whether: for which purpoſe a dram weight of the root of great *Centaurie* drunke in three cyaths of white wine is excellent: as for *Gentian*, it ſerueth properly againſt ſnakes, if it be taken to the poiſe of two drams with Pepper and Rue, in 6 cyaths of wine, green or dry, it makes no matter. Touch herbe *Willow* or *Lythimachia*, ſerpents cannot abide the very ſmell thereof, but flie from it. If any body chance to be ſtung alreadie by them, there is not a better medicine than to giue *Celandine* in drinke. But of *Betonie* about all the reſt there is made a moſt ſoueraigne ſalue to be laied vnto the place that is ſtung. And ſuch a contrarietie in nature or *Antipathie* there is (by folks report) between them and this herb, that if the leaues thereof be ſtrewed in a circle round about them, the ſerpents within wil neuer giue ouer flapping with their tailles, and bearing their own ſides, untill they haue killed themſelues. Now for their ſting, it is an vſuall praſtiſe to giue inwardly one dram weight of the ſeed of *Betonie* in three cyaths of wine, or els to incorporate 3 drams of the pouder in one ſextar of water, and lay it as a cataplaſme to the ſore. *Cantabrica*, *Diſtannum*, and *Aristolochia*, ſerue likewiſe for good counterpoiſons, in caſe a dram weight of their root be giuen in one hemine of wine. But then the Patient muſt vſe to drinke it often. And verily *Aristolochia* worketh the ſame effect, if it be reduced into a liniment and ſo applied: ſo doth *Piſtolochia*, which herb is ſo aduerſatiue vnto ſerpents, that if you doe but hang it vp in the chimney ouer the hearth, it will chaſe away all kind of ſerpents out of the houſe.

CHAP. IX.

¶ Of *Argemonie*, *Agarick*, and *Echium*. Of *Henbane* and *Vernaine*. Of *Blattaria* and *Lemonia*. Of *Cinquefoile*, *Carot*, and the *Clot* or great *Bur*. Of *Cyclaminus* or *Sow-bread*, and *Hurſtrung*: beaues all ſingular againſt the ſting of *Serpents*.

THE root of *Argemonia* taken to the weight of one Roman denier in 3 cyaths of wine, is ſingular againſt the ſting of ſerpents. And ſince I am come to mention this herbe, I thinke it conuenient to diſcourſe farther thereof: like as of other ſimples alſo, which I meane to name firſt, before that I treat of their vertues and effects. And in this courſe of ſetting downe medicines, euer as I meet with any herb of any ſingularity, I will range it there whereas I know it to be moſt ſoueraigne and effectually. Wel, this * *Argemony* aforeſaid hath leaues like to *Anemomy*, i. *Rose Perſly* or *Windfloure*: jagged they be in maner of garden *Parſly*. Heads it beareth in the top of euery ſtalke or branch, reſembling thoſe of wild *Poppy* or *Corne-rose*: and a root alſo not vnlike to that of the ſaid herb. A iuice it yeeldeth, yellow as *Safron*, hot, ſharp, and biting in taſt. VVith vs here in Italy it groweth vpon corn lands. Our countrymen haue deſcribed three kinds thereof, but they allow and commend that only, which hath a root ſenting much of *Frankincenſe*.

Touching *Agaricke*, it is a fungous excreſcence growing out of certain trees neare vnto the ſtraits of *Bosphorus*, much like vnto a white Muſhrum. The ordinary doſe or receipt thereof, to be giuen, bruifed, and beaten ſmall into pouder, is to the weight of two drams in two cyaths of *Oxymel* or honied vinegar. That which is found in *Gaule* or *France*, is thought to be weaker in operation. Moreouer, that *Agaricke* is counted the male which is more maſſiue or compact, and bitterer withall: but one ill quality it hath, namely, to make the head to ake. The female is of a more looſe and ſofter ſubſtance: which at the firſt when you taſt it ſeemeth ſweet, but within a while it turneth to be bitter.

Echium is of two kinds. One of them is like to *Peniroyall*, garniſhed & crowned (as it were) with tufts of leaues in the head: which being giuen to the weight of two drams in 4 cyaths of wine, is ſingular good for the venome of ſerpents, inflicted by their ſting. The like effect hath the other alſo, which is diſtinctly knowne from the other by the rough and prickie downe that the leaues do beare, and it carieth in the top little knobs reſembling *vipers heads*: and this may be taken either in wine or in vinegar, chuſe you whether.

The great *Clot-bur*, called in *Greek* *Arcion*, ſome haue named in Latine *Perſonata*. There is not a plant in the field that carieth a broader leaſe, and beſides, furniſhed it is with as big *Burs*. The root of this hearb boiled, the *Phyſicians* preſcribe to be giuen in vinegar to drinke againſt the ſting of ſerpents.

Hen-

* An hearbe like to the wild *Poppie*.

Henbane, stamped leaues and all, is singular to be taken in wine, especially against the sting G of the Aspiders.

* J. Vervaine.

But of all other herbs, there is none more honored among the Romans than * Hierobotane, called also otherwise in Greek Peristereon: which we in Latine name Verbenaca. This is that hearb, which (as I haue declared heretofore) our Embassadors vse to cary with them when they go to denounce war, and to giue defiance vnto our enemies. VVith this herbe the feastiuall table of * Iupiter is wont to be swept and clenfed with great solemnitie; our houses also be rubbed and hallowed, for to driue away ill spirits. And hereof be two kinds. That which they take to be the female, is stored well with leaues; the male hath them growing but thin: yet both of them put forth many small and slender branches, commonly a cubit long, and cornered. The leaues be lesser and narrower than those of the Oke, but deeper they be indented, and the partition wider: the floures be of a * gray colour, the root long and small. It groweth euery where vpon plains subiect vnto waters. Some writers make no distinction at all of male & female, but hold them all to be of one and the same kind, because they work the same effects. In France the Druids vse them both indifferently, in casting lots, telling fortunes, & foreshewing future euents by way of prophesie. But the wife-men or fages called Magi, ouerpasse themselves mightily in this herb, and shew their foolery and vanity without all sence and reason: They would beare vs in hand forsooth, that whosoever be rubbed all ouer the body therewith, shall obtaine whatsoeuer their heart desireth, be able to cure and driue away all manner of agues, reconcile them that be fallen out, make friendship between whom they list, and in one word, giue remedy to any disease whatsoeuer: they giue moreover expresse order, that it be gathered about the rising of the great dog-star, but so, as neither Sun nor Moon be at that time about the earth to see it; with this especial charge besides, that before they take vp the herbe, they bestow vpon the ground where it groweth, honey with the combs, in token of satisfaction and amends for the wrong and violence done in depriving her of so worthie an hearbe. They rest not so, but when these ceremonious circumstances be performed, they inioine them also who are to dig it vp, for to make a circle round about the place with some instrument of yron, and then to draw and pluck it vp with the left hand in any wise & so to fling it aloft ouer their heads vp into the aire, which done, they appoint precisely that it be dried in the shade, leaues, stalkes, and roots, euery one apart by themselves. To conclude, they adde moreover and say, that if the hall or dining chamber be sprinkled with the water wherein Vervaine lay steeped, all that sit at the table shall be very pleasant, and make merrie more jocundly. VVell, to leaue these toies and fooleries, the truth is this, stamp and beat it, giue the juice or powder thereof in wine, it is a good defensatiue against the poison of serpents.

An herb there is much resembling Mullen or Langwort, and indeed so like, as oftentimes one is taken for the other; howbeit, the leaues be not altogether so white, and more little branches it putteth forth, bearing likewise a pale yellow floure: cast this herb or strew it in any place all the moths thereabout will gather to it, whereupon at Rome they call it Blartaria.

The herbe Lemonium yeeldeth a white juice, much like vnto milke, which will harden and grow together in manner of a gum: and it groweth in moist places. The weight of one denarius giuen in wine, is a singular preseruatiue against the dangerous sting of serpents.

As for Cinque-foile or five leaved grasse, there is not one but knoweth it: so common it is, and commendable besides for the * strawberries which it beareth. The Greeks call it Pentapetes, Chamæzelon, or Pentaphyllon: the Latines Quinquifolium. The root when it is new digged, looketh red: but as it beginneth to drie about ground, so it waxeth black, and becometh also cornered. It tooke the common name both in Greeke and Latine, of the number of leaues which it beareth. This herb herein is of great affinitie with the vine, that they both bud, spring leafe, and shed the same together. It is vsed also about purging & blessing of the house, against naughtie spirits or enchantments.

* Pliny herein erreth grossely. Indeed the leaues of Cinque-foile are much like to the Strawberry leafe: but as the one hath no fruit or berry at all, so the other (to wit, the Strawberry-wire) puts forth but three leaues. The same and the wilde,

As for Sparganium, an herb so called by the Greeks, the root thereof is good to be giuen in white wine against venomous serpents.

Of Carrots, *Petronius Diodotus* hath set downe 4 feuerall kinds. But what need I to go through them all foure, seeing they may be reduced well enough into * twaine, and doe require no other distinctions. The best and most approved Carrots be those of Candy: the next to which in goodnesse come out of Achaia. But generally in what countrey soeuer they grow, the better be

A be such as come vp in the fonder and drier grounds. As touching the Candy Carot, it resembleth fennel, but that the leaues stand more vpon the white, they be smaller also and hairy withall. The stem groweth vp right a foot high, and hath a root odoriferous to smell vnto, and of a most pleasant tast: this ioieth in stony places exposed to the South quarter of the world. As for the other Carots of a wild nature, In what countrey grow they not? you shall finde them vpon earthie bankes and hills, you shall haue them about high waies, but neuer shall a man meet with them in a leane and hungry ground; they loue a battle and fat soile: their leaues come neare to the Coriander: their stem ariseth to a cubit heighth, bearing round heads, three ordinarily, and otherwhiles more: the root is of a woody substance, and being once dried, it serueth to no purpose. The seed of this kind is like vnto Cumin; but of the former, to Millet grain, white, quick, and sharp; and they be all odoriferous and hot in the mouth. The seed of the second is more ægre and biting than the former, and therefore ought to be taken in lesse quantitie. As for the third kind (if we list to make so many) it is much like to the wild Parsnep, called in Greek Staphylinos, and in Latine Pastinaca Erratica: the same beareth a seed somewhat long in form, and a sweet root. All the sort of these Dauci or Carots, are safe enough from the bit of four-footed beasts both winter & summer, vnlesse it be after they haue cast their abortiue fruit before time [for then they seek therto to be clenfed of their gleane.] Of all Carots, the seeds be vsed only: but that of Candie affordeth the root also, which is sweet: but both the seed of the one sort and the root of the other, be most appropriat remedies against serpents: a dram weight in wine is a sufficient dose at a time: which also may be giuen in a drench to foure-footed beasts that be stung by them.

C Touching the herb Therionarca (I mean not that which the Magitians vse) it groweth also in this part of the world here with vs in Italy: many branches it putteth forth, and springs thick with diuers shoots from the root: the leaues be of a light green, and the floure of a red-rose colour: it killeth serpents outright; besides, it hath this property, That if it be brought neere vnto any wild beast whatsoeuer, it benummeth their senses [whereupon it took that name.]

Perfolata, which the Greek writers call * Arcion, there is not one but knoweth: large leaues it hath, and bigger than the very Gourds; more hairy, blacker also and thicker; a white root and a great: this root taken in wine to the weight of two deniers Roman, is good likewise against the venom of serpents. In like manner, the root of Cyclaminus or Sow-bread is as effectual against them all: leaues it hath somewhat resembling those of Ivy, but that they be of a more duskyish and sad Greene, smaller also and without corners, wherein a man may perceiue certaine whitish specks. The stem is little, and hollow within: the flours of a purple colour; the root broad (so as a man would take it to be a Turnep) and couered ouer with a black rind: it groweth in shadowy places. Our countrymen here in Italy call it in Latine Tuber terræ, that is to say, The knur or bunch of the ground. Sowne and planted it would be in euery garden about an house, if so be it be true that is reported of it; namely, that whosoever it groweth, it is as good as a countercharm against all witchcraft and forceries: which kind of defensatiue is called properly Amuletum. Moreover, this root (they say) if it be put into a cup of wine, turneth the brain presently, and maketh as many drunk as drink thereof. For the better keeping and preseruing of this root, it must be ordered after the manner of Squilla or Sea-onion roots, (i.) cut into thinne slices or roundles, then dried, and so laid vp: the same also is vsually sodden to the consistence or thicknesse of hony. As good as this root is in those former respects, yet it is not without some venomous quality; for it is commonly said, That if a woman with child chance to step ouer it, shee will fall presently to labur before her time, and lose the fruit of her wombe. A second kind of Cyclaminus or Swine bread I finde, synamed by the Greekes * Cissanthemos, growing with stems full of knots or joints, hollow within and good for nothing, far different from the former, winding and clasping about trees; bearing berries much like to those of Ivy, but they are soft; a white floure faire and louely to see too, but a needlesse root for any goodnesse in it: the berries that it beareth be only in vse, and those are of a sharp and biting tast, & yet they be viscous and clammy to the tongue: these being dried in the shadow and stamped, are afterwards reduced into certain bals or trofches. My self haue seen a third kind also of Cyclaminus, carying the name besides of Chamæcissos, which brought forth but one only leafe: the root was much forked & diuided into branches, wherewith folk vsed to kil fishes. But among al other herbs of name, Pentedanum is much talked of and commended: principally, that which groweth in Arcadie: next

* Some take it to be the Clotbur, or Butterbur.

* *Microglossis*, *Dioscor. id. eff.* Leaved like to *Iris*.

to it, most account is made of that in Samothrace: a slender stalk it carrieth and a long, resembling the stem of Fennell: neere vnto the ground it is replenished well with leaues: the root is black, thick, full of sap, and of a strong and vnpleasant smell: it delighteth to come vp and grow among shady mountains. The proper time to dig it out of the ground, is in the later end of Autumne: the tenderest roots and those that run deepest downe into the earth, are most commendable. The manner is to cut these roots ouerthwart into certaine cantels or pieces of foure fingers in length, with kniues made of bone, whereout there issueth a iuice which ought to be dried & kept in the shade: but the party who hath the cutting of them, had need first to annoint his head all ouer and his nostrills with oile rofat, for feare of the gid; and least he should fall into a dizzinesse or swimming of the braine. There is another iuice or liquor found in this plant lying fast within the stems thereof, which they yeeld forth after incision made in them. The best iuice is knowne by these marks; It carrieth the consistence of honey, the colour is red, the smell strong, and yet pleasant, and in the mouth it is very hot and stinging. Much vse there is of it in many medicines, as also of the root and decoction thereof: but the iuice is of most operation, which being dissolved with bitter almonds or rue, people vse to drink against the poison of serpents; & in case the body be annointed all ouer with oile, it preserueth them safe against their stings.

CHAP. X.

¶ Of ground Elder or Wallwoort. Of Mullen or Taper-wort. Of the Aconit called Thelyphonus. Of remedies against the pricke of Scorpions, the venome of Hedge-toads, the biting of mad Dogs: and generally against all poysens.

THe smoke or perfume also of V Valwort (a common herb and knowne to euery man) chaseth and putteth to flight any serpents. The iuice of * Polemonia, is a proper defensatiue especially against scorpions, if one haue it tied about him or hanging at his neck: likewise it resisteth the prick of the spiders Phalangia, and any other of these venomous vermins of the smaller sort. Aristolochia hath a singular vertue contrary vnto serpents: so hath Agarick, if foure oboli thereof be drunke in as many cyaths of some artificiall or compound aromatized wine. Vervaine is a soueraigne herb against the venomous spider Phalangium, being taken in wine or oxycrat, i. vineger and water: so is Cinquefoile, and the yellow Carrot.

That herb which the Latines call Verbascum, i. Lungwort or Hightaper, is named in Greek Phlomos. Two special kinds there be of it: the one is whiter, which you must take for the male; the other black, & that may go for the female. There is a third sort also, but it is found nowhere but in the wild woods. The leaues of all the former, be broader than those of the Colewort, and hairy withal: they beare a main vpriight stem, a cubit in height with the vantage: the seed is black and of no vse in Physicke: a single root they haue, of a finger thickness. These grow also vpon plains and champion grounds. The wild kinde beareth leaues resembling fauge: the branches be of a woody substance, & the same grow high. There be moreover of this kind two other herbs named * Phlomidis, both of them hairy, their leaues be round, and they grow but low. A third sort there is besides, named by some Lychnitis, and by others Thryallis: it sheweth 3 leaues or foure at the most, and those be thick & fat, good to make wyks or matches for lights. It is said, that if figs be kept in the leaues of that which I named the female, they will not rot. To distinguish these herbs into seuerall kinds, is a needlesse peece of work, considering they agree all in the same effects: their root together with rue, is to be drunk in water against the poysen of scorpions: true it is, that the drinke is very bitter, but the effect that it worketh maketh amends.

¶ Some take these for the Cowslip and Primrose.

¶ Aconitum Pardalianches, Hébard. baine.

There is an herbe called by some * Thelyphoton, by others Scorpion, for the resemblance that the root hath to the Scorpion; and yet if Scorpions be but touched therewith, they will die thereupon: no maruell therefore if there be an ordinary drinke made of it against their poysen: [and here commeth to my mind that which I haue heard, namely, that if a dead scorpion be rubbed with the white Ellebore root, it wil reuiue and quicken again.] The said Thelyphoton hath such a spiteful nature against the four-footed beasts [of the female sex] that if the root be laid to their snout or naturall place, it killeth them: and if the leafe, which is like vnto the Cyclamin or Sowbread leafe aboue named, be applied in that maner, they will not liue one day to an end. This herb is parted and diuided into knots or joints, taking pleasure to grow in coole and shady places. To conclude and knit vp these remedies against Scorpions, the iuice of Betonie, and

A of Plantaine likewise, is a singular remedie for their poison.

Moreover, Frogs (such especially as keep in bushes and hedges, and be called in Latine Rubetæ, i. toads) are not without their venom: I my self haue seen these vaunting Montebanks calling themselves Psylli, as comming from the race of those people Psylli who feared no kind of poison; I haue seen them (I say) in a brauery (because they would seem to surpass all others of that profession) to eat those toads baked red hot between 2 platters; but what became of them? they caught their bane by it, and died more suddenly than if they had bin stung by the Aspis: but what is the help for this rank poison? surely the herb * Phrynon drunk in wine. Some call it Neuras, others Poterion: pretty flours it beareth: the roots be many in number, full of strings like vnto sinews, and the same of a sweet & pleasant sent. Likewise Alifura is counted another

* Some take it for Ruta muralis, or Salvia vira, a kind of Sixirage or rather Maiden-haire.

B remedy in this case: an herb it is, called by some Damoforium, by others Liron: the leaues might be taken for Planta in, but that they be narrower, more iagged and plaited, bending also toward the ground; for otherwise ribbed they be and full of veins, as like as may be to Plantain. As for the stalk, it is likewise one and no more, plain and slender, of a cubit in height, in the head whereof it hath knobs, roots growing many and thick together, and those but small, like vnto those of the blacke Ellebore, but they be hot and biting, of a sweet and odoriferous smell, and of a fatty substance withall: it groweth ordinarily in watery and moist places. And yet there is a second kind of it which commeth vp in woods, of a more dusky and blacker colour than the former, bearing bigger leaues: the root of both is of singular operation against the venomous frogs or toads abouesaid: also against the sea-hare, if it be taken in wine to the weight of one dram. And

C since we haue mentioned the sea-hares, take this withall, That Cyclaminos also is soueraigne against their venom. Moreover, a mad dog letteth in a dangerous poison by the wound that his tooth maketh, against which there is not a better thing than dog-rose of the Eglantine called Cynorrhodon, as I haue before declared. Plantain is a singular herb against the biting of any venomous beast whatsoever, whether it be taken inwardly in drink, or outwardly applied. Betonie is likewise good therefore if it be drunk in old wine. Veruain, which the Greeks call Peristereos, is an herb bearing one main stalk of a good height, furnished well with leaues, spreading forth toward the head into other branches, much fought to by doves and pigeons, whereupon it took the foresaid name Peristereos. They say, whofoeuer carry this herb about them, there dare not a dog bark at them. Thus much as touching the dangers proceeding from venomous beasts.

* Whereof he writeth in the beginning of the sixt chapter of this booke.

* Euplasindeed signifieth in Homer, a bon-voiage, or prosperous nauigation: but what is that to this place? No doubt Plinie should haue read in Theophrastus, which is no hearb, but the happinesse of a good name among men, whereof Plinie speakeh here, & which Theophrastus attributeth to Antirrhinon, as one of the effects of that hearb. But I say the fault (I pray you) as well here as elsewhere, v. p. Plinies Angnosts or Readers, who either read wrong, or pronounced not their words distinctly and plainly vnto

D What remaineth now but in the next place, to treat as well of such forceries and maleficiall poisons, as men haue deuised and practised to the mischief of their own kind, as of their remedies: where in the first place there presenteth it self vnto vs that noble herb Moly, so much commended by the Poet Homer, as a soueraigne preseruatiue not only against all those wicked inventions, but also against the secret and diuinish practises; to wit, charmes and enchantments, wrought by Art magick and witchcraft. Next vnto which, the herbs * Mithridation, Scordotis, and Centaury: also the seed of Betony drunk in honied wine or sweet cuit: the powder also of the dried herb it selfe, to the weight of one dram taken in 4 cyaths of old wine, doth expell out of the body & euacuat by the seege any poison whatsoever; but the patient must be forced to vomit vp the first potion, and then to recharge again & take another draught of the foresaid medicine. And verily it is a common speech, That whofoeuer vse to tast every day a little of Betony, shall neuer catch harm by any poisoned cup. If a man or woman chance to haue drunk down any poison, the root of Aristolochia is a present remedy, vsed in that order as I haue prescribed before in case of stinging by venomous serpents. The like effect hath the iuice of Cinquefoile.

E Semblably Agarick, if it be taken to the weight of one denier Roman in three cyaths of honied water or mead, is of the same operation; with this charge, That the party do lay vp his stomack or cast before. There is an herb called Calves-snout, in Greeke Antirrhinon or Anarrhinon, a kind of wild Lichnis like vnto Line or flax, with little or no root at all, carying a floure resembling the Hyacinth or Crowtoes, and the seed much like a calves snout or muzzle: the Magitians haue a great opinion of this herb, That whofoeuer be rubbed all ouer with it, or annointed thoroughly with the iuice thereof, shall looke more beautifull, louely, and amiable: and whofoeuer weareth it in a bracelet about the wrist or arme, shall take no harme by charme, forcerie, witchcraft, or poison. The like conceit they haue of another herb called * Euploea; and they affirme, That if any man or woman be annointed therewith, they shall grow in great credit and reputation with the people. Moreover, they say, that the herb Artemisia or Mugwort will preserve him.

all those who haue it about them, from witch-craft, forcerie, and poison, from danger by venomous beasts, yea and from the hurtfull and maligne aspect of the very Sun. The same, if it be taken in wine, helpeth and saueh those that are poisoned with Opium: being either drunke, or worn about the neck, or but tied to any part of the body, it hath a peculiar vertue against the venom of todes. There is an herb of the bulbous or onion-root kind named * Pericarpum; whereof the two sorts, the one hath a red bark or rind [about the roots], the other a black, and is like vnto the Poppy; of greater operation this is than the former, but both of them be very hot: which is the reason, they serue to good purpose for to be giuen vnto them that haue drunk Hemlock: against which venomous herb, Frankincense, and Panaces (especially that which they call Chironium) be counted singular: and this Panaces also last named, is an excellent antidote for them that are poisoned with venomous Mushrooms.

CHAP. XI.

Proper receipts and remedies for the diseases of the head.

Since wee are waded so far into the deep secrets of Physick, it will not be amisse to proceed forward and to set downe many good medicines for all the maladies incident either in generall to the whole body, or particularly to euery speciall part and member thereof, beginning first at the head.

There is an vnseemely accident happening otherwhiles to the head, and disgraceth it much, called * Alopecia, when as the haire vnnaturally falleth off. The cure of this inconuenience, is to make a liniment with the roots of Nymphaea and Hemlocke stamped together, and therewith to annoint the bald and naked places, for it will cause the haire to come vp againe & grow thick. Polytricha & Callitrica [both capillare herbs] differ one from another, for that Polytricha hath white benty filaments or threds, the leaues be also more in number & greater with all: besides, the very plant it selfe spreadeth and brancheth more than the other: this herb is singular to fasten the haire of the head at the root, and to make it bush and grow thick, being otherwise ready to shed. In like manner, there is an herb called in Latine * Lingulaca, which loueth to grow about Springs or fountains, & is singular for the same imperfection of shedding haire, if the root together with the leafe burnt and beaten to powder, be incorporate with the greafe of a blacke sow (but in any wise she must be a yong guilt that neuer farrowed or had pigs) and so brought into a liniment, and the head rubbed and annointed therewith: with this charge besides, That after the annointing, the Patient sit bare-headed in the sun; for that helps forward the cure verie much. And in the same case there is the like vse of the Cyclamine or Sowbread root.

Touching the scurfe or brannie scales called Dandruffe, the root of Veratrum or Ellebore, sodden either in oile or water, maketh a most excellent medicine to rid it away, & to cleanse the head thereof.

As for head-ache, the roots of all the kinds of Panaces, stamped and tempered with oile, doe cure the same: so doth Aristolochia and Iberis, if they be applied in manner of a frontall and bound to the forehead, the space of an houre or longer if the Patient can abide it, so that a bath be vsed presently vpon it. The yellow carot also called in Latine Daucum, is a good remedy for the pain in the head. Moreover, the foresaid herb or root Cyclaminos, if it be mixed with hony and put vp as an errhin or nasal into the nostrills, purgeth the brain, & the same brought into an ointment, healeth the scalls and sores in the head. Of the like operation is Veruain, which they call in Greek Peristereos. The wild Caraway, named Cacalia or Leontine, beareth certain grains resembling smal seed pearls, which a man shal see hanging between the leaues, which be big & large: and it groweth lightly vpon hills: take 15 of these grains or seeds, steep them well in oile, and make thereof a liniment, it is passing good to rub and annoint the head withall, so it be done vpward against the haire. Furthermore, the herb Callitriche, is singular good to prouoke sneezing: it beareth leaues much like vnto those of Lentils or Ducks meat: the stalks be very small like fine bents, and the root is as little: it delighteth to grow in coole, shady, and moist grounds, and is of a sharp and hot taft.

For the lowfie disease, wherein lice and such vermin cawle in exceeding abundance all ouer the head, there is not a better medicine than an ointment made of hyssope and oyle stamped and incorporat together: the same likewise killeth the itch in the head. Now the best hyssop is that

A that of Cilicia, growing vpon the mountaine Taurus: and in a second degree, there is reckoning made of that which commeth out of Pamphylia and Smyrna. An herb this is, nothing friendly to the stomach: being taken with figs, it purgeth downward, with hony, by vomit: howbeit, stamped with hony, salt, and cumin, and so reduced into a plaster, it is thought to be a proper remedy for the sting of serpents.

B Lonchitis is not the same herb (as most men haue thought) that Xiphion or Phasganion, although the seed be pointed like to a speare head, for it beareth leaues resembling lecke blades, which toward the root be red, and more in number than about the stem it selfe: it carrieth little heads in the top, made after the fashion of maskes or visors, such as players in Comedies are wont to weare, lilling out pretty little tongues, and the roots be exceeding long, & yet it groweth in drie grounds far from water. Contrariwise, * Xiphion or Phasganion delighteth in water-rich and moist places: at the first coming vp, it maketh a shew of a sword blade: the stem riseth vp to the heighth of two cubits: the root hath beards or fringes as it were hanging about it, and is in fashion shaped to a filberd nut: which ought to be digged out of the ground before harvest, and to be dried in the shade: the vpper part of this root (for it groweth double) stamped with Frankincense and mixed with wine of equal weight, and so made into a salve, draweth out the spils or broken scales in the brain-pan or skull: the same is good likewise to draw any impostume that is broken, and to fetch out corruption in any part of the body: and it is singular for the bones that be broken and crushed * vnder cart or waggon wheels: lastly, the same is an effectuell remedy against poisons.

C But to returne againe to the head-ache, the said Ellebore boiled either in common oile, or els in oile of rofat, and applied in manner of a liniment, doth assuage the same, so doth Peucedanum [i. Hare-strange] being incorporat in oile of roses and vineger. The same also being laied vnto the head warm, doth mitigate the pain called the migram, when as the one half of the head doth ache, and it cureth beside, the dizzinesse of the braine. The root of Peucedanum made into an ointment and vsed accordingly, prouoketh sweat, by reason of the hot nature that it hath, which is burning and causticke. The herb Fleawort, which some call Psyllion, others Cynoides, Chrystallion, Sicellion, and Cynomyia, hath a small root, whereof there is little or no vse in Physick. The branches that it bringeth forth, be slender and pliable in manner of vine shoots, bearing in the top certain big berries or knobs like vnto beans, the leaues not unlike to * dogs heads; the seed resemblen dogs fleas, whereupon it hath that name Cynomyia, and the same lieth within the foresaid berries. The herb it selfe is ordinarily growing in vineyards: of great vertue it is to refrigerat and to discusse or resolute withall: but the seed it is which yeeldeth most vse in Physicke, and the same is applied in a frontall to the forehead and temples, with vineger and oile of roses, or else with vineger and water together, for to allay the paine of the head. For other accidents, when it is applied in forme of a liniment, the manner is to take the measure of one acetab, and to infuse it in a sextar of water vntill it gather together into a thicke and clammy substance; then it would be stamped, and the mucilage or slime drawne out thereof serueth for any paine, impostume, and inflammation.ouer and besides, Aristolochia is a singular herb for the wounds of the head: it draweth forth broken bones and spils in any part of the head; and so doth Pistolochia. To conclude, there is an herb called * Thysselum, not vnlike to garden Parsley: the root whereof if it be but chewed in the mouth, purgeth the head of phlegmaticke humours.

CHAP. XII.

Receipts for the diseases of the eies, made of Centaurie, Celendine, Panaces, Henbane, and Euphorbium.

It is thought that the Rha-pontick (which is the greater Centaurie) helpeth the eie fight verie much, if a fomentation be made therewith and water together. The juice of the lesse Centaurie tempered with hony and applied, helpeth the imperfections of the eies; namely, when there seeme gnats to flie before them, or when they are ouer cast with a cloud; for it scattereth the dimnesse and web which darkeneth the sight, and doth subtiliate the catara & cicatrices that ouergrow the ball or apple. The herbe Sideritis is so appropriate vnto the eies, that it cureth the verie haw that groweth in horses eies. But so excellent is the herbe Celendine, that it passeth

* So called, because the fruit claspeth round about the stem or stalk of the herbe.

* Because foxe are much subiect vnto it, who are called in Greeke *procyones*.

* Adders tongue.

* Our Glades or Flags.

* Carpenit.

* Whereupon it is called Cynoides.

* Hydrofelyns, Dodonei, id est Water-parsley.

passeth them all, and is a soueraigne medicine for all such imperfections. The root of Panaces G mixed with parched or fried barley meale, maketh a good cataplasme for to repress the rheume of watery and weeping eyes. And there is a singular drink commended for the staying of such humors, made of Henbane seed one obulus, of Opium or the juice of Poppy and wine as much: Some put thereto the like quantity of the juice of Gentian, which also they vsed to mingle with collyries and eie-salues (that require some sharpnesse and acrimony) * in stead of the foresaid Opium or Poppy juice. Moreouer, Euphorbium clarifies the eie-sight, if there be an inunction made therewith. For bleered eyes, it is good to drop the juice of Plantain into them. As for the thick mists that hinder the eie-sight, Aristolochia doth discusse and resolueth them. The herb Iberis bound vnto the forehead, together with Cinquefoile, stoppeth the fall of humors into the eyes, and cureth all other maladies incident vnto them. Mullen or Lungwort is likewise a great defensatiue against the foresaid rheums which haue taken a course to the eyes, and cause them to water, so is Veruain, if it be applied with oile of rose or vinegar: For the cataraſt or suffusion of the eyes, for the pin and web which offend the eie-sight, the Troches of Cyclamine being dissolved and so applied, are soueraigne. As for the juice of Peucedanum, (i. Hare-strange) it is (as I said before) a notable medicine for to cleare the sight, and rid away the muddy mists before the eyes, if it be laid to with Opium and oile of rose. Finally, Flea-wort staieth and keepeth vp the flux of humors into the eyes, if the forehead be annointed with the mucilage thereof.

CHAP. XIII.

P Of Pimpernell, named Anagallis and Corchoros. Of Mandragoras or Circeium. Of Hemlocke, *Cressmarine* or *Sampire*, named in Greeke *Crithmos Agria*. Of the herbe *Molybdana*. Of *Fumiterre*. Of *Acorus* or *Galangale*. Of *Floure-de-lys*. Of *Coryledon* or *Venus navill*. Of *Sengreen*, and *Parcellane*. Of *Groandswell*. Of *Ephemeron*. Of the *Taxill*, and of *Crowfoot*: with the medicinal vertues of the said hearbes, appropriate to the diseases of the eyes, eares, nostrils, teeth and mouth.

The herbe Pimpernell, some call Anagallis, others Corchoros. Of it be found two kinds; the male with a red floure, the female with a blew: neither of them both be taller than the hand-bredth or a span at most: tender they be likewise in all parts: the leaues be very smal, round, and lying vpon the ground: they grow as well the one as the other in gardens and watery places: that with the blew floure bloweth first: the juice of them both tempered with hony, dispatcheth the mist and dimnesse of the eyes, consumeth the rednesse occasioned by a stripe or bruise, and taketh away the red spots in the white of the eie; and so much the sooner, if the hony be of the best, and made about Athens, wherewith the eyes be annointed. The said medicine likewise is good for to extend and dilate the tunicles that make the ball or apple of the eie: and therefore it is an ordinary course that their eyes be annointed therewith beforehand, who are to be pricked with a needle for couching of a cataraſt. These herbs be singular good likewise for the haw in horses or beasts eyes. The iuice of Pimpernell conueyed vp into the nostrils, cleanseth the braine by the emunctory of the nose, so that afterwards the Patient do draw vp wine into the nostrils, for a collution to wash them. A dram of the said iuice drunk in wine, is a counterpoison against the venom of snakes. But this is strange, and I cannot chuse but maruell of it, that sheep should so much hate and abhor the female Pimpernell as they do: howbeit, in case they should mistake the one for the other because they are so like (for in floure only they differ) and tast the Pimpernell with the blew floure, presently they haue recourse (by a natural instinct) to an herbe for remedy called in Greeke *Asyla*, and by vs in Latine *Ferus oculus* [i. the wild and cruell eie, or *Margellane*.] Some there be, who set down certain ceremonies and circumstances to be obserued by them who are to dig or plucke vp this hearbe; namely, That they goe to this businesse before the Sun-rising, and salute or bid good morrow to it three times, before they speak any other word that morning; and then to take it vp and cast it on high: which don, to presse forth the iuice of it. Thus ordered forfooth, they say it is of better operation, and will do the deed surely.

Touching Euphorbium, what it is I haue sufficiently spoken. The iuice thereof is singular for bleered eyes, especially if they be swelled withall: likewise wormwood stamped and incorporat with hony: as also the powder of Betony. There groweth many times a fistulous vicer betwene

A twene the corner of the eie and the nose, called *Ægilops*, for to heale which sore, there is a soueraigne herbe of that * name growing among Barly: in blade or leafe it resembleth that of wheat: the seed or graine whereof, beaten into powder and mixed with meale or floure, or the juice drawne out of the herbe, they vse for the said purpose to applie vnto the affected place in manner of a salve or liniment. Now the said juice must be pressed out of the stalke and leaues thereof, whiles they be fresh and fullest of sap: but then the haw or care that it beareth, ought to be taken away, which being incorporat with the floure of three moneths corn, is made vp into bals or troches. Some were wont in this cure to vse the juice also of Mandragoras, but they gaue it ouer afterwards. Howbeit, for certain, the root of Mandragoras bruised or stamped, and tempered with the oile of roses and wine, cureth weeping and watering eyes; yea, and assuageth their pain: & the said juice, how soeuer it be rejected in the former case, goeth into many collyries or eye-salues.

This herbe Mandragoras, some writers call *Circeium*; and two kinds there be of it: the white which is supposed the male; and the black, which you must take for the female: the leaues of this female resemble those of the * *Leſtuce*, but that they be narrower: hairy also they are, and al of an * equall bignesse. Two or three roots it hath, and those of a reddish or russet colour without, but white within: of a fleshy substance and tender, running downe into the earth almost a cubit in length. A certain fruit or apple they beare, of the bignesse of Filberds or Hazel-nuts, within which there be seeds like vnto the pippens or Pears. The white Mandrage some name *Arsen*, (i) the male; others * *Morion*: and there be again who call it *Hypophlomos*. The white leaues of this Mandrage be broader than the other, and indeed equall to the garden Docke or Patience:

C In the digging vp of the root of Mandrage, there are some ceremonies obserued: first they that goe about this worke, looke especially to this, that the wind be not in their face, but blow vpon their backs: then with the point of a sword they draw three circles round about the plant: which don, they dig it vp afterwards with their face into the West. There is a juice pressed forth both of the fruit, and also of the leaues shred and minced: of the * stem likewise being first headed or the top cut off; and also of the root, which sometime they do pounce and prick for to let out the liquor, otherwhiles they boile it: and the root so prepared, is as good as the juice. The same also being cut into certain thin rundles they vse to * preferue in wine. Howbeit, Mandrage is not found alwaies and euery where full of iuice: but in what place soeuer such may bee gotten, the right season to seek for it is about vintage time: the sent therof is strong, but the root and fruit do smell the stronger. The apples of the white, when they be ripe, the maner is rodry in the shadow, but the juice drawn out of them, is permitted to stand in the Sun for to gather and harden.

D In like sort, the juice of the root whether it be bruised and stamped, or foddren in grosse red wine to the consumption of a third part. The leaues moreouer of Mandrage are commonly kept and condite in a kind of pickle or salt brine: for otherwise the juice of them whiles they be fresh and green, is pestiferous and a very poison. And yet order them sowl as you can, hurtfull they be euery way: the only smell of them stuffeth the head, and breedeth the murre and the poſe. Howbeit, in some countries they venture to eat the apples or fruit thereof; but those that know not how to dresse and order them aright, loſe the vse of their tongue thereby, and proue dumbe for the time, surprisid and ouertaken with the exceeding strong sauer that they haue. And verily if they be so bold as to take a great quantity therof in drinke, they are sure to die for it. Yet it may be vsed safely enough for to procure sleep, if there be a good regard had in the dose, that it be answerable in proportion to the strength and complexion of the patient; one cyath thereof is thought to be a moderat and sufficient draught. Also it is an ordinary thing to drink it against the poison of serpents: likewise before the cutting or cauterizing, pricking or launcing of any member, to take away the fence and feeling of such extreme cures. And sufficient it is in some bodies to cast them into a sleep with the smel of Mandrage, against the time of such Chirurgery. There be that drink it in lieu of Elletore, for to purge the body of melancholick humors, taking two oboles therof in honied wine. Howbeit, Elletore is stronger in operation for to euacuat black choler out of the body, and to prouoke vomit.

E As touching Hemlock, it is also a ranke poison, witnesseth the publicke ordinance and law of the Athenians, wherby malefactors, who haue deserued to die, were forced to drink that odious potion of Hemlock. Howbeit, many good vertues hath this herb, and would not be rejected and cast aside for the sundry vses therof in Physicke. The seed is euery way hurtfull and venomous.

As

them vp han-
ding by little
threads drawne
through them.

As for the stems and stalks, many there be that do eat it both green & also boiled or stewed between two platters. Light these stems be as kexes, and full of joints like Reeds and Canes: of a darke gray or fullen colour, rising vp many times about two cubits high: and toward the top they spread and branch. The leaues in some sort resemble Coriander, but that they be more tender, and a strong stinking smell they haue with them. The seed is thicker and grosser than that of the Annise. The root likewise hollow, and of no vse in Physicke. The leaues and seed are exceeding refrigeratiue: which if they haue gotten the mastery and vpper hand of any that hath taken them, so as there is no way but one without help, they shal feele themselves begin to wax cold in their extreame or outward parts, & so to die inwardly: howbeit there is a remedy euen then, before the cold haue taken to the vital parts: namely to take a good draught of wine, which may set the body in a heat, and chaufe it again: may if they drinke it with wine, there are no meanes in the world to saue their liues. There is a iuice pressed out of the leaues and floures both together, for that is the right reason, namely whiles it is in flour: the which is pressed out of that seed stamped, being afterwards dried in the Sun and made into bals or trosches, kills them that take it inwardly, by congealing & cluttering their bloud; for this is a second venomous and deadly quality that it hath: which is the cause, that whosoever die by this means, there appear certain spots or specks in their bodies after they be dead. And yet there is a vse of this iuice, to dissolue hot and biting medicines therein in stead of water: moreover, there is made of it a very conuenient cataplasme to be applied vnto the stomack, for to coole the extreame heat thereof. But the principal vertue that it hath, is to repress and stay the flux of hot humors into the eies* in summer time, and to assuage their pains if they be annoyed therewith. It entrench besides into collyries or medicines deuised to ease pain: and verily there is no rheumatick flux in any part of the body but it stoppeth it. The leaues also of Hemlocke doe keepe downe all tumors, appease paines, and cure watering eies. *Anaxilans* mine Author saith, That if a pure maiden doe in her virginity annoynt her breasts with this iuice, her dugs will neuer grow afterwards, but continue still in the same state. True it is indeed, that beeing kept vnto the paps of women in child-bed, it drieth vp their milk: as also extinguieth naturall seed, if the cods and share be annoynted therewith. What remedies they should vse to saue themselves who are adiudged by law to drink it, I for my part purpose not to set down. The strongest Hemlocke and of speediest operation is that which groweth about Sufa in the confines of Parthia. Next to it for fearful working, is that which cometh out of Laconica, Candy, and Natolia. In Greece the Hemlocke of Megara is counted the quickest, and then that of Attica.

Crestmarine or Sampier, called the wild Crethmos, riddeth the eies of the gummy & viscous water that sticketh in them, if it be applied thereto: and if it be made into a cataplasme with fried Barly meale, it assuageth also their swelling.

There groweth commonly an herbe named in Greeke Molybdana, that is to say in Latine, Plumbago, euen vpon euery corne land; in leafe resembling the Dock or Sorrell, with a thicke root, and the same rough and prickly. Let one chew this herb first in his mouth, & then estfoons lick with his tongue the eie, it consumeth and taketh away the * Plumbum, which is a kinde of disease or infirmity incident to the eies.

As touching the first * Capnos, which in Latine is commonly called Pedes Gallinarii, i. hens feet: it groweth about decayed wals and ruinated buildings, among rubbish, & in hedges: the branches be very smal, & spread loosely or scattering, the floure of a purple colour, the leaues green, the iuice wherof discusseth the dimnesse and thickenesse about the eies, and clarifieth the sight: and therefore it is vsually put into eie-salues. There is another herb of the same * name, & like in effect, but different in form from it, which doth branch thicke, and is of a tender substance: the leaues for shape resembling Coriander, and those of a wan or ashie colour, but it beareth a purple floure: it groweth in Gardens, Hort-yards, and Barly-lands. If the eies be therewith annoynted, it cleanseth and cleareth them: but it causeth them to weepe and water, like as smoke doth, whereupon it tooke the name Capnos in Greeke. If the haire of the eie-lids be once pulled forth, and then the edges or brims be annoynted therewith, it will keep them for euer coming vp againe.

* Acoros hath leaues like to the Flour-de-lis, but that they be only narrower, & growing to a longer stele or taile: the roots be black & not so full of veins nor grained, otherwise they agree well with the Ireos root, hot & biting at the tongues end. To smel vnto they are not vnpleasant: and

A and being taken inwardly, they do gently moue rising, and cause the stomack to breake winde vpward. The best Acoros roots be those which come from Pontus: then they of Galatia: and in a third rank are they to be set which are brought out of Candy. Howbeit, the principall and the greatest plenty are those esteemed which grow in the region Colchis neere to the riuer Phasis: and generally in what country soeuer, they that come vp in watery grounds be chiefe: the fresher that the roots be and more newly drawn, the stronger sent and lesse pleasant taste they haue with them, than after they haue bin long kept about ground. Those of Candy be whiter than the other of Pontus. They vse to cut them into gobbets as big as a mans finger, and then hang them within bags or pouches of leather a drying in the shade. I find in certain writers, that the root of Oxymyrine is called Acaros, and therefore some (alluding to the name of Acoros) chuse rather to call this plant Acaron the wild. Well, the root of Acoros is of great operation and effect to heat and extenuate: and therefore the iuice thereof taken in drinke, is singular against catarracts or any accidents of the eies that cause dimnesse. Soueraigne likewise it is taken to be against the venome of serpents.

Cotyledon, named in Latine Vmbilicus Veneris, is a pretty little herb, hauing a tender and a smal stem, a leafe thick & fatty, growing hollow, like to the concavity wherein the huckle-bone turneth, and therupon it took the foresaid name in Greeke. It groweth by the sea side and in rocky or stony grounds: of a liuely green colour, and the root round, much like to an Oliue. The iuice is thought to cure the eies. Another kind there is of Cotyledon, with grosse and * fattie leaues likewise, but broader than the former. Toward the root they grow thicker, which they seem to compass and inclose, as it were an eie. A most harsh & vnpleasant tast it hath: the stem is high, but very slender. This herb hath the same properties which the Flour-de-lis.

Of Sengreen or Houfleeke, which the Greeks call Aizoon, there be two kinds. The greater is ordinarily planted in earthen pans or vessels set out before the windows of houses: which some name Buphthalmos, others Zoophthalmos, and Stergethron, because it is thought so good in loue drinks or amorous medicines: others againe giue it the name Hypogeson, for that it is seen to grow vnder the eaves of houses. There are also who loue to term it Ambrosia & Amerimnos. Here in Italy they call it Sedum the greater, Oculus also, and Digitellus. For the second kinde is somewhat lesse, which the Grecians distinguish by the name * Erithales or Trithales (because it beareth floures thrice in the yeare;) others Chrysothales; and some againe, Isoetes. But both the one and the other they call Aizoon, because they be alwaies fresh and green: according to which name in Greeke, some giue it the Latine name Sempervivum. The greater kind beareth a stem a cubit high and more, and the same of the thickenesse of a mans thumb, with the better. The leaues in the head or top whereof, be like vnto a tongue, fleshy and fat, full of iuice, a good inch broad, some bending downe and coping toward the earth, others standing vpright, but so, as if a man mark their round circle or compass wherein they lie couched, he shal obserue the very proportion of an eie. The lesse Sengreen or Iubarb groweth vpon wals, and specially such as be ruinated and broken down: likewise vpon the tiles of house-roofs. This herb is tufted with leaues from the very root euen to the top of the branches. The leaues be narrow and sharp pointed, and full of iuice. The stalk groweth a good hand-breadth or span high. The root is not medicinable nor of any vse.

Much like to this is that herb which the Greeks call Andrachne Agria, i. wilde Purcellane; the Italians, Illecebra. The leaues be but small to speake of, howbeit broader than those of the herb before named, and shorter toward the top. It groweth vpon rocks and stony places: & folke vse to gather it for to eat. All these last rehearsed haue the same operation, for they be exceeding cold and astringent withall. Good they be to stay the rheum that falleth into the eies and causeth them to water, whether the leaues be applied to them, or the iuice in manner of a liniment: moreover, they cleanse and mundifie the vlcers of the eies, they do also incarnate, heale, and skin them vp: singular good besides to loose and open the eie-lids, when they are glued and closed vp with viscous gum. The same do allay the head-ache, if either the temples be annoynted with the iuice therof, or the leaues be applied to them. Moreover, they mortifie or kil the poyson inflicted by the prick of the venomous spiders Phalangia: but the greater Sengreen hath this peculiar vertue, to resist the deadly poison of the herb Aconitum. Furthermore it is sayd, that whosoever carry it about them, shal not be stung by scorpions.

All the kinds of them are proper remedies for the pain in the ears. Like as the iuice of Henbane

* Epiphora
afflictus, for
ther affluens,
hot rheumes.

* Some take it
for a Cararact.
* This Fuchus
thinketh to be
Pistochia or
out Aristolo-
chia the roun-
der.
* It seemes to
be our Fumi-
tory, called in
Greeke Capnos.

* Cataplasma.

* Almagre, out
of Dioscor, not
juncus, as
Pliny seemeth
to read, when
he translated
it (Sordidus).

* Which some
take to be
Pick madame
of the French
Trigue-ma-
dame.

* scilla.

bane also, if it be applied moderately, of Achillea and the best Centaury, of Plantaine and Har-
strang, together with oile of rose and Opium: finally, the iuice of Acorns or Galangale vsed with
Roses, is much commended in that case. But this would be noted, that the manner of preparing
of all these iuices, is to heat them first, & then to conuey or infuse them into the ear by a * pipe
for the purpose [called an Orenchyte.] Semblably, the herb Vmbilicus Veneris or Coryledon
is much commended for mundifying the ears, when they run with filthy matter especially, if it
be tempered with deere sewer, and namely of a Stag or Hind, and so instilled hot. The iuice of
the Walwort root clarified and strained through a fine linnen cloth, and soon after dried & har-
dened in the Sun, healeth the swelling impostumations vnder the ears, if as need requireth, it be
dissolued in oile of Roses, and so applied hot. The like effect in that case hath Veruain & Plan-
tain; Sideritis also being incorporat in old Hogs greafe.

After the same manner Aristolochia together with Cyperus, healeth the stinking and ilfauo-
red vlcere of the nose, called Noli-me-tangere.

The root of Panaces, especially that which is called Chironia, if it be chewed in the mouth,
assuageth the tooth-ache: so dothe the iuice thereof, if there be a collution made therewith. The
root of Henbane hath the like vertue, if one chew it with vinegar, as also of Polemonia or sauge
de bois: for which purpose it is passing good to chew the Plantain root, or to wash the mouth
and teeth with the iuice or decoction thereof boiled in vinegar. And the very leaues of Plan-
tain be singular for the pain of the teeth; yea, though the gums were putrified with rank & cor-
rupt blood, or in case there owld or issued out of them filthy bloody matter. And the seed of
Plantain cureth the impostumations of the gums, albeit they gathered to suppuration and ran-
matter. Moreouer, Aristolochia doth knit and consolidat the gums; yea, and fasteneth the teeth
in the head. For these infirmities of gums and teeth, the root of Veruain is highly commended
if it be chewed: or if it be boiled in wine or vinegar, and the mouth washed with that decoction.
The roots of Cinque-foile sodden likewise either in wine or vinegar to the consumption of a
third part, worke the same effect. But looke that before you boile them, they be wel rinced and
washed either in sea water or salt water at the least: and when you vse this collution, see you hold
the liquor or decoction in your mouth a long time. But some there be who thinke it better to
rub the teeth with the ashes of Cinquefoile burnt, leaues, root, and all. Moreouer, the root of
Mullen or Taperwort sodden in wine, maketh a singular collution for the teeth. Likewise if the
teeth be washed with the decoction of Hyssop or the iuice of Harstrang, together with Opium
or Poppie iuice, much good and ease will insue thereupon. As also by the iuice of a Pimpernell
root: and the rather of that which is counted the female, if the same be conueighed vp into the
nostril of the contrary side to the tooth that aketh. There is an herb called Groundswel, which
the Greekes name Erigeron, and we the Latines Senecio: they say if a man make a circle round
about it with some instrument of yron, and then dig it out of the ground, and therewith touch
the tooth that is pained, three feuerall times, and between euery touching spit vpon the ground,
and then bestow the said herb, root and all, in the very same place where he drew it, so as it may
liue and grow again, the said tooth shall neuer ake afterwards.

This Groundswell is an hearbe much like in shape vnto Germander, as soft also and tender
as it, the small stalkes or branches whereof incline to a reddish colour: and it loueth to
grow vpon tiled houses or VValles. The Greekes imposed that name Erigeron, because
in the Spring it looketh hoarie, like an old gray beard: in the top it diuiderth it selfe in-
to a number of heads, betwene which there commeth forth a light plume, much like vnto
Thistle downe: VVhich is the reason that *Callimachus* calleth it *Acanthus*; and others,
Pappos. But in the farther Description of this Hearbe, it seemeth that the Greekes agreed
not: for some haue sayd that it is leaved like to Rocket; others to an Oke, but that they bee
much lesse. There bee VVriters also who hold the root to bee good for nothing in Physicke:
and there bee againe that commend it to bee singular for the finewes: besides, some others
are of opinion, That it strangleth and choaketh as many as drinke it. Contrariwise, certaine
Physicians prescribe it for the laundise to bee taken in Wine: for all the diseases likewise of
the bladder, and against the infirmities of the Heart and Liuer. And they assure vs, That
it scoureth the Reines or Kidneies of all grauell. In case of the Sciatica they haue ordai-
ned it to bee drunke to the weight of a dramme with Oxymell, presently after some exercise
by walking: giuing out, that there is not a better thing in the World for the gripes and trot-
ments

A ments of the guts, if it be taken in sweet wine cuit: esteeming it a singular herbe for the griefe
of the midriffe and precordiall parts about the heart, if it be eaten with meat in a sallad with
vineger: and in regard of these manifold commodities, they sow and nourish it in their gardens
for to be alwaies ready at hand. And some authours I find who haue made a second kind there-
of: but they haue not described what manner of herbe it is, only they appoint it to be giuen in
water against the sting of serpents, and to be eaten for the falling sicknesse. For mine own part, I
will set downe the vse thereof in some cases, according as I haue found it by experience to work
in the practise here at Rome. The plume or downe which it beareth, if it be stamped and redu-
ced into a liniment with Saffron and a few drops of cold water, and so applied, cureth the inof-
dinat flux of waterish humors into the eies. The same dried and parched against the fire, or o-
therwise fried with some cornes of salt, and laid to the swelling wens called the Kings euill, hea-
leth them.

The May-Lillie (called in Greeke Ephemeron) is leaved like vnto the Lillie, but that the
leaues be lesse: the stem is semblable and equall vnto it, vpon which it beareth a * blew floure.
The seed which it carrieth is nothing medicinable. One single root it hath of a finger thicke-
nesse, which is soueraigne for the teeth, if it be cut and minced small, and afterwards sodden in
vineger for a collution to wash the teeth with it warme. The very substance also of the root is
singular good to confirme the teeth standing loose in the head: and to be put into those that
be hollow and worne eaten. Moreouer, the root of Celendine is good for the teeth, if it be brui-
sed or stamped, and so with vineger held in the mouth. If teeth be rotten and corrupt, the black

C Ellebore is singular to be put into their concavities. And both of them (as well the blacke as
the white) serue in a collution to strengthen and keep them fast in their sockets, if they be boy-
led in vineger. As touching the Tazill (which is called in Latine Labrum Veneris) it grows in
riuers and * waters: within the heads or burs which it beareth, there is found a little worne or
grub, which for the tooth-ache they vse to binde about the teeth, or to put it in their holes and
close them vp with wax. But when that herbe is pulled out of the ground, great heed must be
taken that it touch not the earth. The herbe Crowfoot is called in Latine Ranunculus, in Greeke
Barrachion; whereof be foure kinds: The first beareth leaues like vnto Coriander, but that
they be fatter, and as broad as those of the Mallow, of a swert colour: the stalke is whitish or
gristed and slender, the root also white: it groweth ordinarily along great rode waies, especial-
ly in cold, shadowie, & moist places. The second is better furnished with leaues, and those more
cut and indented than the former, and riseth vp with greater and higher stalks. The third is the
least, hauing a strong sent, and bearing a yellow floure like vnto gold. The fourth is like to this,
and hath likewise a yellow floure. They be all of them of a causticke and burning qualitie. For
lay but the leaues raw and Greene (as they grow) vpon any place, they will raise blisters in the
skinne, as well as a light coale of fire: which is the reason, that they bee much vsed for lepro-
sies and foule scabs; also to take out any markes imprinted in the skinne, or vnseemely scarre.

In summe, it is one of the ingredients that go to the making of all potentiall cauterics or cau-
sticke medicines. VVhere the haire is gone, and the place bare and naked, they vse commonly to
aplie these hearbes for to recover the haire againe: but they must be soone remooued. For
tooth-ache also it is an ordinary thing to chew of their roots, but if one continue so long, it will
burst their teeth in pieces. The same being cut into roundles, and dried, and so beaten into
pouder, serueth to prouoke sneezing. Our Herbarists here in Italy call this hearbe *Strumæ*:
because it helpeth and cureth the wens named *Strumæ* or the Kings euill, and the flat biles or
pufes called *Pani*, if the same be hanged vp afterwards in the chimney to take smoke. For
this opinion they haue, and be verily perswaded, that if it be set again into the ground, the wens
and biles aforesaid which were healed, wil returne and be fore again. The like sorcery and witch-
craft they vse with Plantaine: but in truth, the iuice of Plantaine is singular good for the can-
kers or vlcers within the mouth: so are the leaues and roots, if they be only chewed, yea though
the patient or diseased person were troubled with the spitting theume; for they intercept all
those defluations, which take a course into the mouth. Cinque-foile is a very soueraigne herb
for the sores of the mouth, and for stinking breath. *Psyllium*, i. Fleawort, is good for the vlcers
thereof.

But since I haue named a stinking breath, which is a foule and nastie disease, putting man
or woman to shame, as no infirmity more; I will set downe one or two compound receipts for
that

* *Discozides*
(such white)* It contains
water indeed
within the
concavities or
armes-pi (as
it were) of the
leaues where
they ioine to
the stem, but
specially in riuers
it grows not.Latter *Discoz*
is white.

that imperfection. Take Myrtle & Lentisk leaues, of each a like weight, of the Gal-nuts grow-
ing in Syria, halfe as much in quantity, stamp them all together, and in the stamping, sprinckle
them with good old wine: giue the patient this composition in bole to chew and eat in the
morning, there is not the like medicine vnto it for a sweet breath. Also take Ivy berries, Cassia or
Canell, and Myrrhe, of each an equall weight, incorporat them with wine in manner aforesaid,
and vse this confection accordingly. For the sores that be incident to the nose, the feed of dra-
gons made into powder, and tempered with hony, is singular to be applied therunto, yea though
they were very cankers, and had eaten deep. Where the skin looketh blacke and blew, whether
it be vnder the eies, or otherwise in any part of the visage, a salue made of Hyssope applied ther-
to, restoreth it to the fresh and natue colour. To conclude, a liniment of Mandragoras taketh
out the markes or prints that be branded or seared in the face [if it be applied presently while
they be fresh.]

THE TWENTY SIXTH BOOKE OF THE HISTORIE OF NATURE,

WRITTEN BY C. PLINIUS
SECVNDVS.

The Proeme.

CHAP. I.

¶ Of medicines appropriate and respectiue to al other parts and members of the body. Of
certaine new maladies: and namely, of the ill fauored reter called Lichenes:
what kinde of infection it is, and when it first entred into Italy.
Of the blain or sore called the Carbuncle. Of the filthy
leprosie or wild scab named Elephantia-
sis. And of the Collicke.

Long is it not since the face and visage of men began to be annoied with certaine
new and strange diseases, vnknowne in our forefathers daies, and neuer heard of
before in Italy, nor almost in any part of Europe. And euen of late daies when
these maladies first set foot in these parts, they were not seene for to spread
throughout all Italy, ne yet to range greatly in Illyricum, France, or Spain, al-
though some little sprinckling there was in those countries: but about Rome
only and those quarters adioining, as they rained first, so they raged most. These new-come
diseases verily were nothing painfull to the Patients, nor dangerous any waies and deadly; but
so foule and filthy, so loathsome and ougly, that a man would haue chosen rather to die any
death, than to be so disfigured. But of them all, the worst and most detestable was that, which
by a Greeke name they called Lichenes, and in Latine (because ordinarily it began about the
chin) * Mentagra. A terme giuen vnto it (I assure you) at the first by way of yeast and in a meri-
ment (as commonly we see many are disposed to play and make good game at other mens mi-
series) but afterwards it went currant in euery mans mouth: and by no other name than Menta-
gra was it known, notwithstanding the disease possessed not the chin alon, but in many that had
it, took vp the whole visage, all saue the eies, yea, and ran downward to the neck & breast, spread-
ding also to the armes and the very hands: and in such sort was the skin of the poore wretches
be painted

* For Mentum
in Latine is a
chin.

he painted and beraied with foule scurfe and filthy scales, as it would haue pittied one at the
heart to see them. This contagious disease, our fathers and ancestors in times past neuer heard
of, nor knew what it meant: for the first time that it crept into Italy, was in the daies of *Tiberius
Claudius* late Emperor of Rome, euen about the middle of his raigne; and that was by the means
of a certain knight or gentleman of Rome borne at Perusum, who being secretary or clerke vnto
the Treasurer vnder the Romans in Asia, and giuing attendance according to his place, chan-
ced there to be infected, and so hee brought the disease ouer with him to Rome. But will you
heare the strange nature of this foule cuil? women were not subiect vnto it; no more were slaues,
base and poore commoners, no nor citizens of mean state and condition: the greatest gentlemen
and those of the nobility, it made choise of, and picked them from among the rest: very cat-
ching it was, and soone passed from one to another, especially by the mouth, and * by the means
of a kisse were it neuer so short: foule and ill-fauored enough was the disease it selfe, but the
fear, remaining after it was healed (for many there were who came vnder the Chirurgians hand
and indured the cure) looked a hundred times worse: and why? no way there was to rid it, but
by caustick medicines or potentiall cauteries; and vnlesse the flesh were eaten away to the very
bones, it was not possible to kill and root it out clean, but it would reuiue and spring again: and
verily there came Physitians and Chirurgions out of Egypt (a countrey apt to breed the like,
diseases and where they be common) such as professed only the skill in this kind of cure, who
filled their purses well, and mightily enriched them selues by their practise at Rome: for well
known it is, that *Manlius Cornutus* (late L. Pretor, and lieutenant general for the state in the
provinde of Guienne or Aquitaine in France) dealt with one of these Egyptian leeches for to be cu-
red of this disease, and agreed to pay him 200000 Sesterces for his paine. And thus much of
Mentagra.

Moreover, what a wonderfull thing is this obserued in these new kind of maladies, that many
times (contrary to the course of other sicknesses) they come together in troupes; that some of
them should all on a sudden light vpon a particular country; that they should take to one cer-
taine member of mans body; assaile those of such an age and no other, haue a spight to persons
of this or that quality, and spare the rest; as if they made choise, some to plague young chil-
dren, others elder folk; some to punish none but the rich and mighty, others to be doing with
the poore and needy? In our Annals or Chronicles we find vpon record, That while *Lucius Paulus*
and *Q. Marcius* were Censors of Rome, the pestilent carbuncle (a disease appropriat to Pro-
uance and Languedoc in France) came first into Italy. Of which maladie, there died within the
compasse of one yeare (about that very time when I compiled this worke and history of mine)
two noble men of Rome and late Consuls; to wit, *Julius Rufus* and *Q. Laccianus Bassus*: of which
two, the former was cut for it by the counsell of vnskillfull Physitians, and * by that means lost
his life. As for the other, hauing it vpon the thumb of his left hand, he chanced * to pricke it
himselfe with a needle; and although the wound was so small, that hardly it could be seene and
discerned, * yet it cost him his life. This carbuncle riseth ordinarily in the most hidden and se-
cret parts of the body, and for the most part vnder the tongue: it is hard and red in manner of the
swelling veines called in Latine Varices: and yet in the head it looketh blackish; the skin also
about it seemeth swert and dead: it stretcheth the skinne and the flesh in some sort stiffe, but
without any great swelling; no paine at all, no itching, no other symptome but sleepe, where-
with it so possesseth the Patients, that in three daies it will make an end of them. Otherwhiles
it causeth the party to fall into a quivering and shaking as it were for cold, and raiseth certaine
blisters or angry pimples round about it; and verie seldome causeth an Ague: but looke in
whom soeuer it taketh to the stomacke or throat, it quickly dispatcheth and maketh an end of
them.

As touching the white leprosie, called Elephantiasis (according as I haue before shewed) it
was not seen in Italie before the time of *Pompey* the Great. This disease also began for the most
part in the face, and namely it tooke the nose first, where it put forth a little specke or pimple
no bigger than a small Lentill; but soone after, as it spread farther and ran ouer the whole body,
a man should perceiue the skin to be painted and spotted with diuers and sundry colors, & the
same vneuen, bearing out higher in one place than another, thicke here, but thin there, and hard
every where; rough also, like as if a scurfe or scab ouerran it, vntill in the end it would grow to be
blackish, bearing downe the flesh flat to the bones, whiles the fingers of the hands, and toes of
the

the feet were puffed vp and swelled againe. A peculiar malady is this, and naturall to the Egyptians; but look when any of their kings fell into it, wo worth the subiects and poore people: for then were the tubs and bathing vessels wherein they sat in the bain, filled with mens blood for their cure. But surely this disease continued not long in Italy, before it was quite extinguished: like as another before it, and in old time * *Gemurfa*, which began between the toes: and so long agoe it is since any haue bin troubled therewith, that the very name also is forgotten and grown out of vse. Whereby the way, this is to be noted as a strange and wonderfull thing, That some of our diseases should haue an end and lose their course for euer; and others againe continue still: as for example, the cholique passion, which came among vs no longer agoe than in the daies of *Tiberius Caesar* the Emperor: and the first that euer felt it, was the prince himselfe; whereupon arose no small question throughout the whole city of Rome: for when as the said Emperour published a certain proclamation, wherein he excused himself for not comming abroad to manage the affaires of the State, because he was sick of the cholique; the Senat and people reading this strange name of an vknowne maladie, entred into a deep discourse with themselves, what to thinke and make of it? But what should we say of all these kinde of diseases? and what an anger and displeasure of the gods is this, thus to plague and punish vs? Was it not enough to haue sent amongst men into the world a certaine number of maladies otherwise, and those not so few as three hundred, but we must be in feare and danger still every day of new? and yet see! as many as there be of them coming by the hand of God, yet men thorow their owne excessse and disorders, bring as many more vpon themselves, and be causes still of farther troubles & miseries. Well, thus you see by that which I haue written in the former bookes, what was the old Physicke in times past; namely, consisting of the simples onely found in dame Natures garden, and how she alone at the first and for a long time, was our Physitian and furnished vs with remedies for all diseases.

CHAP. II.

¶ The praise of Hippocrates, and other Physitians meere Simplests.

Hippocrates verily had this honor aboue all men, That he was the first who wrote with most perspicuity of Physicke, and reduced the precepts and rules thereof into the bodie of an art: howbeit, in all his bookes wee find no other receipts, but herbes. Semblably, the writings of *Dioscles* the Carystian, were no lesse stored with the like medicines, and yet a famous Physitian he was, and both in time and reputation next and second to *Hippocrates*. *Praxagoras* also, and *Chrysippus*, yea and after them *Erasistratus* held on the same course. As for *Herophilus*, although he was the first that went more exquisitely to work and brought in a more subtil and fine method of Physick, yet none esteemed better of simples than hee. But surely, practise and experience (which as in all things else is found to be most effectually, so in the profession of Physick especially) began in his daies by little and little to slake, vntil in the end all their Physicke proued nothing but words and bibble babbles; for beleue me, his schollers and disciples thought it more for their ease and pleasure to sit close in the schooles and heare their discourses out of the chaire discourse of the points of Physicke, than to go a simpling into the deserts and Forrests to seeke and gather herbes at all seasons of the yere, some at one time, and some at another.

CHAP. III.

¶ Of the new practise in Physicke: of *Asclepiades* the Physitian: and what course he tooke to alter and abolish the old Physicke for to bring in the new.

What cunning means soeuer these new Physitians could deuise to ouerthrow the ancient manner of working by simples, yet it maintained still the remnants of the former credit, built surely vpon the vndoubted grounds of long experience; and so it continued till the daies of *Pompey* the Great, at what time *Asclepiades* a great Oratour and professor of Rhetoricke went in hand to peruert and reiect the same: for seeing that he gained not by the said Art sufficiently, & was not like to arise by pleading causes at the bar, to that wealth which

A he desired (as he was a man otherwise of a prompt wit and quick spirit) he resolved to giue ouer the law, and suddenly applied himselfe to a new course of Physick. This man hauing no skill at all, and as little practice, considering he neither was well studied in the Theoricke part of this science, nor furnished with knowledge of remedies which required continuall inspection & vse of simples, wrought so with his smooth and flowing tongue, and by his daily premeditated orations gained so much, that he withdrew mens mindes from the opinion they had of former practise, and ouerthrew all. In which discourses of his, reducing all Physick to the first and primitive causes, he made it a meere coniectural Art; bearing men in hand, that there were but five principall remedies which serued indifferently for all diseases, to wit, in Diet, Abstinence in meat, Forbearing wine otherwhiles, Rubbing of the body, Walking, and the * Exercise of gestations. In sum, so far he preuailed with his eloquent speech, that euery man was willing to giue care & applause to his words: for being ready enough to beleue those things for true, which were most easie; and seeing withall, that whatsoeuer he commended to them, was in each mans power to perform, he had the general voice of them: so as by this new doctrine of his, he drew all the world into a singular admiration of him, as of a man sent & descended from heauen aboue, to cure their griefs and maladies. Moreouer, a wonderfull dexterity and artificiall grace he had to follow mens humors, and content their appetites, in promising and allowing the sick to drink wine, in giuing them effsoons cold water when he saw his time, and all to gratifie his patients. Now for that *Herophilus* before him had the honor of being the first Physitian who searched into the causes of maladies: and because *Cleophantus* had the name among the Antients, for bringing wine into request and setting out the vertues thereof: this man for his part also, desirous to grow into credit & reputation by some new inuention of his own, brought vp first the allowing of cold water before said, to sick persons; & (as *M. Varro* doth report) took pleasure to be called the Cold-water Physitian. He had besides other pretty deuises to flatter & please his patients, one while causing them to haue hanging litters or beds like cradles, by the mouing & rocking whereof too and fro, he might either bring them asleep, or ease the pains of their sicknes; otherwhiles ordaining the vse of baines, a thing that he knew folk were most desirous of: besides many other fine conceits very plausible in hearing, and agreeable to mans nature. And to the end that no man might think this so great alteration and change in the practise of Physick, to haue bin a blind course and a matter of smal consequence, one thing aboue the rest that wooon himselfe a great fame, and gaue no lesse credit and authority to his profession, was this, that meeting vpon a time by chance with one he knew not, carried forth as a dead corse in a biere for to be burned, he caused the body to be carried home from the funerall fire, and restored the man to health again. Certes, this one thing, wee that are Romanes may be well ashamed of and take in great indignation, That such an old fellow as he, comming out of Greece (the vaine nation vnder the sun) & beginning as he did of nothing, should only (for to enrich himself) lead the whole world in a string, and on a sudden set down rules and orders for the health of mankind, notwithstanding many that came after him, repealed as it were, and annulled those lawes of his. And verily, many helps had *Asclepiades*, which much fauored his opinion and new Physick; namely, the manner of curing diseases in those daies, which was exceeding rude, troublesome, & painful; such adoe there was in lapping and couering the sicke with a deale of cloaths, and causing them to sweat by all meanes possible: such a worke they made sometime in chafing and frying their bodies against a good fire, but euery foot in bringing them abroad into the hot Sunne, which hardly could be found within a shade and close citie as Rome was. In lieu whereof, not onely there, but throughout all Italy (which now commanded the whole World, and might haue what it list) hee followed mens humours in approouing the artificiall baines and vaulted stoues and hot houses, which then were newly come vp and vied excessiuely in euery place by his approbation. Moreover, he found means to alter the painefull curing of some maladies, and namely of the Squinancie; in the healing whereof, other Physitians before him went to worke with a certain instrument which they thrust down into the throat. He condemned also (& wrought) that dog-physick which was in those daies so ordinary, that if one ailed neuer so little, by and by he must cast and vomit. He blamed also the vse of purgatiue potions, as contrary and offensive to the stomack, wherein he had great reason and truth on his side: for to speake truly, such drinks are by most Physitians forbidden, considering our chiefe care and drift is in all the course of our physick, to vse those means which be comfortable and wholsome for the stomack.

* Some thinke it was an inflammation resembling our Carbuncle or Anthrax.

* Riding on horsebacke, carrying in coach, litter, barge, &c.

¶ The foolish superstition of Art-Magicke, which here is derided. Of the tetter called Lichen: remedies proper for it, and the diseases of the throat.

ABoue all other things, the superstitious vanities of Magicians made much to the establishing of *Aesclepiades* his new Physicke; for they in the height of their vanity, attributed strange and incredible operations to some simples, that it was enough to discredit the vertues of them all. First, they vaunted much of *Aethyopus*, an hearbe which (by their saying) if it were but cast into any great riuer or poole, it would draw the same dry; and was of power (by touching onely) to open lockes, or vnbolt any dore whatsoever. Of *Achoemenis* also another herb, they made this boast. That beeing throwne against an armie of enemies ranged in battell array, it would driue the troups and squadrons into feare, disorder their ranks, and put them to flight. Semblably, they gaue out and said, That when the king of Persia dispatched his Embassadors to any forein states and Princes, he was wont to giue them an herb called *Latace*, which so long as they had about them (come where they would) they should want nothing, but have plenty of all that they desired: besides a number of such fooleries wherewith their bookes were peppered. But where, I beseech you, were these herbs when the *Cimbrians* and *Teutons* were defeated in a most cruell and terrible battell, so as they cried and yelled again? What became of these Magicians and their powerfull herbs, when *Lucullus* with a small army consisting of some few legions, ouerthrew and vanquished their owne kings? If herbs were so mighty, what is the reason (I pray you) that our *Romane* capitaines provided euermore about all things: how to be furnished with victuals for their camp, and to haue all the waies and passages open for their purueours? In the expedition of *Pharsalia*, how came it to passe that the souldiers were at the point to be famished for want of victuals, if *Caesar* by the happy hauing of one hearbe in his campe, might haue enjoined the abundance of all things? Had it not bin better think ye, for *Scipio Africanus* to haue caused the gates of Carthage to flie open with the help of one herbe, than to lie to many yerres as he did in leaguer before the city, & with his engins & ordinance to shake their walls, & batter their gates. Were there such vertue in *Ethiopus* aforesaid, why dowe not at this day dry vp the *Pontine* lakes, and recouer so much good ground vnto the territory about *Rome*? Moreover, if that composition which *Democritus* hath set downe and his bookes maketh prayse of to be so effectual, as to procure men to haue faire, veruious, and fortunat children, how happeneth it that the kings of Persia themselves could neuer attaine to that felicity? And verily wee might maruell well enough at the credulity of our Ancestors in doing so much vpon these inuentions (howsoeuer at the first they were deuised and brought in, to right good purpose) in case the mind and wit of man knew how to stay and keepe a meane in any thing els besides; or if I could not proue (as I suppose to doe in due place) that euen this new leech craft brought in by *Aesclepiades* which checketh those vanities, is growne to farther abuses and absurdities than are broched by the very Magicians themselves. But this hath beene alwaies and euer will bee, the nature of mans mind, To exceed in the end and go beyond all measure in euery thing which at the beginning arose vpon good respects and necessary occasions.

But to leaue this discourse: let vs proceed to the effects and properties remaining behind of those herbs which were described in the former booke; with a supplement also and addition of some others, as by occasion shall be offered and presented vnto vs. Howbeit, to begin first with the remedie of the said Tettars (so foule and vnseemly diseases) I mean to gather a heape of as many medicines as I know appropriat for that malady, notwithstanding I haue shewed already of that kind, not a few. Well then, in this case, *Plantaine* stamped is very commendable: so is *Cinquefoile* and the root of the white *Daffodill*, punned and applied with vineger. The young shoots or tender branches of the fig-tree boiled in vineger: likewise the root of the * *Marsh-Mallow* sodden with glew in a strong and sharpe vineger to the consumption of a fourth part. Moreover, it is singular good to rub tettars thoroughly with a pumish stone first, to the end that the root of *Sorrell* stamped and reduced into a liniment with vineger, might be applied afterwards therupon with better successe; as also the floure of * *Miseto* tempred & incorporat with quick-lime: the decoction likewise of *Tithymale* together with rosin, is much praised for this cure: but the herb *Liuierwort* excelleth all the rest, which therupon tooke the name *Lichen*: it

groweth

* *Hibiscus* some
ta. for the
Hollyhoke.

* *miseto*, some
read *hibiscus*.

A groweth vpon stony grounds, with broad leaues beneath about the root, hauing one stalke and the same small, at which there hang downe long leaues: and surely this is a proper herb also to wipe away all marks and cicatrices in the skin, if it be bruised and laid vpon them with hony. Another kind of * *Lichen* or *Liuierwort* there is, cleauing wholly fast vpon rocks and stones in manner of mosse, which also is singular for those tettars, being reduced into a liniment. This herb likewise stancheth the flux of bloud in green wounds, if the iuice be dropped into them: and in a liniment, it serueth well to be applied vnto apostumat places: the jaundise it healeth, in case the mouth and tongue be rubbed and annointed with it and hony together: but in this cure the Patients must haue in charge, To bathe in salt water, to anoint themselves with oile of almonds, and in any case to abstain from all salads and pothearbs of the garden. For to heale tettars, the root of *Thapsia* stamped with hony is much vsed.

B As for the Squintie, * *Argemonia* is a soueraigne remedy if it be drunk in wine: *Hyssop* also boiled in wine and so gargarized: likewise *Harstrang* with the renner of a Seale or Sea-calf, taken both of them in equall portion: moreover, Knot-grasse stamped with the pickle made of Cackrebs and oile, and so gargled, or els but held only vnder the tongue: Semblably, the iuice of *Cinquefoile*, being taken in drink to the quantity of three cyaths: this iuice besides, in a gargarisme, cureth all other infirmities of the throat. And to conclude with *Mullen*; if it be drunk in water, it hath a speciall vertue to cure the inflammation of the amygdals or almond kernels of the throat.

CHAP. V.

¶ Receipts for the scrophules or wens called the Kings euill: for the paines and griefes of the fingers: for the diseases of the breast, and namely for the Cough.

Plantaine is a soueraigne herb to cure the Kings euill: also *Celendine* applied with honey and hogs lard: so is *Cinquefoile*. The root of the great Clot-bur serueth for the same purpose, if it be incorporat with hogs grease, so that the place after it is annointed therewith, be couered with a leafe of the said Bur laid fast vpon it: in like manner *Artemisia* or *Mugwort*: also a *Mandrage* root applied with water, is good for that purpose. The broad leaved *Sideritis* or *Stone-sauge*, being digged round about with a spike of yron and taken vp with the left hand, and so applied vnto the place, cureth the kings euill; provided alwaies, that the Patients when they be healed, keep the same herbe still by them, for feare least it being replanted againe by these Herbarists (such is the malicious sorcerie of some of them as I haue already shewed) the malady retorne and be as bad as it was before: the like caueat I find giuen vnto them, who are cured of this disease either by *Mugwort* or *Plantaine*. The herb *Damasonium*, called likewise * *Alisma*, if it be gathered about the Summer solstead, applied vnto the foresaid wens with rain water, is singular good for them; for which purpose, the leaues are to be stamped, or the root bruised and incorporat with hogs grease, and so applied in a liniment; with charge, That the place be couered with a leafe of the same: in which manner prepared and vsed, it serueth to allay all pains in the nape of the neck, and to keep downe or dissipat the swelling in any part of the body. There is an herb growing commonly in meadows, called the *Daisie*, with a white floure, & partly inclining to a red, which if it be ioined with *Mugwort* in an ointment, is thought to make the medicine far more effectual for the kings euill. *Condurdum* is an herb of smal continuance, for about the Summer solstice it sheweth a red floure and soon sheddeth the same: which (as they say) if it be hanged about the neck, represseth and keepeth vnder the foresaid disease: the like doth *Vernaine* together with *Plantaine*, vsed and worne in the same manner.

Touching all the accidents happening to the fingers, and namely the excrescences & risings of the skin about the roots of the nailes, called in Greeke *Pterygia*, *Cinquefoile* is a singular good herb for them.

F Amongst all the infirmities of the breast, the cough is most troublesome and grievous, for which, the root of *Panaces* in sweet wine is a soueraigne remedie. The iuice of *Henbane* is excellent for them also: that reach vp bloud out of the breast: and the very smoke therof as it burneth, is as proper for them that cough. In like manner, *Scordotis* beeing dried and made into powder, afterwards mingled with cresses and rosin, and so reduced into a liquid confection or

* *Alisma* in some
readings.

lohoch, cureth the cough. The said herb taken simply by it self alone, raiseth tough flegme out of the brest, and causeth it to break from the Patient with ease. The like effect hath Centaury the greater, yea though a man did bring vp blood: for which infirmity, the juice of Plantain also is thought to be singular. Betony taken in water to the weight of three oboli, is of great force against the spitting of blood, and raising vp of filthy matter out of the chest. The root of the great bur hath the like vertue, if it be eaten to the weight of one dram with 11 Pine-nuts. The juice of Harstrang, as also Galangale, is good for the pain in the brest, and therefore they go both of them into preseruatiues and antidots which serue for counterpoisons. The Carot likewise helpeth those that cough, like as the herb Scythica (which is the wild Caraway;) for beeing drunk to the weight of 3 cyaths in sweet wine cuit, it is generally good for all diseases of the brest, for the cough, and helpeth such as fetch vp filthy and rotten matter.

CHAP. VI.

¶ Of Mullen or Lungwort: of Calalia: of Folefoot called Tussilago or Bechium; and of Sauge: herbs all appropriate for the cough.

Mullen or Lungwort with the yellow golden floure, being in like maner taken to the same quantity, eases the foresaid infirmities. Certes this herb is of that efficacy in these cases, that if a drench thereof be giuen to horses, which not onely haue the cough, but also be broken winded, it will help them: the same effects I find attributed to Gentian. The root of Calalia foked in wine and chewed, is good not onely for the cough but also for the infirmities in the throat. Take 5 branches or slips of hyssop, and two sprigs of rue, with 3 figs, seeth these together, it is an excellent drink for to discharge the brest of flegme that stuffeth it. Folefoot, called in Greek Bechion, that is to say in Latin Tussilago, doth appease the violence of the cough. Two kinds there be of this herb: the wild, which wherefoeuer it is seene to grow, sheweth that there is water vnder it: a thing that they know well enough who seek for springs, for they take it to be an assured sign and direction to water: it beareth leaues like to luy, but somewhat bigger, either 5 or 7 in number, which vnderneath or toward the ground be somewhat whitish, but aboue in the vpper side, of a pale colour, without floure, stem, or seed, and the root is but small. Some would haue it and Chamæleuce both, to be one and the same herb called by diuers names: take this herb, leafe and root together, when they be dried, set all on fire and receiue the smoke by a pipe, as if you would suck or drinke it downe, it is (they say) a notable medicine to cure an old cough, but between euery pipe you must sip a pretty draught of sweet wine. The second Bechion some would haue to be called Saluia, an herb like vnto Mullen: stampe the same, and let the juice run through a streiner, which being made hot, drinke it for the cough and pain in the sides. This herb likewise is very effectuall against scorpions & sea-dragons. Also an inunction made therewith and oile together, is commended much for the sting of serpents. A bunch of hyssop foddren with three ounces of hony, is a fine medicine for the cough.

CHAP. VII.

¶ For the paine of the sides and breast: for those that cannot draw their wind but sitting vpright: for the paine of the liuer: the heart ach: for the lights: difficulty of vrine: the cough: the breast: vlcers: for the eyes: for the flux of the belly, occasioned by a feeble liuer: against immoderat vomits: for the yex, the pleurise, and all griefes of the side.

Lungwort or Mullen drunke in water with Rue, is very good for the pain of the sides and the brest: for which purpose also, they say, that poudre of Betony is as good, if it be taken in water wel warmed. The juice of Scordotis is holden to be a great corroboratiue of the stomack: so is Centaury also & Gentian, drunk in a draught of water. Plantain either eaten alone by it selfe, or with a gruell & broth of Lentils, or els with a frumenty pottage made with wheat, is comfortable to the stomack. Betony, although otherwise it lie heavy in the stomack; yet if one either chew the leaues, or drink them in some broth, it helpeth much the defects & infirmities thereof. In like case Aristolochia if it be taken in drinke. Also Agaricke chewed drie, so as betwixt whiles the patient sup a little of pure wine of the grape, hath like vertue: as for Nymphaea

Aphæa or Nemphar synnamed Heraclia, it strengtheneth the stomacke, applied outwardly in a liniment: euento doth the juice of Harstrang. For the hot distemper of the stomacke, it is good to lay vnto it the herbe Flea-wort or Cotyledon, otherwise called Vmbilicus veneris, stamped with fried Barly meale into a cataplasme: or els to take Iubarb, i. Sengreen, to the same effect. The herbe Molon hath a stem * chamfered or channelled along: soft leaues, & those small: a root foure fingers long, in the * end whereof it beareth an head like vnto Garlicke. Some call it Syroa. Taken in wine, it helpeth the stomack and difficulty of drawing breath: In which cases the greater Centaury is singular, if it be reduced into a lohoch or liquid electuary. Plantain also eaten any way, either in a green-sauce or fallad. This composition is reputed a soueraigne medicine. Take of Betony stamped the weight of one pound, of Articke hony as much, incorporate them together, and hereof drinke euery day the quantity of halfe an ounce in some conuenient liquor, or in water warm. Aristolochia or Agarick are soueraigne meanes to be vsed in these infirmities, if one drinke the weight of three oboli thereof, either in warme water or asses milke. The herb Cissanthemos is good to be drunk for those that be streight winded, and must sit vpright when they draw their breath. In the like case Hyssop is commended: as also for pursuenesse and shortnesse of wind. The juice of Harstrang is an ordinary medicine for the griefe of the liuer, the pains also of breasts and sides, in case the Patient be cleare of the ague. As for Agarick, it helpeth all such as spit blood, if the poudre thereof, to the weight of one Vistoriat, be giuen in five cyaths of honied wine. Of the same operation is Amomum. But particularly for the liuer, the herb Teuceria is thought to be soueraigne, if it be taken fresh & green to the weight of foure drams in one hemine of water and vinegar mixed together. One dram of Betony giuen in three cyaths of warm water, or in tw ain of cold, is thought to be a singular cordiall. The iuice of Cinquefoile helpeth all the imperfections of the liuer and lights, it cureth them that voyd or reach vp blood, and generally it serueth for al inward corruptions and distemperatures of the whole masse of blood. Both Pimpernels be wonderfull medicinable for the liuer. Fumiterre the herb wholoever do eat, shal purge choler by vrine. Galangale is helpfull likewise to the liuer, to the chest also, and the midriffe or precordial parts. The herb Caucon, named also * Ephedra, and by some Anabasis, groweth ordinarily in open tracts exposed to the wind: it wil clime vpon trees, and hang down from their boughs and branches. Leafe it hath none, but is garnished with a number of haire, which are no other but rushes indeed full of ioints and knots: the root is of a pale colour. Let this herb be beaten to poudre, and giuen in red wine that is greene and hard, it is good for the cough, for the shortnesse of wind, and the wrings of the belly: it may be taken also in some other supping, whereto it were conuenient to put wine. In like sort the infusion of one dram of Gentian which hath lien steeped the day before, may be very wel taken in three cyaths of wine for those purposes. Herb Benet or Auens hath a small root of a blackish colour, which hath a good sent: this herb not only cureth the pains of the brest and side, but also discusseth all crudities proceeding of vnperfect digestion, by reason of the pleasant sauour that it hath. As for Veruaine, it is medicinable vnto all the principall and noble parts within the body: good for the sides, the lungs, the liuer, and the breast: but most properly it respecteth the lungs; and namely, when the patient is in a phthisick or consumption, by the means of their vlcers. The root of Bearfoot, an herb which I said was but lately found out, is a present remedie for swine, sheep, goats, & all such cattel, in case they be diseased in the lights, if it be but drawn crosse through any of their eares. The same ought to bee drunke in water, and a piece thereof continually held vnder the tongue. As for any other part of this hearbe aboue ground, be it leafe, stalke, floure or seed, it is not yet certainly knowne, whether it be good or no for any purpose in Physicke. As for the kidneies, the hearbe Plantaine is good to be eaten; Betonie to be drunke; Agaricke also to be taken in drinke, like as for the cough. * Tripolium groweth vpon the rocks by the sea side, on which the sea-water beateth: so as a man cannot say, that it is either in the sea or the drie land: in leafe it resembleth woad, but that it is thicker: the stemme is a span or hand-breadth high, forked, and diuided at the point: the root white, odoriferous, grosse, and hot in taste: when it is foddren in a frumenty pottage of wheat, they giue it with good successe to those that be diseased in the liuer: this is thought of some to be all one with Polium, whereof I haue spoken in due place. Symphonina or Gromphena, an herbe hauing leaues, some red, others greene, growing to the stem in order, one red and another greene, is a soueraigne medicine for such as reach and void vp blood, if it be taken in oxycrat, or vinegar & water mingled together.

* Striato haply for strillo, slender, as Oribassius describeth it. * Discoideis describeth his Moly with such a head vpon the top of the stems.

* By these names he calleth also Horstale.

* A kind of Turbit.

* A Cough-wort.

together. Melandryum is an herb found growing in corn-fields & meadows, with a white floure, G and the same of a sweet and pleasant sent: the small stems thereof be commended for the liuer, in case they be stamped & giuen in old wine. Chalacetum commeth vp in vineyards: which if it be punned, serueth for a good cataplasme to be applied vnto the region of the liuer. The root of Betony taken to the weight of foure drams in wine cuit or honied wine, prouoketh vomit readily, as well as Ellebore. But for this purpose Hyssope is better, being beaten in powder, and giuen with honey: but order would be giuen before vnto the Patient, to eat Cresses or Irio. * Mo-
 * Or Polemo-
 * Celerach.
 * Bugle or
 Symphytum
 Leonidum.

lemonium also is of the like effect, if it be taken to the weight of one denier. Moreover, the herb Silybum hath a white juice like vnto milke: which after it is thickened to the substance of a gum, is vsually taken to the foresaid weight, with honey, for a vomitorie; and doth euacuat chole- H rum, is vsually taken to the foresaid weight, with honey, for a vomitorie; and doth euacuat chole- ricke humors especially. On the contrary side, wild Cumin and the powder of Betony, if they be drunk with water, do stay vomiting. For to digest the crudities of the stomach, and to rid away the loathing to meat, Carrot is thought to be very good: so is the powder of Betony, if it be taken in honied water; and Plantain also boiled in potage after the manner of Coleworts or such like potherbs. * Hemonium staierth the painful yex or hocquet. In like sort Aristolochia. Cly-

CHAP. VIII.

¶ Of all the infirmities and remedies of the belly, and those parts that either be adioining to it, or within contained. The means how to loosen and bind the belly.

Toucing the panch or belly, much ado there is with it: and although most men care for nothing els in this life, but to content and please the belly, yet of all other parts it putteth them to most trouble: for one while it is so costie, as that it will giue no passage to the meat; another while so slippery, as it will keep none of it: one time you shal haue it so peeuish, as that it can receiue no food; and another time so weake and feeble, that it is able to make no good concoction of it. And verily now adaies the world is growne to that passe, that the mouth and panch together are the chiefe meanes to worke our death. The wombe (I say) the wickedest vessel belonging to our bodies, is euermore vrgent, like an importunat creditor, demanding debt, and oftentimes in a day calleth vnto vs for victuals: for the bellies sake especially we are so couetous to gather good; for the belly we lay vp so many dainties and superfluities; to content the belly, we stick not to saile as far as the riuer Phasis; and to please the belly, we seek & found the bottome of the deep seas: and when all is done, no man euer thinketh how base and abject this part of the body is, considering that filthy ordure and excrement which passeth from it in the end. No maruell then if Physitians be much troubled about it, and be forced to deuise the greatest number of medicines for the help and cure thereof. And to begin with the staying and binding of it: a dram of Scordotis the herbe, stamped greene and taken in wine, doth the fear; so doth the decoction thereof, if it be drunke. Also Polemonia is a soueraine herb to be giuen in wine for the bloody flux. The root of Mullen or Lungwort, taken to the quantity of two fingers in water, worketh the same effect. The seed of Nymphæa Heraclia drunk in wine, is of the like operation: so is the vpper part of the double root of Glader or the Flagge, ministred to the weight of two drams in vineger. To this purpose also serueth Plantaine seed, done into powder and

A and put into a cup of wine: or the herb it selfe boiled with vineger, or els frumenty pottage taken with the juice thereof. Plantaine sodden with Lentils, or the powder of the dry herb strewed like spice into drinke, together with the powder of starched Poppie. The iuice also of Plantain or of Betony put into wine that hath bin heat with a red hot gad of Steele, either ministred by clystire or drunk, in the said case is very commendable. Moreover, the same Plantain or Betony is singular to be giuen in some green or austere wine, for those who are troubled with the lask proceeding from a weake stomach: and for that purpose Iberis may be applied vnto the region of their belly, as I haue before said.

In the disease Tineamus (which is an inordinat quarrell to the stool, and a straining vpon it, without doing any thing) the root of Nemphar or Nymphæa Heraclia, is singular good to bee drunk in wine: likewise Fleawort taken in water, & the decoction of * Galangale root: the juice of Houfleeke or Sengreene stoppeth the flux of the womb, staierth the bloody flux, and chaseth out of the body the round worms. The root of Comfrey and of the Carot, stoppeth likewise the bloody flux. The leaues of Houfleeke stamped and taken in wine, are singular good against the wringing torments of the belly. The powder of dried Alexa drunk, cureth the said wrings. Astragalus, Pease Earth-nut, an herb bearing long leaues, indented with many cuts or jags, and those which be about the root made bias: riseth vp with three or foure stems full of leaues: carieth a floure like to the Hyacinth or Crow-toes: the roots are bearded and full of strings, enfolded one within another, red of colour, and exceeding hard in substance: it groweth in rocks and stonie grounds exposed to the Sun, and yet charged or couered with snow the most part of the yeare, such as is the mountain Pheneus in Arcadia. This herb hath an astringent power: the root if it be drunk in wine, bindeth the belly, by which means it prouoketh urine, namely, by driving backe the serous and watery humors to the reines; like as most of those simples that be astringent that way, are diureticall. The same root stamped and taken in red wine, healeth the ex- C ulceration of the guts, & thereby staierth the bloody flux: but suely hard it is to bruise or stamp it: the same is singular for the apostumation of the gums, if they be fomented therewith: the right season to draw and gather those roots, is in the end of Autumne, when the herb hath lost the leaues, and then they ought to be dried in the shade. Both sorts of Ladanum growing among corne, be excellent for to knit the belly, if they be stamped and scarceed. The manner is to drink them in mead: likewise in wine * to repress choler. Now the herb whereof Ladanum is made is called Lada, & groweth in the Island Cypros, the liquor wherof sticketh commonly to goats beards. The excellent Ladanum commeth out of Arabia. There is a kind of it made now adaies in Syria and Africke, which they call Toxicon: for that in those countries the people vse to take their bow strings lapped about with wooll, & trail the same after them among those plants which beare Ladanum, and so the * tattie dew cleaueth therto. Of this Ladanum I haue written more at large in my treatise of ointments & redolent compositions: but this later kind is strongest in fauor & hardest in hande; and no maruell, for it gathereth much grosse and earthy substance, whereas indeed the best Ladanum is commended and chosen, when it is pure, clear, odoriferous, soft, green, and full of rosin. The nature thereof is to soften, to drie, to concoct, and to procure sleep: it retaineth the haire of the head being giuen to shed, and maintaineth the same blacke still, that it turne not hoary: wholsom it is for the eares, if it be instilled into them with Hydromel (that is to say, mead or honied water) or els with oile Rosat. It cleanseth the skin of dandruffe, and when it seemeth to pill: and withall, healeth the running scals of the head, if salt be mixed therewith. And being taken with Storax [Calamita] it cureth an inueterat cough but most proper it is for those who belch foure and strong. Moreover, Chondris, which also is called bastard Dictamnus, is a great binder of the belly: so is Hypocistis, named by some Orobat- F ion, much resembling a green or vnripe Pomegranat. This plant growes (as I haue said) vnder Cistus, whereupon it took the name. Both kinds of it (for twaine there be, to wit, the white and the red) being dried in the shade, stay a lask, if they be drunk in thick, austere, or green wine: the iuice only is vsed in Physick, the which is astringent and desiccative: and the red kind is of the twaine more appropriat for the staying or drying vp of rheumes, which if it be drunke to the weight of three oboli, is soueraine for them that reach and raise vp blood. Either drunke or clysterized with Amyl, it cureth the bloody flux. The like effects hath Veruaine giuen in water, yea, and in Aminean wine, if the Patient haue no ague hanging vpon him: with this proportion, that there be the quantity of five spoonefulls of the herb put to three cyaths of wine. More- ouer,

 roscida.

ouer, the herb Lauer, which loueth to grow in brooks and riuers, being either condite and preserved, or els foddren, allaieth the wrings of the belly. Water-specke or Pondweed, called in Greek Potamogeton, is singular good for the dysentery or bloody flux; for the flux also which proceedeth from a weak stomack. This herb beareth leaues like to Beets, but that they be lesse only and more harry, or furred with a downe. A little it beareth about the water, and hath a peculiar property, which is refrigeratiue and astringent: the leaues alone be medicinale, & those be good for the morimals in the legs: for cankerous and corroding vlcers, if they be applied in a cataplasme with hony or vinegar. *Castor* the Physitian describeth this herb * Potamogeton after another sort, namely with a small slender long leafe like vnto horse-haires, putting forth a long stem likewise, and the same smooth, growing also in waters. He vsed with the root of this herb to cure the Kings euill, and heale all hard tumors. This Potamogeton hath an aduersatiue nature to Crocodiles also, and therefore they who hunt after them, carry this herbe ordinarily about them. In like maner Achillea stoppeth a lask. And the same effects worketh Statice, an herb running vp commonly in feuen stems, in the top bearing buttons or heads resembling Rocks. * Ceratia beareth but one leafe, and hath a knotty and great root, which is good to be casten for to cure the lask, occasioned by the feeble stomacke, and the bloody flux, proceeding from the vicer of the guts. Lions-paw, commonly called * Leontopodion, by some Leuceoron, by others Dorypetron, and Thorybetron, hath a root which * bindeth the belly, and yet notwithstanding purgeth choler: if it be taken to the weight of two denarij Roman, in mead or honied water. This herbe groweth in light and lean champion grounds. It is said, that if the seed thereof be taken in drinke, it causeth strange visions and fantastickall dreames. Harefoot, which the Greeces name Lagopus, drunke in wine, bindeth the belly: but if the Patient be in an ague, it would be taken with water: being applied and bound vnto the share, it represseth the tumors and risings in those parts: an herbe this is growing vsually among corne. Many there be, who for the dangerous bloudie fluxe that is thought incurable, commend highly about all other herbes, Cinquefoile, in case the Patient drinke the roots thereof boiled in milke: and the like opinion they haue of Aristolochia, in case there be taken of the root to the weight of one vngoniat in three cyaths of wine. Now this would be noted by the way, that in these cases of astringency and binding, all the medicines before named which are to be taken warme, ought to be heat with a gad of Steele, quenched in the liquor. Thus much of those Simples that bind the belly.

Contrariwise, the juice of Centaury the lesse is a purgatiue, if a dram thereof bee taken in one hemine of water, together with some few cornes of salt and drops of vinegar; for it doth euacuate choler. The greater Centaury, commonly called Rhapontick, stilleth the wrings and griping paines of the belly. Betonie maketh the body loose and soluble, taken to the weight of foure drams in nine cyaths of Hydromell or Mead. In like manner Euphorbium is laxatiue, & so is Agaricke, if two drammes thereof be drunke in water with a little salt, or to the weight of three oboli in mead or honied water. Sowbread also, named by the Greeks Cyclaminos, taken inwardly with water, or put vp by suppositories, prouoketh to the seege: so doth a suppository made with the root of * Chamæcisus. Take a good bunch or handfull of Hyssope, seeth it in water with a little salt to the consumption of a third part: it serueth to euacuate fleagme, if it be in but applied as a liniment to the belly: or stamped and incorporat with oxymel and salt, in which maner vsed, it driueth worms out of the body. The root of Harstrang purgeth both flegmatick and cholerick humors also. Pimpernel taken in mead, is a good purgatiue: so is Epithymum, which you must take to be the * floure of a kind of Thyme that resembleth Sauery: here is the difference only, that this floure is of a grasse green colour, but that of the other Thyme is white. Some call this Epithymum, Hippopheon: a simple not very wholsome for the stomack, ne yet good to prouoke vomit; howbeit, singular to appease the wringing paines in the belly, and to carminate or dissolue ventosities. The same may be taken also by way of lochoch or liquid electuarie, confected with honey, and sometimes with the Ireos root, for the stuffing and other imperfections of the breast. Epithymum looseneth the belly, if it be taken from foure drammes to six, with honey, a little salt and vinegar. Some Herbarists describe Epithymum otherwise, namely, that it groweth without any root, and that it resembleth a little smal string or thread like vnto haire, of a red colour: which if it be dried in the shade and drunke in water to the weight and measure of halfe an acetable, purge th downward fleagme and choler both.

Nem-

A Nempfar taken in some hard astringent or wine, * gently purgeth the belly. Also, Pycnon-comon is laxatiue: an herb this is like vnto Rocket, but that the leaues be thicker in substance, and * grow more thin: it hath a round root, and the same yellowish, and senting much of the earth: the stem is foure cornered, of a mean height, small and slender, and the floure much like to that of Basil. Found it is ordinarily in stony grounds. The root of this hearb drunke in mead, to the weight of 2 deniers, doth euacuate downward by the belly, both cholericke and also flegmatick humors. The seed causeth troublefome and vnquiet dreames, if one drinke a dram thereof in wine. Fumiterre also * consumeth and dispatcheth the kings-euill. Polypodium (which we call in Latine Filicula) because it is like vnto Fearn, purgeth choler. The root, which is only medicinale and in vse, is full of hairs, of a greenish colour within, as big commonly as a mans little finger: full of hollow concauities it is, representing those holes that the fishes called Polyphi haue about their feet or clees: sweetish it is in tast, and groweth either vpon rocks, or * else at the foot of old trees. After that this root hath bin wel foked in water, they vse to presse the iuice forth of it, or the same may be shred & minced smal, strewed among porhearts either of Beers or Mallows; yea, and put into the pot with the mead: or els tempered in some salt sauce, or foddren in broth: a fine medicine and a safe, gently loosing the belly, though the patient were in an ague: it doth euacuate choler and flegme both: but somewhat offensive it is to the stomack. The powder of it dried, conueighed vp into the nostrils, consumeth the ill-fauoured sore within, called Polypus or Noli-me-tangere. It * floureth, but seedeth not. Moreover, Scammonie also ouerturns and hurterh the stomack, vnlesse two drams of Aloe be put vnto as many oboli of it: for then it purgeth choler, and sendeth it down by the belly. Now this Scammonie is the iuice of a certain herb (called likewise Scammonia) which brancheth and tufteth immediatly from the root: the leaues be fat, white, and made triangle wise: the root thick, moist, and in handling will make ones stomack to rise, and be ready to heaue. It loueth to grow in battle grounds, and those of a white leere. About the rising of the great Dog-star they vse to make an hollow trough in the root as it groweth; to the end, that all the moisture thereof may fall and gather into it: which liquor being dried in the Sun, is wrought and made into bals or trochisks. The root it selfe also is commonly dried or at leastwise the rind thereof. In regard of the country where it groweth, that is commended most which cometh from Colophon, Mysia, and Priene: but if you respect the form, and look of it, chuse that which is neat and clean, resembling as neare as possibly may be, strong Oxe glue, spongeous or fistulous, full of holes or passing small pipes. If you go by other qualities, take that which will soon dissolue or melt: which also hath a strong and stinking smel, clammy and gummy, turning into a whitish liquor like milk, if you taste it at the tongues end, exceeding light in the hand, and when it is resolued, growing to a whitish colour. And yet this property you shall see in that Scammonie which is sophisticate: and that ywis may soone be done, for do but take the meale or floure of Eruille and the iuice of the sea Tithymal (& such is that commonly which cometh from Iudæa) it wil counterfeit the right Scammony: but such stufte as this offendeth the throat, and is ready to choke or strangle as many as vse it. Howbeit this may be soon found by the very tast only: for the Tithymal setteth the tongue in a heat as if it were a bulb root: and is not good to purge, whether a man take it fasting or full. As for the true and sincere Scammony, they were wont to exhibit it for a purgation euen simply by it self alone in a draught of mead with some salt, and the dose was four oboli. But it was found to do the deed best, and most effectually taken with Aloe: so that the patient, when it began once to worke, took a pretty draught of sweet honied wine. Furthermore, the root if it be boiled in vinegar to the consistence of hony, maketh a singular liniment for to annoint the leptosie; yea, and in case of head-ach it is found good to annoint the head with it & oile together. As for the Tithymal afore said, our countrymen here in Italy, some call it Laetaria, as one would say, the Milke herb; other Laetua caprina, i. Goats Lettuce. It is commonly said, that with the milke or juice of these Tithymals, a man may write vpon the skinn of the body: for draw any letters therewith and strew ashes or dust thereupon, when they bedrie, they will appeare very legible.

F And this is a trick practised by those that make court vnto other mens wiues, their mistresses, deliuering their minds secretly vnto them by this means, which they dare not set down in paper or misse letters. Many kinds there be of these * Tithymals. The first is known by the addition of Characias, which also is called the male Tithymal: the * branches be of a finger thickness, red, * riuelled, 5 or 6 in number, running vp to the height of a cubit: and leaued they be immedi-

* Which some take for ground Iuice.

* Here Pliny is deceiued, for it is a kind of lace winding about Thyme, as Doder about Flax.

gether, the weight of one denarius at once in white wine, is singular in that case: the pouder of Betony taken in drink with hony and vineger of Squilla, is commended for that purpose: as also the root of Lonchitis drunk in water; and Teucrium applied as a liniment.

Scordum incorporat with wax, and Agarick with the pouder or floure of Fenigreek, help the infirmities of the bladder, and namely, the intollerable pains of the stone and grauell, as I haue before said. Polemonia drunk in wine; and in like manner Agaricke, is good for that purpose: the root or leaues of Plantaine taken in sweet wine cuit; also Betonie, prepared in that manner as it was appointed for the disease of the liuer, be remedies for the infirmities of that part. Betonie also giuen in drink and applied in a liniment, healeth a rupture; and the same is most effectuall in curing the strangury: some prescribe and giue counsell to drink Betony, Veruaine, Yarrow, or Millefoile, of each a like portion in water, as an excellent remedy for the stone and grauel. And well knowne it is, that for to ease the strangury and remove the cause thereof, Diſſamnus is an approued medicine: so is the decoction of Cinquefoile, if it be boiled in wine to the consumption of a third part, found by experience to be an vndoubted remedy in that infirmity: the same also is singular good to be applied in that rupture where the guts bealne downe. The vpper root of Glader or Flagg, causeth young infants to make water, if it be laid to the bottom of the belly: the same giuen inwardly with water, cureth those that are burst and haue their guts slipped downe; and helpeth the infirmities of the bladder in an outward liniment. The iuice of Harſtrang healeth little children who are bursten; and of Fleawort there is made a good ointment to annoint their Nauell, when it beareth out ouermuch. Both the Pimpernels do prouoke vrine: so doth the decoction of Acorus root: the very root it selfe also beaten into pouder, and taken in drink, worketh the like effect; and besides, healeth all the accidents of the bladder. Cotedon or Vmbelicus Veneris, both herb and root, breake the stone, and expelleth it by grauell; being otherwise singular good for all inflammations of the genitall parts or members of generation, if the stalks and seed be taken with Myrrhe, of each a like quantity: Vvalwort stamped together with the tender leaues thereof, and so drunk in wine, driueth out the stone: the same applied outwardly, cureth the accidents befalling to the cods. Groundswell, with the pouder of Frankincense and sweet wine reduced into an ointment, cureth the inflammation of the sayd cods. The root of Camfrey brought into a liniment, staieth the rupture whereby the guts come downe; and white Hypocistis, representeth the cancerous sores in those parts. Semblably Mugwort is singular to be giuen in sweet wine, for the stone and strangury. The root of Nenuphar or Nympha Heraclia taken in wine, assuageth the paine and grieve of the bladder: of the same power is * Sampier, so highly commended by Hippocrates: now is this one of the wild woorts which are vsually eaten in salads: and certes, this is that very herbe which the good country wife Hecale forgot not to set vpon her boord in a feast that she * made (as we may read in Callimachus the Poet.) And what is it but a kind of garden Batis? It groweth vp with one stem halfe a foot high, or a span at most: the seed is exceeding hot, round, and odoriferous like vnto Rosemary: if it be dried, it bursteth, and hath within a white kernell, which some call Cachrys. The leaues be fatty, and of a grayish white in manner of the oliue leafe, but that they be thicker, and saltish in tast: roots it hath three or foure, of a finger thickness: it groweth vpon the sea coast among rocks and cliffs. This herbe may be eaten, raw or boiled, it skilleth not how, with Beets, Coles, and other such woorts; and in tast likewise it is aromaticall and pleasant: it is vsually preserved and kept condite in a kinde of pickle: and the principall vse that it hath, is to cure the strangury, if either leafe, stalk, or root, be drunk in wine: also, being thus taken, it maketh folke look with a more louely, & cheereful colour: but if one be too bold with it, & vse it not with moderation, it breedeth ventosities. The decoction of Sampier maketh the body soluble, and is diureticall, for it mightly draweth water from the kidnies. In like manner, the pouder of dried Althæa or Marsh-Mallow, drunk in wine, cureth the strangury, and easeth them that pisse dropmeale, which it wil do more effectually, if the Carot be ioined withall: the same is wholefome for the spleen; and a counterpoison against serpents, if it be taken in drink. If the pouder thereof be strewed and mingled among the barley which is giuen in Prouander vnto cart-horses and such like, it helpeth them when they run at nose with the glanders, and stale drop by drop. Touching the herb Anthyllion, it is as like as may be to Lentils, which if it be drunk in wine, cureth all the infirmities of the bladder; and namely, when there issueth forth bloud with vrin: there is another hearbe comming neare to it in name; to wit, Anthyllis, like vnto Iva Muscata, or Chamæpitys,

*To wit, when they be hard or swollen.

*Or Cressmarina.

*To pricke Thelcus.

A mæpitys, carrying purple flours, senting strong, and hath a root like to Cichory, which is good in these cases. But it seemeth that * Brooklime, called otherwise Cepæa (an herbe resembling Purcellane, but that the root is blacker, and good for nothing in Physick, growing vpon the sandy shore, and hauing a bitter taste) is better for the said infirmities than the former named Anthyllis; for if it be taken in wine with the root of Sperage, it is excellent for the diseases of the bladder: of the same operation is * Hypericon, which some call Chamæpitys, others Corion. This herb * shooteth forth many branches, which be small and slender, of a cubit in length, and red withall: in leafe it resembleth rue; the smel is quick, hot, and piercing; the seed which it beareth within certain cods, is black, and the same ripeneth together with barley. The nature of the seed is astringent: it doth increasse and thicken humors, and stoppeth a lask: vrin it prouoketh; and being drunk in wine, scoureth away the stone and grauell in the bladder. A second Hypericon there is, which some call Coris, in leafe it resembleth * Tamarix, vnder which it gladly groweth, but that the leaues be more fat, and not so red: it groweth not aboue a * span high: odoriferous to smell vnto, and of a mild sweet tast, and yet * sharp withall. The seed is hot, and therefore causeth ventosities, and * inflation in ruptures: howbeit, vnto the stomack it is not hurtful; and singular good for the strangury, in case the bladder be not exulcerat: drunk in wine, it cureth the pleurisie. Moreouer, for the bladder and the diseases thereof, Maiden-haire made into pouder together with Cumin, and giuen in white wine, is a soueraine remedy; also Veruaine, fodder leaues and all, vntill the third part of the liquor be consumed: or the very root only thereof taken in honied wine hot, expelleth the stones and grauel in the bladder. In like maner the herb Perpressa, which groweth at Aretium and in Sclauonia, being boiled in water from 3 hemines to one, and so taken inwardly as a drink, is an appropriate medicine for the bladder. Clauer or three leaved grassie taken in wine; Camomile likewise * drunk, is good for the same. Moreouer, Anthemum expelleth the stone; an herb this is, which putteth forth immediately from the root five small leaues, and two long stems, with a red rose colour floure: the roots stamped alone, are as effectuall in this case as green * Lauer. As for Silaus, it groweth along those riuers which run continually and be neuer dry, especially such as glide vpon sand & grauell: it riseth to the height of a cubit, and resembleth garden Parsley: they vse to seeth it after the maner of * Soure-docke, and so prepared, it doth much good to the bladder, which, if it be excoriat and scabbed, the root of Panaces will heale it; for otherwise it is hurtful to that part. The herb called * Malum Erraticum [i. as one would say, the wandring poison, or apple] it expelleth the stone, if one pound of the root be thoroughly sodden in a congius or gallon of wine, vnto the consumption of the half, so that the patient take thereof for three daies together one hemine at a time; and that which remaineth of the decoction, in wine, with Lauer & sea-nettles. Also Carots and Plantaine seed taken in wine, driueth down stone and grauell. The nettle called Fulviana (an herb well knowne to them especially that handle it, and which took that name of him who first found out the vertue thereof) if it be stamped and drunk in wine, prouoketh vrine.

Scordum is singular for the swelling of the generoits or cods. Henbane is good for the diseases of the members seruing to generation. The iuice of Peucedanum [i. Harſtrang] incorporate with hony, like as the seed also taken inwardly, helpeth those who are pained with the strangurie; likewise Agaricke, if three oboli thereof be drunk in one cyath of old wine: the root of Trifoile or Clauer giuen to the poise of two drams in sweet wine: and one dram of Daucum, id est, Carot [either the herb, root, or seed, haue the like effect.

Such as be troubled with the Sciatica or gout in the huckle-bone, finde remedy by a plaster or cataplasme, made with the seed and leaues both, of Madder; also with a drink of Panaces: likewise if the place be well rubbed with Polemonia, and bathed with the decoction of the leaues of Aristolochia, it finds much ease thereby. The broad sinew or cord at the end of the muscles which is called in Greek Platys, likewise the shoulders if they be pained, feele sensible alleviation, by Agaricke, if the weight of three oboli be drunk in one cyath of old wine. Cinquefoile both taken in drinke, and also applied as a plaster, allaieth the paine of the Sciatica: so doth the herb Scammony boiled with barley meale. The seed of both the Hypericons drunke in wine, is proper for that malady.

The accidents of the seat or fundament, especially when that part is fretted or galled, a salue of Plantaine healeth most speedily.

The swellings or blind piles appearing like bigs or knuckles within the fundament, are cured

Vervaine stamped and incorporat with hogs greafe, is good for the gout: so is the root of Sow-G bread, the decoction wherof healeth kided heels, if they be bathed therein: the root of * Xiphion cooleth the hot gout; the seed of * Pysyllium doth the same: Hemlock also, incorporat with Licharge or hogs greafe: but about all other, Housleek or Sengreen is right souveraine to be applied at the first assault or fit of the red gout (.) when it is occasioned by a flux of hot humors: and whether it be hot or cold gout, Groundswell tempered into a liniment with swines greafe, and so applied, is a very fit and convenient medicine: as also Plantain leaues stamped, with a little salt mixed among; and Argemonia punned in a mortar & applied with hony: moreover, Vervaine reduced into an vnguent, is singular in that case; yea and if the goutie feet be well foked in the decoction therof, much ease wil insue thereupon: also Lappago, an herb resembling * Pimpernell, but that it is fuller of branches, and tufted more with leaues, which also be rough, rugged, and wrinkled, yeelding a juice in tast more harsh, and in smell strong and vnpleasant: as for that of this kind which is * soft, they call Mollugo: like vnto which (but for the leaues that be more rough in handling) is Asperugo, whereupon it took the name. Now for the gout, let the Patient take every day 11 deniers weight of the juice pressed forth of the former Lappago in two cyaths of wine: but for this disease the most excellent remedy and that which rids it quite, is the sea-weed, which in Greeke they call Phycos Thalassion, and in Latine Fucus Marinus; an herb like vnto Lettuce, & commonly Murets & other shel-fishes lye bedded vpon these weeds, which being applied before they are dried, do cure not the gout of the feet onely, but also any disease of all other joints. Now of this Sea-grasse so named, there be found three kinds: the first is broad and large; the second longer, and somewhat red; the third hath curled and frizled leaues, which in Candy they do vse in dying of their clothes; but all are of one and the same operation in Physick. *Nicander* was wont to giue them in wine, as a counterpoison against the venome of serpents. Moreover, the seed of that herb which I named Pysyllium, is singular good for the gout, if the same be well steeped in water; so that in euery hemine of the seed there be mingled the quantity of two spoonfulls of Colophonian rosin, and one of frankincense. Finally, the leaues of Mandragoras be highly commended in this case, if they be stamped and incorporat with fried Barly groats into a cataplasme.

CHAP. XI.

¶ General medicines and receipts for all the infirmities incident to the Feet, the Ankles, joints, and Sinews: Item, the remedies for those diseases which possesse and trouble the whole body. Of the herbe Mirthrida. Medicines for those that cannot sleep: and for the Palsie. Of cold fevers: and the ague that is incident to horses: of the Phrensie. Of the herbe Walwort and Housleek. Last of all of the Shingles or S. Anthonies fire.

* Pota, other-
wise Posita,
i. applied.

* Rose of Ie-
richo.

IF the feet be swoln about the ankles, the mud that is found in the bottom of waters, wrought and conecorporat together with oile, is of wonderful operation to allay the same. For the pain in the joints, or griefe of sinews, the juice drawn out of Centaury is passing good: in like manner, the herb Centauris. As for Betony, it is comfortable vnto the nerues, which run and spread behind ouer the shoulder-blades, the shoulders, the back-bone, the loins and hanches, if it be taken in * drink, after the manner as it was ordained for the liuer. Cinquefoile, is souverain for the pain of the joints, if it be applied outwardly: likewise the leaues of Mandragoras made into a pulstesse with parched barley meale, or the root it selfe newly drawn out of the ground & stamped with the wild Cucumber, or els boiled in water, for the chaps that appeare in the feet or vpon the elbows, the root of Polypodie is singular good; for the griefe of the joints, the juice of Henbane reduced into an ointment with swines greafe, is a proper remedy: likewise the juice of the herb * Amomum, together with the decoction: also Cotton-weed or Cudwort, boiled in water: or fresh gathered mossie foked in water and bound to the griued place, and there kept fast without remouing, vntill it be drie: as also the root of the Bur called Lappa Boaria, drunke in wine. Sow-bread sodden in water, cureth the eluifh & angry kibes beginning to rise vpon the heels, and all other chilblanes and bloody fols occasioned by cold. Semblably, Vmbilicus Veneris applied with hogs greafe, healeth the foresaid kided heels: so do Crowfoot leaues; and the juice of Epithymum. Ladanium made into a salve with Castoreum, and so applied, fetcheth out the core of agnells or corns by the roots: the like effect hath Vervaine, if it be laied too with wine.

A wine. And now that I haue run through those maladies which are offensive to euery particular member, I purpose to write in the next place of such as occupy the whole body; and of the remedies common to them all, which I find to be these ensuing.

And first there presenteth it selfe vnto me the noble herb * Dodecatheos, wherof I haue spoken before as a souveraine remedy for those vniuersal diseases, if it be taken in drink. Next to it are the roots of all kinds of the Panaces, which are thought to be excellent, and principally for long and languishing maladies: like as their seed for the obstructions of the bowels and the inward accidents of the guts: for the pains generally of the whole body, the iuice of Scordium is right commendable, and so is that of Betony: which herb taken in drink, hath a peculiar property to mend the wan and leaden hew of body, reducing it to a more fresh and pleasant color.

The herb * Geranion, which some call Myrrhis, others Merthrays, is like vnto Hemlocke, save that it hath smaller leaues, and a shorter stem, which also is round, of a sweet sent to the nose, and good fauor in the mouth, for so we Latines doe describe it: but according to the description of the Greeks, the leaues rather resemble the Mallow, but that they are whiter somewhat, the stalks slender and hairy: * it brancheth out big at the distance of euery two handbreadths, howbeit, full of leaues between: and among the leaues are to be seen in the top of the branches and sprigs little buttons or heads like vnto Crane-bills. Another kind there is of them leaved after the manner of passe-floures, or wind-floures, but that they be intailed or indented deeper: and a round root it hath fashioned like an apple, which is sweet in tast, and is an excellent restorative for all such as haue bin weakened and decayed in nature by long sickness: and this I take to be the true

Geranion, which is a rare herb. A dram weight thereof drunk twice a day [first and last] in three cyaths of wine, is a singular medicine for the phthisicke. And in that order it is good for ventrosities: and hath the same effect though it be taken raw. The iuice of the root is souveraine for the infirmities of the ears. The seed giuen in drink to the quantitie of 4 drams with pepper and Myrrh, cureth the cramp which pulleth the head and body all backward. The iuice of Plantain if it be drunk, or the herb it selfe boiled and so eaten, is whoisome for those that be in a Phthisick. Plantaineaten with salt and oile in a morning, so soon as a man is awakened, is a great cooler. The same is an ordinary medicine for those that mislike, and whose meat is not seene vpon them, if they take it each other day. Of Betony and hony there is a liquid confection or lochoch made, which being licked and let down leisurely, to the quantity at a time of a good big beane,

helpeth those that are in a Phthisick or consumption of the lungs. Also Agarick, if it be drunk to the weight of 2 oboli in wine cuit, is good in the like case: so is Daucum also taken in wine with Rhapontick. For the hungry worms Phagedaene (a name in this place signifying an inordinat * disposition, to be alwaies eating and neuer satisfied, although otherwise I vse it for cankerous and corroding vlcers) the Tithymalls or Spurges taken inwardly with Sesama seed, is counted souveraine. Among the maladies which affect & infest the whole body, want of sleep, or an indisposition thereto, is by most Physicians counted one: for which defect, they shew vs these herbs following; to wit, Panaces, water Betony, and Aristolochia, which they prescribe to the patient both for to smel too, and also to annoint his head al ouer withal. Likewise Housleek called Aeizoon & also Sedum, giuing direction to wrap it within a blacke cloth, and so to lay it

under the pillow or bouldster of the sick person, but in no wise to let him or her know so much. Likewise Oenothera, otherwise named Onuris, is effectual for this purpose: is an herb good also in wine to make the heart merry. It groweth with leaues resembling those of the Almond tree, and beareth floures like vnto Roses. Store of branches it putteth forth, and hath a long roor, which being dried, senteth much of wine. Of such vertue is this herb, that if it be giuen in drink to the wildest beast that is, it will tame the same and make it gentle. As for the crudities or raw humors lying in the stomack, which cause loathing and abhorring of meat, Betony is singular to digest them: the same drunk immediatly after supper, helps concoction, namely, if one dram weight of the herb be taken in 3 cyaths of oxymel: and so it resolueth and scattereth the fumes arising vp into the head, occasioned by strong wine. Of the same operation is Agaricke, drunke at the end of a meale in hot water. The foresaid Betony hath the name of a speciall remedie for the palsie: so is Iberis also reputed, as I haue shewed once before; the same herbe reuiueth the lims which are benumbed and in manner dead. And verily, Argemone is of that vertue,

that it diffuseth all those cold humors which mortifie any member, and put them in danger to be cut off or launced. The root of that Panaces which I named Heraclia, drunke with the ren-

So called, for that it representeth the maiesty of the twelve principall gods and goddesses, called Maiorum gentis, or Con-sentes, whom the Painims imagined to sit in counsell together with Jupiter their President: and these hath En-nina comprised in this Distichon: Iano, Ve-nus, Minerva, Ceres, Diana, Venus, Mars, Mercurius, Iouis, Neptunus, Vulcanus, Apollo.

The Carot.
* Carotus.

uers places: it beareth in the head certain berries as it were in bunches and clusters, odoriferous, and as they sent somewhat strong and hot, so the smell is not vnpleasant: take this herbe, chew it with your teeth, and then lay it to any wounds made by the edge of the sword or such like weapon, and so let it lie and remoue it not vntill the fifth day, you shal see it to heale excellent wel. Camfrey applied vnto a green wound, skinneth it most speedily: so doth Sideritis; as for this herbe, it should be applied with honey. The seed and leaues of Mullen, sodden in wine, & stamped to the form of a cataplasme, draweth forth all thorns, spils, and arrow heads, which sticke within the body. The like effect work the leaues of Mandragoras, incorporat with parched barley meale; and Sowbread roots stamped and mixed with honey. The leaues of Germander punned with oile, are excellent to be applied vnto those vlcers which doe corrode the flesh vnder them and eat forward; like as the Reiks or sea-weeds. Betonie is a soueraigne herbe for cancerous vlcers: also for the blacke sploches that haue continued a long time vpon the skin, if there be salt put thereto. Argemonia tempered with vineger, taketh away warts: so doth the root of Crowfoot, which also is singular good to fetch off with ease, the ragged and fretted nailes that be offensiue. The leaues of Mercurie, the male and female both, or the iuice thereof brought into a liniment, haue the like operation. Al the sorts of the Tithymals take away any warts whatsoever: so do they rid the troublesome risings and impostumations like whitflawes about the naile roots, and all flecks, spots, wheelks, and specks whatsoever. Ladanum reduceth any scars to look faire and fresh coloured againe.

CHAP. XV.

Many experiments and approued receipts for the pronoking or staying of womens monethly tearmes: for curing the diseases of their matrice: for sending out the birth, or retaining the same within the bodie the full time. Also sundry deuises for to amend the faults that blemish the skin of the face: to colour the haire of the head, or to fetch it off. Last of all, diuers medicines for the farcines or scab in foure-footed beasts.

It is said, That if a traueiler or wayfaring man weare fast tied about him, Mugwort or Sauge, he shall neuer be weary nor thinke his journey long. But to come now vnto the infirmities of women: the black seed of the herb Pæony, is generally good for all their *maladies, if it be taken in mead: the root also is of the same operation, and besides prouoketh the ordinary course of their months. The seed of Panaces drunk with wormwood, moues their fleurs, & prouoketh them to sweate: the like effect hath Scordotis either in drink or liniment. A dram of Betony giuen to women in 3 cyaths of wine, helps all the maladies incident to their natural parts, *but especially those that insue vpon their deliuey of childbirth. Achillæa being applied accordingly, staieth the exceffiue flux of their monthly termes: for which purpose also, it is good for them to sit in a bath made with the decoction of the said herb: & in this case, to their breasts or paps. *there would be laid a plaster of Henbane seed tempered with wine: the root also applied in manner of a cataplasme to their secret parts, is counted soueraigne for that infirmity: like as Celendine the greater laid vnto the foresaid breasts. If the after-birth, when the childe is borne, be loth to come away, or if the infant be dead within the mothers womb, the roots of Panaces applied accordingly to the priuy parts, fetch forth both the one and the other. The very herb it self Panaces drunk in wine, or outwardly vsed to the region of the matrice, *clenseth the same. Sauge de bois taken with wine, expelleth the after-birth; and by a suffumigation, munieth the matrice. The iuice of Centaury the lesse, bringeth women to their desired sicknesse, if they drink it, or foment the parts beneath, therewith. Likewise the root of the bigger Centaury vsed after the same maner, appeaseth the pains of the mother. If the same be scraped smooth, & put vpon the right place as a pessary, it draweth away the dead child within her body: for the griefe and anguish which women feelee in their womb, there is no better thing than to apply the iuice of Plantaine in a Locke of wooll: and in danger of suffocation by rising of the mother, to giue it in drinke. But Dictamnus is soueraigne and hath no peere: it prouoketh monthly fleurs: it sendeth out the dead childe, yea though it lay ouerthwart and stuck crosse in the birth: for which purpose, the woman must drink to the weight of one obolus, in water: and verily of such power is this herb in such cases, that so long as women go with child, it must not come within the chamber where they are, for feare it put them to trauell before their time. And not onely in drinke

* To their matrice, as namely, the rising of the mother, &c.

* To wit, the stay of the after-birth, after throwes, suppression of their purgation, or immoderate shits, &c. * Swelled and hard.

* Purgat, some read better (in mine opin on) corrigat, i. reducere it into the right place being infected and peruerbed.

A drink is it thus effectual, but also in a liniment; yea and the very perfume and smoke thereof receiued in the body, will do the deed. Next to it, there is not a more soueraigne herb than the bastard Dictamnus, called Pseudodictamnus: but it must be boiled to the weight of one denier, with pure wine and strong of the grape, and then taken in drinke, it prouoketh womens desired sicknesse. And yet Aristolochia is many waies good for the infirmities of women: for if there be myrrh and pepper put thereto, and then either taken in drink or put in a pessarie, it draws downe their fleurs, bringeth forth the after-birth, and fetcheth away the dead infant: it keepeth vp and staieth the matrice ready to fall, and slip out of the body, either in fomentation, perfume, or pessary, especially the *small kind thereof. But in case a woman be in danger of suffocation by the ascent of the mother, or otherwise diseased for want of her monethly purgation, let her drinke Agaricke to the weight of three oboli in one cyath of old wine: make a pessarie of Veruain incorporated with fresh hogs lard, and applie Calues-Inout, otherwise called Snap-dragon with oile rosat and hony, she shall haue ease, and be cured speedily. Semblably the root of Nenuphar, especially that which groweth in *Thessalie, applied vnto the naturall parts of women, easeth the paines thereof: and if it be drunke in grosse red wine, it staieth their shits or immoderate flux of the moneths. Contrariwise, the Sow-bread root, both taken in drinke and also outwardly vsed, prouoketh the same, if they do stay vpon a woman. Also a decoction thereof, if a woman do sit therein, helpeth the accidents of the bladder. Cissanthemos taken in drinke, sendeth out the after-birth, and healeth the maladies of the matrice. The vpper root of the Flag or Glader, drunke in vineger to the weight of one dramme, bringeth women to the ordinary course of their fleures. The fume of Hartstrang burnt, fetcheth women againe when they lie as it were strangled and dead in a fit of the mother. Flea-wort taken to the weight of a dram in three cyaths of honied water, prouoketh their monthly termes, but especially it maketh them soluble if they were costie. The seed of Mandragoras cleaseth the matrice, if a woman take it in her drinke: the iuice whereof applied to the naturall parts, prouoketh her moneths and fetcheth away the dead child within her body. Againe, the seed taken with wine and brimstone, staieth the immoderate flux of the monethly termes. Crowfoot either drunk or eaten with meat, knitteth the belly and stoppeth a lask: an herb otherwise (as I haue said) of a causticke and burning nature, if it be vsed raw, but certainly, beeing boyled with salt, oyle, and cumine, a commendable meat. Yellow Carrots taken in drinke, doe exclude the after birth, and prouoke womens fleurs with exceeding great facilitie. A perfume of Ladanum, setteth streight the matrice when it is out of the right place, and turned to a side: and for the paine and exulceration thereof, it is of great force either applied outwardly or injected inwardly. Scammonie, either in drink or cataplasme, sendeth forth of the body the dead fruit of the wombe. Both kinds of S. Johns wort, stirreth the issue of womens fleurs, onely by an outward application. But aboue all (in the judgement of Hippocrates) *Crithmos passeth for that, if either the seed or the root be taken in wine. As for the pill or rind thereof, it fetcheth away the after-birth also: and drunk in water, it helpeth the suffocation occasioned by the rising of the mother. The root of *Geranium likewise more particularly, is a very conuenient remedy for to bring away the after-birth, and to cure the inflammation of the matrice. Horsetaile hath a secret vertue to munieth the naturall parts of women, either drunke, or applied outwardly. Knot-grasse giuen in drinke, *staieth the inordinate and exceffiue voidance of the fleurs: so doth the root of Marsh Mallow. The leaues of Plantain, *drue downe the same: so likewise Agaricke in honied water. Mugwort stamped and incorporat with oile of Ireos, Figges, and Myrhe, hath the same effect, if it be applied accordingly: The root of which herbe, if a woman take in drinke, is so purgative and will bring her to such a laske, that shee shall withall exclude the dead infant within her bodie. A decoction made with the branches of Mugwort, bringeth downe womens monethly sicknesse, and fetcheth away the after-birth, if they sit therein: a dramme weight of the leaues taken in drinke, is of the like vertue and operation: if they be but laied vnto the belly in manner of a cataplasme, especially with barley meale, they will doe as much. Moreouer, Acoron, both the kindes of Conyza, as also Sampier, are singular good for all the inward griefes and maladies whatsoever of women. Also both kinds of Anthyllis drunke in wine, are soueraigne for the accidents of the matrice, namely to assuage the throws and wrings thereof, and to bring away the after-birth when it staieth behind. A fomentation made with Maidenhaire, is comfortable to the naturall parts of women: like as it hath vertue to clense the scurfe and dandruffe, to rid away the white patches appearing

* Clematis.

* With the yellow floure.

* Sampier, or Crestmarine.

* Herb Robert.

* Sibire.

* I maruell how that should be considering they are asfrigent, vnto us we haue recourse ad easu propriatam, i. to some secret vertue.

in the skin or haire, and to color the same black, if it be brought into powder, & with oile made into a liniment. Herb Robert drunk in white wine, and Hyocisthis in red, do stay the flux of reds or whites. Hyssop is a soueraign herb to open and relax the obstructions of the matrice causing suffocation. The root of Veruaine taken inwardly with water, is the best thing in the world for all the maladies incident to women, either in their trauell or after their deliuerance. To which effect, some there be, who together with Harstrang mix the grains of the Cypresse tree beaten to powder, and giue it to drink in grosse red wine. For the seed of Fleawort, boiled in water, and laid too warme, doth moderate and qualifie all the violent fluxes of the matrice. Camfrey stamped and giuen in grosse wine or allegant, bringeth down the sicknesse of women when it staith vpon them. The juice of Scordotis taken to the quantity of one dram in foure cyaths of honied water, giueth women speedy deliuerance in childbirth: and for that purpose, the leaues of Distamnus are excellent, if they be taken in water: and knowne it is for certain, that the weight of one obolus of those leaues giuen to a woman in hard trauell, will presently cause her to be deliuered with ease, yea though the infant were dead in the belly. The like operation hath the bastard Distamnus, but that it worketh more slowly: and in this case, they vse to tie the root of Cyclamin about the woman in labour; to cause her also to drinke Cissanthemos; yea and the powder of Berony in honied water. As for Arsenogonon and Thelygonon, they be two herbes, bearing certain grapes or berries like to oliue blossomes, but that they be more pale; and white seeds or kernels within, resembling those of white Poppy. If a woman drink Thelygonum, some say, she will therupon conceiue a maid-child. Arsenogonon differeth from the other in nothing but in the seed, which commeth neare vnto that of the oliue: and (forsooth) if she take this herb in drink, she shall haue a man-child; beleuee it who that list. Others there be, who say, that both the one and the other be like vnto Basil; and that Arsenogonon carrieth a double seed knit together like as they were two genitors.

That kind of Housleek which I called Digitellus, is singular for the diseases incident to womens Breasts. Groundswell bringeth abundance of milke into womens paps, if they drinke it in wine cuir: so doth Sowthistle sodden in frumenty. The grape called Bumastos, taketh away the haire about the nipples of nourses breasts, which spring sometime after they haue once borne children: which also otherwise is very good to cleanse the skales and scurfe in the face, and to scour away other spots and pimples arising vpon the skin. Gentian, and Nymphaea called Hecore, the root also of Cyclamin, riddeth all such cutaneal specks and blemishes. The graines of wild Carawaies, called Calalia, incorporate in wax melted and made liquid, lay the skin of the face plain and euen, and smoothe all wrinkles. The root of Acorum, serueth likewise to purifie the skin from all outward deformities. Herb Willow giueth the hair of the head a yellow colour. Hypericon, which also is named Corion, dieth it black: likewise doth Ophrys, an herbe growing with two leaues and no more, like vnto jagged Beets or Colewoorts. Also Polemonia setteth a black colour vpon haire, if it be boiled in oile. As for depilatorie medicines, which are to take away the haire from any part, the proper place to treat of them is indeed among those that pertain especially to women: but now adaies men also are come to it, and vse such deuises as well as women. The most effectually of all others be they accepted, that are made of the herbe Archezotis. The juice of Tithymall is likewise very good to fetch off haire: and yet there be some, who pluck them out first with pinfers, and then with the said iuice incorporat with oile, rub the place often in the hot sun. Finally, Hyssop tempered with oile into a liniment, is excellent to heale the mange or scab in four-footed beasts: and Sideritis hath a peculiar vertue for to cure swine of their squinies or strangles. Now is it time to pursue all other kindes of hearbes which remaine behind.

* Some think this is meant of hairs which in the paps, which should be swallowed downe by cūā, e in a cup of drinke, and so rangle in the breast, &c. a disease called by Aristotle Trichia. And Rondeletius is of an opinion, that some such thing resembling an haire may breed within the breast, of putrified humours or corrupt milke. But it seemeth by that which followeth, that Plinie meant no such matter, but rather some outward eye-sore.

THE

THE TWENTY SEVENTH BOOK OF THE HISTORIE OF NATVRE,

WRITTEN BY C. PLINIUS
SECVNDVS.

The Proeme.

CHAP. I.

Ertes, the farther that I proceed in this discourse & history of mine, the more am I forced to admire our forefathers and men of old time: for, considering as I do, what a number of simples there yet remain behind to be written of, I cannot sufficiently adore either their carefull industry, in searching and finding them out; or their liberal bounty, in imparting them so friendly to posterity. And verily, if this knowledge of Herbes had proceeded from mans inuention, doubtlesse I must needs haue thought, that the munificence of those our ancestors had surpassed the goodnesse of Nature her selfe. But now apparent and well knowne it is, That the gods were authors of that skil and cunning, or at leastwise there was some diuinitie and heavenly instinct therein, euen when it seemed to come from the braine and head of man: and to say a truth, confesse we must, That Nature (the mother and nource of all things) both in bringing forth those simples, and also in reuealing them with their vertues to mankind, hath shewed her admirable power as much as in any other work of hers whatsoeuer. The herbe Scythica is brought hither at this day out of the great fens & meers of Moëotis, where it groweth. Euphorbia commeth from the mountain Atlas, far beyond Hercules pillars & the straits of Gibraltar, and those are the very vtmost bounds of the earth: from another coast also, the herbe Britannica we haue, transported vnto vs out of Britaine, and the Islands lying without the continent, and diuided from the rest of the world; like as Æthiopia out as far as Æthyopia, a climat directly vnder the Sun, and burnt with continuall heat thereof: besides other plants and drugs necessary for the life and health of man, for which merchants passe from all parts too and fro, and by reciprocall commerce, impart them to the whole world; and all by the meanes of that happy peace which (through the infinite maiesty of the Roman Empire) the earth inioieth: in such sort, as not only people of sundry lands and nations haue recourse one vnto another in their traffick & mutual trade, but high mountains also & the cliffes surpassing the very clouds, meet as it were together, & haue means to communicat the commodities, euen the very herbs which they yeeld, one to the benefit of another: long may this blessing hold, I pray the gods, yea and continue world without end: for surely it is their heauenly gifts, that the Romans as a second Sun should giue light and shine to the whole world.

CHAP. II.

¶ Of the poison Aconite, and the Panther which is killed thereby.

Aconite alone, if there were nothing els, is sufficient to induce any man to an endlesse admiration and reuerence of that infinit care and diligence which our antients employed in searching out the secrets of Nature; considering how by their means we know there is no poison in the world so quicke in operation as it, inso much as if the shap or nature of any living creature

creature of female sex be but touched therewith, it will not liue after it one day to an end. This G was that poison wherewith *Calphurnius Bestia* killed two of his wiues lying asleep by his side, as appeareth by that challenge and declaration which *M. Caelius* his accuser framed against him. And hereupon it was, that in the end of his accusatory inuestiue, he concluded with this bitter speech, That his wiues died vpon his finger. The Poets haue feined a tale, That this herb should be ingendered first, of the fume that the dog *Cerberus* let fall vpon the ground, frothing so as he did at the mouth for anger when *Hercules* pluckt him out of hell: and therefore it is forsooth, that about *Heraclea* in *Pontus* (wher is to be seen that hole which leaderh into hel) there groweth *Aconit* in great plenty: howbeit, as deadely a bane as it is, our forefathers haue deuised means to vse it for good, and euen to saue the life of man: found they haue by experience, that being giuen in hot wine, it is a counterpoison against the sting of scorpions: for of this nature it is, that H if it meet not with some poison or other in mens bodies for to kill, it presently fets vpon them and soon brings them to their end: but if it encounter any such, it wrestleth with it alone, as hauing found within, a fit match to deale with: neither entreth it into this fight, vnlesse it find this enemy possessed already of some noble and principall part of the body, and then beginneth the combat: a wonderfull thing to obserue, that two poisons, both of them deadely of themselves and their own nature, should die one vpon another within the body. and the man by that mean only escape with life. Our ancestors in times past staid not thus, but found out and deliuered vnto vs proper remedies also for wilde beasts; and not so contented, haue shewed means how those creatures should be healed which are venomous to other: for who knoweth not, that scorpions I if they be but touched with *Aconite*, presently become pale, benumbed, astonied, and bound, confessing (as it were) themselves to be vanquished and prisoners: contrariwise, let them but touch the white *Elleboro*, they are vnbound and at liberty again; they recover (I say) their former vigor and vertue: whereby we may see, that the *Aconite* also giueth the bucklers to enemies twaine, pernicious poisons both, the one to it selfe, and the other to all the world. Now if K happily any man should say, That the wit and head alone of man could possibly compasse the knowledge of these things, surely he should shew therein his ingratitude and impiety vnto the gods, in not acknowledging their beneficence. The people about *Heraclea*, to kil the Panthers which breed in those parts, vse to rub with *Aconite* certain gobbets of flesh, which they doe lay about the mountains as a bait and bane for them: and vnlesse by this meanes they did destroy them, no doubt they would fill the whole countrie, which is the cause that some call it *Pardalich-anches*, *i. libard-bane*: but they again on the other side, presently haue recourse to the excrements of a man, as I haue before declared, the only counterpoison whereby they saue themselves: who doubteth now, but the knowledge of this secret came first to them by meere chance? and considering that it is not possible to render a reason of the nature and vsage of such wild beasts (and whensoever we see the like to fall out, we count it still a new & strange accident) we must needs attribute the finding thereof to Fortune.

CHAP. III.

¶ That of all Creatures and Inventions in this life, the author is a god.

THIS Chance and Fortune then, by means wherof we attaine to so many inuentions that we haue, is a diuine power, and no lesse indeed than a God: by which name also we vnderstand and call that great mother and mistresse of all things, dame Nature: and surely considering that conjecturall it is and doubtfull, Whether these wild beasts come by this knowledge day by day at a venture, or were indued naturally at the first with that perceiuaunce? we haue as great reason to attribute a diuinity and godhead to the one, as the other. Well, be it Chance, or be it Nature, that hath thus ordered the matter, certes a great shame it had bin, that all other creatures should haue knowne thus (as they do) what is good and profitable for them, and man only remain ignorant. But such was the industrie and goodnesse of those ancestors of ours in times past, that they not only deuised means, but also deliuered to posterity, how this venomous M herbe *Aconitum* might be most safely and commodiously mingled in those collyries and medicines which be ordained for the eies: an euident argument and plaine prooffe, I assure you, that there is nothing so bad but it hath some goodnesse in it, and may be vsed well. And therefore dispensed withall I looke to be, if I who hitherto haue written of no poisons, put downe the description

A scription thereof; to the end that a man may know it, and by knowing, take heed and beware. This herb hath leaues, resembling *Cyclamin* or the *Cucumber*, in number no more than foure, and those toward the root in some sort rough and hairy. The root but small, and the same like vnto a sea crabfish: and therefore some haue named it *Cammaron*, whereas others, for the reason before shewed, call it * *Theliphonon*. And for that the root doth turn and crook inward in manner of a scorpions taile, there be that giue it the name *Scorpion*. There wanted not others who chose rather to call it * *Myostotonon*, because with the very sent it is able to kill mice and rats a great way off. It groweth naturally vpon bare and naked rocks, which the Greeks call * *Aconas*: which is the reason (as some haue said) why it was named *Aconitum*. And for that in the place B where it groweth or neare vnto it, there is no mould, nor so much as any dust found for to giue it nourishment, some haue thought it took the name therupon. Yet there be others who assigne another cause of that denomination, to wit, for that it is as forcible and as speedy in working the death of those whom it toucheth, as the hard stopec or rag in turning or wearing the edge of any yron tooles; for no sooner commeth it neere vnto the body and is applied vnto it, but the quicke operation is sensibly found.

CHAP. IIII.

¶ Of *Æthiopis*, *Ageraton*, *Aloe*, *Alcea*, *Alypon*, *Alfina*, *Androsace*, *Androsamon*, *Ambrosia*, *Anonis*, *Anagryon*, and *Anonymon*.

THE leaues of *Æthiopis* are great and many in number, hairy also neere vnto the root, and otherwise correspondent to those of *Mullen*. It riseth vp with a four cornered stem, rough in handling, and after the manner of the main stem of the *Clot-bur*, hauing many concauities or holes like arm-pits in the grafting of the branches to the said stem. It beareth seeds like vnto Eruile, which ordinarily grow double two by two, and are white. The roots be many, and those long, full and well nourished, soft, and clammy in tast: being dried, they wax black & grow hard withal; in such sort, as a man would take them for horns. They grow ordinarily in *Æthiopia*, also vpon the mountain *Ida* in the region of *Troas*, and in *Messenia*. The right season to gather these roots, is in Autumne; and then they ought to be laid a drying in the Sun for certain daies together, to keep them from moulding. Being taken in white wine, they help the infirmities of the matrice; and the decoction therof drunk, is good for the *Sciatica*, the pleurisie, & the hoarsenesse in the throat. But that which commeth out of *Æthiopia* is counted best and hath no fellow, for it worketh presently.

As for *Ageraton*, it is an herb of the *Ferula* kind, growing vp to the height of 2 spans like to *Origanum*, but that the floures resemble buttons or brooches of gold. The fume of this herbe when it burneth, prouoketh vrin and mundifieth the matrice, especially if a woman sit in a bath thereof, and do soment the natural parts therewith. The reason of the name *Ageraton*, is this, because the floures continue very long before they see-m to fade and wither.

Aloe is an herbe which hath the resemblance of the sea-onion, but that it is bigger and the leaues be more grosse and fat, chamfered or channelled biass all along: the stem that it beareth, E is tender, red in the midst, not vnlike to *Anthericon*: one root it hath and no more, which runneth directly deep into the ground in manner of a big stake: strong it is to smell vnto, and bitter in tast. The best *Aloe* is brought out of *India*: but there groweth good store thereof in *Asia*, howbeit of no vse, but that they lay the leaues fresh vnto green wounds, for they do incarnate and heale wonderfully, like as their iuice also. And for that it is such an excellent wound-herbe, folk vse to set and sow it in barels or pipes pointed beneath, and broad above, like as they do the greater *Houfseek*. Some there be who for to draw a iuice or liquor out of it, stay not vntill the seed be ripe, but cut the stem for that purpose: others make incision also in the leaues: moreover there is otherwhile found in *Aloe* a certain liquid gum issuing out of it self, and sticking fast to the stem thereof: and therefore they hold it good to paue or ram the ground hard all about the place where *Aloe* groweth, that the earth should not drink vp the liquor which distilleth from it. * Some haue written that in *Iury* about *Ierusalem*, higher into the country, there is a certain minerall *Aloe* to be found, growing in manner of a mettall within the ground: but there is none worse than it, neither is there any blacker or moister. If you would know the * best, chuse that which is fat and cleare, of a red colour, brittle and apt to crumble, close compact in manner of a liuer,

* *Femalbane*.

a liuer, easie also to melt and resolute. If you see any that is black, hard, sandy, or grittie (a thing which may soone be knowne betweene the teeth in tastings of it) the same is to be rejected for naught. Many there be who do sophisticate it with other gums and the juice Acacia. Aloe is of an astringent nature, seruing to make thick, to close fast, and gently to heat any part of the body. Much vse there is of it in many cases, but principally to loosen the belly: being the onely purgatiue medicine that is comfortable to the stomack and strengtheneth it, so farre is it from offending the same by that laxatiue vertue or any contrary qualitie that it hath: & for this purpose the ordinary dose to be giuen in drinke, is one dram. But when the stomacke is feeble and wil keep nothing, the manner is to take the quantity of one spoonfull thereof, in two cyaths of water either warm or cold, twice or thrice in a day by turns, pausing some space between as need requireth, and as the patient shall find expedient. Morcouer, if occasion be to purge the bodie thoroughly, Physitians vse to giue three drams thereof, and not above. And the better wil it work if it be taken presently before meat. If the head be rubbed or annointed therewith and some austere and astringent wine, against the haire and in the Sunne, it retaineth the haire that is ready to fall. A liniment made of it together with vineger and oile Rosat, applied vnto the forehead and temples in maner of a frontall, easeth the head ach: so doth it also, if by way of embrochation it be distilled from aloft vpon the head in a more thin and liquid substance. A very conuenient and singular medicine it is to heale all the diseases incident to the eies, but especially for the itch and scab rising in the eie-lids. Also when the skin looketh blacke and blew vnder the eies, or otherwise be marked by occasion of some bruise, it taketh them all away, if it be applied thereto with hony: and namely that which cometh out of Pontus. It is a proper remedy for the amygdals, the gums, and all the vlcers of the mouth. Taken to the weight of a dram in water, it stablisheth the spitting and voiding of bloud vward, if it be not excessiue: but in case it be violent & immoderat, it ought to be drunk in vineger. The flux of bloud in wounds, or the bleeding in any part whatsoever, it stancheth, either applied by it self alone or els with vineger. In other respects also it is right souerain for wounds, a great healer, and that which vnitheth & skinneth quickly. A singular remedy it is to be either cast vpon the vlcers of a mans yard, the swelling piles, the rifts & chaps of the seat, in plain dry powder by it self alone, or els to be applied thereto with wine or with cuit, according as the griefe requireth to be mitigated or repressed. Moreouer, it gently stablisheth the immoderat flux of bloud by the hemorrhoids. And in a clyster it is excellent to heale the exulceration of the guts in the bloody flux. Also it is very good & whole-some for those who hardly digest their meat, to drink it a pretty while after supper. And for the Jaundise it is singular to take the weight of 3 oboli thereof in water. It is good to swallow pills of Aloe either with boiled hony or Turpentine for to purge the guts and inward bowels: and a salve made therewith, taketh away the whitflaws and impostumations about the naile roots: for eie-salues, and other ocularie medicines, it ought to be washed, that the most sandy and grosse parts thereof may settle to the bottom and be separated from the purer substance: or els it ought to be torried in an earthen vessell, and plied continually with stirring with a quill or feather, that it may be burnt and calcined equally.

Touching Alcea, it is an herb bearing leaues like vnto Vervain, which also is called Peristemon, rising vp with three or foure stems, well garnished with leaues, and carrying floures in maner of Roses: it putteth forth for the most part six white roots, and those a cubit long, not directly, but crooked and bending bias. It groweth ordinarily in battle grounds, and such as stand somewhat vpon water. The roots chiefly do serue in Physick, which being taken with wine or water, do cure the dysentery or bloody flux, stop a lask, and knit those that are burst inwardly vpon some violent strain or convulsion.

As for Alypon, a pretty herbe it is, shooting vp with a slender stem adorned with little soft and tender heads, not vnlike to the Beet, quick and sharp in taste, biting exceedingly and burning, howbeit clammy to the tongue. Taken in mead with a little salt, it maketh the body soluble. The least dose that is giuen thereof is two drams, from which they arise to foure, which is counted a reasonable & indifferent potion: but neuer exceed the weight of six. And ordinarily this purgation is taken by them that haue occasion to vse it, in broth of a cock, capon or pullet.

* Alfine, which some call * Myosoton, is an herbe growing among * groues, whereupon it tooke that name Alfine. It begins to put forth and appeare about ground about midwinter, and by midsummer it is dried away: when it traileth and creepeth vpon the ground, the leaues doe represent

* Chickweed.
* i. Mouse ear.
* Alfine a groue.

A represent the ears of little mice. But another herb there is, as I will shew hereafter, which more fitly and properly in that regard may be called * Myosotis. Surely this might be taken well enough for * Hexine, but that the leaues be smaller, and those lesse hairy. It groweth usually in gardens, and most of all vpon walls: when it is stamped or bruised, it senteth of a Cucumbers Commonly used it is in cataplasmes for to be applied vnto impostumes and inflammations: and employed it may be in all those cases whereunto Parietary serueth. For the same effect they haue both, but that Chickweed is weaker in operation. And this particular property it hath by it selfe besides, to stay the flux of waterie humors into the eies: also to heale all vlcers, and those especially which are in the priuy parts, being applied thereto in a pulsette with Barly meale: the juice thereof is good to be dropped or poured into the ears.

B Androsaces is a * white herb, bitter in taste, without any leaues, but in stead thereof it hath certain little husks or cods hanging by small bents, and those containing seed within them. It groweth along the sea side, and most of all vpon the coasts of Syria. The cods being stamped or boiled in water, vineger, or wine, are good to be giuen (to the weight of 2 drams) to them that are in a dropsie, for they prouoke vrine mightily. It serueth also in the cure of the gout, either taken by the mouth, or applied outwardly in a liniment. Of the same operation is the seed also.

C Androsæmon, or as some call it Afeyron, is not vnlike to Hypericon, whereof I haue already spoken: but that the stalks be bigger, stand thicker together, and are more inclining to red: the leaues be white or grey, fashioned like vnto those of Rue: and the seed resembleth that of black Poppie: crush or bruise the vpmost crops or heads thereof, they yeeld from them a bloody iuice: in time it senteth like vnto rosin: and is found ordinarily growing in vineyards. The proper time to gather this herb is in mid Autumne, and so to hang it vp a drying. The manner is to stampe the herb, seed and all, for to purge the belly: whereof they drink either first in the morning or last after supper, the weight of two drams in mead, wine, or sheere water, so that the whole draught of the potion be a full sextar and not above. Properly it doth euacuate choler: and is principally good for the Sciatica: but the morrow after the patient ought to swallow down a dram weight of the Capers root mixed with rosin: and then after pausing foure daies between, to do the like againe: after which course of purging, if the patient be of a strong complexion, he may drinke wine; otherwise, those of a weaker constitution ought to forbear, and drinke water. Excellent good it is for all gouts of the feet, and for burns, if it be applied vnto the place, and a good vulnerary herb besides, and stancheth the bleeding of wounds.

D Ambrosia is a name that keepeth not to any one herb, but is common to many. Howbeit, the true Ambrosia runneth vp from the root into one small stem, which notwithstanding brancheth thick, riseth to the height of three spans or thereabout, and ordinarily is one third part, shorter than the root: and the leaues be like Rue. Toward the foot of the said stem it bringeth forth certain little grapes with grain or seeds within, and those haue a sent of wine, and hang down from the branches of the said herb: for which cause some there be who call it Botrys, although others giue it the name Artemisia. The people of Cappadocia vse therewith to make themselves chaplets to weare vpon their heads. This herb is much used in those accidents that require to be dissolved and sent out by the pores of the skin.

E Anonis (which some chuse rather to call Ononis) is an herbe full of branches like vnto Fennigreek, but that it springeth thicker from the root, brancheth more, and is more hairy: of a pleasant smell, and prickly, after the spring. Many vse to keep it condite in pickle. Beeing applied to any vlcere while it is fresh and Greene, it eateth away and consumeth the excrescence of proud flesh in the brims or edges thereof. The root is good for the paine of the teeth, if it be sodden in vineger and water mingled together, and the mouth washed withal: the same taken in drinke with hony, expelleth grauell and stone: boiled in Oxy-mell to the consumption of the one halfe, it is a singular drink for the falling sicknesse.

F Anagyros, which some call Acopos, is an hearbe which brancheth thicke, of a strong and stinking smell: it beareth floures like vnto those of Beets: in certaine cods like horns, which be of a good length: it bringeth forth seed resembling kidnies in shape, the which in harvest time becommeth hard: the leaues are singular good to be laid vpon impostumat swellings: they serue also for women which be in hard trauell with child, to be hanged or tied fast about them; with this charge, that presently they be remoued after they are deliuered. But if the child be dead & stick still in the matrice, or in case the afterbirth tarry behind, & wil not come away after the infant

fant is born : or if a woman desire to see her monthly sicknes, it is good to drink a dram weight of the leaues in wine cuit. And in that maner they are giuen to those who be short winded : but in old wine against the sting of the venomous spiders Phalangia. The root is singular to be put to those plasters which either do resolute or maturate any impostumed place. The seed chewed, staeth immoderate vomits.

* Some take it
for Bugle or
Scler heal.
* Namelesse.

* Anonymos, finding no name to be called by, got therupon the name * Anonymos. a Plant this is brought out of Scythia to vs ; highly commended by *Hicesius* a Physitian of great name and authority, also by *Aristogiton*, for an excellent vulnerary, if it be bruised or stamped in water, and so applied; but taken inwardly in drinke, it is good for womens breasts and the precordiall parts about the heart, if they haue gotten a stripe, or be bruised: also for such as reach vp blood. Some haue ordained a vulnerary drink to be made thereof for those that be wounded. But what is said moreouer as touching this herb, I hold meere fabulous : and namely, that if two pieces of yron or brasse be put into the fire and burn together with this herbe, fresh and new gathered, they will fonder and joine againe.

CHAP. V.

¶ Of *Erith* or *Goose grasse*. Of the *Clot-bur*. Of * *Ceterach*. of *Asclepias* and *Aster* or *Bubonium*. Of *Ascyron* or *Ascyroides*. Of *Aphace*, *Alcibium*, and *Alectorolophus*.

* or *Scolopendrium*.

ERith is by some called in Greeke *Aparine*, by others *Omphalocarpus* and *Philanthropus*. An herb giuen to be full of branches, rough and prickly, carrying fise or six leaues growing round together about the said branches in order like a star, and a pretty distance there is between euery of these roundles. The seed is round, hard, hollow, and sweetish. It groweth in corn fields, in gardens and meadows: rough it is, that it is ready to * catch hold of folkes clothes as they passe by, and to stick vnto them. An effectuall herb against serpents, if a dram of the seed be drunk in wine : also for them who are pricked with the spiders Phalangia. The leaues haue a singular vertue to repress the abundant flux of blood out of wounds, if they be outwardly applied : like as the iuice hath a speciall property to help the infirmities of the ears, being dropped or poured into them.

* Whereupon
they call it *Philanthropus*, i. a
louer of man.

Arction, which some rather name *Arcturus*, is like in leafe to the great Mullen or Taperwort, but that it is more rough : the stem tall and soft, and the seed resembling Cumin. It grows ordinarily in stony grounds, with a root tender, soft, & sweet. Being sodden in wine, it easeth the tooth-ach, so that the patient hold the decoction in his mouth. For the Sciatica and frangurie it is good to be taken at the mouth in wine; and outwardly applied, it healeth burns and cureth kibed heeles: in which cases the root is much commended, if together with the seed it be stamped with wine, and a fomentation made with the decoction thereof.

* *Trientalibus*.

As touching *Asplenium*, some there be who call it *Hemionion* : an herbe putting forth many leaues * foure inches long: the root is giuen to haue cranks and holes, and those full of mud or dirt : much what do the leaues grow like to Fearn : the root is white and rough. It beareth neither stalk, stem, nor seed. It delighteth to grow among rockes and stones, vpon walls standing in the shade, and in moist grounds. The best is that which we haue out of Candy. It is commonly said, that if the decoction of the leaues boiled in vinegar be drunke forty daies together, it waisteth the swelled spleen. The same may be applied in a liniment for that purpose, & so also they do stay the excessive yex or hoeket. This herb would not be giuen to women, for it causeth them to be barren.

Asclepias beareth leaues resembling Iuie, long branches, many small roots, and those odoriferous; howbeit the flours haue a strong and rank stinking smell with them, the seed much like to the *Axvitch*. It loveth to grow vpon mountains. The roots of this herbe not only taken inwardly in drinke, but also applied outwardly in a liniment, do ease the wrings of the belly, and resist the sting of serpents. *Aster*, is by some named *Bubonium*, for that it is a present remedy for the tumours arising in the share. This herbe putteth vp a small stemme, with two or three leaues somewhat long. In the top thereof it beareth certaine little heads inuironed with spokie leaues, and those disposed round in manner of a starre. Taken in drinke, it is thought to be a preseruatiue against the venom of serpents. But to make a medicine for the share beforenamed,

A it must (they say) be gathered with the left hand : and then kept fast bound neere vnto the middle or girding place of the patient. And surely it helpeth the Sciatica, in case it be tied sure to the affected place.

Ascyron and *Ascyroides*, be herbes resembling one another, and both like vnto *Hypericon* : howbeit that which is named *Ascyroides*, hath the bigger branches, and those streight and direct, much after the manner of Fenell and such like, red throughout : and in the top thereof appeare little heads or knobs, of a yellow color. The seed contained in certain pretty cups, is small, black, and gummie : bruise the said tops or knobs between your fingers, they seem to stain them with blood, which is the cause that some call this herb * *Androsæmon*. The seed is singular for the Sciatica, namely if the patient drink two drams weight thereof in a sextar of Hydromel, that is to say, mead or honied water : for it looseth the belly and purgeth choler. A liniment made therewith, is much commended for a burne.

* Mans blood

Apace is an herb which hath very fine and small leaues : and a little taller it is than the *Lentill*; but larger cods it beareth, wherein lie three or foure seeds, blacker, moister, and smaller than the grains of the said *Lentill*. It groweth vpon corn lands. More astringent it is by nature than the *Lentill*, and bindeth stronger ; for all other matters it worketh the same effects. The seed boiled, staeth vomits and lasks.

Touching * *Alcibion*, what manner of herb it should be, I neuer could yet finde in any writer. But they giue direction to stamp the roots and leaues thereof, and so in a cataplasme to apply them vnto any place stung with serpents, and to drink them also. Now they prescribe for the drink, to take of the leaues one good handfull, and to stamp them, and so to giue them in three cyaths of meere wine full of the grape : or of the root three drams weight, with the like measure of wine.

na. with it
Arction.

Alectorolophus in Greek, called by vs in Latine *Crista Galli*, i. Cocks-comb, hath leaues for all the world resembling the crest or comb of a cock, and those in number many : a slender stem and black seed, inclosed within certain cods. A soueraign herb it is for them that cough, if it be boiled with bruised beans, and taken in maner of an electuary with hony. It scattereth the cloudy films that trouble the eye-sight; & the maner is to take the seed whole and sound as it is, and to put it into the eye: it is nothing offensive nor troubleth that part one whit, but gathereth to it selfe all those grosse humors which impeached the sight. And in very truth, this seed whiles it is within the eye changeth colour, and being black before, beginneth to wax white; it swelleth withall, and in the end commeth out of the eye by the owne accord.

CHAP. VI.

¶ Of *Alum*.

THe herb which we name in Latine *Alum*, the Greeks call *Symphytum Petræum*, as if one would say, Comfrey of the rock: and verily like it is to wild *Origan*. The leaues be small, and three or foure branches spring immediatly from the root : the tops whereof resemble those of *Thyme*. Much branched it is otherwise, odoriferous in smell, and sweet in taste: it draws down water into the mouth and causeth spitting. The root which it putteth forth is long & red. This herb taketh pleasure to grow in stony places among rocks: in which regard it took the addition of the name *Petræum*. Singular good it is for the sides and flanks, the spleen, reines, and wrings of the belly : for the breast, the lights, for such as reject or cast vp blood, and are troubled with the asperity and hoarsnesse in the throat: for which infirmities, the root is to be stamped, boiled in wine, and so drunke; yea, and otherwhiles to be reduced into a liniment, and so applied. Moreover, the chewing of it only, quenchech thirst, and hath a principal vertue to coole the lungs. Being applied outwardly in the form of a cataplasme, it knitteth dislocations, helpeth convulsions, is comfortable to the spleen, & the bowels or guts, if they be fallen by any rupture. The same root roasted or baked vnder the ashes, staeth a lask, in case it be first shrugged from the hairy strings thereof and pilled; and then after it is beaten into powder, be drunk in water with nine Pepper corns. And for healing of wounds, so soueraigne it is, that if it be put into the pot and sodden with pieces of flesh, it will fonder and reioine them, whereupon the Greekes imposed vpon it the name *Symphytum*, i. Confound: finally, it serueth to waite again broken bones.

CHAP.

¶ Of Reits or sea-grasse, and Wallwort. Of the wild vine, and Wormewood.

THe sea-weed that looketh red, named in Latine Alga, is very proper for the prick and sting of Scorpions.

Touching Wallwort, it hath leaues carrying a strong and stinking smell with them: the stems be rough and parted into ioints: the seed black like to that of the luy, saue that the berries containing the same be soft. This herb delighteth in shady, cool, rough, and watery places. Beeing giuen to the full quantity of one Acetabulum, it is singular for the inward maladies which be proper to women.

The wild Vine, called by the Greeks Ampelos-Agria, is an herbe (as I haue sufficiently described already in my Treatise of Vines planted and wel ordered by mans hand) which putteth forth hard leaues of Ash-colour, long branches and winding rods clad with a thicke skin, and the same be red, resembling the floure Phlox, which in the chapter and discourse of Violets, I called Iouis Flamma; and a seed it beareth much like vnto the graines within a Pomegranate. The root boiled in three cyaths of water and two cyaths of the wine comming out of the Island Coos, is a gentle emollient of the belly, and maketh the body soluble, in which regard it is giuen with good successe to such as be in a drop sicke. A very good herb for women, as well to rectifie the infirmities of the matrice, as also to scoure and beautifie the skin of their face. Moreover, for the sciatica it is good to stamp it leafe and all, and to annoint the grieved place with the iuice thereof.

As for Wormewood, there be many kindes thereof. One is named Santonicum of a city in France called Saints: another, to wit Ponticum, taketh that name of the kingdome Pontus; where the sheep feed fat with it, which is the cause that they be found without gall: neither is there a better Wormewood than it: much bitterer than that of Italy, and yet the marow or pith within of that Ponticke Wormewood, is sweet to ours. Meet and requisite it is that I should set down the vertues and properties thereof, an herb (I must needs say) as common as any, and set down the vertues and properties thereof, an herb (I must needs say) as common as any, and the most ready at hand, howbeit, few or none so good and wholesome: to say nothing of the especial account which the people of Rome make of it about their holy sacrifices and solemnities: for in those festiuall holydaies named Latinae, at what time as there is held a great running with chariots for the best game, he that first attaineth to the goale and winneth the prise, hath a draught of VVormewood presented vnto him. And I beleue verily, that our forefathers and ancestors deuised this honourable reward, for the good health of that victorious chariotier, as judging him worthy to liue still. And in truth, a right comfortable herb it is for the stomack, and doth mightily strengthen it: In which regard, there is an artificiall wine that carrieth the strength and tast thereof, named Abinthites, according as I haue shewed heretofore: moreover, there is an ordinary drinke made of the decoction of VVormewood boiled in water: for the right making whereof, take six drams weight of the leaues and sprigs together, seeth them in three sextars of raine water, and in the end put thereto a small quantity of salt; which done, the liquor ought to stand a day and a night afterwards to coole in the open aire, and then is it to be vsed: Certes, there is not a decoction of any herbe of * so great antiquitie as it, and knowne to vs: I haue bene vsed so long. Moreover, the infusion of VVormewood is in great request, and a haue bene vsed so long. Moreover, the infusion of VVormewood is in great request, and a common drinke: for so we vse to call the liquor wherein it lay steeped a certain time. Now this would be considered, that be the proportion of water what it will, the said infusion ought to stand close couered for three daies together. Seldome or neuer is there any vse of wormewood beaten to powder, ne yet of the iuice drawn by way of expression. And yet those that presse forth a iuice, take the VVormewood when the seed vpon it beginneth to swell and wax full, and being newly gathered, let it lie soking in water three daies together: but if it were drie before, to steep it a whole seuen night: which done, they set it ouer the fire in a brasen pan, with this proportion, namely, ten hemines of the herbe, to five and fortie sextars of water, and suffer it to boyle vntill a third part of the liquor be consumed: after this the decoction must run through a strainer, with hearbe and all well pressed: then ought it to be set vpon the fire againe, and suffer to seeth gently and leisurely to the height or consistence of honey, much after the order of the syrrop made of Centaurie the lesse. But when all is done, this iuleb or syrrop of VVormewood

* VVormewood is vsed in some read VVormewood, that is, if this drinke be stale, and not vsed presently, it is good for nothing.

A wood, is offensive to the stomack and head both; whereas that decoction first above named, is most wholesome: for altringent though it be, and binding the mouth of the stomack aloft yet it doth euacuat choler downward, it prouoketh vrine, keepeth the body soluble, and the belly in good temper, yea and if it be pained, giueth great ease: the worms ingendered therein, it expelleth: and being taken with Sefeli, and Celticke nard, so there be a little vineger put thereto, it dispatcheth all ventosities in the stomack, and cureth women with child of that inordinat desire and strange longing of theirs: it clenseth the stomack of those humors which cause loathing of meat, bringeth the appetite againe and helpeth concoction: if it be drunke with Rue, Pepper, and salt, it purgeth it of raw humors & crudities occasioned by want of digestion. In old time, Physicians gaue wormewood for a purgative; but then they tooke a sextar of sea water that had bin kept long, six drams of the seed, with three drams of salt, and one cyath of hony: and the better will this purgation worke, in case the poise of salt be doubled; but it would be puluerized as fine as possibly may be, to the end that it might passe away the sooner, and worke more easily. Some vse to giue the weight before said in a gruell of Barley groats, with an addition of Penitroyall: others against the Palisie: and others againe had a deuise to put the leaues of wormewood in figs, and make little children to eat them so, that they might not tast their bittrenes. Wormewood being taken with the root of Floure-de-lis, dischargeth the brest of rough fleagme, and clenseth the pipes. For the ianduse, it would be giuen in drinke raw, with * Parsley or Maiden-haire. Supped hot by little and little in water, it breaketh wind and resoluet ventosities: and together with French Spike-nard, it cureth the infirmities of the liuer: and taken with vineger, or some gruell, or els in figs, it helpeth the spleen: giuen in vineger, it helpeth those that haue eaten venomous Muthrums, or be poisoned with the gum of Chanellion called Ixia. In wine if it be taken, it saueeth those who haue drunk Hemlock: it resisteth the poison inflicted by the sting of the hardi throw, the sea dragon, and scorpions. It is holden to be singular for the clarifying of the sight: if the eyes be giuen to watering, it represseth the rheum or flux of humors thither, so it be applied with wine: cuit: and laid vnto contusions, and the skin blacke and blew vnder the eyes, with hony, it reduceth the place to the native colour againe. The vapour or fume of the decoction of wormewood receiued into the eares, shageth their paine: or if they run with corrupt matter, it is good to apply the same, reduced into powder and incorporat in hony. Take three or foure sprigs of wormewood, one root of Nardus Gallicus, boile them in six cyaths of water, it is a soeraigne medicine to drinke for to prouoke vrine, and bring downe the desired sicknesse of women: or beeing taken simply alone with hony, and withall put vp in a pessarie made with a locke of wooll, it is of speciall operation to procure their monthly terms: with honey and salnitre, it is singular for the Squinancie: it healeth chill-blanes, if they be bathed with the decoction thereof in water: applied vnto fresh or green wounds in a cataplasme, before any cold water come vnto them, it healeth them: and besides, in that manner, it cureth the scabs in the head: being incorporat with * Cyprian wax or figges, and so applied to the flanks or hypochondrial parts, it hath a particular vertue by it selfe to helpe their griefes. Moreover, it killeth any itch. Howbeit, this would be noted, that wormewood in no case must be giuen to those that haue an ague. Let a man or woman vse to drinke wormewood, they shall not be sea-sicke nor giuen to heauing, as commonly they be that are at sea. If wormewood be worne in a trusse to the bottom of the bellie, it allayeth the swelling in the share. The smell of wormewood procureth sleepe: or if it be laid vnder the pillow or bolster, provided alwaies that the patient be not ware of it. Either basted within cloaths, or strewed vpon them, it keepeth away the moth. If one rub his body therewith and oile together, it driueth gnats away: so doth the smoke thereof also when it burneth. If writing inke be tempered with the infusion of wormewood, it preserveth letters and bookes written therewith, from being gnawne by mice. The ashes of wormewood burnt, and incorporate with oile Rosat to an ointment, coloureth the haire of the head black. There is yet another kinde of Sea wormewood, which some call Seriphium: and excellent good is that which groweth about the city * Taphosiris in Ægypt. Of this wormewood it is, that the priests of Isis in their soleinne marches and processions, vse to beare branches before them. The leaues be somewhat narrower than those of the former, and the bitternesse not altogether so much. An enemy it is to the stomack: howbeit, the belly it loosneth, and chafeth worms out of the guts; for which purpose, it is good to drinke it with oile and salt: or else the infusion thereof in a * supping or grewell made with the floure of the three-moneth corne. To make the decoction

* Cum apio, not opio.

* Or the Cerot Cyprian, after Dioscorides.

* So called, because Olyris was entered, and his sepulchre renewed there.

* Or is her, a kind of sweet root called H. p. f. ma. h. o. u. c. which signifies a so i. wa. ter gruell.

coction of wormwood well, there would be taken a good handfull of wormwood, and foddren in G a sextar of water to the consumption of the one halfe.

CHAP. VIII.

¶ Of stinking Horehound : of Mille graine, or Oke of Ierusalem : of Brabyla, Bryon, Bupleuros, Catanance : of Calla, Circeæ, and Cersium : of Crataegonon and Thelygonum : of Crocodilium and Cynoforchis : of Chrysolachanon, Cucubalon, and Conserua.

STinking Horehound, which some Greeks call Ballote, others Melampasjon, *i.* Black Horehound, is an herbe tufted full of branches: the stems be black and cornered; the leaues wherewith they be clad and garnished, are somewhat hairy, resembling those of sweet or white Horehound, but that they be bigger, blacker, and of a stinking sauer: but the leaues stamped and applied with salt, be very effectually against the biting of a mad dog: also, if they be wrapped in a Colewort or Beet leafe, and so roasted vnder the embers, they are commended for the swelling piles in the fundament. This Horehound made into a salue with honey, clenseth filthie vlcers.

Botrys is an herb full of branches, and those of a yellowish colour, and beset round with seed: the leaues resemble Cichorie. Found it is commonly growing about the banks of brookes and riuers. Good it is for them that be streight-winded and cannot draw their breath but sitting vpright. The Cappadocians call it Ambrosia, others Artemisia.

As for * Brabyla, they be astrigent in manner of Quinces. More than so, I find not any Author to write thereof.

Bryon no doubt is a Sea-herbe, like in leaues to Lettuce, but that they be riuelled and wrinkled as if they were drawne together in a purse: no stem it hath, and the leaues come forth at the bottom from the root: it groweth ordinarily vpon rockes bearing out of the sea: and ye shall find it also sticking to the shels of certaine fishes, especially such as haue gathered any mud or earth about them. The herbe is exceeding astrigent and desiccative, by vertue whereof it is a singular repercussive in all impostumes and inflammations of the gout especially, & such as require to be repressed or cooled.

Touching Bupleuros, I read that the seed thereof is given against the sting of serpents: and that the wounds inflicted by them, are to be washed or fomented with the decoction of the herb, putting thereto the leaues of the Mulberrie tree, or Origan.

Catanance is a meere Thessalian herb, and growing nowhere els but in Thessalie; and forasmuch as it is vsed only in amatorious matters, and for to spice loue drinks withall, I meane not to busie my selfe in the description thereof: howbeit, thus much it would not be amisse to note, for to detect and lay open the folly and vanities of Magitians; namely, that they went by this conjecture onely, that it should be of power to win the loue of women, because forsooth when it is withered, it draweth it selfe inward * like a dead kites foot. For the same reason also, I will hold my tongue and say neuer a word of the herb * Cemos.

* Cala is of two sorts: the one like to Aron, which loueth to grow in toiled and ploughed grounds: the time to gather this herb is before it begin to wither: the same operation it hath that Aron, and is vsed to the like purposes: the root thereof is commended to be giuen in drink for a purgation of the belly, and to prouoke the monthly termes of women: the stalkes boyled leafe and all together with some pulse or other into a pottage, and so taken, cure the inordinate prouocations to the stoole, and streinings thereupon without doing any thing. The second kind some call Anchusa, others, * Rhinochilia: the leaues resemble Lettuce, but that they be longer, full of plume or down; the root red, which being applied with the floure of barley groats, healeth shingles, or any other kind of *S. Anthonies* fire: but drunke in white wine, cureth the infirmities of the liuer.

Circeum is an herb like to winter Cherry or Alkakengi, but for the flours which are black: the seed small, as the graine of Millet, and the same groweth in huskes or bladders resembling little hornes: the root is halfe a foot long, forked for the most part into three or foure grains or branches: the same is white, odoriferous and hot in the mouth: it loueth to grow vpon rockes and stonie grounds lying pleasantly vpon the Sun. The infusion of this root in wine, is good to

A be drunke for the paine and other diseases of the matrice: but of the said root there ought to be taken three ounces stamped, and the same to steepe a day and night in 3 sextars of wine, for to make the infusion aboue-named. This portion also serues to send down the after-birth, if it stay behind. The seed of this herbe drieth vp milke, if it be drunke in wine or mead.

Cirson commeth vp with a slender stalke two cubits high, and seemeth to be made 3 cornered triangle-wise: the same is beset round about with prickie leaues: howbeit, the said prickies are but tender and soft. The leaues in forme resemble an ox tongue or the herb * Langue-de-boeuf, but that they be smaller and somewhat white, in the top whereof there put forth purple buttons or little heads, which in the end turne to a plume like thistle down. Some writers hold, that this herb or the root onely, bound vnto the swelling veines called Varices, doth allay the paine thereof.

Crataegonos spindleth in the head like vnto the eare of wheat, and out of one single root ye shall haue many shoots to spring and rise vp into blade and straw, and those also full of ioints. It gladly groweth in coole and shadowie places: the seed resemblith the grain of the Millet, which is very sharp and biting at the tongues end. If a man & his wife before they company together carnally, drink before supper for 40 daies together the weight of three oboli of this seed, either in wine, or as many cyaths of water, they shall haue a man childe betwene them, as some say. There is another * Crataegonos, called also Thelygonos; & the difference from the other may soon be known by the mildnesse in taste. Some authors affirme, that if women vse to drinke the floures of Crataegonos, they shall within 40 daies conceiue with child. But as well the one as

C the other applied with honey, do heale old vlcers: they incarnat and fill vp the hollow concavities of fistulous sores: and such parts as do mislike and want nourishment, they cause to gather flesh and fill the skin again: soule and filthy vlcers they mundifie, the flat biles and risings called Pani they rarifie and discusse: gouts of the feet they mitigat; & generally all impostumations, in womens breasts specially, they resolute and assuage. *Theophrastus* would haue a kind of tree to be called Crataegonos or Crataegon, which here in Italy they call * Aquifolia.

Crocodilium doth in shape resemble the thistly herbe or Artichoke called the blacke Chamaeleon: the root is long and thicke in all parts alike, of an hard and vnpleasant smel: it groweth ordinarily in sandy or grauelly grounds. If one drinke of it (they say) it will set the nose a bleeding, and send out a deale of thicke and grosse blood, that the spleene will diminish and

D weare away by that means. As touching Testiculus Canis or Dogs-stones, which the Greeks call Cynoforchis, & others simply Orchis, it hath leaues like vnto those of the oliue; soft & tender they are, and about halfe a foot long, and therefore no marvell if they lie spread vpon the ground: the root is bulbous and growing long-wise, in a double ranke, or two together: the one aboue, which is the harder, the other vnder it, and that is the softer: when they be foddren, folke vse to eat them after the manner of other bulbs: and lightly a man shall find them growing in vineyards. Of these two roots, if a man eat the bigger, it is said, that he shall beget boies; and if the woman eat the smaller, she shall conceiue a maiden childe. In Thessalie, men vse for to drinke in goats milke, the softer of these roots, to make themselves lustie for the act of generation; but the harder, when they would E coole the heat of lust: whereby we may see, that they be contrarie, and one hindereth the operation of the other.

Chrysolachanon commeth vp like a Lettuce, and commonly groweth in plots of ground set with Pines: the vertue of this herbe is to heale wounds of the sinewes though they were cut quite asunder, if it be presently laied too. There is another kinde of * Chrysolachanon, bearing floures of a golden colour, and leaved like vnto the Beet: when it is boiled, folke vse to eat it in stead of meat, and it looseth the belly as well as Beets, Coleworts, and such like: and if it be true that is reported, whosoever beare this herbe tied fast about any place of their bodies which is euery in their eie, so as they may see the same continually, it will cure them of the jaundise. Touching this herbe Chrysolachanon, well I wot that I haue not written sufficiently, that men might know it by this description, and yet could I neuer meet with any author who hath said more, or described it better. This verily hath been the fault and oversight euen of our moderne Herbarists of late daies, To write feightly of those herbes and simples which they themselves knew and were acquainted with, as if forsooth they had been knowne to euery man; setting downe onely their names and no more: which is euen as much as to tell vs a tale and say,

* Parry: but it should be Mar-ruby, according to the Greeke word *μαργαρίτης*.

* Some take them for Damask-plums, or rather for Bullois, Skags, or such like wilde Plums.

* As if it would catch women and hold them fast perforce. * *καλα* or *καλα* in Greeke signifies a bridle or bit: and it is thought to be *Leontopodium*, *Dioscor.* though others take it for *Poder.* * Or rather *Calla*. * Rather *Oreoclea*, out of *Dioscorides*.

* Or Borage, called in Greeke *Βαγος*.

* Some take this for our *Perficaria*, or *Art-mert*.

* *i.* Holly or Hulier: nay rather, *Aquifolia* is *Agrifolia* in Greeke: and the *Crataegus* of *Theophrastus*, which he meaneth here, is a kinde of *Ceruoise* tree now called *Terminalis*.

* I thinke he meaneth *Oreoclea*.

* *Coagula terre*
Some thinke
this place vn-
perfect, but I
guede rather,
that *Pliny* her-
in glanceth at
the obsecritie
of their wri-
tings in those
daies of sim-
ples, who put
downe that
herbe many
times, which
no man can
make any sense
of no more
than of *Coagu-
la terre.*
* *a conferru-
mingande.*

that with the * rennet or rundles of the earth, one might stay a laske, or giue free passage to the
vrine in the strangury, so it be drunke in wine or water.

As for Cucubalum, they write of it, That if the leaues bee stamped with vineger, they heale the stings of serpents and scorpions. Some of them cal this herb by another name, Strumus, and others giue it the Greeke name Strychnos: and black berries (they say) it hath. The iuice thereof taken to the quantity of one cyath, with twice as much honied wine, is foueraigne for the loins or small of the back: likewise it easeth the head-ache, if together with oile of roses it bee distilled vpon the head by way of embrochation. The herb it selfe in substance made into a liniment, healeth the wens called the kings euill.

Concerning the fresh water Spunge (for so I may more truly terme it, than either mosse or herbe, so thicke of shag haire it is and fitfulous withal) it groweth ordinarily within the riuers that issue from the root of the Alpes, and is named in Latine * Conferua, for that it is good to conglutinat, in manner of a soulder. Certes, I my selfe know a poore labourer, who as he was lopping a tall tree, fell from the top down to the ground, and was so pitiously bruised thereby, that vnneath he had any sound bone in all his body that was vnbroken: and in very truth, lapped he was all ouer with this mosse or spunge (call it whether you will) and the same was kept euermore moist and wet with sprinkling his owne water vpon it, whensoever it began to drie vpon him with the heat of his body: seldome was it vndone or remoued, and neuer but when of necessity for verie change fresh was laied too for default of the other: and by this manner of cure and no other, the poore wretch recovered perfectly, in so smal a time, that it was wonderful and almost incredible.

CHAP. IX.

¶ Of the berrie called *Coccum Gnidium*. Of the *Taxill*, and *Oke fern*e. Of *Dryophonon*, and *Elatine*. Of *Empeirum*, otherwise named *Calcitragra*. Of *Epipactis*, or *Eleborine*. Of *Epimedium*, *Enneaphyllon*, and *Ferne*. Of the herbe named *Oxe-thigh*. Of *Galeopsis*, otherwise *Galeobdolon*. Of *Glaux*, or *Eugalactum*.

THe berrie *Coccum Gnidium*, in colour resembleth the Scarlet graine; in quantity a pepper corne, but that it is bigger : of an ardent and caustick quality it is, and therefore they vse to lap it in the soft crum or pith of a loaf of bread, and to swallow it, for feare it should burn the throat as it passeth down. A present remedy this is for those who are impoisoned with Hemlocke ; and it hath a good propertie to stop a laske.

The Tazill, called in Greeke * Dipfacos, hath leaues much resembling LeAuce, fauing that in the mids of the back-part, there are to be feen certain bubbles as it were, or rifings, and thofe be prickly: the main ſtem which it beareth, is two cubits high, and the ſame armed with prickles: at euery ioint and knot whereof, it putteth forth two leaues which do compaſſe and incloſe the ſame round about in maner of wings, making thereby a certaine * concauitie or hollow receptacle, wherein alwaies there ſtandeth a * ſaltish dew or water. In the top of this maine ſtem and other branches proceeding from it, it beareth certaine burry heads, beſet all ouer with ſharpe prickles, like thoſe of an Vrchin: and it loueth to grow in waterie places. This herb cloſeth vp and ſkinneeth the fiſſures or chaps in the fundament: alſo the root boiled in wine, healeth fiſtulous; but the ſame ought to be ſo tender ſodden, as it may be wrought like wax, that a colyrie or tent made of it may be put into the concauitie of the fore. Moreouer, it cureth werts of all forts: and ſome there be, who to take away werts, waſh them with the liquor found in the hollow pith of the foreſaid wings. The Oke fern named in Greeke Dryopteris, is like to other fern, & groweth vpon trees, hauing leaues finely ſlit, and thoſe ſomewhat ſweet in taſt: the root is rough and hairy: of a cauftick and fiery nature is this herb; and therefore the root being punned, is a depilatory and fetcheth off haire: for which purpoſe, the manner is to apply it in manner of a liniment, vntill it procure ſweat: which courſe would be re-iterated twice or thrice, during which time the ſweat muſt not be wiped away.

Dryophanon is an herb much like to Dryopteris: the stems wherof be small, yet growing to the length of a cubit, & those be inuironed on both sides with leaues an inch broad: in shape much like to Bruscus or butchers-broom, called in Greek Oxymyr sine, but they be whiter and softer,

A softer, bearing a white floure likewise in manner of the Elder. The young crops and tendrils of this herb, may be eaten when they are sodden: and the seed is commonly vsed in stead of pepper.

Running Buckwheat or **Bindweed**, named in Greek *Elatine*, putteth forth final leaves, round and hairy, much like to those of *Parietary* of the wall; and immediately from the root there spring fine or six pretty branches halfe a foot long, furnished well with leaves. This herb grows among corn: foure it is and harsh in taste, wherupon it is taken to be very effectuall to repress the fluxe of humors which cause watering eyes, if the leaves be stamped with barley groats, and applied with a fine linnen cloth underneath. The same boiled together with *Linseed*, cureth the bloody flux, in case the patient drinke the broth or decoction thereof.

As for Empetron, which our countrymen in Latine name Calcifraga, it groweth vpon mountains regarding the sea, and commonly vpon rocks and stony cliffes: the nearer it is to the sea, the saltier tast it hath, by which means if it be taken in drink, it purgeth choler & fleam: the farther off that it groweth from the sea, and the more terrene and earthly substance that it hath, the bitterer it is found to be, and this doth euacuat waterish humors: but the manner of taking it, is in some porage, or els in mead. Being long kept, it loseth the force: if it be fresh and new gathered, and then either foddren or stamped, it is diureticall and breaketh the stone. And verily they that promise thus much in the behalfe of Empetron, and would seeme to iustifie and make good their word, do affirme for the better credit thereof, That if stones doe boile with it in the same pan, they will burst in peeces.

C Epipactis, named by some Elleborine, is a little herb bearing small leaues: soueraign for the diseases of the liuer, and against all poisons, if it be taken in drinke.

Epimenidion putteth forth no great stem, bearing ten or twelve leaues resembling the Iuie, but it neuer sheweth floure: the root is smal, black, and of a strong and stinking smell: it groweth vpon moist grounds: of an astringent nature it is, and cooleth mightily: an herbe that women * must beware of. The leaues stamped and applied to the paps of maides, keep them down that that they shall not grow.

Encephallon hath long leaues, in number nine, neither fewer nor more, and those be of a burning or causticke nature: a singular hearbe for the paines of loines, and the Sciatica, but it ought to be applied enwrapped well in wooll, for feare leaft it burne the flanks, for presently it maketh blisters.

D Of Ferne be two kinds, and they beare neither floure nor seed. Some of the Greekes call the one Pteris, others Blechnon: from one root whereof there spring many branches representing wings, and those exceed two cubits in length, yeelding * no vnpleasant fauor, and this they suppose to be the male. The second kind, the laide Greeks some call Thelypteris, others Nymphaea Pteris: this groweth single, and brancheth not into many stems; shorter it is than the former, softer also, and thicker of leaues, and those toward the root guttered and somewhat hollow: there is neither of them both, but their roots will feed swine fat: and the leaues of the one as well as the other, are disposed on both sides so, as they do represent birds wings, wherupon the Greeks gaue them the name * Pteris. The roots of both Fernes be long, and those growing bias: in colour blacke, especially when they be drie: and dried they ought to be in the Sunne. Fern grow-

CHAP. XI.

¶ Of *Hypoglossa* and *Hypecoon*, *Idæa*, *Isopyron*, *Lathyrus*, *Leontopetalon*, *Lycopsis*, *Lithospermon*. The vulgar stone. Of *Limeum*, *Leuce*, and *Leucographis*.

Bistlingua.
Horse-tongue,
or Double-
tongue.

Hypoglossa hath leaues fashioned like vnto Butchers broome, and those turning hollow, and prickie: within which concauities there come forth certaine little leaues resembling tongues. A garland or chaplet made of these leaues, and set vpon the head, easeth the pain thereof.

Hypecoon groweth amongst corne, and is leaved like vnto Rue. It hath the same nature and properties that Opium or the juice of Poppie.

As for the herb *Idæa*, the leaues thereof resemble those of ground-Myrtle or Butchers broom: vnto which there grow close certaine tendrils, and those carry floures. It stoppeth a lask, staith the immoderat flux of womens moneths, and stancheth all vnmeasurable bleeding: for by nature astrigent it is and repercussive.

Isopyron, some there be who call it *Phasiolum*, because the leaf (otherwise like vnto *Annis*) doth turne and writhe like vnto the tendrils of *Phasils*. In the top of the stemme it beareth small heads or buttons full of seed, resembling *Nigella Romana*. A soueraigne hearbe, taken either in hony or mead, against the cough and other infirmities of the breast: likewise for the accidents of the liuer.

* *Lathyrus*.
* For the mil-
ky juice chaply.
For *Discolor*.
saith *amysda-*
la, of the Al-
mond tree.
* *Purgat facili-*
tia. Some
thinke gentle
purgatives.

* Spurge hath many leaues resembling * *Lectuce*: besides which, it putteth forth as many other slender and small branches, containing in little tunicles or husks certain seeds in manner of capers: which being dried and taken forth, resemble for bignesse corns of Pepper, white in colour, sweet in tast, & easie * to be clenfed from their husk. Twenty of these seeds drunk either in cleare water or mead, do cure the dropsie: besides waters humors, they euacuat choler. They that desire to be thoroughly purged & would haue them to work strongly, vse to take them husk and all; but certainly so taken, they hurt the stomack: and therefore there is a deuise of late found out to giue them either with fish, or els in some broth of a cock or capon.

Leontopetalon, which some call *Rhaphion*, carrieth leaues like to Coleworts, and a stalk halfe a foot high, garnished with many branches resembling wings: and seed it beareth in the head contained within cods, after the maner of eiches. The root is made much after the fashion of a rape or turnep, big and black withall. This herb groweth in corne grounds. The root is a singular counterpoison to be giuen in wine against the sting or venome of any serpents; and verily there is not in the world a more speedy remedy. Very good it is for the *Sciatica*.

* Some take it
for a kind of
Orchard,
others for
Hounds-
tongue.

* *Lycopsis* hath leaues like to *Lectuce*, but that they be longer and thicker: it riseth vp with a long stem, and the same hairy, with many branches growing thereto of a cubit in length: and beareth little Purple floures. It loueth to grow vpon champion plaines. A liniment made with it and barley meale, is good for the shingles and *S. Anthonies* fire. In agues it procureth sweat, so that the patient drink the juice thereof mingled with hot water.

* *Quincuncialis*.
is fire: others
read *Quincque*
caulibus ferè,
i. commonly it
beareth fise
stalkes.
* This some
take to bee
nearer of that
Greimile cal-
led *lobi*, teares.

But of all herbes that be, there is none more wonderful then *Greimile*: some call it in Greek *Lithospermon*, others *Ægonychon*, some *Diospyron*, and other *Heracleos*. It groweth ordinarily * five inches high: and the leaues be twice as big as those of Rue. The foresaid stalks or stems be no thicker than bents or rushes, and the same garnished with small and slender branches. It bringeth forth close ioining to the leaues, certain little beards one by one, & in the top of them little stones white and round in manner of pearls, as big as eich pease, but as hard as very stones. Toward that side where they hang to their steles or railes, they haue certain holes or * concauities containing seed within. This herb groweth in Italy, but the best in the Island Candy. And verily of all the plants that euer I saw, I neuer wondred at any more: so lightly it groweth, as if some artificiall goldsmith had set in an alternatiue course and order, these prety beads like orient pearls among the leaues: & so rare a thing it is & difficult to be conceiued, that a very hard stone should grow out of an herb. The Herbarists who haue written thereof, do say that it lieth along and crepeth by the ground: for mine owne patt, I neuer saw it growing in the plant: but shewed it was vnto me plucked out of the ground. This is for certaine knowne, that these little stones called *Greimile* seed, drunke to the weight of one dram in white wine, breake the stone, expell

A expell the same by grauell, and dispatch those causes that be occasions of strangurie. Certes, a man no sooner seeth this hearb, but he may presently know the vertues thereof, and for what it serueth in Physicke; a thing that he shall not obserue again in any other whatsoeuer: for at the very first sight of these little stones, his eie will tell him what it is good for, without information from any person at all. There be common stones found about riuers, bearing a certain drie hoary mosse vpon them. Rub one of these stones against another, hauing spit first therupon, and then therewith touch the tetter or ringworme in any part of the body, it will kill the same: but the party must as he toucheth it, vtter this charme following:

* *ῥαῖς καὶ σαλίδας, ἄνεθ' ἀγροῦ ὕμνος δίδω.*

That is to say,

Cantharides flie apace: for a wilde Wolfe followeth in chase.

B The French-men haue a certaine herbe which they call *Limeum*, out of which they draw a venomous juice, named by them Stags poison, wherewith they vse to envenome their Arrow heads when they go to hunt their red Deere: Take of this as much as goeth to the poysoning of one arrow, and put it in three measures or Modij of a mash wherewith they vse to drench cattel: and make sops thereof, and conuey them down the throat of sick oxen or kine, it will recouer them. But presently after the receipt of this medicine, they must be tied vp sure vnto their boues vntill the medicine haue done purging: for the beasts commonly fare all the while that it is in working, as if they were wood. In case they fall a sweating vpon it, they must be washed all ouer with cold water.

* *Leuce* is an herbe like vnto Mercury; but it tooke that name by reason of a certaine white strake or line that runneth crosse through the mids of the leafe, for which cause some call it *Mesoleucas*. The iuice of this herbe healeth fistuloes: and the substance of the herbe it selfe stamped, cureth cancerous sores. It may be peraduenture the same herb which is named *Leucas*, that is so effectuell against all venomous stings proceeding from any sea-fishes. The herbarists haue not described this herb otherwise than thus, That the wild kind thereof with the broader leafe, is more effectual in the leaues; and that the seed of the garden kind, hath more acrimony than the other.

D Touching *Leucographis*, what manner of herbe it should be, I haue not found in any writer: and I wonder therat the rather, because it is reported to be so good for them that void & reach bloud vpward, namely, if it be taken to the weight of three oboli with Saffron: likewise stamped with water and so applied, it is singular good against those fluxes that proceed from the imbecility of the stomack: soueraigne also for to stay the immoderat flux of womens termes. And it entereth into those medicines which are appropriate for the eies, yea and into incarnatiues, such especially as be fit to incarnat those vlcers which are in the most tender and delicat parts of the body.

CHAP. XII.

E ¶ Of *Medium*, *Myosota*, *Myagros*, *Nigina*, *Natrix*, *Odontitis*, *Othenne*, *Omosma*, *Onosporos*, *Osfris*, *Oxys*, *Batrachion*, *Polygonois*, *Pancration*, *Peplos*, *Periclymenos*, *Laucanthemon*, *Phytocuma*, *Phyllon*, *Phellandrium*, *Phalaris*, *Polyrrhizon*, and *Proserpinaca*: of *Rhacoma*, *Refeda*, and *Stachas*.

Medion hath leaues like vnto * garden Floure-de-lis. A stem three foot * high, garnished with faire large floures, of purple colour, and round in forme: the seed is small, and the root halfe a foot long: it groweth willingly vpon stony grounds lying in the shade. The root taken in a liquid electuary or lohoch made with hony to the quantity of 2 drams, for cert daies together, staith the immoderat flux of womens monethly termes. The seed also reduced into powder and drunke in wine, represseth their extraordinary shifts.

* *Myosota*, otherwise called *Myosotis*, is a smooth herbe, shooting forth many stems from one single root, and those in some sort of a reddish colour, and hollow: garnished with leaues, which toward the root be narrow, long, and blackish, hauing their backe part sharpe and edged: which leaues grow along the stems two by two together: and out of the concauities or armpits be-

* *Tripedale*.
But *Discolor*.
saith *Tricubi-*
alem, i. three
cubits high.
* Mouse eare.

between the stalk and them, there put forth other small branches with a blew floure. The root is of the thicknesse of a mans finger, bearded with many small strings resembling hairs. This root is of a corrosiue nature, fretting and exulcerating any place wherunto it is applied: in which regard it healeth vp the fistulous vlcers called *Egilops*, growing between the nose and angles of the eies. The *Egyptians* are of opinion, that if vpon the 27 day of that moneth which they call *Thiatis* (and which answereth very neare to our moneth August) a man or woman do annoint themselves with the juice of this herb in a morning before they haue spoken one word, he or she shall not be troubled with bleared eies all that yeare long.

Myagros is an herb growing vp with stems in manner of *Fenell* geant, in leaues resembling *Madder*, and riseth to the height of 3 foot. The seed which it beareth is oleous, & out of it there is an oile drawne, which is good for the sores in the mouth, if they be annointed therewith.

The herbe called *Nigina*, hath three long leaues like vnto those of *Succorie*; wherewith if scars (remaining after vlcers and wounds) be rubbed, it will reduce them to the natural color of the other skin.

There is an herb, which in Latine is named *Natrix*, the root whereof being pulled out of the ground, hath a rank smell like vnto a Goat; with this herbe they vse in the *Picene* country to driue away those hob-goblins which they haue a marvellous opinion to be spirits, called *Farii*: but for mine own part, I am verily persuaded they be nothing else but fantastickall illusions of such as be troubled in mind and bestraught, the which may be chased and rid away by the vse of this medicinable herbe.

Odontitis may be reckoned among the kinds of hey-grasse, putting forth many small stems growing thicke together from one root, and those knotted and full of ioints, triangled and blackish withall: in euery ioint small leaues it hath, resembling those of knot-grasse, howbeit somewhat longer: in the concauities between the said leaues and the stem there is contained a seed like vnto Barly corns: the floure is of a purple colour, and very small. It groweth ordinarily in meadow grounds. The decoction of the branches and tender stalks of this herb, to the quantitie of one handfull, boiled in some astringent wine, cureth the toothach, if the patient hold the same in the mouth.

Othonne groweth plenteously in *Scythia*, like vnto *Rocket*: the leaues be full of holes, and the floure resembleth *Safron*: which is the cause that some haue called it *Anemone*. The juice of this herbe entreth very well into those medicines which are appropriate to the eies; for it is somewhat mordicatiue, and heateth gently: besides exiccatiue it is, and by that meanes astringent. It clenseth the eies of those films and clouds which darken the sight, and remoueth whatsoever hindereth the same. Some ordain for this purpose that it should be washed first, and after it is dried againe made into certain balls or trofchisks.

Onosma beareth leaues wel-neare three fingers long, and those lying flat vpon the ground: three in number, and indented or cut after the manner of *Orchanet*, without stem, without floure, without seed. If a woman with child eat thereof, or do but step ouer it, she shall cast her vntimely birth out of her wombe.

As for *Onopordon*, they say if a fesse eat thereof, they will fall a fizing and farting. Howbeit of vertue it is to prouoke vrine, and the monethly sicknesse of women: to stop a laske, to discusse and resolute impostumes, and to heale them when they be broken and do run.

* *Osyris* putteth forth small branches of a browne colour, slender, pliable, and easie to wind; the same be garnished with leaues * resembling those of *Line* or *flax*, of a dark & dusky green at first, but afterwards changing colour, and inclining to a red colour, and the seed is contained in those branches. Of these leaues are made certain washing balls, to scoure womens skin, and make them look faire. The decoction of the root being drunk, cureth those that haue the jaundice. The same roots, gathered before the seed be ripe, cut into roundles, and dried in the Sun, do stop the laske: but drawn after that the seed is ripe, they repress all catarrhes and fluxes of the belly, if the patient drink the supping wherein they are boiled. Also stamped simply, and so giuen in rain water, they haue the same effect.

* *Oxys* beareth three leaues and no more. This herb is singular to be giuen for a feeble stomach which hath lost all appetite to meat. They also who haue a rupture, and whose guts be fallen down, eat thereof to very good successe.

Polyanthemum, which some call *Batrachion*, hath a causticke quality, whereby it doth blister

* *Linaria* or
"Roads" flax.
* According
to *Dioscorides*.

* *Cuckowes*
nest, or
Wood-sorrell.

After any vnseemly scars, by means whereof, reduceth them to their fresh and former colour: the same also applied, scoureth away the morpew, and bringeth the skin to the natie hue, answerable to the rest of the body.

Knot-grasse is that herb, which the Greeks name *Polygonon*, and we in Latine, *Sanguinaria*: in leaf it resembleth *Rue*, in seed common quich grasse, & riseth not from the ground but creepeth along: the juice of this herb conueied vp into the nostrils, stancheth bleeding at the nose. They who set down many kinds of *Polygonon*, do hold that this is to be taken for the male, and by reason of the multitude of seed which it beareth is called * *Polygonon*: or for that it groweth so thick in tufts, *Calligonon*. Others name it * *Polygonaton*, for the number of * knots or knees which it carrieth. There be again, who giue it the name *Theuthalis*: some call it *Carcinotron*, others *Clema*, & many *Myrtopetalon*: and yet I meet with some writers, who say this is the female knot-grasse: and that the male is the greater, and not altogether so dark of colour, growing also thicker with knots, & swelling with seed vnder euery leaf: wel, howsoever it is, the property of them both, the one as well as the other, is to bind and coole: and yet their * seed doth loosen the belly, which if taken in any great quantity, is diuretical and represseth any rheums, provided alwaies that the patient be troubled therewith, otherwise it doth no good. The leaues are singular good to be applied vnto the stomach, for to assuage the heat thereof: in a liniment they mitigat the grieue of the bladder, and stop the course of shingles and such like wilde-fires. The juice is soueraigne to be dropped alone by it selfe into the eares that run, and into the eyes to abate their pain. It is vsually giuen to the quantity of 2 cyaths in tertian Agues, and Quartans especially, before the fit commeth: likewise for the feeblenesse of the stomach when it will keep nothing: for the bloody flux, and the rage of cholerick humors both vpward and downward

A third kind there is, which they call * *Oreon*, growing vpon the mountains, resembling a tender reed: rising vp in one single stem, but full of little knees or knots, and those * couched & thrust together. Leased it is like the *Pitch* tree: the root needlesse, and of no vse: and generally the whole herb of lesse strength and operation than the former. Howbeit, this singular propertie hath it, to help the sciatica. A fourth *Polygonum* there is, called the wild; and this busheth like a shrub or a pretty tree rather: the root is of a woody substance, & the stock or plant of a reddish colour, resembling the *Cedar*: it beareth branches much like to *Spart* or *Spanish broome*, two spans long, iointed into three or four knots, and those of a blackish colour. This also hath an astringent nature, and tasteth in the mouth like to a Quince. The decoction thereof in water, till the third part be consumed, or the poudre of it dried, is commended for the sores in the mouth, and for any part that is fretted and galled. And the very substance thereof is good to be chewed in case the gums be sore. It represseth the malignity of eating corrosiue vlcers and cankers: and in one word, staith the malice of all sores that run on end, and be vntoward for to be healed: but a peculiar property it hath by it selfe to cure any vlcere occasioned by the snow. Our Herbarists vse this kind much for the squinancy; and to ease the head-ach, make a garland thereof, appointing it to be set vpon the head: but to repress any violent catarrhs, they prescribe to wear it about the neck. In Tertian agues, some giue direction to pluck it out of the ground with the left hand, and then to tie it to the arm or other part of the patient. And there is not an herb or plant that they be more careful to keep dry and to haue alwaies ready at hand, than *Polygonon*, for to stanch any issue or flux of blood whatsoever.

Pancration, which some chuse rather to call the little *Squilla* or sea-onion, beareth leaues resembling the white Lilly, but that they be longer and thicker, with a great bulbous root; & the same in colored. The juice of it taken with the floure of *Eruile*, maketh the belly laxatiue: and outwardly applied, mundifieth vlcers. For the dropsie and hardnesse of the spleene, it is giuen with hony in maner of a syrrop. Some take the root and boile it in water vntill the liquor be sweet, which they poure forth; and then stamp the said root, and reduce it into bals or trofches, which they lay to dry in the Sun: and vse them afterwards as occasion serueth for the skals or vlcers of the head, and all other sores that require mundification. Semblably, they giue thereof as much as one may take vp with three fingers in wine, for the cough, and in a liquid eleatuarie or lochoch for the pleurisie and peripneumonie. They prescribe it likewise to be drunke in wine for the Sciatica: to allay also the gripes and wrings of the belly, and to procure the monethly termes of women.

* *Peplos*, called by some *Syce*, by others *Meconion* * *Aphrodes*, from one smal root busheth into

* of many many
and vire seeds
* And yet *Serapion*
saith it
is called *Polygonon*, because
it groweth e-

* i. Floethe
Poppie.

into many branches; the leaues be like vnto Rue, but that they be somewhat broader: the seed appeareth vnder the leaues round, & (but that they be smaller) not vnlike to the white Poppie. Ordinarily it is found among Vines, and they gather it in haruest time. They hang it forth seed and all together a drying, setting water vnderneath, that the said seed or fruit may fall down into it. If it be taken in drinke, it purgeth the belly, and doth euacuat both choler and fleagme. The measure of one acetable is counted an ordinary and indifferent potion to be drunk in three hemines of mead or honied water. With this seed they vse to powder meats and viands, thereby to keep the body soluble.

* Wood-bind.

* *Periclymenon* is also a bushie plant, and loueth to branch much: it beareth whitish & soft leaues, disposed two by two at certain spaces & distances very orderly. In the top of the branches it beareth hard feeds between the leaues, which hardly may be plucked off. It groweth in tilled corn fields & hedges, winding about euery thing that it can catch hold of, for to support and beare it vp. The seed after it is dried in the shade, folk vse to pun in a mortar, and so to make it vp into trochisks. In case that the spleen be swollen or hard, they take of these troches, and after they be dissolued, giue thereof a sufficient quantity in 3 cyaths of white wine for 30 daies together: which drink is of such operation, that it will waite and spend the spleen, partly by vrine which will appeare bloody, and partly also by seege: and this will be perceiued sensibly by the tenth day of the cure. The leaues also be diureticall, and a decoction made with them, prouokes vrine. The samelike is good for those that cannot draw their wind but sitting with their body vpright. Being drunk in like manner, they help women who are in fore trauell, to speedie deliuerance, and fetch away the after-birth.

¶ Some take it
for *Securidaca*,
i. *Axfitch*.

As touching **Pelecinum*, it groweth as I said before among corn, branching thick, and garnished with leaues like vnto the cich peafe. It beareth feed in certain cods, which crook in manner of little horns, and those be four or five in number together. The said feed resembleth Gith, so far as euer I could see, and is bitter, but good for the stomack: one of the ingredients that goe into antidotes and preseruatiues against poison.

Polygala reacheth vp with a stem a span high, in the top wherof it beareth leaues resembling the Lentils, of an astringent tast, which being drunk, causeth nources to haue plenty of milk in their breasts.

Poterion, or as some call it, Phrynon or Neurada, brancheth and spreadeth much: armed it is with sharp prickes, and besides, full of a kind of thicke down: the leaues be small and round: the branches slender, long, lofte, and pliable: the floure in form long, of a graffe green color. The seed is of no vse in Physick, but of a quick and sharp taste, odoriferous also, and pleafant to the smell. It is found growing as well in watery places, as also vpon little hills. Two or three roots it hath, which run down two cubits deep into the ground, full of cords or sinews, white, and of a firm and hard substance. About Autumne they vse to dig round about it, hauing before cut the plant it selfe above ground, which yeeldeth thereby a iuice like vnto a gum. The root is (by report) of wonderfull operation in healing wounds, and especially of sinews cut in sunder, if it be applied thereto in a liniment. Also the decoction thereof drunke with honey in manner of a syrupe, helpeth the feeblenesse and diffolution of the sinewes; and namely, when they bee wounded and cur.

Phalangites by some is called Phalangion, by others Leucanthemon, or, as I find in some copies, Leucacantha. Little branches it putteth forth, neuer fewer than twaine, and thofe tending directly a contrary way. The floures white, fashioned like the red Lilly : the seed blacke, broad, and flat, shaped after the manner of halfe a Lentill, but much leffe : and the root is of a greenish colour. The leafe, floure, and seed of this herbe is a singular remedie against the venomous sting of scorpions, the spiders Phalangia, and serpents ; also for the wringing torments of the belly.

As for Phyteuma, somewhat els I haue to do rather than to describe it, confidering there is no vse of it but in amatorious medicines to procure womens loue.

There is an herbe called by the Greekes Phyllon, growing vpon stony mountaines standing much vpon a rocke. The female of this kinde is of a deepe greene colour, the stem is slender, the root small, the seed round, and like vnto that of Poppie. This hearbe serueth for the getting and conceiuing either of boyes or girles, according as the male or the female is vsed: which differ only in seed or fruit, which in the male resembleth an oliue that is new come forth and

A and biginneth only to shew. But both of them are for the said purpose to be drunke in wine.

Phellandriõ groweth in moory grounds, and in leafe commeth nere vnto garden Parsley : the seed thereof is good to be drunke for the stone, and the infirmities incident to the bladder.

As for Phalaris, it hath a long slender stem like vnto a reed, in the top whereof it beareth a floure bending downward; and the seed resembleth that of Sefamà: and this alſo breaketh the ſtone, if it be drunke in wine or vineger, or otherwiſe with milk and honey. The ſame cureth the accidents of the bladder.

Polyrrhizon is leafed like unto the Myrtle, and hath many roots, which being bruised, are given in wine againſt the poiſon of ſerpents; not only if men but alſo if fourfooted beaſts be ſtung by them.

* *Proserpinaca* likewise, being otherwise a common herb, is counted a soueraigne remedy against scorpions: the same stamped and incorporat with fish-pickle and oile, is (by report) a singular medicine against the prick of scorpions.ouer and besides, it is said, that if it be but held vnder the tongue, it refresheth those who be ouertruelled or any waies wearied, so as they haue lost their speech with very faintnesse: but in case it be swallowed downe the throat, it procureth vomit, which alwaies is good and wholsome for the Patient.

As touching Rhacomia, it is brought vnto vs out of those countries which are beyond the kingdom of Pontus: a root it is much resembling the black Costus, but that it is smaller and somewhat redder; also without any smell; hot at the tongues end and astringent: being panned, it is of a wine colour inclining to saffron: a liniment made of this root, doth mitigate all im-

About the towne Ariminum there groweth an herb commonly knowne by the name of *Refeda*: it refolucth and discuffeth all impoſtumes: it reduceth alſo into temperature any inflammation. But they that uſe to cure with this herb, muſt when they lay it to the place, ſay withall theſe words following, *Refeda, morbos Refeda, ciſſe ciſſe, quis hic pullos egerit? Radices nec caput nec pedes habeant.* That is to ſay, *Refeda, cauſe theſe maladies to ceaſe: knoweſt thou, knoweſt thou, who haſt drinen theſe pullets here? Let the roots haue neither head nor foot.* This charm (I ſay) they muſt pronounce three times ouer, and ſpit vpon the ground as often.

To conclude, Stoechas groweth in those Islands only which carry that name and be called Stoechades: an odoriferous herb it is, bearing leaues like vnto hyssop, and is bitter in tast: taken in drink, it procureth womens moneths, and doth mitigat the pains of the brest. Also it is one of the species or ingredients entring into the preferuatiue compositions called Antidotes.

that their seeds be nothing to effectually, if incision were made in the roots for to draw juice out of them, before the said seed is fully ripe.

Furthermore, this is known & found by experience, that the ordinary use of all simples doth alter their properties and diminish their strength, in so much, as who soeuer is daily accustomed vnto them, shall not find when need requires, their vertue powerfull at all, either to do good or to work harme, as others shall who seldome or neuer were acquainted with them.

Ouer and besides, all herbes be more forcible in their operations, which grow in cold parts, exposed to the Northeast winds, likewise in dry places, than in the contrary.

Also there is no small difference to be considered betwene nation and nation: for, as I haue heard them say who are of good credit, as touching worms and such like vermin, the people of Egypt, Arabia, Syria, and Cilicia, be troubled & infested with them: whereas contrariwise, some Græcians & Phrygians haue none at all breeding among them. But lesse maruel there is of that considering how among the Thebans and Boeotians (who confine vpon Attica) such vermine is rife and common; and yet the Athenians are not giuen at all to ingender and breed them: the speculation whereof, carrieth me away again vnto a new discourse of liuing creatures, and their natures, and namely, to fetch from thence the medicines which Nature hath imprinted in them, of greater prooffe and certainty than any other for the remedy of all diseases. Certes, this great Mother of all things, entended not that any liuing creature should serue either to feed it selfe only, or to be food for to satisfie others; but her will was and she thought it good, to insert and ingraffe in their inward bowels, wholsom medicines for mans health, to counterpoise those medicinale vertues which she had ingrauen and bestowed vpon those furd and sencelesse herbes: nay her prouidence was such, that the soueraigne and excellent means for maintenance of our life, should be had from those creatures which are indued with life; the contemplation of which diuine mysterie, surpasseth all others, and is most admirable.

THE TWENTY EIGHTH BOOK OF THE HISTORIE OF NATURE, WRITTEN BY C. PLINIUS SECVNDVS.

CHAP. I.

The medicinale vertues of liuing creatures.

Having discovered as well all those things which are ingendred between Heauen and Earth, as also their natures; there remained nothing for me to discourse of, saue only the Minerals digged out of the ground; but that this late Treatise of mine, as touching the medicinale properties of Herbs, Trees, and other plants draweth me quite aside from my purpose, and haleth me back againe, to consider the foresaid liuing creatures themselves (euen the subiect matter of Physicke) in regard of greater meanes found out euen in them, to aduance Physicke and cure diseases. For to say a truth, since I haue described and pourtraied both Herbes and Floures, since I haue discovered many other things, rare and difficult to be found out; should I conceale such meanes for the health of man, as are to be found in man himselfe? or should I suppress other kind of remedies which are to be had from creatures liuing amongst vs, as wee doe, if they may benefice vs? especially seeing that our very life is no better than torment and miserie, vnlesse

A we be free from paine and sicknesse? No verily; and far be it from me that I should so do. But on the contrary side, I will do my best indeuor to performe and finish this task also; how long and tedious soeuer it may seem to be: for my full intent and resolution is, so I may benefite posteritie and doe good to the common life of man, the lesse to respect the pleasing of fine eares, or to expect thanks from any person. And to bring this my purpose about, I mean to search into the cuities of forreine countries, yea and to lay abroad the rites and fashions of barbarous nations, referring the readers who shall make scruple to beleue my words, vnto those Authors whom I alledge for my warrant. And yet herein, this care I haue euer had, To make choice in my reports of such things as haue bin held in manner adjudged true, by a generall consent & approbation of all writers; as conuening to stand more vpon the choice of substance, than the variety and plenty of matter. But before I enter into this argument, I thinke it very necessary to aduertise the Reader thus much, That whatsoever I haue heretofore written of liuing creatures, concerneth the instinct of Nature wherewith they be indued, and certain simples whereof they haue giuen vs the knowledge (for surely, as much good haue they done vnto vs by the medicinale herbes by them found out, as possibly they can by the remedies which themselves do afford from their own bodies:) But now it remaineth to shew simply the medicinale & helpful properties in themselves, which notwithstanding in the former treatise were not altogether left out and passed ouer. And therefore this my present discourse of those creatures, howsoeuer it is in nature different, yet it dependeth of the other. Begin then I will at Man himselfe, to see what Physicke there may be found in him to help his neighbor. In which first entrance of mine, there presenteth it selfe vnto mine eie, one object that troubleth and offendeth my mind exceeding much: for now adiaies you shall see them that are subiect to the falling euil, for to drink the very blood of offenders and sword-plaies as out of liuing cups: a thing, that when we behold within the same shew-place, euen the tygres, lyons, and other wild beasts to do, we haue it in horreur as a most fearfull and odious spectacle. And these monstrous minded persons are of opinion, That the said blood forsooth is most effectually for the cure of that disease, if they may sucke it breathing warme out of the man himselfe; if they may set their mouth (I say close to the veine, to draw thereby the very heart blood, life and all: how vnnaturall soeuer otherwise it beholden for a man to put his lips so much as to the wounds of wild beasts, for to drinke their blood: nay, there be others that lay for the marrow-bones, the very braine also of young infants, and neuer make strageto find some good meat and medicine therein. Ye shall find moreover among the Greeke writers not a few, who haue deciphered distinctly the seuerall tastes as well of euery inward part, as outward member of mans body, and so neare they haue gone, that they left not out the paring of the very nailes, but they could pick out of them some fine Physicke: as if health consisted in this, That a man should become as bloudie as a sauage beast; or that be counted a remedy, which indeed is cause of a mischiese and malady. And wel deserue such blood-suckers and cruell leeches to be frustrat of their cure, and thereby to worke their owne bane and destruction; for if it be held vnlawfull and abhominable to prie and look into the entrails and bowels of a mans body, what is it then to chew and eat them? But what monster was hee, who first broched this geare, and deuised such accursed drugs! Ah wicked wretch, the inuenter and artificer of those monstrosities; thou that hast ouerthrowne all law of humanity; for with thee will I haue to do, against thee will I whet my tongue and turne the edge of my stile, who first didst bring vp this brutish leech-craft, for no other purpose but to be spoken of another day, and that the world might neuer forget thy wicked inuentions. What direction had he who thus began to deuoure mans body lim by lim: nay, what conjecture or guesse moued him so to do? what might the original and foundation be, whereupon this diuelish Physicke was grounded? what should he be that bare men in hand, and would persuaide the world, That the thing which is used as a poison in witchcraft and forcerie, should auaille more to the health of man, than other knowne and approued remedies? Set case that some barbarous people vsed so to do: say that strangenations and farremoued from all ciuility, had these manners among them, must the Greekes take vp those fashions also, yea and credit them so much, as to reduce them into a method, amongst other their goodly Arts? And yet see what *Democritus* one of them haue done? there be extant at this day books of his inditing and penning, wherein you shall reade, That the scul of a wicked malefactor, is in some cases better than that of an honest person; and in other, That of a friend and guest, preferred before a stranger. As for *Apollonius*, another of that brood, hee hath written,

date, when as a certain chariot with foure horses, made of clay, and prepared for to be set vpon the iouuer or lantern of the said temple, chanced as it lay baking in the furnace, to grow into an extraordinary bignesse. For the forsaide Wife men of Tuscan being asked what the said prodigy should betoken, praetised the like, as *Olenus* did: but the Romans being wise & wary in their words, faued and retained the same fortune still for the behoofe of Rome, which was presaged vnto them by that happy foretoken. These examples may suffice to shew & prouoe evidently, that the vertues and significations of these signes and presages do lie in our own power: and are no otherwise of force and effect, but according as euery one of them is so taken * and accepted. True it is, and held for an vndoubted principle in the Augures discipline & learning, That neither cursed execrations, ominous and vnlucky birds, nor any other preface by their flight singing and feeding, can touch those persons who take no heed of them, and do protest plainly, that they regard them not, what businessse soeuer they go about and be entering into: a greater gift than which, and testimony of the diuine indulgence and fauor of the gods to vs, we cannot haue, thus to subiect their secrets to our puissance. Moreover, in the laws and ordinances of the 12 tables here at Rome, are not in one place these very words to be found, *Qui fruges occentassit*, [i. who soeuer shall enchant or fore-speak any corne or fruits of the earth:] and in another place, *Qui malum carmen incantassit*, [i. What person soeuer vseth pernicious charmes to the hurt or mischief of any creature?] Ouer and besides, *Verrinus Flaccus* doth affirm vpon the credit of certain Authors which he alleadgeth and beleueth, That the first thing which the antient Romans were wont to doe at the siege and assault of any towne or city, was by their priests to conjure and call forth that god or goddesse which was the patron or patronesse therof, and withal to promise vnto the said god or goddesse, either the same place againe, or else a greater and more spacious feat; yea, and the like diuine worship, or better, among the Romanes: and euen at this day our Pontifices or Bishops haue the charge of this sacred ceremony amongst other functions belonging to their ministry. And hereupon well known it is, that for this cause and nothing else, it was neuer divulged abroad, what god was the protector and patron of Rome city, for feare least some of our enemies should assay to coniure him forth, and deale by vs as we do by them. Furthermore, who is there that is not afraid of all maledictions and cursed execrations; and especially when the * names of the infernall fiends or vnluckie foules are vsed in such bannings? For feare likewise of some harme, see we not that it is an vsuall thing to * crush and break both egge and fish shels, so soon as euer the meat is supped and eaten out of them; or els to bore the same through with a spoone stele or bodkin? From hence came those amatorious cydyls and eclogues of *Theocritus* among Greek Poets, of *Catullus* and *Virgil* among vs, full of amorous charmes, in imitation of such exorcismes and coniurations indeed. I assure you many folke there be of this beleefe, That by certaine spells and words, in manner of charmes, all the pots and vessels of earth baking in a furnace, may be cracked and broken, without touching them at all. And there are not a few who are perswaded for certaine, that euen the very serpents as they may be burst by incantment, so they can vnwitch themselves: and that as brutish otherwise and earthly as they be, yet in this one thing they haue a quicke fence and vnderstanding, in so much, as at the charms of the Marsians they will shrink from them and draw in their bodies round into a knot, though it were in the night season when they lie asleepe. Some there be also that when a skare-fire hath taken an house, write certaine * words vpon the walls, and thereby limit and confine the fire, that it shall go no farther. Certes, I am not able to say, whether strange, forraigne, and ineffable words hard to be pronounced, are more auailable to the effecting of these incredible things, or our Latin words, comming out at a venture vnlooked for and spoken at random: which mult needs seem ridiculous in our judgement, seeing that the spir it and mind of man, expecteth alwaies some great and mighty matter in these coniurations and exorcismes, which may carry a majesty therewith to incline and moue the gods to mercy and fauour, or rather indeed to command their heauenly power perforce. But to proceed, *Homer* the Poet hath written, that prince * *Polyxenes* being wounded in the thigh, stanchd the blood with a charme. And *Theophrastus* testifieth, that there be proper spells to cure the Sciatica. *Cato* hath left in writing, that there is a special charm for dislocations, whereby any bone put out of ioint may be set again. And *M. Varro* reporteth the like vertue of certain good words for the gout. As for *Cesar* the Dictator, it is commonly said of him, that hauing bene once endangered with the fall or ouerthrow of his coach wherein he rode, would neuer afterwards ride in coach againe, vnlesse so soone as euer hee had

* Whereupon it was thought materiall to speake in this manner Accipio omen. For otherwise it auailed not.

* As in saying thus, The Devil will take thee, or, the Rauens peck out thine eyes, or I had rather see thee pie pekt: and such like. * Because fearwards no witches might prick them with a needle in the name and behaile of those whom they would hurt and mischief, according to the praetise of pricking the images of any person in wax: vsed in the witchcraft of these daies. * That is to say, *Ayle* vsed, out of *Afranius*, as *Pestus* noteth, which in the old Tuscan language signifieth *Auertere ignem*, i. Put backe the fire. * or rather the sonnes of *Auolus* in his *Odysseia*.

A had taken his place, and before that he set forward vpon his way, he had pronounced a certaine charm that he had in store: and perswaded he was, that if he said it ouer three times together, he should come by no mischance in his journey, but trauele in security. A thing that I know many now adaies to praetise ordinarily as well as he. But for farther prooffe and confirmation of this opinion, I report me to euery mans conscience and knowledge, to that (I say) which there is not one but knoweth: What is the cause I pray you, that the * first day of euery yeare we salute one another for luck sake, with wishing a good new yere? What is the reason, tel me, that in all our publick processions and generall solemnities euery fifth yeare for the health and good estate of the city, they * made choice of such persons for to lead the beasts appointed to sacrifice, whose * names were good and fortunate: or how commeth it about, that for to preuent or diuert witchcraft and forcery, we obserue a peculiar adoration, and inuocat vpon the Greekish [goddesse of vengeance] *Nemesis*, in which regard onely, we haue her statue or image set vp in the Capitoll, notwithstanding we know not yet what name in Latine to giue her? How is it, that in making mention of those that be dead, we speake with reuerence and protest that we haue no meaning to disquiet their ghosts thereby, or to say ought preiudiciall to their good name and memorie? If there be nothing in words, how hapneth it, I would faine know, that we haue such an opinion of odd numbers, beleeuing that they be more effectuall in all things than the euen? a matter I may tell you of great consequence, if we do but obserue the criticall daies in feuers. Also in the gathering of our first fruits, be they Pears, Apples, Figs, &c. wherefore vs we to say, These be old, God send vs new? What moueth vs to wish health and say, God helpe, or blesse, when one sneezeth? for euen *Tiberius Caesar*, who otherwise was known for a grim fir, and the most vnfoliable and melancholick man in the world, required in that manner to be salued and wished well vnto, when soeuer he sneezed, though he were mounted in his chariot. And some there be who in this case do ceremoniously salute the party by name, and thinke there is a great point of religion lies in that. Moreover, is not this an opinion generally receiued, That when our ears do glow and tingle, some there be that in our absence doe talke of vs! *Attalus* auoucheth for a certainty, that if a man chance to espie a scorpion, and do no more but say this one word * *Duo* [i. two] the serpent wil bestil & quiet, and neuer shoot forth his sting. And now seeing by occasion of mentioning a scorpion, I am put in mind of Africk, you shal vnderstand thus much, that throughout all that country there is not one goeth about to do any thing, but before he begins he saith this word * *Africa*. Africk. As for other nations, in euery enterprife that men take in hand, they vse the name of their gods, & pray ordinarily, that it would please them to giue a grace and blessing to their attempts. As for this ceremony, namely, when the table is spread and furnished with viands, to lay a ring from the finger vpon it, we see it commonly & orderly praetised; and that it is of force to put by many scruples and religious doubts it is very euident. You shall see some men to take the spittle out of their mouths, and conuey it with their fingers end behind the ear, for to reioice the heart & driue away all pensiuensse and melancholick fanies that trouble the mind. And to bend or bow down the thumbs when we giue assent vnto a thing, or do fauor any person, is so vsuall, that it is growne into a prouerbiall speech, to bid a man put down his thumb in token of approbation. In adoring the gods and doing reuerence to their images, wee vse to

B * kisse our right hand and turne about with our whole body: in which gesture * the French obserue to turne toward the left hand; and they beleue that they shew more deuotion in so doing. As touching the maner of worshipping and adoring flashes of lightening, all nations with one accord and conformity do it with a kind of * whistling or chirping with the lips. If there be mention made of scarsefires at the table as we sit at meat, we hold it ominous, but we turn away the perillous presage thereof, by spilling and casting water vnder the bourd. When one riseth from his meat and is ready to depart, if they of the house go in hand presently for to sweep the floore and make all cleane: as also to take away dishes, trenchers, &c. vpon the bourd; or to remoue the cupboard of plate, & liuery table, whiles one of the guests is a drinking, are thought to be most vnfortunat tokens, and to presage much harm. *Seruius Sulpitius* a principal person of our city, hath written a treatise of this argument, wherein he giueth a reason why we should not leaue or shift our trenchers at euery course or change of dishes; for in those daies there were no more allowed than there sat guests at the tables, and those were serued but once for all. If one chance to sneeze after repast, the order is to call for a dish of meat and a trencher againe to be set vpon the bourd: and in case he taste not of somewhat afterward, it is thought a most fearefull and

* i. The first of March.

* *Dies causa*, i. pro forma: As *Valegius* *Lucius*, *Salvius* *Statorius*, &c. which are significant, and import by the very letter, some happines and prosperity.

* Which fastidious was afterwards taken vp in doing reuerence to princes and great persons, whereas other nations obserued to turne to the right hand, as appeareth by *Plautus*, *Quam me veris nescio*. *Si des saluas*, *Dexterosum censeo*, i. *proprium*, i. setting your lips close together, and drawing the breath inward, as our manner is in playing with a tame Sparrow, or cheating vp and making much of an horse.

* Of the special providence of God: I have speake like himselfe, a heaven with himselfe.

* Fame labor est.

* Which answer to our R and A.

and cursed presage on this behalf: like as to sit at the table and eat nothing at all. * See how ceremonious those men were, and what precise ordinances they instituted, who were of beleeve, that in all our affaires and actions, and at all times, the diuine power of God was present: and that by these means they left them pacified for all our sins and vices. Neither is there an end here: for ouer and besides it hath been marked, that many times all the table is hushed, and there is not a word heard from one end to the other: but this is noted neuer to happen but when the guests make a just euen number. But what doth this silence presage? Surely, euery one of them * shall be in danger to lose or impaire his credit, good name, and reputation. Moreouer, if a peece of meat chanced to fall out of the hand down to the floore, it was taken vp and deliuered vpon the boord again, where it passed from one to another, and went through the table: but in any wise they were forbidden to blow thereupon, for to cense it from the dust or filth that it caught. Furthermore, they haue proceeded thus far, as to gather presages from such things as happen just at the time whiles one either speaketh or thinketh of the same. But of all others, this was counted a most execrable token, in case it chanced that the Pontific or high Priest sitting at the table *pro forma*, and for order sake, at any solemne feast or sacrifice, let fall a morcel of meat: but if the same were laid vpon the boord again, and afterwards burnt and sacrificed to the familiar gods of the house *Lares*, it was thought a sufficient expiatory satisfaction. Semblably, men are of opinion, That if any medicines purgative or others, fortune to be set vpon a table before they be giuen to the patient for to drink, they will do no good at all, but lose their operation. Also there is a superstitious ceremony in paring the nailes of the fingers, during the market daies held at Rome, with this charge, that the party hold his tongue and be silent all the while, & begin at the fore-finger, and this forsooth concerns the mony of many a man. Likewise, as great a matter as that, lieth in stroking or handling the haire of the head, either on the 17 day after the change of the Moon, or the 29: for a special means this is to keep the haire on, which is giuen to fall, as also to ease the head-ach. Moreouer, the peasants in the country obserue this custome in many manners and farnies of Italy, to forbid their wiues and women to spin as they walke vp and downe abroad in the street or any common way of passage, or to carry their rockes and distaues vndized or bare; for this opinion they haue, that in so doing they preiudice the hope of al fruits, and the corne especially growing in the field for that yeare. Not long since, *M. Seruilius Nonianus*, (who in his time was a principal citizen of Rome) to prevent the blearednesse of his eies which he feared, before that either any man else foretold him of that disease, or himselfe once named it, took a little peece of paper, and wrote therein these two capital Greek letters P and A, which he lapped round & fast tied with a linnen thred, and so wore it hanging at a lace about his neck vnder his throat. *Mutianus* (who had bin thrice Consull of Rome) obserued the same effect by wearing a flie aliue within a little rag of white fine linnen cloth: and both of them did highly commend these medicines of theirs; reporting, that by those meanes they were free from bleared eies. Finally, we read of certain charms and spels against storms of hail: against sundry sorts of diseases, and namely for any part that is burnt or scalded, and verily some of them haue been proued by experience to be effectuell. But for mine own part abashed I am and ashamed to put them downe in writing, considering how diuersly men are affected in minde. And therefore to conclude this matter, I leaue euery man to himselfe to giue credit or otherwise vnto them at his owne pleasure and discretion.

CHAP. III.

¶ Remedies proceeding from man, for the cure of diseases.

IN my former Treatise as touching strange and wonderfull nations, I spake of certaine races of men which were of a monstrous nature, and carried a venomous regard and looke in their very eies: besides many other properties of beasts, which here to repeat were needlesse. Howbeit, in this place I think it not amisse to note, that some people there be whose bodies be from top to toe all medicinable and wholesome to others. As for example, the men of those families which do terrifie serpents, and driue them away with their very presence: who also are of this nature, that they be able to cure and ease such as are stung already either by touching only, or else by a medicinable sucking of the place: of which kind are the *Psylli* and *Marisi*: those also in the Island * *Cyprus*, whom they call *Ophuges*: and of this race and house there came an Embassadour

A sadour out of the said Island, whose name was * *Exagon*, who by the commandement of the Consul was put into a great tun or pipe wherein were many serpents, for to make an experiment and trial of the truth: and in very deed the said serpents licked his body in all parts gently with their tongues, as if they had bin little dogs, to the great wonder of them who beheld the manner of it. A man shall know those of this family (if any of them remain at this day) by this signe, that they breath a strong and stinking sent from them, especially in the Spring season. Now, these people beforenamed had not only a gift to cure folk with their spittle, but their very sweat also had a medicinable vertue against the sting of serpents. For as touching those men who are borne and bred in *Tentyrus* (an Island lying within the riuier *Nilus*) so terrible they be vnto the *Crocodiles*, that they wil not abide so much as their voice, but flie from them so soon as they heare it. Moreouer, it is knowne for certaine, that all the sort of these people, who haue their bodies thus priuiledged by that secret antipathic in nature between them & serpents, are able to ease those who are stung, if they come but come in place where they be: like as a wound will be more angry and sore, if they come neare who at any time before haue been hurt by sting of serpent or tooth of mad dog: such also carry about with them in their bodies so venomous a quality, that their onely presence is enough to marre the eggs that a brood-hen sits vpon, and make them all addle, yea, and to driue ewes and other cattell to cast their yong before the time: such a virulent property remaineth still behind in their bodies who haue bin once stung and bitten, that notwithstanding they be cured thereof, yet venomous they are now and hurtfull to others, who beforetime were poisoned themselves. But the only way to remedy this inconuenience, is to cause them to wash their hands before they enter into the roome where the patients lie, and with the same water to besprinkle and wash them who are to be cured. Againe, this is to be obserued, that who soeuer at any time haue bin pricked with a scorpion, shall neuer afterwards be stung by hornets, wasps, or bees. A strange thing this is no doubt, howbeit, no great wonder vnto them who know, that a garment or cloth which had bin vsed at funerals, wil neuer be afterwards morth eaten: and how that serpents hardly can be plucked out of their holes, vnlesse it be by the left hand.

CHAP. IIII.

¶ Of certaine Sorceries: and the properties of a mans spittle. Also against Magicians.

THE inuentions of *Pithagoras* as touching numbers, beare a great stroke in these matters, and lightly misse not: but principally in this, That the said Philosopher would giue judgement by the vowels contained in the proper name of any person, concerning their fortunes, for in case the vowels were in number odde, he pronounced, that if the party euer proued lame of a lim, lost an eie, or met with any such like accidents, the same should happen vpon the right side of the body: but contrariwise, if the number of vowels were euen, then these infirmities should befall the left side. Furthermore, it is commonly said, that if one take a stone, dart, or instrument of shot, wherewith a man hath killed these three liuing creatures, a man, a wilde Bore, and a Bear, one after another, & that with one single stroke to euery one of them, and fling the same cleane ouer an house where there is a woman in hard trauell of child-birth, so as it light on the other side without touching any part thereof, the woman shall presently be deliueed. More reason there is that a * light jauelin or Pertuisan should do this feat, which had bin drawn forth of a mans body, so as it neuer touched the ground after; for do but bring this murdering jauelin into the place where a woman is in labor, it wil forthwith procure her deliuerance. *Orpheus* and *Archelaus* do write much after the same matter of arrows pulled out of men bodies, namely, that if care be had that they touch not the earth, & then be laid vnder the bed where man or woman lieth, they wil cause the parties to be enamored vpon them that bestowed the said arrows there: and these authors report moreouer, that the venison of any wild beast killed with the same weapon which was the death of a man before, is singular to cure the falling sicknesse.

As some men there be whose bodies all throughout be medicinable, so there be others who haue certain parts onely of the same vertue, according as I haue written already concerning the thumbe of king *Pyrrhus*. In the citie *Elis* also the inhabitants were wont to shew as a wonderfull monument the rib of *Pelops*, which they auouched to be all of Iuory. And euen at this day,

* *Delitark* has been which also was called *Calliaris*.

many there are who make great scruple to shauē or clip the haire growing in any molle or wert G
vpon the face. As touching the fasting spittle specially of man or woman, I haue shewed already how it is a soueraigne preseruatiue against the poison of serpents. But that is not all: for in
mny other cases it is found by daily experience to be of great operation, and to worke effectually. For first and formost, if we see any surprised with the falling sicknesse, we spit vpon them,
and by that means we are persuaded, that we our selues auoid the contagion of the said disease.
Item, an ordinary thing it is with vs to put by the danger of witch-craft, by spitting in the eyes of
a witch: so do we also, when we meet with one that limperth, and is lame of the right leg. Likewise
when we craue pardon of the gods for some audacious and presumptuous praier that wee
make, we vse to spit euen into our bosoms. Semblably, for to fortifie the operation of any medicines,
the manner is to pronounce withal a charm or exorcisme three times ouer, and to spit vpon
the ground as often, and so we doubt not but it will do the cure and not faile. Also when we
perceiue a fellon or such like vncom fore a breeding, the first thing that we doe, is to marke it
three times with our fasting spittle. I will tell you of a strange effect, and whereof it is no hard
matter ywis to make the triall. If one man hath hurt another, either by reaching him a blow
neare at hand, or by letting flie somewhat at him farther off, & repect him when he hath so done;
let him presently spit iust in the midst of the palm of that hand which gaue the stroke, the party
immediatly that was smitten, shall be eased from pain, and take no harm thereby. And verily
we find this to be so, by experiments oftentimes made vpon the bodies of fourfooted beasts: for
let them be swaied in the back, orhipped by some stripe giuen them with stone or cudgel, do no
more then but spit into that hand which did the deed, & streightwaies they will goe vpright again
vpon all foure. Contrariwise some there be, who before they either strike or discharge any
thing from them against another, after the same manner first spit into the bal of their hands, and
so they make account to do a greater displeasure, & to hurt more dangerously. But this we may
assure our selues, that there is not a better thing in the world for to kil tettare, ringworms, & the
foule lepric, than to rub and wet them continually with our owne fasting spittle: likewise to anoint
therewith euery morning our eies, keepeth them from being bleared: also cankerous sores
are cured with the roor of Sowbread, which we call the earth-apple, if the same be wrought into
a salue with our fasting spittle. Moreover, if a man haue a cricke and ach in the nape of his neck,
let him take the spittle of a man that is fasting, some in his right hand, and there with anoint the
ham of his right leg, and the rest with his left, and do the like to the left leg: and thereupon hee
shall find ease. If an earwig or such like vermin be gotten into the eare, make no more ado but
spit into the same, and it will come forth anon. Among countercharmes, & preseruatiues against
forcerie, these be reckoned, namely, that a man spit vpon his own vrine as soon as he hath deliue-
red it out of his body, likewise to spit into the shooe that serueth his right foot, before he put it
on in a morning, also whensoever he goeth ouer or passe by a place where sometime he was in
danger, to remember that he spit vpon it. *Marcion* of Smyrna, who wrote a Treatise of the vertues
and effects of simples, reporteth, that the Scolopendres of the sea will burst in sunder if one spit
vpon them: and so will hedge toads and other venomous frogs. *Ophilius* writeth, that spittle wil
do the like by serpents, if one spit into their mouths as they gape. As for the learned *Salpe*, hee
saith, that if one perceiue any member or part of the body be asleep and benumbed, there is not
a better thing to recouer the sence thereof, than to spit into the bosome, or to touch the vpper
eieliids with fasting spittle. Now, if we beleue these things to be true, we may as well giue credit
to all that which followeth. Wee see it is an ordinary thing, that if a stranger come in place
where a babe lieth in the cradle, or look vpon the said infant whiles it is asleep, the nource vseth
to spit thrice: although I am not ignorant that there is a religious opinion of this fillable * Mu,
that it is able to defend such yong sucklings, as also of the foolish puppet *Fascinus*, both which
are of power to put back any witchcraft from them, and returne the mischief vpon the eie-biting
witch. And since I am light vpon this name, I must let you vnderstand that this *Fascinus* is
holden to be a god forsooth, the gardian & keeper not of infants only, but of great captains and
braue generals of the field; who hath diuine seruice done to him at Rome among other gods,
and that by the vestall Nuns, for the manner was to hang this ridiculous puppet vnder the cha-
riots of noble victors riding in triumph, not onely to defend them by a medicinable power a-
gainst the venome of enuious and spightfull tongues, but also to returne all enuie vpon them, &
bid as it were to take it among them: the like vertue is in the tongue, beseeching fortune to bee

thie object.

A propitious and fauorable vnto them: Fortune (I say) who ordinarily commeth after to whip and
punish them, as the scourge and tormentresse of glory and honour.ouer and besides, the tooth
of a man, especially when he is mad, is reckoned to be as dangerous and pernicious a biting as
any other. The excrement found in mans ears, called ear wax, is thought in this case to be soue-
raigne: and let no man maruell thereof, considering how it will heale the sting of Scorpions and
serpents also, if it be applied to the place presently: but it is the better and more effectually, if it
be taken out of the Patients own ears, who is thus wounded: and in that sort it healeth also the
whitflaws and impostumations that breed about the naile roors. Moreover, take a mans or wo-
mans tooth, and stamp it into powder, it is thought good for the sting of a serpent. The haire of
yong boy-children which is first clipped off, is held to be a singular remedy for to assuage the
painful fits of the gout, if the same be tied fast about the foot that is grieved: & generally their
haire, so long as they be vnder 14 yeres of age, easeth the said anguish, if it be applied vnto the
place. Likewise, the hair of a mans head cureth the biting of a mad dog, if it be laid to the place
with vineger: it healeth also the wounds in the head, applied with oile or wine. But if it were
plucked from his head whiles he hangeth vpon the gallows, then is it soueraign for the quartan
ague: but we may chuse whether we will beleue it or no. Certainly the haire of the head burnt
to ashes, is known to be very good for a cancerous vlcere. If a woman take the first tooth that a
yong child cast, set it in a bracelet, and so weare it continually about her wrist, it will preferre
her from the pains & grieuances of her matrice and naturall parts. Tie the great Toe and that
which is next vnto it together, you shall see how it will allay any risings & tumors in the share.
Bind gently the two middle fingers of the right hand, with a linnen thred, marke of what force
this remedy is to repress the rheum falling into the eies, and how it will keep them from being
bleared. If all be true that is commonly said, the stone that one hath voided & thrust out of the
body, easeth all others that be pained with the stone, if the same be kept fast tied to the share:
also it doth mitiga the grieue of the liuer, and procureth speedy deliuerance to women in tra-
uel with child. *Granius* affirmed moreover, that in all these cases it would do the better, if one
were cut for it, & that it were taken forth of the bladder by way of incision. If a woman be neere
her time, and looks euery day to fall to labour & cry out, let the man come by whom she is with
child, and after he hath vngirt himselfe, gird her about the middle with his own girdle, and vn-
loose the same againe, saying withall, this charme, *I tied the knot, and I will vndo it againe*, & there-
with go his waies, she shall soone after fall to her businesse and haue more speedy deliuerance.
D *Orpheus* and *Archeleus* both, do affirme, That if the squinancy be anointed with man or womans
bloud (it skilleth not out of what vein or part of the body it issued) it is an excellent remedy for
that disease. The like effect it hath, if their mouthes be rubbed with the said bloud, who being
ouertaken with the epilepsie, arealne down; for immediatly thereupon they will rise and stand
vpon their feet. Some write, That if the great toes be pricked vntill they bleed againe, the drops
that come forth worke the like effect in the falling sicknesse, so that the face of the Patient be
sprinkled or besmeared therewith: or if a maiden touch the parties face that lieth in a fit of the
said disease, with her bare thumbe or great toe, he shall come againe to himselfe and recouer. By
which experiment Physicians going by coniecture, are of opinion, That such persons subiect to
E that disease, should feed of the flesh of * such beasts as neuer were with yong. *Aschines*, a Phy-
sician of Athens, was wont to cure squinies, the inflammations of the amygdals, the infirmities
of the vula, and all cancerous sores, with the ashes of a man or womans body burnt: and this
medicine he called Botryon.

Many maladies there be, that goe away the first time that either a man hath carnall know-
ledge of a woman, or that a maid seeth her monthly sicknesse: but if they end not at such a time,
commonly they proue chronicke diseases and continue a long time, and especially the falling
sicknesse. It is said moreover, That the company of a woman easeth them very much who are
stung with a scorpion: but women in the same case catch harme by that means. Some say also,
that if the eies be dipped three times in that water wherein a man or woman hath washed their
feet, they shall be troubled neither with blearednesse nor any other infirmity. And others there
be who affirm, that the wens called the Kings euil, the swelling kernels also behind the ears, and
the squinancy, are cured with touching the hands of them that haue died a violent & vntimely
death. Some stand not so much vpon that point, but say, That the backe of the hand of any one
that is dead (it skills not how nor by what means) if it touch the grieved part, wil work the like

effect, so that the dead party & the Patient be both of one sex. As for the tooth-ach, it is a common speech, That if one bite off a peece of some tree that hath been blasted, or smitten with lightning, prouided alwaies that he hold his hands behind him at his back in so doing, the said morfell or peece of wood will take away the toothach if it be laid vnto the tooth. Some there be who giue direction to take the perfume of a mans tooth burning in the fire, for to ease the tooth-ach of a man, and semblably of a womans tooth to help women in the same case. Others you shall haue, that prescribe to draw one of the eie-teeth, called in Latine Canini, out of the head of man or woman lying dead and not yet enterred, and to wear the same against the tooth-ach. It is a common speech, That the earth found in or about a man or womans scull, is a singular depilatory, and fetcheth away the haire of the eie-brows. As for the grasse or weed that grows therein (if any such may be found) it causeth the teeth to fall out of the head with chewing on-ly. As also that no vicer will spread farther but keep at a stay, if there be a circle drawne about it with the bone of a man or womans body. As touching the cure of a tertian ague, some there be who lade vp water out of 3 pits, as much out of one as another, and mingle all together; which done, they put the said water into a new earthen pot that neuer was occupied before, & begin to the Patient out of it, giuing the rest vnto him or her for to drink, when the fit commeth. But for the quartan ague, they get me a broken fragment of a wooden pin which held the sides & crosse peece of a paire of gallows together, wrap it within a lock of wool, and so hang it about the Patient: or els they take a peece of the halter or rope from the gallows, and vse it in like maner for the foresaid purpose: but wot ye what? when the patient is by this meanes rid of the feuer, the said parcel of wood or cord they vse to bury or bestow close in some hole within the ground, where the Sun may neuer shine on it, & then the access will neuer return more. See the toies & vanities of these Magicians! and yet these be not all; for they run on stil and say, that if one take a whetstone which hath serued a long time to whet knives & other edge tooles on, and lay the same vnder the boulder or pillow where one lieth that is ready to faint and giue vp the ghost vpon some indirect means, by forcery, witchcraft, or poisoning (but this must be done without the knowledge of the said party) you shall from the very mouth of the patient hear, what poison was giuen, in what place, & at what time; but who it was that gaue it, he or she shall not be able to name. Moreover, this is known for a truth, that if one be stricken speechlesse with lightning, and then the body be bent and turned toward the wounded place, the party shall recouer presently and speak again. Some there be, who to driue back and keep down the biles and botches that rise in the share, take the three or yearn out of the weauers loome which serue for the selvedge or list, making seuen or nine knots, and in the knitting of euery one of them name some widow or other, and then tie it fast about the grieved place. Also for to assuage the paine of any wound, they giue order, that the wounded party take a naile or some other thing that one hath troden vnder foot, and to weare the same tied about the neck, arme, or other part of the body. For to be rid of warts, some chuse a time to pluck them vp by the roots, when the Moone is twenty daies old at least, and then lay themselues along vpon their backs in some ordinary high way, looking fully vpon the Moone, and stretching their armes backward as farre as they can beyond their heads, and looke what they can catch hold of with their hands, therewith they rub the place. If one cut and pare an agnell or corn in any part of the body, obseruing a time when a star seemeth to shoot or fall, they say, it wil quickly weare away and be healed for euer. They would beare vs in hand, That if a man poure vinegar vpon the hooks and hindges of doors, and make a liniment with the durt that commeth of the rust thereof, and therewith annoint the forehead, it will assuage the head-ach. They promise also to do as much with a wyth or halter that a man is hanged withall vpon a gibbet, in case it be done about the temples of the head in manner of a frontall. Moreover, if any fish-bone stick in the throat and will not remoue, it shall incontinently goe downe, if the party ready thus to bee choked withall, put his feet into cold water: but if some peece of any other bones be ready to choke one, make no more adoe, but take some other little spils of the said bone and lay them vpon the head, you shall see it passe away and do no harm. If a peece of bread haue gone wrong or lie in the way readie to stop the breath, take the crumbs of the same loafe and put them into both the eares, you shall see it will soon be gon and do no further harme. Furthermore, the Grecks (who were giuen much to make money of euery thing, and namely of their publicke places of bodily exercise) made great account of certaine excrements that came from mens bodies, as singular remedies for many diseases: for the filth

that

A that was scraped & rubbed from the bodies of wrestlers, &c. serued to mollifie, to heal, resolu-
and incarnat, a medicin consisting of sweat & oile tempered together: with it they vsed to cure
the inflammations, contractions, distortions, and risings of the matrice, by application outward-
ly: therwith they would draw down the monthly fleurs of women; lenifie the intemperat heat,
and dissolue piles and swelling bigs in the seat or fundament: they vse the same also to assuage
the grieve of the sinews, to rectifie dislocations & set the bones in ioint, and to discusse the no-
dosities of the ioints. Howbeit, the scrapings that come of sweating in banes and hot-houses,
be counted of greater validitie in all these infirmities, and therefore no maruell if they enter in-
to the composition of maturative emplasters, and which bring an impostume to suppuration: as
for the foresaid medicines which stood vpon sweat, oile wherewith wrestlers were anointed, and
some vrine mingled among, they be good onely to mollifie the nodosities of the ioints: for as
they heat and resolu- more effectually, so in the other respects nothing so forcible they are as
those that be gathered out of stoues & baines. Verily a man would not beleue to what shame-
lesse and impudent curiosity some authors are grown vnto (and euen those of all others who be
most renowned) who bash not with open mouth to commend vnto vs that, for a singular remedy
against the prick of scorpions, which I am not willing to name, euen the filthy sperme that pas-
seth from a man by his priuities. Neither could they stay there, but to cause barren women for
to teem and beare children, they haue found out a proper pessarie to be put vp into their secret
parts, made forsooth of the ordure that commeth away from infants so soone as they be out of
their mothers womb: and this medicine they haue a pretty name for, & call it Meconion. More-
ouer, the Grecks haue gone so neare, that they haue scraped the very filth from the wals of their
publicke halls and places of wrestling, and such like exercises, and the same (say they) hath a
speciall excafactory vertue, whereby it discusseth and resolueth the biles and impostumes cal-
led Pani; and serueth as a fourraigne liniment to heale the vlcers in the bodies of children and
old folk, yea & to skin any place that is galled, raw, & blistered with burning. Lo what remedies
haue bin found in the body of man? And surely since I haue taken the pains to put them down,
I may not omit those voluntary medicines which depend vpon his minde, & proceed from his
will and vnderstanding. In the first place, you shall haue some that wil fast and forbear all kinds
of meat; others drink not at all; one while they abstaine from wine onely, another while from all
flesh meats; and you shall see diuers men neuer come vnto bathe or baine, euery one according
as their sicknes doth require. And this kind of abstinence or regiment of the selues, they hold
to be the readiest and surest means to recouer their health. In the rank of these remedies, are re-
coked bodily exercise, straining of the voice, vnction, scratching, and rubbing, as need and occa-
sion requireth; for hard and vehement friction doth confit and bind the body: contrariwise,
gentle and soft frictions do mollifie and open the pores; and, as much rubbing taketh down the
body and causeth leanness, so that which is moderat setteth it vp and encreaseth fatnesse: but
nothing is there more wholsome than walking and gestation; which is an exercise performed
many waies. If the stomacke be weake, and the legs feeble, riding on horseback is an excellent
exercise: for the pt thy sicke or consumption, nothing so good as to saile or be rowed vpon the
* water: but in case there be a long disease hanging vpon a man, what better thing in the world
E than to change the aire, and remoue from place to place? In like manner to procure sleep, by ly-
ing in some pretty bed that may be rocked too and fro, is oftentimes good for a mans health: as
also to vomit now and then, but in no wise to vse it ordinarily. Lying in bed vpon the backe, is
commended for the infirmities of the eies; but vpon the belly, for the cough. To lie vpon the
sides shifting from one to the other, is held to be singular against rheums and catarrhs. Aristotle
and Fabianus do, say, That we be giuen to dreame at the Spring and Fall, more than in the other
seasons of the yere: also, most when we lie with our face vpward, but neuer groueling. And Theo-
phrastus affirmeth, That sleeping vpon the right side, helpeth forward the concoction of meat in
the stomacke; whereas they that lie vpon their backe shall not haue so quicke digestion. The
manner of bathing also and vsing the baine and hot house, (which is one of the chiefe and prin-
cipall means of our health) is in a mans power to order as he list himselfe: like as he may chuse
what kind of friction he will in the stoue or hot-house; either to be rubbed with linnen cloths,
or well curried and scraped with kombes. Item, it is knowne to bee verie good and wholsome,
to wash ones head with hot-water, before hee enter into the baine or hot-house; and af-
ter that he is out of it, to doe the like with cold water: as also to take a draught of cold water

Dd 2

immedi-

* Specially vpon
on the sea.

immediatly before meat, and to do as much between meals:likewise to drink the same to bedward, yea, and otherwhiles in the very night, so as we sleep both before and after; where, by the way this would be noted, That no liuing creature else but man alone, delighteth to drinke any drink hot; know then hereby, that such kind of drinks be not natural. Finally, to wash the mouth with wine before one goeth to bed, for a sweet breath: likewise so soon as he is vp betimes, with cold water against the tooth-ach, so as he do it three or fīue times together, or at least wīse obseruing such an odde number; as also to bath the eies in a morning with Oxycrat (2) with vinegar and water mingled together, to preferue them for being bleared, are singular and approued experiments.

CHAP. V.

¶ Observations as touching Diet, and the manner of our feeding, for the regiment of Health.

Like to the former rules is this also, as touching our Diet, That it be not too precise, but so as we may feed indifferently of all viands, and acquaint our bodies with variety of meats; which is obserued to be the best way to maintain our health; and in very truth, Hippocrates saith, That to eat but one meale a day (2) to forbear dinners, is a diet that will drie vp a mans body within, and bring them soon to age and decay. But this aphorism of his he pronounced as a Physitian to reclaim vs from that hungry and sparing diet, and not as a patron and maintainer of full feeding and gourmandise: for I assure you, a temperat and moderate vse of our meats, is the wholsomest thing that is for our bodily health. But *L. Lucullus* was so strict herein, that hee suffered himselfe to be ordered and ouer-ruled by his owne seruant, who would not let him eat but as he thought good: in such sort, that it was no small disgrace vnto him in his later daies but as he thought good: in such sort, that it was no small disgrace vnto him in his later daies thus to make his man his master, and to be governed by him rather than by his * own selfe: for was it not (think you) an approbrious and shamefull sight, to see a * slaue and no better, to put his lords hands from a dish of meat, beeing an aged gentleman as he was, and who in times past had rode in triumph; to gage him thus (I say) and keep him short, though hee were set amongst great states at a roiall feast within the capitoll of Rome?

CHAP. VI.

¶ Of sneezing: the vse of Venerie: and other means which concerne mans health.

Sneezing dischargeth the heauinesse of the head, and easeth the pole or rheum that stuffeth the nose: and it is commonly said, That if one lay his mouth to the nostrills of a mouse or rat and touch the same, it wil do as much. To sneeze also, is a ready way to be rid of the yex or hicquet. And *Varro* giueth counsell, to scrape a branch of a * Date tree with one hand after another by turnes, for to stay the said hicquet. But most Physitians giue direction in this case, to shift a ring from the left hand to the longest finger of the right, or to plunge both hands into very hot water. *Theophrastus* saith, that old men doe sneeze with more paine and difficulty than others.

As touching carnall knowledge of man and woman, *Democritus* vtterly condemned it: and why so? Because (quoth he) in that act, one man goeth * out of another. And to say a truth, the lesse one vseth it, the better it is for body and mind both: and yet our professed wrestlers, runners and such gamsters at seats of a ctiuity, when they feele themselves heauy or dull, reuiue and recouer their liuely spirits again by keeping company with women. Also this exercise clenseth the brest and helpeth the voice, which being sometime before cleare and neat, was now become hoarse and rusty. Moreover, the temperat sports of *Venus*, easeth the pain of the reins and loins, mundifie and quicken the eyesight, and be singular good for such as be troubled in mind and giuen ouermuch to melancholy.

Moreover, it is held for witchcraft, to sit by women in trauell, or neare vnto a Patient who hath a medicine either giuen inwardly or applied vnto him, * with hand in hand, crosse-fingered one between another: the experience whereof was well seene (by report) when lady * *Alcmena* was in labour to be deliuered of *Hercules*. And the worfe is this peece of sorcery, in case the parter hold the hands thus joined a-crosse one finger within another about one or both knees. Also

* For every man is to be his owne Physitian: whereupon might rise this proverbe, A foole or a Physitian.

* Thought to be Calisthenes his Physitian: for in those days Physitians were reckoned but seruants to such persons as *Lucullus* was.

* *Palmis alternam manu scalpere*: vnlesse hee meaneth to scratch the palm or inside of the hand, &c.] which answereth somewhat to the remedies next following.

* *Et in alius exilire ex homine*: which *Dalcambius* expounds thus, For that a man in that action, goeth beside himselfe.

* For it is held that women in pain still, & hindreth the operation of Physicke.

* There was an old witch that by this means kept her in a long and tedious trauell.

A to sit crosse-legged, with the ham of one leg riding aloft vpon the knee of the other, and that by turns shifting from knee to knee. And in very truth, our ancestors time out of mind, haue expressly forbidden in all counsels of State, held by princes, potentates, and Generals of the field, to sit hand in hand or crosse-legged; for an opinion they haue, That this manner of gesture hindereth the proceeding and issue of any act in hand or consulted vpon. They gaue out likewise a strait prohibition, That no person present at any solemnity of sacrifices or vows making should sit or stand crosse-legged or hand in hand in manner aforesaid.

As for veiling bonnet before great rulers and magistrats, or within their fight, *Varro* saith, it was a fashion at first nor commanded for any reuerence or honour thereby to be done vnto gouernors, but for healths sake; and namely, that mens heads might be more firm & hardy, by that ordinary vse and custome of being bare.

When a mote or any thing els is salne into one eie, it is good to shut the other hard. If there be water gotten into the right eare, the maner is to jump and hop with the left leg, bending and inclining the head toward the right shoulder; semblably, if the like happen to the left eare; to do the contrary. If one be salne into a fit of coughing, the way to stay it is to let the next fel low spit vpon his forehead. If the vula be salne, it will vp again, if the Patient suffer another to bite the haire in the crown of his head, and so to pull him vp plumb from the ground. Hath the neck a crick or a pain lying behind, what better remedy than to rub the hams? Be the hams pained? do the like by the nape of the neck: say the cramp take either feet or legs, plucking & stretching the sinewes when one is in bed, the next way to be vsed, is to set the feet vpon the floore or the ground where the bed standeth: or put case the crampe take the left side, then be sure with the right hand to catch hold of the great toe of the left foot: and contrariwise, if the cramp come to the right leg, do the like by the right foot. If the body fall a shaking and quivering for cold, or if one bleed excessively at the nostrills, it is passing good to bind strait and hard the extreame parts; to wit, hands and legs, yea and to plucke the eares also. It falleth out oftentimes, that one cannot lie dry nor hold his water, but it cometh from him euer and anone; what is then to be done? mary tie the foreskin of his yard with a linnen thred or a papyr ruff, & withall, binde his thighs about in the middle. If the mouth of the stomacke be ready to turne, and will neither receiue nor hold any thing, it is good to presse hard and straine the feet together, or els to thrust both hands into hot water.

D To come now vnto our speech and exercise of the tongue: in many cases and for diuers causes it is wholsom to speak but little. I haue head say, that *Mecenas Messius* inioined himselfe three yeres silence, and during that time neuer spake word, for that in a fit of a convulsion or crampe, he had beforetime cast vp blood. In case any thing be ready to fall or rush violently against vs, and that we be in danger of some stroke, say that we be climbing vp hill, or turned downe backward, or lying along, there is not the like meanes againe to preferue our bodies, as to hold our winde: and this inuention we had from a bruit and dumbe beast, according as I haue shewed before.

Moreover it is said, that to stick down a spike or yron naile in that very place where a man or womans head lay during the fit of the falling sicknesse, at the very first time that hee or she fell, secureth the party that so doth, for euer being troubled with that disease. Also it is holden for a singular thing to mitigate the intollerable torments of the reins, loins, and bladder, to pisse with the body bending forward and groueling in the bathing tubs within the baines. As for greene wounds, it is wonderfull how soon they will be healed, in case they be bound vp and tied with a * *Hercules* knot: and verily it is thought, that to knit our girdles which we weare about vs euery day with such a knot, hath a great vertue in it, by reason that *Hercules* first deuised the same.

Demetrius, in a treatise that he compiled as touching the number of foure, affirmeth that it is of great efficacy; and he alledgeth reasons why it is not good to prescribe in any medicine to be drunke, the quantitie of foure sextars or foure cyaths. To rub the ears behind, is supposed to be very good for them that are giuen to be bleared: like as to rub the forehead, for weeping or watering eies.

Concerning the signs of life & death which may be found in man, this is one, That so long as the Patients eie is so cleare that a man may see himselfe in the apple of it, wee are not to despair of life.

As for the Vrine of mankind, diuers authors haue treated of it; who as I find, haue not onely

* Wherein the ends are to be seene, they are so close couched, & therefore hardly to be valuated.

saith, with the deadly Dwale called Dorycnion. In this maner also it cureth those whose brains be troubled and intoxicat with drinking Henbane. Physitians likewise haue prescribed to make a liniment with milke and Hemlock for to be applied vnto the gout. And some there be who vse it in that case, together with Oelype (r) the sweat or fattinesse of vnwashed wooll, and Goosegrease: in which manner it serueth in a pessary to be put vp in the naturall parts of women, to assuage the pain of the matrice. To drinke breest milke is a good meane to stop a laske, as *Rabirius* writeth, & yet the same doth prouoke the monthly course of womens fleurs: what is to be sayd now of a womans milke who hath borne a maid child? surely it is better than the other in these cases only, to wit, in scouring the skin of the face, and taking away the pimples, spots and freckles, which be therein. But I must not forget, that any breast milke whatsoeuer, cureth the maladies incident to the lights: and if there be tempered therewith the vrine of a yong lad not full fourteen yeares old, and Attick honey, so there be of each one spoonfull, I find it to be an excellent remedy for to rid away the ringing end thumping within the ears. And to conclude, it is a general speech, That if dogs do lap and tait the milke of a woman which hath borne a maid child, they will neuer run mad.

As touching the falling spittle of a woman, it is judged to be a proper medicine for bloud-shotten eies; also for the rheum that hath taken a course thither, if to be the corners of the eyes be euer and anone bathed and wet therewith when they be hot and inflamed; but more effectually will this remedy work, in case the woman forbear all meat and wine the day before. I read moreover in some Authors, That if the head be bound vp with a womans haire-lace or fillet, it easeth the pain thereof. And thus much in some good sort as touching the medicines proceeding from women. As for the rest that are written and reported, they exceed all reason, and there is no end of them.

For first and formost it is said, that if a woman whiles her monthly sicknesse is vpon her, bee set into the wind abroad with her belly naked, she will scar away haile storms, whirlewindes, and lightnings, yea, and avert any violence of the weather whatsoeuer. And at seaueryly, any woman standing openly against the weather bare, although she haue not her fleurs, is enough to seaman standing openly against the weather bare, although she haue not her fleurs, is enough to cure the failers and passengers from all tempests. As for the very monthly flux it self of women, (a thing in other respects and at all times, as I haue shewed before, of a monstrous nature) there be writers who tell and presage wonders thereof, such as be horrible, abhominable, and indeed not to be spoken: and yet some of these things I hold it no shame to deliuer in writing, namely, If it fall out just in the eclipse of Sun or Moon, that a woman hath her sicknesse come down, the same is a pestilent quality, and apt to breed diseases incurable. Likewise, if haply the time of the change, when the Moon is in coniunction with the Sun, and those things concur together, the man who medleth with her during that time, shall not auoid his bane but it will bring vpon him some pestilent malady remediless. Moreover, the venome thereof is so strong at that time especially more than at any other, that the presence or breath only of a woman then, will infect and staine any purple cloth. And yet bad enough it is at all times: for whensoever they are in their fleurs, it skills not in what quarter of the Moone, if they goe about any field of corn with their nakednesse vncovered, yee shall see the canker wormes, caterpillers, beetles, and all such wormes and hurtfull vermine, to fall from the corn as they passe along. This inuention by the saying of *Scepheus* and *Merodorus*, came from the Cappadocians, who being infected with a number of those green flies called *Cantharides*, deuised this means to be rid of them; for they caused their women at the time of their monthly terms (sauiing the reuerence of womanhood be it spoken) to go through the standing corne, with their cloths tuckt vp round about their waist, and all bare beneath. In other countries yet they are more mannerly, and in a better respect to the honor of women, put them only to go barefoot for this purpose, with their haire hanging loose about their eares, vngirt, vnclad, and vnbraced. Howbeit, great heed must be taken, that they walke not thus at the Sunne rising, for then surely all the crop vpon the ground will wither and dry away to nothing. Also if a woman during her natural courses doe but touch any yong vines, it is enough to marre them for euer. As for Rue and Iuie, Plants otherwise of themselves most medicinable, and indued with singular vertues against poison, they will presently die with their touch. Much I haue already said of this strong and pestiferous venome, and yet I haue not written all. For ouer and besides, certaine it is that if a menstruous woman doe no more but touch a Bee-hiue, all the Bees will be gone and neuer come to it againe. Also if at such a time she handle

A die any skains or slips of linnen yearn and set them ouer the fire to seeth, they will in the boiling turn black. Let her but take a barbers rasor in her hand, the edge wil turn and become blunt; nay if she do no more but touch any brasen vessel, it is wonderfull what a strong fauor it wil cast, and how it wil rust and canker therupon; and the rather, if this fall out to be in the decrease or wane of the moon. Doth a woman at such a time touch a mare that is in foale, it is enough to make her cast the same before due time. And not onely so, but the very sight of women in that case, although they be a great way off, is able to do much harm; but principally the first time that they haue the said fleurs after the losse of their maidenhead; or otherwise during their virginity, when they first come down by course of nature of the owne accord. The malignitie of this venomous humor is so great, that the slime ingendred within the lake of Sodome in Iury, as viscous as it is otherwise, will forgoe all that tenacity, and diuide in sunder by nothing els but a thred infected with the said menstrual blood, according as I haue declared heretofore. So forcible it is besides that the very fire, which is of power to ouercome all things and change their nature, is not able to conquer and alter this: for burne or calcine it to ashes, and strew neuer so little thereof vpon any cloths that are to be washed or scoured in the Fullers mill, it wil change their color, though they were of purple, and cause any die whatsoeuer to lose the fresh lustre. And more than that, so pernicious is the quality of this venome, that as naturall otherwise as it is to women, it is no better than a poison to those of their own sex: for in case one woman with child be annointed about her naturall parts, with the foresaid blood of another, or do but step ouer the place where it is, she will immediatly fall to labour, and slip an abortiue birth. As for the famous curtizans, C *Lais* and *Elephantis*, who haue written for contrary one to the other of this argument, and namely, as touching abortions, and of what efficacy the cole of Colewort, Myrtle, or Tamariske roots is, after it hath bin quenched in the said blood; as also, how she Asses will not conceiue for so many yeres as they chauce to eat Barly corns infected therewith; besides other strange deuises that they haue set abroad, I think them incredible, & I would not haue any credit at all giuen vnto their writings, considering the monstrosities & contrarieties which they haue put down, whiles the one prescribeth medicines for to make fruitful, & the other ordaineth the very same, to hinder conception and cause them to be barren. Moreover, *Bythm* of Dyrhachium saith, that for to make a mirror or looking glasse cleare againe, which was dused and dimmed by the aspect of a menstruous woman, the next way is to cause her to cast her eies backward and to look ouer her shoulders vpon it againe; he saith moreover, that if women in that case haue about them D the fish called a Barbill, they shal not by that means infect or do hurt at all, but the same menstruous blood shall lose all the foresaid strength.

Well, as hurtfull and mischieuous as it is otherwise, yet many there be who affirm it to be in many diseases medicinable, and namely, for the gout, if the place be annointed therewith; as also if women while their monethly sicknesse is vpon them, doe handle the wens named the Kings euil, the swelling kernels behind the eares, the broad tumors or biles called Pani, shingles, S. *Anthons* fire, felons, or violent flux of humors to the eies or other parts, there wil insue much ease therupon. *Lais* and *Salpe*, two notable strumpets, haue left in writing, That if the foresaid menstruous blood bestowed within a little Locke of wooll that came from a blacke Ram, be worne E inclosed within a siluer bracelet, it is a soueraigne remedy against the biting of mad dogs, and for Tertian and Quartan agues. *Diotimus* of Thebes reporteth, That any little peece or rag of cloth, yea, though it were but a thred stained therein, and so set hand somly into a bracelet, is sufficient to do as much. *Sotira* the renowned midwife affirmed, That there was not in the world so good a thing against the Tertian & Quartan, as to rub & anoint therewith the soles of the patients feet: but much more effectually would it do the deed, in case the woman her self had the doing of it with her own hand, so as the sick party know not thereof in any hand. And this (quoth she) is a soueraigne medicine to raise them out of a fit of the Epilepsie, who are surprisid and fallen therewith. *Ictidas* a worthy Physitian among the Greeks, assureth vs vpon his word, That Quartane agues will make an end and go away by the act of generation, at what time onely as a woman beginneth to enter into her fleurs. But this is agreed vpon by all authors professed and seen in this theam, that if one be bitten with a mad dog, and so far gone, that he is afraid of wa- F ter, so as he dare not see it or drink at all, do but put a clout or shred of cloth dipped in the said menstrual blood vnder the cup whereout hee is to drinke, hee shall immediatly be deliuered from that feare: And this commeth by that powerfull and predominant Sympathie, whereof the

the Greeks write so much, between mad dogs and the said blood, considering, as I haue before-
said, that they begin first to run mad by tasting therof. This is known for certain, that the ashes
of a burnt cloth infected therewith, or of the blood it self calcined, is a singular powder to heale
the tarcins or sores of horses and all such laboring beasts, so it be mixed with the foot of chim-
ney or furnace, and al incorporat together with wax. Now say there be any garment or cloth pol-
luted therewith, there is not any thing will take out the staine, but the urine onely of the same
woman. The ashes before said tempered alone with oile of Roses into a liniment, and so applied
in maner of a frontal to the forehead, allaieth the headach of women specially. This also would
be noted, That for the first yeare after a woman hath known a man, and so parted from her vir-
ginity, her fleurs are most sharp, mordant, and fretting. Furthermore, this also is resolued clearly
among all writers, That there is no charme or enchantment whatsoeuer, of any validity to doe
harm to that house where the side posts or dore cheeks are striked lightly ouer with menstruous
blood: an argument I assure you, that convinceth notably the folly of these Magitians, the vai-
nest people vnder heauen, and ouerthroweth all their art: and a point that pleaseth me very wel,
& which for mine own part I am right willing to beleue: and since I am light thus vpon them,
I care not much, if to detest their vanities, I set downe one of the most modest receipts that they
haue giuen their word for, and which may seem to carry some shew of truth or probability. For
thus they prescribe with great warrantize, To rake al the nail-parings of toes and fingers of man
or woman lying sick of an intermitten feuer, and to mix or incorporat them with wax, so as the
party in the doing herof do say these words, *I am about a remedy for the Tertian, Quotidian, or Quar-*
tan ague (according as the patient is troubled with the one or other of these feuers) which done
and said, to stick vp the said wax vpon the dore of another man or womans house that is not sick
at all, and that before the Sun be risen, which no doubt (as they say) wil cure the sick person, and
set the ague vpon another that was well before. Now would I gladly know what greater vanitie
and folly there can be, if this medicine misse and do not the feat; or what more villany and mis-
chiefe, than thus to transfer and remoue diseases from those that be sick already, vnto such as be
found and think no harme? To conclude, some of these Magitians are so far gone, that after all
the foresaid nailes of fingers and toes be pared, they ordaine them to be thrown into Ant-holes,
and to obserue that Emmet that first begins to draw one of them into her nest, to catch her vp
quickly, and hang her about the necke of any one that is sick of an ague, and so the patient *pro-*
cure, shall shake off the disease and be quite rid of it.

CHAP. VIII.

¶ The medicines that are found in diuers strange and forraign beasts, as namely, the Ele-
phant, Lion, Cammell, Hyæna, Crocodile, Chamæleon, Skinke, Water-
horses, and Onnces.

These be the remedies which the bodies of men and women do afford: as many I meane as
I may with some honesty relate: and yet ywis many of them be such as are not to be read
out and vttered, but with leaue and patience first craued, for the reuerence that we owe to
chastitees. I know ful wel there is a great deale more behind that I haue not touched, but such
stuffe I assure you as is detestable and not fit to bee spoken or committed to writing, which
makes me rather to make hast and leaue the discourse of Man and Woman, and so to proceed
to the singular vertues and operations of bruit beasts.

And to begin with the Elephant, The blood of that beast, especially the male, staieth all flux-
es of humors, which the Greeks cal Rheumatismes. The shauings of yvory (which is the Ele-
phants tooth) incorporat with Attick hony, scatter (as folk say) the dusky spots that appeare
in the visage: like as the dust thereof, which the file or saw doth make, cureth the whitflawes or
impotumations breeding at the naile roots. The trunk or muffle of an elephant if it be but tou-
ched only, allaieth the head-ach; & the more effectually it is, in case sneezing come withall. It is
said moreover, if one take a piece of the right side of the same trunk, & carry it fast about him
with the red ocre of Lemnos (called Terra Sigillata) it will incite him mightily to carnal lust.
The blood of an elephant is singular good for those that be in a consumption & wast away: like
as the liuer helpeth such as be giuen to the falling sicknesse.

The greafe or fat of a Lion tempered with oile of Roses into an vnguent, preserueth the skin
of

A of the face from all ill fauord spots, and keepes it white and smooth. The same ointment healeth
th skin that is scorched and pilled with cold, by traueilling ouer mountains charged with snow;
yea, and abateth the tumors & nodosities vpon the ioints. Now, if we list to beleue the foole-
ries of Magitians, they would bear vs in hand, that whoeuer be anointed all ouer with the said
greafe, shall be gracious with princes and kings, yea, and win much fauor among the people, and
any state or nation where they shall conuerse; but principally it must be the rat in the forehead
between the cie-brows (where indeed it is vnpossible to find any at all.) The like effects they do
promise of the Lions teeth, and those especially of the right side; like as of the shag haire (for-
sooth) that should hang vnder their nether jaw. Indeed, the gal of a Lion mixed with water, cla-
rifieth the eyesight, in case the eyes be bathed therewith: the same tempered with the own greafe,
B dispatcheth as they say the falling sicknes, in case the patient tast neuer so litle of it, & so soon
as he hath taken it, run a while for to digest the same. A Lions heart cureth a Quartane ague, if
the sick person do eat thereof, and their fat is a foueraigne remedy for the feuer Quotidian, if it
be vfed with oile of rose. There is not a beast so fel and sauage, but it wil run away from them: that
be anointed with Lions greafe; and it is thought to be a singular preseruatiue for to prevent any
secret ambushes or practises intended against one.

As touching the Cammell, his braine (by report) is excellent good against the epilepsie or
falling sic knesse, if it be dried and drunk with vineger; so doth the gall likewise taken in drinke
with hony: which also is a good medicine for the Squinancy. It is said that a Cammels tail dri-
ed causeth loosnesse of the belly: like as the dung reduced into ashes and incorporate with oile,
C doth curl and frizzle the haire of the head. The said ashes made into a liniment and so applied,
yea, and taken in drinke as much as a man may comprehend with three fingers, cureth the dysen-
tery: so doth it also the falling sicknesse. Cammels pisse (they say) is passing good for Fullers
to scour their cloth withal: and the same healeth any running sores which be bathed therein. It
is well known that the barbarous nations keep this stale of theirs vntil it be 5 yeres old, and then
a draught thereof to the quantiry of one hemine, is a good laxatiue potion: likewise that the
haire of their tails, twisted into a wreath or cord, and so worn about the left arme in manner of a
bracelet, cureth the Quartane ague.

As for the Hyæna, there is not a wild beast of the field that the Magitians haue so much in
admiration as it: for they hold that in the Hyæna it selfe there is a certaine magicall vertue, at-
tributing a wonderfull power thereto, in transporting the mind of man or woman, and rauishing
their senses so, as that it will allure them vnto her very strangely. Concerning the rare property
of these beasts to chaunge the sex each other yeare (i.) to be male this yeare, and female next;
as also touching other monstrous qualities obserued in their nature; because I haue discoursed
already of them, it remaineth now that I proceed to shew the medicinable vertues that are re-
ported to be found in them: wherof this may be counted for one of the chiefe, that considering
they be so terrible * to Panthers, that they dare not quetch nor make head against them: who-
foeuer hath about him but a piece of the Hyænes skin may be sure that a Panther will not set
vpon him, nor once come neere. And that which is a wonderfull thing to be spoken, in case the
D hides of them both be hung vp one against another, the haire of the Panther will fall off. When
E the Hyænaes flie before the hunter and would not be taken, they wind with a cariere out of the
way toward the right hand, and wheele about vntil the man be gotten before them; & this they
do, because they would meet with his trafts and footing, which if they happen vpon, and get be-
hind him, you shall see the hunter incontinently to be so intoxicat in his brain, that he is not a-
ble to beare his head nor sit his horse, but to fall from his back. But in case that they turn on the
left hand, it is an euident signe that they be ready to faint, and then will they quickly be taken.
The sooner also and with more ease be they caught (if we may beleue art Magick) if the hun-
ter tie his girdle about his middle with 7 knots, and the cord of his whip likewise wherwith he
ruleth and jerketh his horse, with as many. But see how subtil and cunning these Magitians bee
to cloke and colour their vanities and deceits, with superstitious circumstances! This chase for-
sooth after the Hyæne, must be iust at the very point when the moon is passing through the sign
F Gemini: and then if they be taken, the huntman must be sure to saue euery haire of their skins,
and misse not one, so medicinable they are. By their saying also the skin that grows to the head
of the Hyæne, if it be applied in manner of a frontall, is singular good for the headach: the gall
of the Hyæne cureth bleared eyes, if the forehead be anointed therewith: but if the same bee fod-
den

den with three cyaths of Attick hony and one ounce of Saffron, to a liniment, it is an excellent preferuative to keep one from euer being blear-eyed, if so be the eies be annointed with it. The said composition likewise is singular for to rid away the cloudy films and catarracts that breed in the eie. But for to clear the sight & quicken it, the older this medicine is, the better they hold it to be. And kept it must be in a brasen or copper box, which eie-salue they say, serues also for the mailles or spots, for the asperities, excrescences, cicatrices, dents, & excauations remaining in the eies. The graue or dripping likewise of the Hyænes liuer, newly taken out of the body and rosted, being incorporat with clarified hony into an vnquent, riddeth away the red film that ouercasteth the apple of the eie and darkneth the sight thereof. They will make vs beleue, that the Hyænes teeth are good for the tooth-ach, if the pained teeth be but touched therewith, or if the said teeth be arranged in order, and so applied fast vnto the patients teeth, as they may fit e-
 uery tooth in his head. The shoulders also of the Hyæne are proper to ease the paines that lie in our shoulders and arms both, so they be set likewise orderly and hanged close to the grieved parts. The teeth of the said Hyæne plucked out of the left side of the chaw, and bound vp sure within a piece of a sheep or goats skin, is right soueraigne to be worn in manner of a scutcheon or stomacher for to ease the intollerable paines of the stomack. A dish of meat made of their lungs and eaten, is soueraigne for the flux proceeding from a feeble stomack. But if the saue be burnt and reduced into ashes, and so brought into the form of a liniment with oile, and applied accordingly, it comforteth the stomack mightily. The pith or marrow taken out of the backbone along, and incorporat with old oile and * gall, is passing good for the nerues. The liuer of the Hyæne driueth away Quartan agues, in case the patient take three bits thereof one after another before the accesse. Take the ashes of the Hyænes ridge bone, the tengue and right foot of a Seale, put thereto a Bulls gall, seeth them all together and make a cataplatme thereof, spreading the same vpon a piece of a Hyænes skin, and apply it accordingly, you shall see how it will ease the pain of the gout. The very gal likewise of this beast mixed with the powder of the stone Asius, is commended by them for to cure the said malady. They that are subiect to trembling and to the cramp, such also as be giuen to leap out of their beds, or are troubled with the beating and panting of the heart, ought to take and boile the heart of the Hyæne, and eat one part thereof, and with the other being burnt to ashes and with the brains of the said Hyæne together reduced into a liniment, to annoint the grieved part. This composition likewise serueth to take away the hairs of any place, if it be annointed either with it alone, or els with the gall, & in case one would not haue them euer to come vp againe, they ought to be plucked vp before, and then the place to be annointed. Thus they vse to rid away the haire of the eie-lids that be troublesome. In like manner for the paines of the loins, the flesh about the Hyænes loines is prescribed to be eaten, and therewith oile together, and the place also is to be rubbed well and besmeared. They say moreover, that if a woman which is barren, eat the eie of a Hyæne with Liquorice and Dill, she shall proue fruitful: and so neare they go, as to promise she shall conceiue within three daies after. And (by their report) whoeuer are haunted with sprites in the night season, and be affrighted with such bugbears, let them but take one of the master teeth of the Hyæne, & weare it about them tied by a linnen thred, they shall be freed from all such fantastical illusions: these Magitians also giue direction to those that be out of their wits and gon besides themselves, to haue a perfume made with the smoke of those teeth, and to weare one of them hanging before the brest, with the fat growing about the kidnies, or els with the liuer or the skin. If a woman be with child, and would gladly go out her full time, let her take a peece of the white flesh of this beast, and 7 haire, neither more nor lesse, together with a stags pizzle, bind them all fast within the skin of a Buck or Doe, and so weare them hanging about her necke just against her brest, she shall not slip an vntimely fruit. Furthermore they promise in the behalfe of this beast, that if a man or woman do eat the genital member of a Hyæne, according to their sex, they shall be prouoked to fleshly lust, how cold soeuer the man were before, and could not abide to imbrace a woman.ouer and besides, if the said pizzle and shap of this beast be kept in any house, together with a joint of the ridge bone, skin & al as it groweth too, the whole family shall agree together well, and liue peaceably; now this ioint or knot aboue said they call Atlantion, and it is the very first spondyle of them all. The same also they make no small reckoning of, but hold it for a speciall remedy for the falling sicknesse. Fry the greafe or fat of an Hyæne, the fume thereof (by report) wil chase away serpents: a piece of the chawbone beaten smal to powder & eaten together with

* Helle: some read melle, i. Honey.

A with anise seed, doth mitigat the quivering & quaking in a cold ague fit. A suffumigation made therewith, draweth down womens sicknesse, if we may beleue magitians, who are grown to this passe in their vanity, that they auouch for certain, that if an archer do bind vnto his arm a tooth of an Hyæne, growing on the right side of the vpper chaw, hee shall shoot point blanke and neuer misse his mark. Take the palat or rouse of the mouth of this beast dried and made hot together with Egyptian Alumne, put the same into the mouth and change it three times for new fil, they promise it shall correct a stinking breath, and heale any vlcers or cankers in the mouth. And as for those that weare vnder the soles of their feet within the shoe, a Hyænes tongue, there is not a dog will be so hardy as to bay or bark at them. The brain of the Hyæne lying in the left side of the head, easeth any deadly diseases of man or beast, if the nothrills be annointed therewith. The skin of the forehead serueth as a countercharm against all witch-craft and inchaunments. The flesh growing to the nape of the necke, being dry and made into powder, appeaseth the pain in the loins of the backe, either eaten or drunk, it skils not whether. For the griefe of sinews, they giue order to make a suffumigation with the nerues of Hyæna, which run along the shoulders and back. And the hairs growing about the muzzle of this beast, haue an amatorious vertue with them, to make a woman loue a man, in case her lips be but touched therewith. The liuer of the Hyæna giuen in drink, cureth the cholique and stone. As for the heart, be it taken in meat or drink, it easeth all the paines of the body: the milt cureth the spleen: the kelle with the fat about it, helpeth any inflammation of vlcers if it be applied with oile: the marrow within the bones, appeaseth the griefe of the backbone and sinews, and finally, doth recouer and refresh the wearinesse of the reins and kidnies. The sinews of this beast drunk in wine with frankincense, restore women to the fruitfulness of the wombe, especially when by indirect means of forcery they are become barren and vnapt for conception. The matrice of the female Hyæne giuen in drink with the rind of a sweet pomegranat, is a very comfortable medicin for that part in a woman. A suffumigation made with the fat taken from the hetchill piece or loines, is singular for those women that be in hard trauell of child, and procureth them speedy deliuerance: the marrow or pith out of the ridge bone whoeuer carrieth about them, shall find help against vain illusions and fantastical imaginations. The pizzle of the male Hyæna, if it be burnt, casteth a fume which is good for them that haue any sinews plucked with the cramp. Saue the feet of this
 D beast, and the very touching of them is soueraigne for blear-eyed eies, for ruptures, & inflammations: but this regard must be had, that the left foot be applied to those griefes in the left side, and the right to the contrary. But wot ye what? if the right foot of the Hyæna chance to be carried over a woman whiles she is in labour of childbirth, she shall surely die of it; but contrariwise, let it be the right foot, she shall haue a quick dispatch and be deliuered with ease. The skin or purse that holdeth the gall, beeing either drunke in wine or taken with meat, helpeth those that for weaknesse of stomack be apt to faint and fall into cold sweats: and the bladder taken with wine, cureth those that cannot hold their water. Now look what vrine is found within the bladder of this beast, you must thinke it is an excellent drink if it be mixed with oile, Sesame seed, and hony, for any old griefe whatsoeuer. The first rib and the eighth will make a perfume, which
 E is passing good for those who are bursten: the spondyles or ioints of the ridge-bone, are as conuenient for women in trauell of child-birth: and the Hyænes blood taken inwardly with fried barley meale, doth mitigat the wrings and gripes of the belly. If the side posts or dore cheeks of any house be striked with the said blood, where soeuer Magitians are busie with their feats and juggling casts, they shall take no effect, whether they be charms, exorcismes, or inuocations: in so much as they shall not be able to raise vp spirits, nor haue any conference with familiars by any means of conjuration, whether it be by torch-lights, by bason, by water, by globe, or otherwise. The flesh of this beast eaten, is very effectual against the biting of a mad dog, and yet the liuer is of greater efficacy in this case. If there chance either flesh or bone of man or woman whom this beast hath killed and deuoured, to be found in the maw, surely the perfume thereof is a present remedy for the gout, as these Magitians would seeme to persuade vs. But how if there be found the nails of man or woman there: then wo be to all those that were at the hunting and taking of this beast, for it presageth that one of them is sure to die for it. Beside all this, they do affirme, That either the excrements or bones which the Hyæna dischargeth out of the belly at the time that she is killed, serue for countercharms or preferuatiues against forceries and practices of Magitians. As for the ordure or dung which is found within her guts, being dried and taken

ken in drinke, is auailable against the dysentery: and the same reduced into a liniment with Goose grease and so applied, helpeth those that by some poison are infected all the body over. The greafe likewise of this beast vsed as an ointment, hath a singular property to cure the biting of a dog, so that the patient be couched vpon the skin of the said Hyæna, as say our Magicians: who affirm moreouer, that a decoction made with the ashes of the pastern bone of the left leg, boiled together with the bloud of a weazil, causeth as many as be anointed all ouer therewith, to be odious in the eyes of all men. The same effect do they attribute to the decoction of the eie. But of all the fooleries that they haue broched as touching the Hyæna, this passeth and may go for the chiefe, That the hindmost end of the gut in this beast is of vertue, that no captain, prince, or potentat, shall be able to wrong or oppresse those who haue but the same about them: but contrariwise assureth them of good speed in all their petitions, and of happy issue in all suits of law and trials of iudgements. The concavity or wrinkle thereof, if a man do weare fast tied about his left arme, is so forcible to charme a woman, that if he do but set his eie vpon her, she will leaue all and follow him presently. The ashes of the haire growing therabout made into a liniment with oile, and applied accordingly, causeth those men who before were giuen to lewd wantonnesse and liued in bad name, not onely to become chaste and continent, but also to put on grauity and grow staide in their behauiour. Thus much of Hyæna.

For fabulous tales, the Crocodile may challenge the next place: a beast this is which naturally doth liue as well on land as in water: for two kinds there be of them; whereof the former (keeping thus in both elements) hath this especiall vertue, if we may beleue these Magicians, To prouoke vnto carnal lust, if the teeth which grew in the right side of the chaw, be hanged fast likewise to the right arme of man or woman. The eie-teeth of the said Crocodile, filled vp with frankincense (for hollow they be) and tied to any part of the body, put by those periodicall feuers which vse to return at sett and certaine hours; but then the patient must not for fiewe dayes together, see the party who fastened the same about him. And they report likewise, that the little grauel stones taken out of their belly, be of the same vertue to driue away the shaking fits of agues when they are comming, which is the cause that the Egyptians vse ordinarily to anoint their sick folke with the fat of this beast. The other Crocodile resembleth this in forme; but far lesse he is, and keepeth only vpon the land, liuing vpon most sweet and redolent flours. In which regard, much seeking there is after his guts, for the pleasant senteurs and odors wherewith they be stuffed full; this dung they call Crocodilea, a singular remedy for all the diseases of the eyes, and namely against cataracts, suffusions, and mistie films, if they be anointed with an eie-salue, made of it and the iuice of Porret mixed together. The same brought into a liniment with the oile Cyprinum, serueth to take away all pimples that rise in the face, and clenseth the skin from those spots that blemish the visage. But if it be incorporat with water, it scoureth whatsoever accidents be apt to run ouer the face, and reduceth the skin vnto the natieue color; for it riddeth freckles, moles, and generally any spots or flecks that marre the beautie or fauour. The same is good to be drunke in oxymell to the weight of two oboli for the falling sicknesse: and applied in forme of a pessarie, it prouoketh womens fleurs. Now if you would chuse the best Crocodilea, take that which is whitest, brittle, or easie to crumble, least weighty in hand, and withall swelling in manner of a leuaine, if it be rubbed between the fingers. The manner is to wash it, as they do white lead called Cerusse. Sophisticated it is with amyll, or the scouring Fullers clay & Tuckers earth called Cimolia; but principally with the dung that sterlings meut, which are of purpose caught and fed only with rice. Now there is not a better thing in the world (say these Magicians) for the cataract, than to anoint the eyes with it and honey together. And if a man may beleue their words, there is a soueraigne perfume made of the guts and the whole body besides, for women who are sicke of the mother, or otherwise diseased in the matrice, if they sit ouer it whiles it smoketh. In like manner, it doth them good to be lapped round about with wooll that hath bin so perfumed. The ashes of the Crocodiles skin, as well the bigger as the lesse, brought into a liniment with vineger, and applied vnto those parts of the body which had need to be cut away or dismembred, causeth the patient to haue no sence or feeling at all either of saw or launcer. The very swoke also of the said skin burning, doth the semblable. The bloud of both Crocodiles mundifieth the eyes, and causeth them to see cleare which are anointed therewith, removing the filmes and dispatching the spots that impeach the same. The very body or flesh it selfe of the Crocodile, all saue head and feet, is good meat foddren, for those

A those who bee troubled with the Sciatica: the same cureth an old cough, especially the chini cough in children; and assuageth the paine of the loins. The Crocodiles haue a certaine fat in them that is depilatorie; for no sooner is the hare rubbed therewith, but presently it sheddeth. The said fat or greafe preferueth those who be anointed therewith, from the danger of the Crocodiles, and is excellent good to be melted and dropped into the wounds made by their bite. The Crocodiles heart wrapped within a lock of wooll which grew vpon a black sheep, & hath no other color medled therewith, so that the said sheep were the first lambe that the dam yeared, is said to driue away quartane agues.

To this discourse of Crocodiles, wee shall not doe amisse if we annex other beasts in some sort resembling them, and which be likewise straungers as well as they. And to begin with the Chamæleon, *Democritus* verily made so great reckoning of this beast, that hee compiled one entire booke expressly of it, and hath anatomized euery seuerall member thereof: and certes, I cannot chuse but take great pleasure therein, knowing as I do by that meanes how to decipher and deliuer abroad the loud lies of vaine Greekes. This Chamæleon for shape & bignesse, is much answerable to the Crocodile last named, differing onely in the curbing or crookednesse of the ridge-bone, and largenesse of the taile. There is not a creature in the world thought more fearefull than it; which is the reason of that mutability whereby it turneth into such varietie of colours: howbeit of exceeding great power against all the sorts of hawkes or birds of prey; for by report, let them fly and soare neuer so high ouer the Chamæleon, there is an attractive vertue that will fetch them downe, so as they shall fall vpon the Chamæleon and yeeld themselves willingly as a prey to be torne, mangled, and deuoured, by other beasts. *Democritus* tellethvs a tale, That if one burn the head and throat of the Chamæleon in a fire made of oken wood, there will immediately arise tempests of rainy stormes and thunder together: and the liuer will do as much (saith he) if it burne vpon the tiles of an house. As for all the other vertues which the said author ascribeth to the Chamæleon, because they smell of witch-craft, and I hold them meere lies, I will ouerpasse them all, vnlesse they be some few, for which he deserueth well to be laughed at, and would indeed be reproved by no other means better: namely, That the right eie of this beast if it be pulled out of the head whiles it is aliue, taketh away the pearl, pin and web in man or womans eyes, so it be applied therto with goats milk. The tongue likewise plucked forth quicke, secureth a woman from the danger of childbirth, if shee haue it bound to her body whiles shee is in trauell. If there be found by chance a Chamæleon in the house where a woman is in labor, she shall soon be deliuered in safety: but if such an one bee brought thither of purpose, the woman is sure to die. Also, the Chamæleons tongue pulled out of the head whiles the Chamæleon is quicke, promisseth good successe in iudiciall trials. The heart bound within black wooll of the first shearing, is a most soueraigne remedy against quartan agues. The right forefoot hanged fast to the left arm within the skin of a Hyæna, is singular against the perills and dangers by theeues and robbers; as also to skar away hobgoblins and night spirits. In like manner, whoeuer carry about them the right pap of this beast, may bee assured against al fright and feare. But the left foot they vse to torrisie in an ouen with the herb called also Chamæleon, and with some conuenient ointment or liquor to make in certaine troches, whereof if a man do carry any in a box of wood about him, hee shal go inuisible, as sayth *Democritus*, if we were so wise as to beleue him: who affirmeth moreouer, That whoeuer hath about him the right shoulder of the Chamæleon, shall bee able to ouerthrow his aduersarie at the barre, and to vanquish his enemy in the field: but first, hee must be sure to cast away and make riddance of the strings and sinewes belonging thereto, and to tread them vnder-foot. As for the left shoulder, I am ashamed to relate, vnto what monstrous spirits hee doth consecrate it; and namely how by the vertue thereof, a man may cause what dreames and fantasticall illusions hee listeth, yea, and make those whome hee will himselfe, to imagine the same apparitions. As also, how the right foot of the said beast driueth away all such strange visions; euen as the lethargie will goe away by the meanes of the left side of this beast, which lethargie was occasioned by the right. Touching head-ache, hee sayth plainly, that the next way to cure it, is to besprinkle and wet the same with wine, wherein either of the two sides were soaked. Take the ashes (quoth hee) of the left thigh or foot, chuse you whether, incorporate the same with the milke of a Sow, and therewith annoint the feet, it wil be an occasion, speedily to bring the gout vpon them. But of the Chamæleons gall, for the most part, folk are in manner verily persuaded,

that it will rid the pin and web, the cataract also of the eyes, with three daies anointing; chase away serpents if it be dropped into the fire; gather all wezils in a country together, only by throwing it into the water, and fetch off haire if the body be anointed therewith. It is a common saying also, That the liuer of this beast is of the same effect, in case it be brought into a liniment with the lights of a hedge land. tode: like as, that all amatorious drinks & loue-charms become void and of none effect by the said liuer. As for those who be troubled in mind & giuen to melancholy, they find remedy, if out of this beasts skin they drink the juice of the herb Chamæle. Furthermore, the guts, and the dung therein contained (and that is worthy to be noted, considering this beast liueth vpon no meat at all) being striked vpon the dore of an enemies house, together with the vrine of apes, cause him to be hated of all the world. The like wonders they report of the Chamæleons taile, namely, how it wil stay any violent streame of riuer; stop the course and inundations of waters; and withall, bring asleepe and mortifie serpents. The same being aromatized or spiced with Cedar and myrrh, and tied fast to a branch of the Date tree growing double or forked, wil diuide the waters that be smitten therewith, so as a man may see what- ing branch, to haue made him hold in so many lies as he hath told, considering hee hath reported this quality of it among other, namely, to repress intemperat speech and inordinat walking of the tongue. But euident it is, that the only reason why *Democritus* faulted that way (being otherwise a man of a singular wit and wholly addicted to the good of mankind) was an excessive and extraordinary zeale that he had to profit and benefit the whole world.

Much like to this kind is the Skink (whom some haue named the land Crocodile) saue that the skin is whiter & more fine. But the principal difference is this, for that the bristles or scales are couched so, as they tend from the taile vward to the head; whereas in a crocodile the same are set contrary. The biggest of this sort, be thole of India: the next be they which are brought out of Arabia; & transported they be to vs salted. The muffle & the feet giuen to drink in white wine, do inflame the heat of lust; but especially when they be mixt with Satyrion and Rocket seed, of each one dram, mingled with two of pepper; and when they be wrought into trofches weighing euery one a dram, one of them must be taken at once. But the very flesh of the Skinks sides, drunk to the quantity of 2 oboli, with myrrh and pepper in like proportion, are supposed to be more effectuell for this purpose. The same (as *Apelles* reporteth) taken both before & also after meat, is a singular preferuatiue against inuenedomed arrows. Besides, it is one of the ingredients which go to the noble compositions that be called Antidors. Howbeit, *Sextus* is of opinion and doth write, that if a man drink aboue one dram weight of it in a hemin of wine, it is enough to indanger his life. Moreover, the iuice or broth of the Skinks flesh boiled and taken with honny, is thought to keepe downe the flesh and to coole lust.

As touching the riuer-horse called Hippopotamus, there is a great affinity or kindred rather between him and the crocodile, in regard that they both do haunt the same riuer, and participate both of land & water. This beast (as I haue shewed hertofore) deuised first the practise of phlebotomy or blood-letting. Great store there be of them beyond the Signory Saitica in Egypt. Take the ashes of this beasts hide, and reduce them with water into a liniment, it is singular to cure the broad biles or apostemations called Pani. The grease, and likewise the dung, is good against the cold fits of agues, if the patient receiue the perfume thereof. The teeth which grow on the left side of the mouth, do ease the tooth-ach, if so be the gums be scarified therewith: the skin taken from the left side of the forehead, laid vnto the share and kept fast thereto, staeth the prouocations to venery. The ashes of the same doth cause the hair to grow again thick in those places, where by disease it is shed. Take of the generois of this water-horse, the poise of one dram, and drink it in water, it is a good counterpoison against the venome of serpents. As touching their blood, it serueth painters in good stead.

The Onces be likewise taken for strange and forrein, and of all foure-footed beasts they haue the quickest eie and see best: by the testimony of all writers, there is in the Island Carpathos, a singular kind of ashes made of their houses, burnt together with their hide: and they hold, that if men drink therof, they will become chaste, were they neuer so licentious and libidinous before: again, let women cast the same vpon their nature or priuie parts, it will coole their appetite of mans companie; yea and kill the itch in any part of the body, if it be rubbed therewith. And the vrine of this beast helpeth the Strangurie, to wit, the infirmitie of the bladder when the water passeth

A passeth by drop-meale: which propertie they being by a naturall instinct aware of, so soone as euer they haue pissed, do hide and couer the vrine with mould, which with their feet they raise just ouer it, as it is commonly reported. The same vrine is prescribed for a good remedy in the pain or griefe of the throat. Thus much may suffice as touching forrein beasts: returne therefore now I will to those in this part of our world; and first declare the vertues and properties medicinal which are found common in all liuing creatures, yet making choise of those that be singular about the rest.

CHAP. IX.

B ¶ The common and ordinary medicines drawne as well from wild beasts as those which be tame of the same kind. The use of milk in Physicke, with the obseruations belonging thereto. Also of Cheese, Butyr, the grease also and tallow of beasts.

And to begin with Milk: these points following are to be obserued: *Imprimis*. Each liuing creature liketh best and findeth most good by the own mothers milk. *Item*. For nourses to conceive with child whiles they giue suck, is a most hurtful thing to their babes: for after such a time, their milk will thicken and cruddle in manner of a cheese (a dangerous matter for sucking infants) who thereupon be called Colostrati. Now the beestings, called in Latine Colostra, be that thick and spongy milk which is drawne first from the teat after the birth of the yong, be it in woman or beast. Also, there is no milk so nutritiue as that of a woman, whatfoeuer it be: next vnto which, goats milk is thought to nourish most; whereupon haply arose the fable that Poets fained, who deuised, that *Iupiter* was suckled therewith. Howbeit, setting womans milke aside, the sweetest of all other is that which the Camels giue: but asses milk is supposed to haue most vertue and efficacie in it. Moreover, this is to be noted, that the bigger bodied beasts be more glad milch, and their milk sooner passeth away through the belly and is easier digested than that of the smaller kind. Goats milk agreeth best with the stomach; the reason is this, because they brouse rather than graze: but cow milk is held to be more aromaticall and medicinal; howbeit ewes milk is the pleasanter, & yeeldeth more nourishment; notwithstanding it be not so wholesome, for that it is more fatty and grosse than any other. And generally,

D the milke which any beast giueth in the Spring, is more waterish & fuller of whey than in summer time: like as the milke of any young thing is thinner than other. But simply the best milk is that held to be, which sticketh to ones naile and wil not run off. Milk is least offensive and hurtfull when it is foddren, especially with little grauell stones among. Cow milk of all other is thought meetest for to make the body soluble. But what milk soeuer it be, lesse ventosities it ingendreth boiled than raw. In sum, this property hath milk in generall, To heal all inward vlcérations, but chiefly of the kidneys, bladder, guts, throat, & lungs: applied outwardly, after a spare diet or abstinence from meat, it cureth the itch of the skin; & any wheals & breakings forth occasioned by phlegmatic humors. As for the diet drink made of cow milk (which they vse in Arcadia for the phthyick or consumption of the lungs, for those that be giuen to colliquations and to weare away, as also in case of misliking when the habit of the body receiue no benefit by food) I haue written already in my treatise of herbs. We shall find vpon record in the Chronicles, diuers who by drinking asses milk, haue bin deliuered from the gout, as wel of hands as feet. The Greek Physitians, besides the generall kinds of milk, haue made mention of one more, which is artificiall, and they name it Schiston: the maner of making it is thus: Take what quantity you will of any milke, but let it be of a goat especially, if you can come by it, seeth the same in a new earthen pan neuer occupied before, with certaine branches of fig-tree, such as be fresh and new gathered; but you must put to euery hemine of milke, one cyath of mead or honied wine: while it doth seeth, keepe it from running ouer the vessell, by plunging into it a siluer goblet or boll full of cold water, and take heed that none thereof doe run out: after it is thoroughly foddren take it from the fire; for when it is cooled, you shall see how the parts therof wil diuide, and the whey depart from the milky substance. Some there be, who take the very whey againe, being now very strong of the mead or Must aboue sayd, and boile the same vntill a third part thereof be consumed, and then set it a cooling abroad in the open ayre: The vse heereof is very effectuell and commodious, if for fise daies space together, the Patient

tient take at times, with some rest between, one hemine thereof in a day; but after the drinking of this whey, if some exercise by gestation be presently vsed, it will haue the better operation. This drinke is vsually giuen to those that be subiect vnto the falling sicknes, the passions of melancholy, and the palse; also for the leprosie, elephanse, and all gouts or diseases of the ioynts. But to returne againe vnto milke: a clystire made therewith, is excellent good against any inward gnawings and frettings occasioned by the taking of some strong purgatiue medicines. Also in case of the dysentery, or hot exulceration of the bowels, the decoction of milk sodden together with the grauell stones about the sea-side, or with barley ptisan, is passing good to be clysterized; but for the corrosian of the guts, the milke of kine or ewes is better than any other. Also for the dysentery or bloody flux, the milk that is injected by way of clystire, would be fresh and newly drawne from the vdder: for the cholique, it ought to be ministred raw without any boiling: in like maner is it to be vsed raw, for the diseases of the matrice, the sting of serpents, the phthisick particular, cow milke is singular for them who be poisoned with drinking Colchicon, hemlock, Dorycnium, or the venome of the Sea-hare. As for asse-milke, it is soueraign good for those who haue taken inwardly, any plaster ceruse, *brimstone, or quick siluer: also to loosen the belly that is costie in a feuer: moreover, if the throat be exulcerat within, it is an excellent thing to gargarize therewith. The same is a very good restorative for them to drink, who after great weaknes are vpon their recouerie and would gather strength againe: such also as the Greekes call Atrophos, who haue no feeling nor benefit of their meat: also it may be allowed in an ague, so that the patient haue no head-ach. It was held in old time for a notable secret in Physick, to giue vnto children before meat one hemine of asses milke; or at the end of a meale, if they felt any fretting or gnawing occasioned by their meat: but for default hereof, they vsed goats milke in stead of the other. The whey of cow-milke is about all, soueraigne for those that be troubled with the straitnesse of breath, so as they cannot fetch their wind but sitting vpright, if there be put to it a little cresses: also it is good therewith to anoint beared eies, adding to euery hemine of milk foure drams of Sefame beaten to powder. Goats milke cureth the hardnesse and swelling of the spleen, especially if the goats being kept from meat two daies, and forbear all other food: and yet of which milke the patient must drink three daies together, and forbear all other food: and yet milke otherwhiles is contrary to those who be giuen to head-ach, subiect to the debility of the liuer, and the opilation of the spleen; to such as haue the ague, occasioned by some infirmite of the sinews; or be troubled with dizinesse, with the murre, poise, and stuffing in the head; with the cough also, and beared eies, vnlesse it be giuen as a purgation. Sows milke is of al other most excellent for the inordinat desire to the stoole, and straining thereupon without doing any thing; for the bloody flux also, and the phthisicke or consumption of the lungs. And some Authors there be, who affirme, that it is most wholesome for a woman to drink in any of the afore-named infirmities.

Of Cheefe, and the sundry kinds thereof, I haue spoken sufficiently in that discourse wherein I treated of Vdders, and the seuerall parts or members of liuing creatures. And verily *Sesius* attributeth the same effects to the cheefe made of mares milke, as he doth to that which is gathered of cow-milk: that kind of cheefe he calleth Hippace. Generally, all cheefe vn salted (i) fresh and Greene, is good for the stomack. Old cheefe stoppeth a laske, abateth flesh and maketh the body lean, yea, & is *hurtfull to the stomack. In sum, all salt meats take down those that be corpulent, whereas soft and tender viands do feed and nourish the body. Fresh cheefe applied with hony, reduceth the skin which is black and blew by reason of stripes, to the fresh and naturall color againe. * Old cheefe maketh the body costie, and assuageth the torments of the belly, if it be made into trofches, and those sodden in some stypticke or austere wine, and afterwards fried in a pan again with hony, and so applied. There is a kind of rotten & putrified cheefe, which the Greeks call Sapon: the same being punned with salt and drie Seruoises, and so giuen in wine to drinke, cureth the flux of the belly caused by the infirmite of the stomack. The cheefe made of goats milke, stamped into a cataplasme and so applied, healeth the carbuncles engendered about the priuy parts; so doth the soure cheefe also with oxymell. The same reduced into a liniment with oile, taketh away all spots in the skin, if the body be therewith annointed in a stoupe or hot house.

As touching Butyr, it is made likewise of milk, and among barbarous nations is held for the daintiest

A daintiest meat, and which doth distinguish the * rich and better sort from the poore commons. The milk of kine yeeldeth most butyr, whereupon it tooke that name: but the farrest Butyr is made of Ewes milke. Also there is a kind of Butyr gathered of Ewes milke: but in Winter the milke ought to be heated: whereas in summer time there needs no more to do but to presse it forth from the milk after much shaking & often agitation in certain long vessels (called cherns) hauing in the very mouth, a little narrow hole to receiue aire and giue vent to that within, or els otherwise stopped close, and bound vp with some cloth. Now in the churning, they vse to put thereto a little water, to the end that the milke may soure the sooner. After this beating and working of the milk, the thickest part [which is Butyr] floteth aloft, & is naturally of an oily substance. The rest they vse to boile in certain pans, & that which swims above, they take from B the other, & putting salt to it, they call it Oxygala. * Butyr the stronger sent or smacked that it hath, the better it is esteemed to be: & in very truth, stale butyr that hath bin long kept, is mingled in many compositions: for by nature it is *astringent, emolliuie, incarnatiue, & mundificatiue. Moreover, there is another way to make Oxygala; namely, to put four milke into the fresh milk, which you would haue to be soure, and this kind of chern milk, (sour-milke, or butter-milk, call it what you will, is thought to be most wholesom for the stomacke. But the properties and effects thereof I will set down in another place.

Among the medicinable parts which be common to all liuing creatures, their fat deserueth greatest commendation: but especially swines greafe, which in old time they vsed with great ceremony and religion. Certes, euen at this day there is a solemne ceremony, that the bride newly wedded, as she entred into her husbands house, should strike the side posts therewith for good luck sake. Hogs lard or greafe may be kept two maner of waies, either with salt, or as it is of itself vn salted: and indeed, the older, the better. The * Greeks in their books called it Axungia. But that there should be such strength in swines greafe, it is no maruell: for the reason is plain, because it is a beast that feedeth much of herb roots. Which is the cause also that their dung is much vsed for a number of purposes. And therefore take my words thus, that I meane no other swine but such as * feed and root in the field: among which, the female, especially a guelt that neuer farrowed, is more effectually than a [tame] bore, barrow hogge, or a breeding sow. But the greafe and dung both, of the wild bore, is preferred before al. Swines greafe then is imploied to mollifie, to heat, to discusse and mundifie. And some Physitians there be who prescribe for the gout an ointment made of it, with goose greafe, buls tallow, and the greasie sweat of wooll called Oesypus. But in case the pain continue still, they giue direction to vse it with wax, myrtle, rosin, and pitch. Hogs greafe alone vn salted and simply as it is, healeth burns and scaldings, yea, though one were scorched and sendged with snow. It cureth also kibed heels, if it be tempered with the ashes of burnt barley and gall nuts pulverized, of each a like quantity, and so reduced into a salve. Also it is good to anoint merigals therewith, namely, when one part of the body is fretted & chafed against another: likewise it refresheth those that be weary & tired with much trauell: for an old cough, seeth of fresh hogs greafe, that is sweet, the quantity of three ounces in as many cyaths of wine, putting hony thereto, and let the patient drinke it. Old seame also that is tried and kept vn salted, made into pills and taken inwardly, cureth the phthisick & consumption of the lungs. For surely if it haue taken salt once, there is no vse therof, vnlesse it be to mundifie and cleanse, or els before the part is exulcerat. Some there be who ordaine to seeth hogges lard & hony, of each three ounces, in three cyaths of wine, for a medicine to cure the consumption of the lungs: with this charge, that the first day after the patient take a quantity of tarre in a rare egge, hauing his side, breast, and shoulders well swadled before and emplaistered with the said composition: for so forcible it is, that if a plaster therof be but bound to the knees, the very sent thereof will come vp to the mouth, and cause a kind of saliuation, whereby the patient shal seeme to spit it vp againe. The greafe of a young guelt which neuer had pigs, is a very proper medicine for women, to make their skin supple and euen without wrinkles. But any hoggs seam tempered with beatts tallow or suet, to the quantity of a third part, & some pitch, all melted together, & made somewhat hot, is soueraigne for scabs. Swines greafe that is pure and vn salted, if it be put vp beneath in manner of a collyrie or pessary, giueth comfort to the infant within the mothers wombe, which otherwise would haue bin ready to slip forth before time, and proue an abortiue fruit. The same being tempered with cerusse or lycharge of siluer, into a salve, and so applied, reduceth any skars to the naturall colour of the other skin about them. But with

* Either for that the rich only are allowed to feed vpon butyr, because they haue plenty thereof, and raise a yearly revenue for that commodity, whereas the rest can spare none from their own bellies. * Quo magis virus respicit. Some would amend this place, and for [magis] put in [minus] in a contrary sense: but I suppose he writ: in regard of barbarous people who make more account of such ranke butyr: like as the viciuall Irish in these daies. * Natura eius adstringere, some reade digere, it is digessive. * And yet it is a Latine name of this Xungia because they vse to greafe axeltrees therewith. * Not those that be franked or kept in sties.

* Insultiores: ex Disco. 23. 45. 50. 70.

* Vetus.

brimstone it cureth the raggednesse of the nails: it staieih likewise the haire of the head which G is giuen to shed: also if it be mixed with a fourth part of gall-nuts, it healeth the vlcers in a wo- mans head: but if it be well smoked, it helpeth to preferue the haire of the eie-lids. An ounce weight thereof boiled in one hemine of old wine, vntill there be three ounces and no more of the whole remaining, is giuen (an ounce at once) to those who are in a phthisick. Some appoint a little hony to be put thereto. The same together with Quick-lime reduced into a liniment, is singular for the biles and impostumes called Pani, as also for felons and the hard tumors of wo- mens paps: it serueth besides to cure inward ruptures and convulsions, spasmes, crampes, and di- H flocations. Being applie d with white Ellebore, it healeth corns, agnells, fissures, chaps and callo- sities. But incorporat with the pouder of a saltars pot-shard, it heales the swelling impostumes behind the ears, as also the wens called the Kings euil, being ordered in like manner. If the bod- dy be well rubbed and annointed therewith in the baine or hot-houfe, it taketh away all itch, red pimples & wheals rising in the skin. Moreouer, prepared after another sort, to wit, with old oile together with the stone called by the Greekes Sarcophagus, beaten to pouder, adding thereto the herb Cinquefoile stamped in wine either with Quicklime or with ashes, and so reduced in- to a liniment, it is very good for those that be troubled with the gout. Thereof also is made a singular plaster against inflammations, in this wise, Take of the said greafe the weight of four- score and five pound, of white litharge of siluer one hundred pound weight, mix them both to- gether. As for Bores greafe, if there be a liniment made of it and rosin, it is thought to be excel- lent good for to anoint therewith vlcers that be corrosiue and giuen to spread farther. [In old time men vsed it most about the axletrees of their carts and wagons, anointing them therewith, I that the wheels might turn about more easily: whereupon it took the name Axungia.] And be- ing employed in this maner, it serueth for a medicin to cure the vlcers of the feet & priuy mem- bers seruing to generation, by reason that it is mixed and coloured with the rust of the yron in- corporat into it. The ancient Phyticians made most account alwaies of the said hogs greafe, by it selfe, which was plucked from the kidnies, for after it was clenfed from the strings, veins, and skins, they washed it often and rubbed it well in rain water, which done, they sod it in new ear- then pots, shifting it out of one into another many times; and beeing thus tried and clarified, they kept it for their vse. Howbeit, all are agreed, that when it hath taken salt, it is a greater e- mollitiue, it heateth also, discusseih and resolueth more: yea, & being washed in wine, it is much better than otherwise.

As touching the fat or greafe of a Wolfe, *Massurius* writeth, that in old time it was esteemed before any other, & had the price aboue all. And he saith, that new wedded wiues were wont vpon their marriage day to anoint the side posts of their husbands houses therewith at their first en- trance, to the end that no charms, witchcrafts and forceries might haue power to enter in: thus much of greafe. Look what vertue greafe hath, the same, be sure, is the suet and tallow endued with which commeth from those beasts that chew cud: and although it may be handled & dres- sed otherwise, yet in force it is nothing inferior. But what talow soeuer it be, the best way of pre- paring it, is after the skins or veins be rid away, to wash it first either in sea water or salt brine, and then within a while to stamp it in a mortar, eftsoons sprinkling it with sea-water: after which it ought to be sodden in many waters, vntill it haue lost all the sauer & rank tast that it had: and then at last by setting it in the Sun continually, it wil be reduced to a perfect whiteneffe: more- over, this is to be noted, that the best suet is that which groweth about the kidnies. But say that old tallow is called for, and to be vsed in any cure, it ought first to be melted, and then anon to be well and often washed in fresh cold waters; which done, it must be liquified a second time, casting and pouring thereupon eftsoons the best odoriferous wine that may be gotten: after which maner they vse to seeth it again and again, and neuer giue ouer, vntill the rank smell and sent thereof be clean gone: and verily many are of opinion, that particularly the fat of Buls, Li- ons, Panthers, and Cammels ought thus to be ordered and prepared. As for the vses & proper- ties of these Pomonades, I will treat thereof in conuenient place.

Concerning marrow, it is a thing common to all creatures, like as the fat abouesaid. All the kinds thereof are emollitiue and incarnatiue: they dry also & heat the body. The best marrow simply is that of Deere, as well red as fallow: next to it in goodness is calues marrow: and then in a third rank follow kids and goats marrow. Prepared they ought to be and dressed, before Au- tumne, when they be new and fresh washed, and dried in the shadow. But afterwards they must be

* If they come from beasts of hot nature: for otherwise they be temperat.

A be melted again and run through a finer sercer or pressed through liinnen strainers, which done, they should be put vp in earthen pots, and set in a cold place.

But of all those things which are generally to be found in euery liuing creature, the gall is that which is of greatest efficacy in operation: for power it hath naturally to heat, bite, cut, draw, discusse and resolu. The gall of smaller beasts is taken to be more subtil and penetratiue than that of the greater, and therefore supposed to be the better for to go into eie-falues. Buls gall is thought to haue a speciall faculty aboue all others, principally in setting a golden colour vpon skins, & brasse. What gall soeuer it be, in the preparation therof for any vse, regard must be had, that it be taken fresh and new, and then the orifice of the burse or bag wherein it is contained, ought to be tied fast with a good round packthread; thus being bound vp close, it must be cast in- to boiling water, and there remain halfe an hour, within a while after, so soon as it is dried (out of the Sun) it ought to be preferred and kept in hony. The gal of horses only is vtterly condem- ned, & reputed as a very poison: which is the cause that the arch-Flamin or principall sacrificer is forbidden by law expressely to touch an horse, notwithstanding that in Rome it is an ordinar- y thing to sacrifice euen horses publicly: and not their gall alone but also their blood, is cor- rosive by nature, and putrefactiue. The blood of Mares milke likewise, vnlesse they be such as were neuer couered nor bare soles, doth corrode: in which respect it is good to eat away scurfe about the brims of sores and vlcers: and verily * Buls blood fresh running out of the body, is reckoned no better than venom: and yet I must except *Agira*, a city in Achaia, where the priest- resse of the goddesse * *Ops*, at what time as she is to prophesie and foretel things to come, vseth C by drinking buls blood to prepare her self before she goeth down into the vault or shrouds out of which she deliuereth her prophesies: so forcible is that sympathy, wherof we speak so much, that otherwise it is occasioned either by a religious opinion & deuotion in mens mindes, or els by the nature of some place. *Drusus* sometimes a Tribune of the commons in Rome, drank (as it is reported) Goats blood, to make himselfe look pale & * wan in the face, at what time as he meant to charge *Q. Capius* his enemy with giuing him poison. And verily, the blood of a buck goat is so strong, that there is not any thing in the world wil either sharpen the edge of any yron tools sooner, or harden the same when it is keen, than it. And as for the ruggednes of any blade, it wil take it away more effectually and polish it better than the very file. Considering then this diuersity which is seen in the blood of beasts, I cannot write thereof in such generall termes as of a thing indifferently common to euery one of them, but I must be forced to speak particular- ly of their severall effects. In which regard I will treat respectiue of beasts, according as they do yeeld remedies against this or that malady: and first as touching those which are aduersen- to Serpents.

To begin then with Stags and Hinds: no man there is so ignorant but he knoweth, that they plague serpents to the very death, for they pluck them forth of their holes, and eat them when they haue don. And not only whiles they be aliue do they war against serpents with the breath of their nostrills, but also when they be dead, euery member and peece of their body is contrary vnto them. Burn a peece of an Harts horne, you shall see how the smoke and smell thereof will chase away serpents, as I haue obserued hertofore: & yet they say that the perfume of the bones which are about the throat of a Stag, hath a contrary property, to gather them together. Let a man lay vnder him Stags skins in stead of a matrace, he shall sleep securely, without any feare that serpents will approach to do him harm. The rennet in their maw, or the rede it selfe, if it bee drunk with vinegar, is a soueraigne antidot against their venomous sting: and look what day one do but handle it, he shall be sure and safe from any danger by them. The genetoirs of a Stagge kept vntill they be dry, like as the pizzle also made into pouder and taken in wine, is a singular counterpoison, resisting the venome of Serpents. Euen as the rim of the paunch, which is called in Latine Centipellio. Who soeuer haue about them so much as the tooth of an Hart, or be an- nointed with the marrow or suet of a Stag, Buck, or Hind-calf, need not to feare any serpents, for they will flie from them. But aboue all remedies, there is none like to the rennet of a Fawne or Hind-calf, such a one especially as was ripped out of the dams belly, as I haue shewed hereto- fore. If together with Deeres blood there be burned the herbe Dragon, bastard Mariaram, and Orchanet, in a fire made with Lentisk wood, Serpents (by report) will gather round together in- to an heap: take away the same blood and put into the fire the root of * *Pyrethrum*, they will scatter a funder againe.

* *Themistocles* therewith poi- soned himself. * *i. Tellus*, or Terra the earth.

Iravidia, for *Liurus*.

* *i. Pelitary* of Spaine.

I reade

I read in Greek writers of a certain beast lesse than a Stag, but like in haire, called Ophion, G which folk say is wont to be found only in the Isle Sardinia: but I suppose that the race of them is utterly extinct and gone. Wherefore I will forbear to write of the medicinable properties reported by that beast.

CHAP. X.

¶ *The medicines (against Serpents) found in the wild Bore, in Goats, and wild hares. Also of other remedies which diners beasts do yield against all diseases.*

The brains of a wild Bore is highly commended against the sting and venome of serpents. R So is the blood likewise. Semblably, is the liuer kept and preserved long with Rue, if the same be drunk in wine. In like maner the fat of the wild bore incorporat with hony & rosin. Also the liuer of a tame bore being clenfed from the filaments and strings therein, taken to the weight of foure oboli, or the very brains drunke in wine.

If a man burn the horn or haire of goats, the fume thereof driueth away serpents, as it is commonly said: and the ashes that come thereof either drunke inwardly or applied in a liniment without, are of great force against their stings. Moreover, a draught of Goats milke taken with the grape of the vine Taminia, or of their vrine drunk with squillitike vinegar. Furthermore, it is said, that cheefe made of Goats milke together with Origan used in a cataplasme, or their tallow incorporat with wax, worketh the like effect. A thousand medicines besides are reported to be drawn from this beast, as shall hereafter appeare: whereat for mine own part I much marvel, considering, it is commonly said that he is neuer out of a fever. The wilde of this kinde doe afford medicines more effectuall than the tame, and those as I haue said multiplie exceedingly. As for the Bucks or male Goats, they haue medicinable properties apart by themselves. And Democritus saith, That the Buck which the dam bare alone, is of greater efficacy than any other: who affirmeth moreover, that it is very good to anoint the place stung with serpents, with Goats dung sodden in vinegar: also with the ashes of the said dung fresh made, and tempered with wine into a liniment. In sum, as many as hardly are cured of serpents stings, recouer thereof passing wel, if they ordinarily haunt Goat-pens and stals where they be kept. But such as would haue a more speedy & assured cure, take the panch cut out of a Goat newly killed, together with the dung found therein, & presently bind the same fast to the place affected, so soone as they be stung. Others perfume the flesh newly hurt, with kids hair burnt: & with the same smoke chase away serpents: they vse also to apply their skin newly flaid, to the wound: like as the flesh and dung of a horse that lieth out and feedeth abroad in the field: the rennet likewise of an Hare in vinegar against the prick of a scorpion and the venomous tooth of an hardishrew. Moreover, it is said, that as many as rub and anoint their bodies with hares rennet, need not feare their stinging. If any be hurt by a scorpion, Goats dung helpeth them; but the better, if it be boiled in vinegar: and in case one be poisoned with swallowing down those venomous flies called Buprestes, he shall find great help by eating lard and drinking the broth or decoction thereof. Furthermore, if a man round an asse in the eare, and say closely, That he is wounded by a scorpion, the pain and grievance thereof will immediatly passe away: yea and any venomous thing whatsoever, will flie from the fume of his lungs as it burneth: also it is good for those who are stung by scorpions, to be perfumed with the smoke of calves dung. If a man be wounded by the biting of a mad dog, some there be who cut round about the place to the very quick, laying therto the raw flesh of a calfe, and then giue the patient to drink the broth of the said flesh boiled, or els hogs greafe stamped with quick-lime. Others highly praise the liuer of a buck Goat, affirming that if it be once applied, he shall not fall into that symptome of hydrophobie or fearing water, incident to those that be bitten with a mad dog. They commend also a liniment made of goats dung and wine or hony tempered together: like as the decoction of a grey or badger, of a cuckow and a swallow, taken in drink. For the biting of other beasts, it is an ordinary practise to lay vnto the sore, dry cheefe made of goats milke, together with origan, but they giue direction to drink the same in some conuenient liquor: in case one be bitten by a mans tooth, they prescribe boeuse sodden and applied, howbeit the flesh of a calf is more effectuall; with this charge, that this cataplasme be not removed before the fift day. It is a common saying, that the muffle or snout

A snout of a Wolfe kept long dried, is a countercharm against all witchcraft and sorcery; which is the reason that they vsually set it vpon gates of countrey fermes. The same force the very skin is thought to haue which is flaid whole of it self, without any flesh, from the nape of the neck. And in truth, ouer and aboue the properties which I haue reported already of this beast, of such power and vertue it is, that if horses chance to tread in the tracks of a Wolfe, their feet will be immediatly benumbed and astonied. Also their lard is a remedy for those who are empoisoned by drinking quick-silver. Asses milke if it be drunke, doth dull and mortifie the force of any poison: but more particularly, if any haue taken Henbane, the viscous gum of the herb Chamæleon, Hemlock, the sea-Hare, the iuice of Carpathum, the poison Pharicum, or Dorycnium: also in case that cruddled milke haue done harm to any; for surely it is no better than poison, especially the first beestings, if it quaille and cruddle in the stomacke. To conclude, Asses milke hath many other medicinable properties which we will speake of hereafter. But remember alwaies to vse this milke whiles it is fresh and new drawne out of the vdder, or els not long after, & then it must be warmed: for there is not any milke that sooner loseth the vertue. Moreover, the bones of an Asse well broken, bruised, and sodden, are giuen for a counterpoison against the venome of the sea-Hare. And for all these purposes before said, the milke and bones of the wild Asses be thought more effectuall.

As touching wild horses, the Greeks haue written nothing, because throughout all Greece there are none of them to be seene. Howbeit, whatsoever medicinable vertues be attributed to horses, the same we must think more forcible in the wild than in others. Neither had the Greeks any experience of those Neat or Buffles called Vri and Bifontes: & yet the forest of India be full of wild buls & kine. Now by good reason and proportion, we are to think, that whatsoever cometh from them, is more auailable in Physicke, than from the tame of that kind. And verily, Cow milke is said to be a generall counterpoison, able to kill any of those venoms abouenamed. Ouer and besides, if the dangerous Lilly called Ephemerum Colchicum, be taken inwardly and setled in the stomack, or if the Greene flies Cantharides haue bin giuen in drink, the said milke will send vp all againe by vomit. And as for the Cantharides, the broth of Goats flesh will doe the like. Against those corrosiue poisons which kill by exulceration, the tallow of a calfe or any Boeuse, is a soueraigne medicine. As for the danger that cometh by drinking Horse-leaches, Butyr made of Cows milke, is a singular remedy, if it be taken with vinegar, heat with a gad of Steele. The same alone without any other thing is a good counterpoison, for if oile be wanting, butter may serue the turn as well. Being ioined with hony, it healeth the sores occasioned by the biting of the Porcelers called Multipeda. The broth made of their tripes, if it be drunke, is thought to kill any poison abouenamed: and besides, the Aconite and Hemlock: so doth the suet of a Calfe. Greene cheefe made of Goats milke, is good for them that haue drunk the venomous viscositie issuing out of the herb Chamæleon, called Ixias: but their milke is a remedy against the flies Cantharides and the venomous hearbe Ephemerum, if it be drunke with the grape Taminia. Goats blood sodden together with the marrow, is taken against the poisons called Toxica; and kids blood against the rest. The rennet found in the maw of a kid, hath a peculiar vertue to mortifie the venom of the foresaid viscous gum Ixia, as also of the herb it self, Chamæleon the white, yea, and Bulls blood: for which the rennet of an Hare with vinegar, is a singular defensatiue. Against the venomous Raie or Puffen called Pastinaca Marina: the prickle or sting also of any sea-fish, the said rendles of an Hare, Kid, or Lamb, is a singular antidote, taken to the weight of one dram in wine. As for the rennet of an Hare, it is one of the ordinary ingredients that go to the composition of all preseruatiues and counterpoisons.

There is a kind of Butterflie that vseth to fly about candles as they are burning, which is reckoned among poisons. The aduersatiue remedy against it, is a Goats liuer: like as their gal is soueraigne against any venomous drinks made of the rusticke weazill.

CHAP. XI.

¶ *Receipts and remedies for many kinds of maladies, taken from sundry beasts.*

But now will I returne to the remedies appropriate to diseases respectiue to the particular members of the body: and first to begin at the head: Bears greafe mixed with Ladanum, and that kind of Maidenhaire which is called Adiantum, retaineth the haire of the head which is

ears, but they ought to be well chaused and set into an heat before. Now are these medicines to be inclosed within wooll, and so applied. Moreover, calues tallow, with Goose grease and the juice of Basil, is good for the hearing: also calues marrow incorporat together with the powder of cumin, and so powred into the ears. The slimy sperme of a bore which passeth from the shap of a sow after she is brimmed, if it may be gotten before it touch the ground, is singular for the pain of the ears. If the ears be crackt and hang flagging down, there is nothing better than glue made of calues pizzles, if the same be dissolued in water. For other impediments of the ears, the fat of foxes is very good. In like manner, Goats gall, with oile of Roles warme, or the juice of leeks: or if there be any rupture within the ears, the said gall must be applied with breest-milke. For those who be hard of hearing, or haue their eares running and suppurate within, it is not amisse to drop into them a beasts gall, with the vrine of a shee-goat or of the male, it makes no matter. But these medicines howsoever they are to be vsed, are thought to be more effectual by far, in case they were put into a goats horne, and so hung in the smoke for the space of 20 dayes together. Also there is great commendation of the rennet of an hare, if there be one third part of a Roman denarius thereof, and halfe a denare weight of gum Sagapene, conporat in Aminean wine. As for the swelling impostumes behind the ears, bears grease represseth and keepeth them downe, if there be a cerot made thereof, together with the equall weight of wax and bulls tallow: some there be who put Hypoquist thereto: and butter alone is good to annoint them with, so that they were fomented before with the decoction of Fenigreeke. Howbeit, of much better operation it would be, in case Nightshade were added thereto. The stones of a fox, bulls bloud also dried and reduced to powder, be commended in this case. Moreover, the vrin of a shee-goat made warme, and so dropped into the ears: the dung likewise brought into a liniment with hogs grease is very good.

hogs greafe is very good.

To come now to the infirmities of the teeth: if they be loofe and shake in their sockets, the afhes of harts horn will fettle them firme and faft again: if they ake, the fame afhes are verie good to eafe the paine, whether the teeth be rubbed or wafhed therewith. But fome are of opinion, that the powder of the faid horne not burnt at all, is far better than the afhes in thefe cafes: howbeit, there be dentifrices made both of the powder and alfo of the afhes. Moreover, the afhes of a wolues head is thought to be a foueraigne remedy for the pains incident to the teeth. Now it is well knowne, that among the excrements of a wolfe, there be many times bones found, which if they be hanged about the necke, arme, or other parts of the body, haue the fame effect. Likewise the crudled rendles of an hare infused into the eare, are fingular for the tooth-ache: the afhes alfo which come of the head burnt, is a pretty dentifrice for to rub the teeth withall: but if you put Nard thereto, it doth correct and palliat a ftinging breath. But fome there be, who chufe rather to mingle therewith, the afhes of mice and rats heads. There is found in the fide of a hares head a certaine* sharpe bone like vnto a needle, herewith, Phyficians giue counfel to fcarriffe the teeth and let the gums bloud, for the tooth-ache. Take the bone of a beaft, fet it on fire, and when it is red hot, hold it clofe to the teeth that be loofe and ake withall, it will fet them faft againe: the fame being reduced into afhes, and tempered with myrrhe, is a proper dentifrice to blaunch the teeth. The bonie fubftance likewife of hogs cleyes burnt and calcined, is of the fame force and operation: alfo the hollow hetchill or whirlebones of their hips, about which their hucklebones turne, worke the like effect if they be brought into afhes. Well knowne it is, that if the fame be conueighed downe by a horne into the throat of horkes and fuch like beafts, they will cure the wringing torments of the botts that fret and gnaw them in the bellies: and beeing burnt, they are fingular good to confirme and faften the teeth that bee loofe and doe shake. Alfo if the teeth be payned by occafion of fome blow given vnto them, Affes milke helpeth them: fo do the teeth of the faid beaft, if they be calcined and reduced into afhes: this infirmitie is helped alfo with the rough wert or corne of an horfe if it be infused into the eares with oile: this bunch is called by the Greekes Lichen: and it is not that which is named Hippomanes, whereof I haue no purpofe to fpeak (confidering it is a hurtful and venomous thing) but a certaine excrefcence growing about Horfe knees, and about their houfes. Moreover, in the heart of an Horfe there is found a bone, like for all the world to the eye-teeth of a dogge: this they hold to be a very foueraigne thing for to fcarriffe the teeth when they ake. Alfo if one take a tooth out of one of the chawles of a dead horfe, it will eafe his owne that aketh. fo it be correspondent in place and number to that which is in paine. The fperme that paffeth from

A from the mature of a mare after she hath been covered by a stallion, if the wicke of a candle or lamp be therewith besmeared and set a burning, doth represent a most strange and monstrous sight of horse heads, as *Anaxilans* hath reported: euen so will that of the shee Assie, make a shew and apparition of Assie-heads. As for Hippomanes before named, it is so strong and forcible a venome, especially to incite and stirre vnto lust, that being vpon a time poured into the brasen mettall that was cast into the forme and similitude of a mare at Olympia, the stone-horses which came nere vnto the said image, were set into such a heat and so farre enraged, that they could nor by any means be held back but they would needs couer the said brasen mare. Moreover, the glew that Carpenters and Ioyners vse, cureth the tooth-ache, if the same be boyled in water, and the teeth annointed therewith, but the same within a little while after must be removed, and the mouth presently washed with wine, wherein were sodden the pill of sweet pomegranats. Furthermore, if the teeth be ill affected, a collum made with goats milke, or buls gale, is thought to be a remedy of great efficacy. Finally, the ashes of the ankle bones of a female Goat whiles they be fresh and new, are counted an excellent dentifrice to whiten the teeth: so are the said bones of all other four-footed beasts, reared or nourished about a ferm house, if they be in like manner calcined: which I note but once for all, because I would not repeat one thing so often.

СНАР. XII.

¶ Remedies obserued out of the bodies of beasts, for the accidents that befall to the visage, necke, and breast.

IT is thought generally, that the skin of the face may be made smooth and without wrinkles: tender and delicate, yea and be kept faire and white, with asses milke: for well knowne it is, that some dainty dames (forsooth) there be, that keep and maintain daily in ordinary to the number just of 500 the Asses for this purpose: according to the first example of the Empresse *Poppea*, wife to *Nero* the Emperor; for she vsed commonly to bath in Asses milke, and deuised whole baines to swim therewith: and euer as shee rode in progresse, or remooued from place to place, she had her curie of the Asses in her traine attending vpon her for no other intent, but onely to wash and bath her body in their milke. As for the pimples and wheales that breake out in the face, if they be annointed with butter, they will weare away and be gone; and the sooner, if *Cerule* or Spanish white be tempered therewith: but pure butter alone without any thing else mingled with it, killeth any fretting humors in the face that be corrosiue, if so be that presently after the inunction, barly meale be cast vpon the place. The gleane of a Cow hauing newly calued, taken whiles it is moist and so applied, is good for any vlcers of the visage. There is another receipt made for this purpose, which may seeme but a fantastical and foolish thing, howbeit, for to satisfie and please in some sort, our fine dames that are desirous of such deuises, I am content to set downe: They say (forsooth) that the pasterne bones of a young white bulkin or steere, sodden for the space of 40 daies and nights together, vtill such time as they be resolved into the liquor, if the face be wet with a fine linnen cloth dipped in the said decoction, it causeth the skin to looke cleare and white, and without any riuels or wrinkles; but the said liniment must be kept all night to the face in manner of a maske. Moreover, they say, that bulls sherne is a excellent complexion forsooth, to set a fresh rosat or vermilion colour in the ball of the cheeke: and the liniment *Crocodilea*, made of Crocodiles ordure, doth it no better: but then they giue order, that the face be washed with cold water both before and after this dressing. The dung of a calfe tempered and wrought in ones hand with oile & gum, is singular good to take away sun-burning, or any thing whatsoeuer whereby the colour is decayed and lost. As touching the vlcers and chaps appearing in the lips or face, the suet of a Calfe, or beasts tallow, incorporat with Goose greafe and the iuice of Basill, maketh a singular pomado to amend and **F**ix and rectifie those defects and imperfections. There is another composition also for this purpose, to wit, calues suet and deeres marrow mixed together, with the leaues of the white Saint *Mary* thistle, punned all together and reduced into a liniment. The same operation hath any marrow, though it be of a cow, and the broth of cow boeufe. The tectars and wild-fires breaking forth about the mouth and nose, there is nor the like medicine againe to be found, to kill and

extinguish, than a glew made of a calues genetoirs, dissolved in vinegar with quicke brimstone, G
and mingled together with a fig-tree branch; with this charge, that when it is fresh made, the
place affected be anointed twice a day therewith. This glew boiled in hony and vinegar, is sin-
gular for the leprosie: which disease, the liuer also of a calfe applied hot, doth cure: like as goats
gal healeth the foule white lepry called Elephantiasis: but an oxe gall and sal-nitre mixed ther-
with taketh away the lepry and the filthy dandruffe appearing in the skin. The vrine of an asse
taken about the rising of the Dog-star, clenseth the face from all spots: so doth the gall as well
of an asse as a bull, vied alone by it selfe, after it hath bin well broken and tempered in water, and
the old skin of the face taken off; but then the patient must forbear to goe abroad either into
the Sun or wind. The like effect hath buls tallow or calues gall, incorporat with the seed of Sa-
norie and the ashes of an Harts horne, if the same be burnt at the beginning of the Dog-daies. H
Asses greafe is a soueraigne thing to reduce vnto a fresh and natue colour, any skars or places
of the skin blemished with the tooles remaining of ringworme, tettar, and leprosie. The gal of
a buck-goat incorporat with cheefe, sulphur vit, and the ashes of a sponge, and brought to the
consistence and thicknesse of honey, taketh away moles and pimples. Some make choise rather
of old galls which hath been long kept to vse in this case, mingling therewith hot brans to the
weight of one obolus, and four times as much of hony; but first the said spots and specks ought
to be plied well with chaufing and rubbing. The suet of the same Goat, tempered with Gith
or Nigella seed, Brimstone, and Floure-de-lys root, is verie effectuall for this purpose. Sem-
blably, it is good for the chaps in the lips, if it be incorporate with Goose greafe, Deeres mar-
row, rosin, and vnquencht lime. I finde it recorded in some Authors, that they who are giuen to
haue red pimples appearing in their face, are disabled for exercising any sacrifices belonging to
Art Magicke.

Art Magicke.
If the tonsils, throat, and windpipe, be either inflamed or exulcerat, they finde much ease by cow milke, or goats milke, fo the patient gargarize therewith warme as it commeth new from the beaſt, or otherwiſe made warme againe afterwards: but goats milke is the better of the twain, if mallows be ſodden therein, and a little ſalt. For bliſters in the tongue and throat, the broth made of tripes is very good to be gargarized: and more particularly, for the inflammations and ſores incident to the tonsils or almonds of the throat, the kidnies of a fox dried are ſingular, if they be beaten into powder and reduced into a liniment with honey. The gall of a bull or goat mixed with hony, ferueth right well for the ſquincany. The liuer of a grey or badger tempered with water and made in manner of a collution, reſiſteth a ſtrong and ſtinking breath: the cankers alſo and ſores in the mouth, are healed with butyr. If a thorne, fiſh-bone, or any other ſuch thing ſticke in the throat, take the dung of a cat, rub & annoint the place wel without-forth, the ſame (by report) will thereupon come vp againe, or paſſe downward. As for the ſwelling wens called the kings euill, either the gall of a bore doth ſcatter and diſpatch; or elſe of a boeufe, if the place affected be annointed therewith warme: for hares rendles tempered with wine and put into a linnen cloth, is good to be applied vnto the ſame onely when they be ſore and run. The aſhes alſo of the houſe both of horſe and aſſe, incorporate with oile, water, and hot vrine, into a liniment, & fo applied, doth reſolue them before they be broken. Of the ſame effect is the aſhes of an Oxe or Cowes clee, applied vnto the place with water: as alſo their dung laid too very hot with vineger. In like manner Goats ſewet with quicke-lime, or their dung ſodden in vineger and the genetoirs of a fox. For this purpoſe, there is much good done with ſope: an inuention deuſed by the French for to colour the haire of the head yellow: made it is of tallow and aſhes: the beſt of all other is that which they make of Beech-wood aſhes and Goats ſuet; and the ſame after two manner of waies; either thicke and hard, or elſe liquid and ſoft: but the one as well as the other is verie much vſed in Germanie, and a great deale more indeed by men than women.

The crickes and pains in the neck, are much assuaged by rubbing the nape of the necke with butter or beares greafe: if the same be stark and stiffe, there is nothing in the world better than beafts tallow, the which, together with oile, is very good for the kings euill beforefaid. The painfull *cramp that draweth a man back, so as he cannot bow his head forward (which convolution the Greeks name Opisthotonos) is much eased by infusing into the eares thevrine of a shee goat, or with a liniment made with their dung and bulbe roots.

If the nailles be bruised, it is passing good to tie about them the gal of any beast whatsoeuer. As

A As for the risings and fore excrescences about their roots, bulls gall dissolved in hot water, and so applied, easeeth that grievance: some there be who put thereto brimstone and alumne, of each a like weight.

Moreover, it is said, that a wolues liuer taken in a draught of wine warme, cureth the cough : also a bears gall mingled with hony: or the ashes made of the vppermost tips of a beasts horne : likewise the froth or slauer of an horse mouth: and some say, that be the cough neuer so bad, it will make an end thereof in three daies drinking. Semblably, the lights of a stag, together with the throat dried in the smoke, and afterwards puluerized and brought into a loch or liquid electuary, is good for the cough, and to be taken ordinarily euery day : and for this purpose, the lungs of the spitter in this kind of red deere, is thought to be more effectual. In case a man spit blood,

B the ashes of Harts is much commended: and the rendles of an hares maw taken in drinke to the weight of a third part of a denier, with Terra Samia and Myrtle wine, cureth it perfectly. The ashes likewise of Hares dung drunk in wine late in an evening, staieeth the cough which is busie in the night season: also a perfume made with the hair of an hare, dischargeth the lungs of those tough and viscous humors which stick vnto them, and are not otherwise easily remooued. The purulent vlcers in brest and lungs, remaining after a pleurisie or peripneumony: the strong and stinking breath also proceeding from the lights, are cured most effectually with an electuarie made of butter, boiled with a like quantity of Attick hony, vntill it look reddish, if the patient taketh thereof euery morning the measure of one ligula or spoonfull: some in stead of hony, chuse rather to put thereto the * rosin of the Larch tree, if one do reach or cast vp blood, it is said, that cowes blood, taken moderatly and with vineger, is of great force and efficacy to stay the same: but to think that this is meant of buls blood, were great folly and rashnesse. Howbeit the strong glew that is made of a buls skin, taken to the weight of three oboli in warm water, is soueraigne for an old infirmity of reaching and fetching blood vpward.

CHAP. XIII.

¶ *Receits for the paine of stomacke and loines : also for the infirmities of the reins.*

D I F there be an vlcce growe in the stomacke, drinke the milke of an Affe or Cow, and it will heale it. Stew a peece of boeufe in wine and vineger among, the broth thereof is singular for the gnawing and fretting in the stomacke: the ashes of an Hartts horne is verie good to drie vprheumes and catarrhes, that haue taken a coure thither. As for those that cast vp blood, the fresh blood of a Kid taken to the quantity of three cyaths, with the like proportion of sharpe vineger, and so drunke as hot as may be: the rehdles also of the said Kid drunke with vineger, so as there be two third parts of the vineger to one of the rundles, is a singular remedy for the said infirmitie.

For the griefe of the liuer, caused by obstructions, the liuer of a wolfe dried and taken in honied wine, is a proper receipt. So is the liuer of an Asse being dried and brought into powder with two parts of stone parsley, and so incorporat with three nut kernels and hony, which composition, the patient must vse to eat. In which case, goats bloud is highly commended, if it be prepared so as it may be taken with meat.

Moreover, it is said, that for them who be short winded, there is nothing so good as to drink the blood of wild horses. In the next place to it, great account is made of Asses milke warme, or foddred together with bulbe roots, so that the patient drinke the whey that commeth thereof, putting to three hemines of the blood one cyath of white garden ereffes, infused first in water, and then tempered with hony. The liuer also or lungs of a fox, taken in some grosse wine like Alegant : or a bears gall in water, doth open the wind-pipes stuffed with fleame, and giueth free liberty for the wind to go and come.

Furthermore, Bears greafe is exceeding good for the paines in the reins of the backe, yea and for any place els that hath need of emollitiues, in case it be wel rubbed therewith. Also in these cases, it is thought meet, to take the ashes either of a bores or fowes dung which hath bin long made, and therewith to spice a cup of wine.

But before I proceed any farther, it is to be noted, that Magicians also haue medled with this part of Physicke, and haue deuised frange medicines, drawne from the parts and members of

beasts. And first of all they would make vs beleue, that be a buck-goat neuer so much intraged, G do but stroke him by the beard, he will come into good order and be quiet againe: cut and lop the same off with a paire of sheers, he will not stray away nor depart to another flock. But to return to the griefe of the reins: the Magitians adde to the foresaid medicine, goats dung, which being put into a linnen cloth, and the same well greased, they giue direction to hold in the hollow ball of the hand, as hot as may be indured; with this regard, that if the paine be in the left side, this medicine be made in the right hand, and so contrariwise. Moreouer, the dung or tredsles which must serue this turn, they giue order, that it be gathered and taken vp with the point of a brassen needle or bodkin. Now the foresaid medicine must be held in the hand so long, vntill the patient perceiue that the vapor thereof do pierce as far as the loines: which done, they appoint afterwards to anoint the head with the iuice of leeks stamped: to rub the loines also with H the said dung tempered with hony: giuing counsell, to eat the stones also of an Hare, for to appease the said pain. As for those that be troubled with the Sciatica, they ordaine a cataplasme of oxe or cow dung, to be laid vpon the grieved place; but it ought first to be lapt within some leaues, and so made hot in the embers. For the pain in the kidnies, they giue order to swallow downe the kidnies of an Hare raw, or at leastwise sodden, yet so, as the patient touch them not with his teeth.ouer and besides, they do say, that whosoever haue about them the ankle bone of an Hare, shall not be grieved with the belly ach. As touching the paine of the spleene, the gall of a swine, be it Bore or Sow, taken in drink, or the ashes of Harts horn in vineger, assuageth the same. But the most effectuall and soueraigne remedy of all other, is the milt of an Asse which hath bin long kept; for within one three daies the benefit thereof will be felt, and the patient I shall find ease. Also, for the disease of the spleen, they vse to giue in oxymell, the ordure of an asses sole, which first came from it after it was soled (and this dung the Syrians call Polca;) furthermore, for this infirmity the tongue of an horse which hath bin kept dry a long time, giuen in wine, is a present remedy: and this is a secret which *Caelius Bion* reporteth that he learned of the Barbarians, whiles he conuersed among them. In like manner, a beasts milt whether it be cow or oxe, hath the same operation, if it be vsed in that manner: but say it be fresh and new taken out of the beast, then it ought to be either roasted or sodden, and so taken as meat. ouer and besides, take 20 heads of garlick, pun them all, and after they be bruised, put them into a beasts bladder with a sextar of vineger; apply the same to the region of the spleene, it assuageth the pain. And if all be true that these Magitians say, the milt of a calfe is singular good for the malady of the spleen; but then it must be bought at the same price that the butcher setteth first upon it, without hucking and beating it lower for to haue any thing abated; because in their opinion (so ceremonious they be) therein lieth a great matter. Now when it is thus bought, it would be slit through the length in two parts, & both pieces attached to the shirt of the patient, with this charge, That when he is about to put on his other cloths and make himselfe ready, he suffer the said pieces to drop down to his feet, and then take them vp again, and so dry them in the shadow: for in thus doing, the diseased spleen of the sick party will likewise fall and settle down, so as the patient shall sensibly perceiue himself to be deliuered of that infirmity. Finally, the lungs of a Fox dried in the ashes and so drunk in water, is good for the spleen: as also the milt of a kid, applied to the grieved part accordingly.

CHAP. XIII.

¶ For to stop a lask and knit the belly: for the flux proceeding from the imbecillitie of the stomacke: for the dysenterie or bloody flux: for the ventosities and inflation of the belly: for tumors: the straining vpon the seige without doing any thing: for the wormes in the guts, and for the cholique.

TO stay the running out and extraordinary loosenesse of the belly, these medicines following be conuenient: *Imprimis*, the blood of a stag: *Item*, the ashes of an harts horne: the liuer of a bore fresh and without any salt at all, taken in wine: likewise the liuer of a sow roasted, or of a male goat sodden in one hemine of water: the cruidd rennet in a hares maw, drunk in wine to the quantity of a cich-peafe, or in water, in case the patient haue an ague. Some there be, who put gall nuts thereto, others content themselves with Hares blood alone sodden with milke. Also the ashes comming of horse dung drunke in water: the ashes of that part of a bulls

A bulls horne which groweth next to the head, strewed into a draught of water. In like manner, Goats blood sodden vpon coles. A Goats skin or fell, haire and all boiled together, yeeldeth a decoction which is good in this case to be drunke.

Contrariwise, to loose the belly: the rennet found in a Colts maw: the blood of a femal goat, or els hermarrow or liuer, are thought conuenient laxatiues. *Item*, a plaster made with a wolues gal, together with the iuice of a wild Cucumber, and applied to the nauil. Also a draught either of Mares or Goats milke, taken with salt and hony. The gall of a she-Goat is good for this purpose, if it be taken with the iuice of Sowbread and a little Allum. But some there be who think it better to put thereto salnitre and water. Buls gall stamped and incorporat with Wormwood, made into a round ball, and so put vp in stead of a suppositorie, will giue a stooile, and make the body soluble.

Butter eaten in any great quantity, is good for those who haue a flux occasioned by the weakness of the stomack, and a dysenterie or bloody flux: so is a Cowes liuer: the ashes of an Harts horn, taken to the quantity of as much as three fingers will comprehend, in a draught of water: likewise the rennet of an Hare wrought in dough for to make bread: or if the patient do voyd blood withall, the same ought to be incorporat in parched Barley meale. The ashes of a Bores, Soves, or hares dung, is good to spice a warme potion of wine in these infirmities. Moreouer, an ordinary Veale broth, as it is commonly giuen, is counted one of the remedies for these kind of fluxes about named, whether they come of feeble stomacke or exulcerat guts. But if the patient drink Asses milk for this purpose, it will be the better, if hony be put thereto. Furthermore, the ashes of an Asse dung taken in wine, is as effectual in operation as the rest, for both diseases. As also the first ordure of the Asse sole, which we termed Polea in the former chapter. The cruds or rennet of an horse sole maw, called by some Hippace, is soueraigne for such lasks, yea, though the patient did shere blood vpon the stooile. The ashes also of horse dung, and the powder of Horse teeth is said to be singular: yea, and Calues milk sodden and so drunke. But if the flux do proue to be a dysenterie, Physicians giue aduise to put thereto a little hony: if gripes come thick, they prescribe the ashes of Harts horn, or buls gall tempered with Cumin seed: and the fleshy substance of a Gourd, to be laid in maner of a cataplasme to the nauil. The tender cheefe curd of Cowes milke clysterized, is passing good both for the stomack flux, and also for the bloudie flux. In like sort the butter made of Cows milk taken to the quantity of foure hemins with two ounces of right Terpentine, either in the decoction of Mallows or oile of Roses. The suet of a Calfe, or beasts tallow, is likewise an ordinary remedy in these cases. But diuers there be who seeth the marrow forth as well of the one as the other, with meale, wax, and a little oile, yet so, as the broth be clear, that it may be supped off. Their marrow also is vsually incorporat in the past whereof bread is made, and so taken with great successe. Goats milke sodden vntill the halfe be consumed, is reputed also a proper medicine. And in case the guts besides be wrung & griped, there would be put thereto a little vnpressed wine of the first running, called Mere-goutte: howbeit, some there be who think it sufficient for to appease the torments of the wombe, to drinke Hares rennet but once in a draught of wine warm: but the wiser sort and those that deale more warily, think it good withall to make a liniment of goats blood, incorporat with Barley meale and rosin, & therewith to anoint the belly. And they also aduise their patients for any violent flux of the belly whatsoeuer, to apply thereto soft cheefe: but if the flux be from the stomack, or dysentericall, they prescribe old cheefe to be grated and giuen to the patient in wine, with this proportion, that in 3 cyaths of wine there be a third part of cheefe. Goats blood boiled with this marrow, is singular good for the dysenterie or bloody flux. The liuer of a female goat roasted, is a soueraigne medicine for the fluxions of the stomack, but it were better if the male Goats liuer were taken in drinke after it hath bin sodden in some green and austere wine, or with oile of Myrtles reduced into a cataplasme, and so laid to the nauil: some seeth the same in water, from six sextars to one hemine, and put Rue thereto. Others roast the milt of a goat, male or female (it skilleth not) and vse it for the same purpose, or else they take the suet of a buck goat with bread that hath bin baked on the harth vnder the embers. But about all they hold, that the suet taken from the kidnies of a she goat, & so drunk alone by it selfe, is a singular remedy for these infirmities: but they inioin the patient presently therupon to drinke a little cold water. Yet there be others who ordain the same suet to be boiled in water with fried barley groats, Cumin, Dill, and vineger mixt all together. And they giue order to such as haue the stomack flux to anoint their bellies

bellies with Goats dung sodden with honey. And for both these fluxions, as well from the stomach as the vicer of the guts, they prescribe the rennet of a Kid to the quantity of a Beane for to be drunk in Myrtle wine: also a pudding made of the blood thereof, which kind of meat we call in Latine * Sanguiculus. Moreover for the dysenteric, they ordaine to inject into the guts by a clystire, Bulls glue resolued in hot water.

For any ventosities, Calues dung is holden to be singular good for to resolue them, if it be sodden in wine and the decoction thereof vsed. But if the guts be diseased any waies, the rennet of red Deere is very effectually, sodden with Lentils and Beets, and so eaten with meat. Likewise the ashes of the haire of an Hare boiled with hony. Also to drink Goats milk sodden with Mal-lowes and a little salt put thereto, is good for the said infirmities: but if the rendles be mixed therewith, the operation will be the better. Of the same vertue is Goats suet, taken in any warm supping; with this charge, that the Patient drinke presently vpon it cold water. Moreover, it is said, that the ashes of a kids hanch hath a wonderfull vertue to soulder the rupture, whereby the guts are false downe. Likewise, Hares dung sodden with hony, and taken euery day to the quantity of a Beane, is a medicine for a rupture, so soueraigne, that it hath bin knowne to cure them who were past all hope of remedy. Much commended also is the decoction of a Goats head sodden, haire and all together.

The disease called Tenefmos, which is a desire to go often to the stoole without doing any thing, is cured by drinking of Asfes and Cowes milke.

All the sort of worms bred in the guts, the powder of Harts horn taken in drink, doth expell. There be, as I said before, certaine bones found among the excrements of a Wolfe, which if they be hanged about the arme, do cure the Collicke; if this regard were had before, that they neuer touched the ground. As for Polca (whereof I made mention before) which is the first ordure of an Asse sole, it is singular good in that case. Likewise the powder of a Sows dung taken in the decoction of Rue sodden in water, with Cumin, is singular for the collicke. Finally, the ashes of a yong Harts horne while it is new come vp and tender, incorporat with the shell fishes of Barbary, stamped shels and all together, and so taken in a draught of wine, is highly commended for the passion of the cholicke.

CHAP. XV.

¶ For the dolorous torments of the bladder: for the stone and grauell. The remedies for the infirmities of the members of generation, of the fundaments and the share.

THe vrine of a Bore helpeth those who be tormented with the paine in the bladder, and the stone: yea, and the very bladder of the Bore eaten as meat, is singular good in that respect.

Howbeit, if the one and the other were permitted to be consumed before in smoake, you should see a greater operation. Now the said bladder ought to be first sodden & then eaten: and if a woman be troubled with the said griefs, she is to chuse the bladder of a wild sow. There be found also in the liuers of Swine certain little stones, or els hard callousities like vnto stones, and white of colour, such as we may see daily in our tame swine: which being beaten into powder and drunk in wine, do expell the stone and grauell within our bodies. And verily the Bore feedeth himselfe so far forth charged with his own vrine, that vnlesse hee be deliuered thereof be-fore, he is not able to flie before the chase, but suffereth himselfe to be taken as if he were inclo- sed and fast bound within net and toile: and they say that his vrine doth burne him within. The kidnies of an Hare kept vntill they be dry, then made into powder and drunk in wine, doe thrust forth the stone. In the pestle and gammond both of a swine, there be certain ioint whirrbones as I haue said before, which if they be sodden, do yeeld a broth that is very good for the easie pas- sage of vrine. Likewise, the reins of an Asse dried, pulverized, & giuen in pure wine of the grape, do cure the diseases of the bladder. The suets or rugged werts in horse legs & the corns about their hoofs called Lichenes, drunk either in simple wine or meath for the space of 40 daies to- gether, do expell the stone and grauell engendred in the body: the ashes also of an horse house, ta- ken in wine or water, is good in that case. In like maner Goats dung drunk in honied wine, is sin- gular for those accidents; but especially that of the wilde Shamois is much more effectually. Moreover, the ashes of Goats haire is thought to auaille much in these diseases.

As

As touching the botches and carbuncles which arise in the priuie members; the brains and blood of a Bore or Sow are thought to be proper remedies for them: and say there be some can-kerous or corroding vlcers in those parts, the liuer of a Bore or swine burned in a fire made prin- cipally of Iuniper wood, together with the Papyr reed and Arsenicke, doth heale the same: so doth the ashes of their dung. Or els take a Cow or Oxe gall and Egyptian Allum, wrought and incorporat together with * Myrrh, to the consistence of honey. Beets also sodden, yea, and their flesh boiled in wine and so applied as a cataplasme. In case they be running sores: the suet and marrow of a calfe boiled in wine, or Goats tallow tempered with hony and the iuice of the bri- er, are reputed to be soueraign. Now if the said sores spread farther still, it is said, that their dung incorporat with hony or vinegar, doth much good: as also butter and nothing els simply applied to the grieved place. If the cuds do swell, the suet of a calfe made into a liniment, with sal-nitre put thereto, keepeth downe the tumour. Of the same operation and effect is the dung also of a Calfe boiled in vinegar.

Such as cannot hold their vrine, but that it passeth from them against their wills, finde great helpe by eating of a Bore's bladder roasted or broiled. And verily the ashes of a Bore's or Sows cleyes, is singular good against the involuntary shedding of vrine, if a cup or drinke be spiced therewith for the patient to take. Likewise, the bladder of a Sow burnt and giuen to drink, ser- ueth well in this infirmity: so doth the bladder of a kid, or the lungs in that manner vsed. Fur- thermore, it is said, That the brains of an Hare taken in wine, is singular to helpe this infirmity. Semblably, the stones of an Hare broiled and eaten, or the rennet in the Hares maw, incorporat with Goose grease in Barley groats. The kidnies besides of an Asse, reduced into powder and drunk in pure wine of the grape. The Magitians haue a deuise by themselves, and they affirme, That for to hold ones vrine, it is passing good to drink the ashes of a Bore's pizzle in sweet wine: but they instruct the patient withall, to make water in a dogs kenel, and in so doing, to say these words, *I do this, because I would not pisse my bed as the dog doth his couch*. Thus much for the inconti- nency of vrine. Now if one be pent and would gladly void vrine, let him take the bladder of a Swine, so that it neuer touched the ground, and apply the same to the share, for it will prouoke the water to passe.

But to come vnto the diseases of the * seat: there is nothing so good for them as Bears gall, incorporat together with their grease. Some put thereto litharge of siluer and Frankincense: in which cases butter is very good, if with Goose grease and oile of Roses it be reduced into a lini- ment: the consistence or thickenesse of which composition, must be such as the grieved place will admit; namely, that it be gentle and smooth, so as there be no paine in the anointing. Also Buls gall is a soueraigne medicine applied thereto vpon soft lint: for it wil quickly skin the chaps and clefts in the fundament. If that part be swelled, the suet of a Calfe is very good to anoint it therewith: but if the tumors appeare about the share, then there would be Rue iointed thereto: as for other infirmities incident to those parts, nothing better than Goats blood, tempered with parched Barly meale. In like manner, for the hard knobs in the seat called Condylomata, Goats gall by it selfe is a speciall remedy: so is the gall of a Wolfe tempered in wine and so applied.

For the biles and impostumes rising in any place therabout, there is not a better medicine to scatter and dissolue them, than Bears blood or Buls blood, dried first and so beaten to powder. But the soueraigne remedy of all others, is the stone which a wilde Asse is said to void with his vrine, at what time as he is killed in chase: which stone as it commeth first forth of his body, seemeth very liquid and thin, but being shed once vpon the ground it groweth thicke and hard of it selfe. This stone tied to the twist or inward part of the thigh, is said to dispatch all collection of humors that might ingender biles and botches; or at leastwise so to resolue them, that they shall neuer impostumat and come to suppuration. This stone is very rare and hard to be found, for it is not in euery wild asse: but surely famous it is and much spoken of by reason of this me- dicinable property that it hath. Moreover, the vrin of an Asse together with Nigella, otherwise called Gith, is singular good in these cases. Likewise a liniment made with the ashes of an horse house incorporat together with oile and water: so is the blood of any horse, but especially of a stallion: the blood also and gal of a Cow or Oxe. Their flesh moreover, which we call boeuf, hath the same effect, if it be laid warme vnto the place. The ashes also of their cleies tempered with water and hony. The vrine of the Goats; the flesh of the male Goats boiled in water. In like man- ner their dung sodden with hony. Bears gall or the gall of a bore: last of all, the vrine of a Sow applied

moued before seuen firs be past. Now tell me (I pray you) what was he that could find out this secret first? Gladly would I learne what reason there is in this mixture, and why an owles clay or toe was chosen aboue all other for this purpose? Certes, there be some of them yet more modest than their fellows: and they haue giuen out, That the liuer of a Cat killed in the wane of the Moone, laid vp in powder with salt, is to be giuen in a draught of wine a little before the access or fit of a Quartan. And these magitians haue yet another pretty receipt against such agues: for they take the ashes of a Cow or Oxe mucke, and sprinkle it wel with the vrin of a yong boy; wherewith they annoint the toes of the patient: but to his hands or arms they bind the heart of an Hare, which done, they ordain also to giue him before the fit, the Hares rennet in a draught of drinke. To conclude, they say, that a fresh greene cheefe made of Goats milke, out of which the whey hath bin well pressed, is singular to be giuen in hony.

CHAP. XVII.

¶ Proper remedies against the trouble of the braine by reason of Melancholy; against the lethargie, dropisie, shingles, and S. Anthonies fire. Also for the paine of the sinewes.

THe dung of a Calfe sodden in wine, is an excellent remedy for those who are giuen to melancholy. For to raise and awaken them that are in a lethargie, there is not a better thing than the rough werts growing vpon an Asses leg, if the same be tempered with vineger in to a liniment, and the nostrils anointed therewith: also the perfume of the horne or haire of a Goat: yea, and a bores liuer which is the cause that it is giuen ordinarily to those that haue the drowfie disease, and be alwaies sleepe.

For the phthisicke, the liuer of a wolfe sodden in wine is very good: likewise the lard of a lean running sow feeding only vpon grasse: as also Asses flesh sodden and eaten with the broth: and verily in Achaia this is the principall course they take for the cure of that disease. Moreover, it is said, that to receiue through a pipe or reed the smoke of the dry dung made by Cow or Oxe lying forth and feeding only vpon green grasse, is very wholesome for those that haue the phthisicke or consumption of the lungs. Also there be who calcine the tips of Boeufs horns, & taking the measure of two spoonfulls of the ashes, incorporat the same with hony, make it vp into pills, and so swallow them down for the said malady. Many there are who affirm, That the phthisicke and cough be cured by eating a kind of pottage made with Frumenty corne and goats suet: and they hold opinion, That the said suet taken fresh and sweet and so dissolved in mead, with this proportion, that to euery cyath of the mead there be put an ounce of suet, and that order be taken to mingle them thoroughly well, with a branch or sprig of Rue among, is a foueraigne medicine for those infirmities. There is one writer of good credit & authority, who vpon his certain knowledge doth auouch, That there was one so far gone in a phthisicke, that he was giuen ouer by the Physitians, & yet he recovered by drinking the suet of a Shamois or wild goat, together with milk, of each one cyath at a time. Others say, that much good hath bin found by drinking in sweet cuit, the ashes of swines dung, as also by the lungs of a red Deer, especially the Spitter of that kind, dried in the smoke, reduced into powder and so drunke in wine.

In case of the dropisie, the vrin of a Bore found in his bladder giuen to the patient in drink by little and little, helpeth very much: but of greater efficacy it is, if the same be permitted to drie within the bladder. Furthermore, the ashes of Harts dung, & namely of that Deer which is called the Spitter: as also of Neats dung, such I mean as go abroad and feed with the heard (& that they call by a peculiar name * Bolbiron) is a foueraigne remedy for the dropisie. Mary, if the patient be a woman, there must be choise made of cow dung; but if a man, the dung of the other sex is to be taken: and this I may tel you is such a secret mystery, that the Magitians would not haue to be reuealed & made known. Many other medicines there be for the dropisie, to wit, the dung of a Bull calfe vsed in a liniment: the ashes of a calves dung drunke in wine, with an equall quantity of the wild parfneep seed: goats blood together with the marrow, eaten with meat: it is thought that this blood will worke the better, if it be taken from the male Goats; provided alwaies, that they feed vpon the Lentisk tree, and then no doubt it will do the deed surely.

As touching S. Anthonies fire, the shingles, &c. the meanes to quench the same, is to annoint the place with Bears greafe, and especially the fat that is found about the kidneys: also with the greene

A greene dung of a calfe, cow, or oxe. Some vse hard cheefe made of goats milke and porret together: also the fine scrapings of a stags skin fercht off with a pumish stone & brought into powder, and so applied with vineger. For the rednesse of the skin with much itching, the some of an horse mouth, or the ashes of his house, is a singular medicine. If there be any wheals or small pox proceeding of fleam, do annoy the skin, no better thing than a liniment made of asse-dung ashes incorporat in butyr: say these wheals or pimples appear blackish and swert by reason of melancholy, dry cheefe made of goats milk brought into an ointment with hony and vineger, is good to rub the body withall in a bain or hot house, without any vse of oile at all. For blisters and angry meazils, the ashes of swines dung are thought to be very meet: as also the ashes of harts horn, so that the place be rubbed with them and water together. If there be any dislocation or bone out of ioint, the green dung of a bore or sow is good to be applied: so is that of a calfe: the some frothing from a bore, laid to the place with vineger: and goats dung with hony.

There is not a better thing to bring down any swelling, than a cataplasim of raw beefe: and as for any hard tumors, swines dung made hot and dried in an earthen pot-sheard, or vpon a tile, is excellent to discusse and resolute them: the greafe of a wolfe is exceeding good to break any impostumation that is grown to ripenesse: so is neats dung made hot vnder the embers: or goats treddles sodden in wine or vineger: as touching fellons & such like apostumations, boeuf tallow with salt is much commended for to resolute them: & if the place be much pained, it were good to dip the said tallow in oile, and to melt the same without any salt: and in like manner is goats suet to be vsed. For a burn or scald, there is a proper salve made of bears greafe and lilly roots: for which purpose, the dung of bore or sow that hath bin long kept, is very good: so is the ashes of their bristles (such as pargettars whiting brushes be made of) wrought and incorporate with greafe: also the ashes of a beatts ankle or pastern bone tempered with wax and the marrow either of a deere or bull: like as the dung of an hare. And verily, goats treddles are so accomodate to this cure, that (by report) they will heal a burn without any skar at all. The most excellent glew is made of the ears and pizzles of bulls: and there is not a better thing in the world than it, for to heal any place burnt or scalded; but nothing is so much sophisticated, what with other old skins and hides, and what with old shoes and such like lether, boiled again and made into glew. The most fast and strongest glue which a man may trust vnto, is made at Rhodes, and that is it, which painters & physitians most vse: the whiter that the same is, the better it is esteemed: that which looketh black, and is hard withall and brittle like wood, is reiected.

It is thought, that for the pain of the sinewes, goats dung boiled in wine with hony is soueraigne, yea though a nerue began to putrifie: convulsions, crampes, and spreines of nerues vpon some violent stroke, are cured with bores dung gatherd in the spring & so dried. After the same manner, such as be ouerstrained and plucked with the draught of any charriot, or wounded with the wheels going ouer them; and generally, how soeuer the blood be settled black vnder the skin by confusion or bruise, if the places be anointed with the said dung, though it were greene and fresh, much ease and help insueth therupon: howbeit, some think that it were better to seeth the dung first in vineger: and others reduce the same being drie into powder, and promise them that be either bursten, wounded and bruised inwardly, or haue bin ouerthrown and saln from on high if they drink it in vineger, that they shall haue help thereby. But the better, and those that loue not to make the greatest boast of their medicines, vse the ashes thereof with water. And verily it is said, that the Emperor Nero was wont in this kind of drink to take great pleasure, and with it to refresh himselfe, when his purpose was by that means to win a name, and approue himselfe a doubtie wight, in running with coaches in the great cirque or shew place. To conclude, next to the dung of a bore, is commended that of a sow or any other hog, and thought to be in a second place of operation.

CHAP. XVIII.

¶ Medicines to stanch blood: to heale vlcers, cancerous sores, and the wild scab: also what medicines they be that draw thorns, pricks, or what soeuer sticketh within the flesh. Finally, proper receipts to cicatrize and skin a wound or sore.

THe rennet of any Deere or a Hare, vsed in vineger, stancheth blood. The ashes also of the haire of an hare: likewise of Asses dung: yea and the very ashes of their haire made into a liniment with any conuenient liquor, hath the same effect: but if you would haue it work

more effectually, chuse these excrements of the male asse, mix the same with vineger, and apply it with wooll; for it will stay any flux of blood whatsoeuer: likewise if it be of the haire which is curried from the horsehead or buttock when he is dressed: or els the ashes of calues dung tempered with vineger, and so applied vnto the place. In like manner the ashes of the goats horn or dung, with vineger; and yet the blood that issueth out of a buck-goats liuer when it is sliced and cut in sunder, is more effectually: but the ashes of them both, as wel the male, as female; the liuer and the blood drunke in wine, or applied vnto the nostrills with vineger, is of vertue to staunch blood. Moreover, the ashes only of a leather wine bottle made of a male goats skin, mixed with an equall quantity of rosin, doth not only stop an issue of blood, but also conglutinat and heale a wound. Furthermore, the rennet of young kids, with vineger; the ashes also of their haunches burnt, is thought to haue like operation in stanching of blood. If there be any vlcers vpon the shins or any part of leg & thigh; bears greafe & red oker incorporat together into a salue, doth heale the same: but in case the said sores be corrosiue and eat farther, the gal of a bore with rosin and ceruse, cureth the same: so doth the ashes of a bores or sows cheek: likewise swines dung dried and applied to the grieved place: as also goats treddles warmed well ouer the fire with vineger, and laid too accordingly. But for to mundifie and incarnat all other sores, they vse butter, the ashes of a stags horn, or the marow of red deere; buls gall likewise, with the oile of the plant Cypros, or els the dung of a goat, male or female it skils not whether. If there be a wound made by sword or edged weapon, there is good means to heal it with the fresh dung of swine, or els the powder thereof being long kept and dried, if the place be dressed therewith. In case there be an vlcere that eateth deep to the very bone, or an hollow fistula, it is good to iniekt into it with a syringe, a buls gall, with the juice of leeks or breft milk: or els to dresse the same with the powder of his blood dried, incorporat with the herb called Vmbilicus Veneris. Is the same cancerous? the rennet of a leueret with the herb Capers, taken of ech a like quantity, & sprinkled with wine doth cure it. If it grow to mortification & proue a gangrene, it is good to anoint the place with bears gall, with a feather. As for corroding vlcers which spread still farther, no better thing to repress them, than to strew vpon them the ashes of an asse-hoofe. The blood of an horse is corrosiue, by vertue whereof it doth eat away and consume the excrescence of proud flesh; so doth the cinders of old horse dung burnt: as for those kind of fretting cankers which the Greeks call Phagedanae, the ashes of a boeuse hide mingled with hony, doth cure and heale perfectly. The application of raw veale vnto a green wound, keepeth it from swelling: and a cataplasm of beasts dung and hony together, doth the like. But say the vlcers be maligne and filthy morimals, such as the Greeks call Cacoethe, the ashes of a leg of veale incorporat with womans milk, do heale vp cleane. Fresh wounds occasioned by sword or edged weapon, buls glue dissolved or melted, & so applied, doth cure very wel, so it be not removed vntil the third day. If a sore need to be clenfed, dry cheefe made of goats milk, tempered with vineger & hony, is a singular mundificatiue. An vlcere giuen to go farther, and to eat as it goeth, is repressed by applying tallow thereto and wax incorporat together: put to it pitch and sulphur, it will heale and skin the same throughly. In like manner, for the vntoward morimals before said, which they call Cacoethe, it is very good to lay a pultus made with the ashes of a kids leg and breft-milke. As for carbuncles, take the brains of a tame fow, rost the same and apply it vnto the sores, it is a soueraine remedy. Touching the scabs that men be subject vnto, there is not the like medicine for killing the same, to the marow of an asse: & a liniment made with the vrin of the said beast together with the earth vpon which he hath staled. Butyr likewise is very good in that case, as also for the farcins, fullanders, and mallanders in horses, if it be applied therto with rosin made hot: so is strong buls glue dissolved in vineger, with quick lime put thereto: also goats gall tempered with the ashes of a lume calcined. For the red blisters and meazils likewise, there is not a better medicine than the dung of a cow or ox, and therupon they tooke the name of Boe. The mange in dogs, is healed with beasts blood, so they be bathed therewith whiles it is fresh and warm; and after the same is dried vpon the body, to follow it a second time the same day: & the morrow after to wash them throughly with lie made of strong ashes.

If thorns, spils, bones, and such like things haue gotten into the flesh and there sticke, cats dung is very good to draw the same forth: likewise the treddles of a goat with wine. Any rendles also, but especially that which is found in an hares maw, serue in that case, reduced into a salue, with the powder of frankincense and oile; or else with the like quantity of birdlime, or the cer-

reous matter in the Bee-hiue called Propolis.

Furthermore, the greafe of an asse is singular to reduce any swert sploches and black skars to a fresh and natue colour; which, if they ouergrow the skin about them, are brought downe and made more euen and subtile, by an inunction of calues gall: but the Physitians prepare the sayd gall with an addition of myrrh, hony, and safron, and then put it vp in a brazen box for their vse: yet some there be, who mingle with the rest verdegis or the rust of brasse.

CHAP. XIX.

Receipts appropriat to the maladies of women, and the diseases of sucking babes: also remedies for them that are unable to performe the act of generation.

TO begin with the naturall course of womens purgation: the gall of a bul or ox, applied to their secret parts in vnwashed greafe wooll, is very effectual to bring the same down. The skilfull midwife of Thebes, *Olympias*, vsed to put thereto * hyssope and sal-nitre. For this purpose, hartshorne burnt to ashes is very good to be taken in drinke. But if the matrice be out of order and vnserled, it is not amisse to apply the same ashes vnto the naturall parts: yea and buls gall together with * Opium to the weigh of two oboli; or else perfume their secret parts with a suffumigation of deers hair. Moreover, it is said, that the hinds when they perceiue themselves to be incalf, swallow down a little stone, which is singular good for women with child to carry about them, that they may go out their full time: and therefore much seeking there is after this stone, which is commonly found among their excrements at such a time; or else in their womb, if haply they be killed with calfe, for then it is to be had there also. Moreover, there are found certain little bones in the heart and matrice of an hinde, and those bee passing good for great bellied women, and such as be in trauel of child-birth. As for that stony substance resembling a pumish, which in like manner is found in the wombe of kine, I haue spoken already in my discourse of Kine, and their nature. If the matrice of a woman be growne hard, and haue a scirrhe in it, the fat of a wolfe will mollifie it: if it be grieved with paine, the liuer of a wolfe assuageth the same. When women be neare their time, and ready to cry out, it is good for them to eat wolues flesh: or if when they fall first to trauell, there be but one by them who hath eaten thereof: & this is such an effectual thing, that if they were forespoken, or indirectly dealt withall by sorcery & witchcraft, this is thought to ease them of paine, and procure them speedy deliuerance. But in case such a one as hath eaten wolues flesh, chance to come into the chamber when a woman is in the mids of their trauell, she shall surely haue a hard bargaine, and die of it. Moreover, great vse there is of the hare in all womens infirmities; for the lungs of an hare dried, made into powder, and taken in drinke, is comfortable to the matrice, and helpeth it in many accidents thereof: the liuer drunk with Samian earth in water, staith the excessive flux of their fleurs: the rennet of their maw fetcheth away the after-birth when it staith behind; but then in any wife the woman must not bathe or sweat in bain the day before the same rennet applied as a cataplasm vpon a quilt of wooll, with Safron & the juice of porret, forceth the dead infant within the mothers wombe to come forth. Many are of opinion, that if a woman eat with her meat the matrice of an hare, she shall thereupon conceiue a man child if she company with her husband. And some say, that the genetours of the male hare, yea & the rendles, are good for that purpose. And it is thought, that if a woman who hath giuen ouer bearing children, doe eat the young leueret taken forth of the dams belly when she is newly bagd, she wil find the way again to conceiue & breed freshly as before: but the magitians do prescribe the husband also to drinke the blood of an hare, for so (say they) he shall sooner get his wife with child. And they affirme moreover, that if a maiden be desirous her breasts or paps should not grow any more, but stand alwaies at one stay, knit vp round and small, she is to drinke 9 treddles or grains of hares dung: and for the same intent, they aduise a virgin to rub her bosom with a hares rennet & hony together: also to anoint the place with hares blood, where the haire is plucked off, if they be desirous that it should not grow again. As touching the ventosities and inflation of the matrice, it is good to vse thereto a liniment made of bores or swines dung, incorporat with oile: but in this disease, it were better for to repress the said windines & flatuosity, to spice a cup with the powder of the same dung dried, & giue it to the woman to drinke; for whether she be vexed with wrings whiles

Eg 2

* *Hyssopus*, some read *Oxy-
spermum*, which the Apothecaries call *Hyssopus humida*: & is nothing else but the greasy slich & sweat tried out of the wool growing in sheeps flanks.
* *Opio*, some read *Opio*, & *Perley*.

within silver & so caried about one, is of great power in this case, as *Osthanes* mine author saith. But *Salpe* (a famous courtizan) giueth direction to plunge the genitall member of this beast seuen times together in hot oile, and with the said oile to anoint the share and parts therabout. *Bialcon* aduiseeth to drinke the ashes of the said member, or the stale of a bull presently after hee hath done his kind to a cow, and with the earth that is moistened and made mire with the said stale, to anoint the priuy parts. Contrariwise, there is not a thing that cooleth the lust of a man more, than to annoint the said parts with the dung of myce and rats. To conclude, for to auoid drunkenesse, take the lungs of an hog, be it bore or sow it matters not, in like manner of a kid, and rost it, who soeuer eateth thereof fasting, shall not be drunke that day, how liberally soeuer he take his drinke.

CHAP. XX.

¶ Strange and wonderfull things obserued in beasts.

THere be other admirable properties and vertues reported of the same beast, ouer & besides those before rehearsed, for it is said, that whosoever do find and take vp an horse shoe shaken from the house (an ordinary thing that happeneth vpon the way when a horse casteth his shoole) and lay the same vp, they shall find a remedy for the yox, if they do but call to mind and thinke vpon the place where they bestowed the same. Also, that the liuer of an Hare is in this regard for curing of the hicket, like to an horse shoole. Moreover, if an horse doe follow in chase after a wolfe, and chance to tread vpon the tracks where the wolfe hath run, he will be broken winded and burst, euen vnder the man vpon his backe. It is thought moreover, that the anke-bones of swine, haue a property to make debate and quarrels. Also, when any sheep-pens or oxe-stals be on a fire, if some of the dung be cast forth, the sheepe and oxen that be within will sooner be gotten and drawne forth, and neuer come thither again. Furthermore, that goats flesh will haue no ranke smell or taste, if so be the same day that they were killed, they did eat barley bread, or drinke water wherein Laser was infused. Besides, that no flesh which is powdred well with salt in the wane of the moone, shall euer corrupt and be subiect to worme or maggots. But see how diligent and curious our ancestors haue bin in searching out the secrets of euery thing; inso much as we find obserued by them, That a deafe Hare will sooner feed and grow fat, than another that heareth.

And to come vnto leechcraft belonging to beaſts : it is ſaid, that if an horſe void blood exceſſiuely, it is good to poure or iniekt into the body, hogs dung with wine. As for the maladies of kine and oxen, tallow, fulphur-vif, crow garlick, a foddren[hens] egge, are ſingular good medicines to be giuen euery one of them beaten together in wine: the ſaf also of a fox is good in that caſe. If ſwine be diſeaſed, the broth made of horſe-fleſh foddren, is very good to be giuen them in their waſh to drinke. And in what diſeaſe ſoeuer it be of all four-footed beaſts, there is not a better remedy than to ſeeth a goat all whole, in the very ſkin, and a land roaſt together. Also it is ſaid, that a fox will not touch any cockes, hens, or ſuch like pullen, that haue eaten (before) the dried liuer of a Reinard; nor thoſe hens which a cock hauing a collar about his necke of a Fox ſkin, hath troden. The like effects are reported of a weazils gall : as alſo that kine and oxen both in the Iſle Cyprus, when they are troubled with the belly ach, cure themſelues with eating the excrements of a man : that the cleyes of kine and oxens feet will not weare to the quick nor be ſurbated, if their horns before were anointed with tar : That wolues wil not come into any lordſhip or territory, if one of them be taken, and when the legs are broken, be let blood with a knife by little and little, ſo as the ſame may be ſhed about the limits or bounds of the ſaid field, as he is drawne along, and then the body be buried in the very place where they began firſt to dragge him. Others take the plough-ſhare from the plough wherewith the firſt furrow was made that yeare in the field, and put it in the fire burning vpon the common hearth of the houſe, and there let it lie vntill it be quite conſumed : and look how long this is in doing, ſo long ſhal the wolfe do no harm to any liuing creature within that territorie or lordſhip. Thus much by way of digreſſion : now it is time to returne to the diſcourſe of thoſe liuing creatures which be rauaged in their ſeueral kinds, and ſuch as are neither tame nor ſauage.

D  Headmirable nature of a number of medicines, as wel those which I haue already shewed, as those which remain as yet to be handled, forceth me to write yet more of Physicke, and to found to the very depth and bottome : albeit I know full well, that there is not a Latine writer who hath trauelled hitherto in this argument, and am not ignorant how ticklish and dangerous a point it is at first to set abroch any new matters, especially such, whereby a man is sure to reape but small thanks, and in deliuerie whereof, is to make account of a world of difficulties. But forasmuch as it is very like that those who are well acquainted with this study, will muse how it is come about, that the remedies drawn from simples, so easie to be found and so accommodat to maladies, are cast behind and grown out of vse in the practise of physick, it cannot be, but withall they must maruell much, and think it a great indignity, that no science and profession in the world hath had lesse soliditie in it and bin more vnconstant, yea, and how it daily changeth still, notwithstanding there is not any other more profitable and gainfull than it.

But to enter into the discourse thereof, First and foremost, the invention of this Art hath been fathered vpon the * gods, such I mean as are canonized gods in heauen: yea, and euen at this day: we haue recourse stil vnto diuine Oracles for many medicines. Moreover, the fabulous tales deuised by Poets haue giuen a greater name and reputation thereto, in regard of the offence committed by *Aesculapius* in raising prince * *Hippolytus* again to life: for which bold part of his, *Iupiter* being highly displeased, smote him dead with lightning. And yet for al this, Antiquity hath not staied there, but made relation of others, who were reuiued by the means of the said *Aesculapius* or his art: which during the * Trojan war, whereof the fame and bruit is more certain, grew into much request and estimation: and yet in those daies there was no other part of Physicke professed and practised, but Chirurgery, and that in the cure of wounds only. But in the age ensuing, and for many a yeare after, wonderful it is, in what obscurity this noble science lay dead, and as it were buried in darknesse and obliuion, euen vntill the famous Peloponnesiacke war: for then arose *Hippocrates*, who reuiued and set on foot againe the ancient practise of *Aesculapius*, so long forelet: and being borne in Coos, a renowned and wealthie Island, altogether deuote and consecrated to *Aesculapius*, he made an extraict of al the receipts, which were found written in the temple of the said god (for the maner was in that Island, that whosoever were cured and deliuered of any disease, registred there vpon record, the experiments of medicines whereby they had remedy;

* Such as bath
in cold water,

Seneca, *Psy-*
chrolon.

foone after, when hee was knowne once to carry a cruell hand ouer his poore patients, in cutting, lancing, dismembred, and cauterizing their bodies, they quickly began to alter his name, and to terme him the bloody Butcher or Slaughter-man: whereupon not onely all Physitians, but Physick also grew into a bad name and became odious; as may appeare euidently by the monuments and books of *M. Cato*, a worthy personage, and in regard of whose vertues and commendable parts, his triumph and Censorship, as famous & honorable as they were, deserue the least part of his authority and reputation; so much was there in himselfe, about the gifts and graces of Fortune. I will therefore insert in this place, word for word, an Epistle of his vnto his sonne *Marcus*, touching this matter, wherein he thus writeth: *Concerning these Greckes (sonne Marcus) I will write in place and time convenient, what I haue found out and knowne by them in Athens: and namely, that it were good to looke into their books and reade them (as it were) by the way, but in no wise to study vpon them much and learn them thoroughly. I haue already giuen the attempt, and intend to conuince and put downe the wickedest race and most peruerse and obstinat kind of them. And learne this of mee, as from the mouth of a true Prophet, That whensoever this Greekish Nation shall bring into Rome their Philosophie, they will corrupt and marre all: but let them send once their Physitians hither, you shall see a greater wrecke and confusion thereby. For I assure thee, they haue complotted and sworne one to another for to murder all * Barbarians by means of their Physicke. And euen to effect and bring this about, they will be fed also and take money, to the end, that both we should trust them the rather; and they also haue the better meanes to worke the feat and dispatch folke with more facility. As for vs, it pleaseth them vsually to name vs Barbarians; yea, and they giue vnto vs more filthy termes than any others, and mis-call vs * Opiques. Well, remember thou once for all, that I haue giuen thee warning of their Physitians, and forbidden thee to be acquainted with them.* Now *Cato*, who wrote this letter, died in the six hundred and fifti yere after the foundation of our city, when himselfe was fourscore yeres old and fise: whereby a man may see that he wanted not grounded knowledge when he deliuered this speech vnto his sonne, for hee had both the practise of former times in publicke affaires, and age sufficient of his owne to furnish him with experience of priuat examples. What say we then to this resolution of his? Are wee to judge and beleue that hee hath condemned thereby a thing so necessary and profitable as Physicke is? God forbid: for himselfe setteth downe a little after, what Physick, and what medicines both he and his wife were acquainted with, and by meanes whereof they came to be so aged as they were: and those were no other (verily) but the vse of simples, whereof wee now are in hand to treat. He saith moreover and professeth, that he hath made one Treatise expressly, containing certaine receipts for the cure of his son and seruants, and for the preseruatiue of their health: the which I haue not omitted, but dispersed here and there, according to the occurrences of accidents and diseases of sundry sorts, whereof I haue had some occasion to speak of, and stil shall haue more, whereby it is plain, that our ancient forefathers blamed not the thing it selfe, I meane, Physicke, and medicines, but the Art and cunning of Physitians, who had the handling thereof. And most of all, they held off and were afraid to entertaine those amongst them, who sought such exceeding gaines for their handi worke, especially where they endangered their liues withall. And that they made some account of Physicke, may appeare by this, that when they receiued *Esculapius* as a canonized god into their Kalender, they built one temple for him without the city of Rome: yea, and the second which in his honour they erected, was situate within the Island apart from other buildings. Also at what time as by vertue of an edict all other Grekes were banished Italy, Physitians were excepted; and that was many a yere after *Cato* his time. And here by the way, one word will I speake to the honour of our Romanes for their singular wisdom and prouidence; namely, That howsoeuer they are growne to good prooffe and be accomplished in all other Arts and Professions of the Grekes, yet their grauity hitherto hath bin such, as they would not giue themselves to the practise of this only Science. And notwithstanding the exceeding wealth that accrueeth by Physicke, yet very few or none of our naturall Roman citizens haue medled therewith. And those also that haue betaken themselves vnto it, presently haue forsaken their natie language, and gone to the Greek tongue. For this opinion verily there is of this Art, That if the Professors thereof handle it in their vulgar and mother tongue, or otherwise in any other than Greeke, all the authoritie, grace, and credit thereof is lost, euen with those that be altogether vnlearned and know not so much as the Greek Alphabet. See the nature and foolish propertie of our Countrey men, to haue lesse confidence and trust in those things which concerne their life and health, if they be intellegible and deliue-

* That is to say all nations but themselves.

* Opici, were a certain people of Italie, infamous for their vnhonest life and filthy language. *quasi opici*

A deliuered to their capacity, than in others, which they vnderstand neuer a whit! And hereupon verily it is come to passe, that the art of Physicke hath this peculiar gift and priuiledge alone, That whosoever professeth himselfe a Physitian, is straightwaies beleeued, say what he wil: and yet to speak a truth, there are no lies dearer sold or more dangerous than those which proceed out of a Physitians mouth. Howbeit, we neuer once regard and looke to that, so blind we are in our deep perswasion of them, and feed our selues each one in a sweet hope and plausible conceit of our health by them. Moreover, this mischiefe there is besides, That there is no law or statute to punish the ignorance of blinde Physitians, though a man lost his life by them: neither was there euer any man known, who had reuenge or recompence for the euill intreating or misusage vnder their hands. They learne their skill by indangering our liues: and to make prooffe & experiments of their medicines, they care not to kill vs. In a word, the Physitian only is dispensed withal, if he murder a man: so cleare he goeth away without impunity, that none so hardy as once to twir or challenge him for it: but say that one be so bold as to charge them with any vntoward dealing, out they cry presently vpon the poor patients, at them they rail with open mouth, they are found fault with their vnlineesse, distemperature, wilfulnesse, and I know not what: and thus the sillie soules that be dead and gone, are shent & bear away the blame. The decuries or bands at Rome of those knights which are deputed and called Iudges, are not chosen but by an ordinary triall and examination of their estate, quality, and person, and the same by the principal of that order and degree, both taken and approued: streight inquisition there is made of their demeanor from house to house: of their parentage also, yea and true information giuen to the electors before they can be chosen. Mint-masters, such as are to giue their iudgement of mony, and the touch of coin, be not taken hand ouer head: but if any be more skilfull than others therein, they are sent for (rather than to faile) as far as from Calis and the straits of Gilbretar. And for to pronounce sentence as touching the banishment of a Roman citizen, the five deputed or elected delegats (named *Quinqueviri*) had no warrant or decree passed before 40 daies were expired. But for these Physitians, who are the judges themselves to determine of our liues, and who many times are not long about it, but giue vs a quick dispatch & send vs to heauen or hel, what regard is there had, what inquiry and examination is made of their quality and worthines? But surely, wel enough are we serued, and we may thank none but our selues, if we come by a shrewd turn, so long as there is not one of vs hath any care or desire to know that which is good for his life and health. We loue to * walk (forsooth) with other mens feet. * We read, we looke by the eyes of others: we trust the remembrance of another, when we salute any man: and to conclude, in the very main point of all we commit our bodies and liues to the care and industry of others: No reckoning is there now made of the riches and treasure of Nature: but the most precious things indeed which serue for the maintenance and preseruatiue of health and life, are vtterly rejected and cast away: no account make we of any thing and think our owne, but to liue in pleasures and dainty delights. I will not leaue my hold of *M. Cato*, whom I haue opposed as a shield and buckler against the enuie and spight of this ambitious and vain-glorious Art: neither will I giue ouer the protection of that honorable Senat which hath judged no lesse: and that without catching aduantage of the sinfull pranks & lewd parts which are committed and practised vnder the pretence of this art, as some man haply would look that I should set them abroad: for to say a truth, is there any trade or occupation goeth beyond it for poisoning? what is the cause of more gaping and laying wait after wils and testaments, than this? What adulteries haue bene committed vnder the colour herof, euen in Princes and Emperors palaces? as for example, *Eu-demus* with *Livia* the Princeesse, & wife to *Drusus Caesar*: *Valens* likewise with the Queen or Emperesse about named, *Messalina*. But say that these crimes and odious offences are not to be imputed vnto the Art it selfe, but rather to be charged vpon the persons, I meane the corrupt and lewd professors thereof: yet surely I am of this beleefe, that in regard of these enormities, *Cato* was as much afraid of the entrance of Physicke, as of some Queene into the citie of Rome. For mine own part, I mean not to say ought of their extreme auarice, of the merchandise, spoile, and hauocke that they make when they see their patients in danger of death, and drawing to their end; nor how high they hold (as it were in open market) the easement and release of the sicke mans pains, whiles he is vnder their hands, ne yet what pawnes and pledges they take as earnest of the bargaine, to dispatch the poore Patient out of the way at once; and lastly, of their hidden secrets and paradoxes, which forsooth they will not divulge abroad, but for some round summe

* In this place he causeth in the Romanes reeth their *Leu* *Heuery*, *Anag* *nisse*, and *Co* *mentatores*. * *Agnosimus* *in* *quoniam*

summe of money. As for example, that a cataract or pearle in the eie is to be couched rather and driuen down by the needle, than quite to be plucked forth: wherby it is come to passe, that it is a very good turne & the best for vs (as the case standeth) that we haue so great a number of such murderers and theeves in the commonwealth: for I assure you it is not long of any shame and honesty (whereof there is none in them) but their malicious emulation, being so many as they are, that the market is well fallen, and the prices come down of their workmanhip. Notorious it is, that *Charmis* the abouenamed Physitian that came from Marfiles, bargained with one patient that he had, to haue 200000 Sesterces for his cure, and yet hee was but a stranger and a prouinciall inhabitant. Also as well knowne it is, that *Claudius Caesar* vpon a condemnation and judgement, tooke at one time by way of confiscation, one hundred thousand sesterces from one *Alcones*, who was no better than a Chirurgion or Wound-healer: who being confined into France, and afterwards restored, gathered vp his crums again & got as much within few yeares. I am content also, that these faults should be laid not vpon the art, but the men that professe it: Neither verily do I mean to shew and reprove the base, abject, and ignorant sort of that crew: nor how little order and regiment they obserue in the cure of diseases, or in the vse of baines and hot waters: how imperiously they prescribe otherwhiles to their patients most strait diet: and again, when they are ready many times to faint & die vnder their hands for want of sustenance, how they be forced to cram them as it were, and giue them meat vpon meat, oftentimes in one day, before they haue digested the former viands. Moreover, how they do and vndo, altering the manner and course of their proceedings a thousand waies, misliking and bethinking themselves after they haue done a thing: making a mish mash and mingle mangle in the kitchin of those viuals which they ordain for their poore patients: besides a deal of mixtures and sophisticated compositions of drugs and ointments. For there is no superfluity tending vnto vain pleasures and wanton delights that hath ouerpassed their hands. And since I light vpon the mention of these drugs and spices, for mine owne part I am verily persuaded, that our ancestors and forefathers were nothing well pleased with the bringing in of such forrain wares, which beare so high prices and are extream deare: and that *Cato* neuer thought of these drugs and mixtures, nor foresaw these corruptions by them occasioned, when he blamed so much and condemned this art of Physick. Yet see what account there is made of a composition called * Theriacke, deuised onely for excesse and superfluity: composed it is of diuers ingredients far fetcht and deare bought: whereas Nature hath bestowed vpon vs and presented to our eyes so many wholesome simples, and euery one of them by it selfe medicinable and sufficient. Moreover, another antidote and confession there is, consisting of no fewer than 54 sundrie sorts of drugs and ingredients, all of diuers weights, and some of them are prescribed to carrie the poysse precisely of the sixtieth part of one denarius or dram. Now would I gladly know what god he was (for surely it passeth the wit of man thus to dispense the ingredients, and calculat their vertues, to a single scruple) that taught first this subtil and intricat composition: By which it appears manifestly, that this geere bewraith onely a vaine ostentation, and all to giue a glorious and wonderful lustre to the art, for to make it better accepted and more vendible. And yet the very Artists themselves are not wyis so skilfull, as to know that whereof they make profession. For I my selfe haue scene these that goe for Physitians, put commonly into their medicines and receipts *quid pro quo*, and namely, in stead of the Lidian * Cinnabaris, * Minium, which is no better than a very poysen, as I will proue and shew hereafter in my Treatise of Painters colours: which error proceedeth only from this, that they are not well seen in Grammar, nor in the proper signification of words. But these and such like errors touch and concerne the health of euery one in particular. As for those abuses in the art of Physick, which *Cato* feared, foresaw, and would haue preuented, they be such as are nothing so hurtfull and dangerous as the rest, and indeed small matters in the opinion of man: and such as the principall Professors and Masters of this Art do auow and confession among themselves. Howbeit, euery one of these deuises, as harmlesse as they seem to be, haue been the ouerthrow of all vertue and good manners in our Romane State, I mean those things which we doe and suffer in our health: our exercise of wrestling, our greasing and anointing with oile for that purpose, brought in for sooth and ordayned by these Physitians for to preserve our health. And what should I speak of their drie stouues, hot houses, and ardent bayns, which they would beare men in hand to be so good for digestion of meat in their stomackes? Yet could I neuer see any, when he came forth of them vpon his own feet, but he was more heauy, & found himselfe

21. Treacle.

* Sanguis Draconis Sang- dragon La-
* Myrme species,
* a kind of gum,
* Metakiscum,
* mineral Ver-
million,

A himselfe feeblar than before he went in: and as for those who haue bin more obseruant of their rules than the rest, and wholly gouerned by them, I haue known many such caried off for dead, or else extream sicke. To say nothing moreover of the potions and drinks ordained by them, to be taken in a morning fasting, for to vomit and scour the stomack thereby, and all to makeway for to quaffe and carouse again vpon it more lustily. I forbear also to write of their rosins and pitch-plasters deuised by them for to pluck away and fetch off the haire where Nature hath ordained it to grow, whereby they would seem to effeminate our men. I bask also to speak how euery our women haue prostituted their nakednes and priuities vnto them, by occasion of these their wanton deuises. In sum, conclude we may, that considering these enormities and corruptions which haue crept into our life, by nothing more than by the meanes of Physick, *Cato* was a true prophet indeed, and his oracle is verified & fulfilled euery day, when he said, That it was sufficient to look curiously into the writings and witty deuises of the Greeks, without farther studying therupon and learning them thoroughly. Thus much I thought good to speak in iustificati- on of that Senat and people of Rome, who not without great reason continued 600 yeeres with- out the entertainment of Physicians; and against that Art which of all others is most danger- ous and fullest of deceit: in regard wherof, it hath bleered the eyes of good men, and they be those who haue giuen credit & authority thereto. And withall, thus much may suffice to meet with the fond opinion and foolish persuasion of those, who are rauished and caried away with a conceit, esteeming nothing good for the health of man, but that which is costly and pretious. For certes I doubt not, but some there be who will loath these receipts taken from diuers beasts, wherof I shall haue occasion to speak hereafter. But I comfort my selfe again herein, That *Virgil* disdained not to name the very pismires and the weevils; * blind beetles also delighting in darknesse, and their nests wherein they keep, of which he wrote, notwithstanding he was not vr- ged thereto vpon necessitie. Neither did *Homer* think it improper, to * mingle the description of a shrewd and vnhappie flie, euery with the heroicke battailes of the gods: ne yet dame Nature, who hath brought forth and made man, thought it any disparagement to her maiestie for to engender also these fillie and small creatures. And therefore let euery man consider their ver- tues, properties, and effects, and not regard so much themselves. To come then to those things that are most common and known, begin I will at sheeps wooll, and birds eggs, to the end that by that means due honour may be yeilded to the chiefe and principall of all others, as it doth ap- pertain. Howbeit, I must of necessitie speak of some other things by the way as occasion shall be offered, notwithstanding the place be not so proper & fit for them. Neither wanted I means sufficient to furnish this worke of mine with many gallant matters and pleasant discourses, if my delight and mind had been to looke after any thing else but a plaine and true narration, ac- cording to my first dessein and intention: For well I wot, that I might haue inserted here and there, the rare receipts which are reported to be of the ashes of the bird Phoenix, and her nest; but that I know all to be meere fabulous, howsoeuer they carrie a pretence of truth. Besides, I count it a very mockerie and no better, to deliuer vnto the world those medicins which are not to be but once in the reuolution of a thousand yeeres.

* Iliados 6.

CHAP. II. ¶ The vertues and properties of Wooll.

THE ancient Romans attributed vnto Wooll great authoritie, & had therein a certain reli- gious and reuerent opinion of holines: in so much as new wedded wiues by an old custom and ordinance at Rome, were wont with great ceremonie to adorn and bedeck with wooll the side-posts of the dore or entrie into their husbands house, on the marriage day. Now besides the vse of wooll for decent apparel, & defence against cold weather, that which is vnwasht and full of the sheeps sweate serueth in Physick, and is a foueraign remedy for sundry accidents, being applied with oile, wine, or vinegre, according as need requireth, either in mitigation of pain, or mordication and corosion, and according as our purpose is, to bind, or to enlarge and open any part: and namely, it is imploied in dislocations of members, and griefe of sinues, if it be laid to the affected place, well sprinkled & wetted with the said liquors: that it might be alwaies moist. But more particularly, for disioined members, some put thereto a little salt: others take rue, & when they haue stamped it, incorporat the same with some conuenient grease, & so apply it in maner of a cataplasme vpon sweate wooll: after which maner, it is good for contusions or bruises & swellings. Also it is said, that if the teeth & gums be well rubbed with such wooll and

H h

honey

hony mingled together, it will cause the breath to be the sweeter: a suffumigation or perfume therof is singular for the frensie: applied with the oile of roses, it stanches bleeding at the nose: or otherwise if the ears be well stopped therewith, and a little garlick conueied withal therinto. Moreouer, it is laid to inueterate sores with good successe, so that hony be put thereto. Soake wooll in wine, vinegre, or cold water and oile, and then wring and presse the same forth, it heales any wound. The wooll of a ram well washed in cold water, & afterwards steeped in cile, is singular for womens infirmities, and particularly allaieth the inflammation of the matrice: but in case it be saln downward and readie to slip out of the bodie, a perfume therof receiued beneath, staiteth the same and keepe it vp. The fattie wooll of a sheep being either applied, or put vp in manner of a pessarie, drawes down the dead infant out of the mothers belly: and yet the same otherwise represseth the immoderat flux of womens fleurs. If it be couched hard & close within the wound occasioned by the biting of a mad dog, it serueth to great purpose, but with this charge That it be kept bound thereto & not remoued vntill the seuenth day be past: applied vnto whit-flaws and impostimations about the naile-roots, with cold water, it cureth them: the same, if it be dipped & foked in a medly made of salnitre, brimstone, oile, vinegre, and tar, all dissolved together and ready to boile, and so laid as a cataplasme to the loins as hot as the patient can abide it, changing it twice a day, appeaseth the paine of those parts. Take the greasie wooll of a ram, bind therewith very hard the joints of the extreame parts, as namely the fingers and toes, you shall see how it will stanch bleeding. [Howbeit, note this, that the wooll growing vpon the sheeps neck is euer best and most medicinable: and if we regard the country from whence it coms, that of Galatia, Tarentum, Attica, and Miletum, is alwaies reputed better than any other.] Furthermore, the greasie or sweatie wooll of a sheepe, is proper to be applied to any raw places where the skin is fretted off, to contusions, bruses looking black and blew, strokes, crushes, rushes, rubs, and gals; as also from them who are tumbled down from some high place; for the head-ach and other pains; and lastly, for the inflammation or heat of the stomach, being decently applied with vinegre and oile rosat. Reduced into ashes and vsed as a liniment, it is singular for them that be crushed or squeezed, wounded, burnt, and scalded. This ashes entrench also into collyries and eie-falues: it serueth for hollow vlcers & fistuloes: like as for the ears when they run filthie matter. For these purposes about specified, some sheare it from the sheeps back: others chuse rather to plucke it: and when they haue clipped off the vpmost parts, or forced it lay the same forth to dry: they toze & card it also, and then bestow it in an earthen pot not fully baked, which they besmeer all ouer with hony, and so burn & calcine it to ashes: others put vnder, smal chips or slices of torchwood, and lay certain beds or courses thereof between the locks of wooll; and after they haue besprinkled the same with oile, set all one fire: which done, the ashes that come therof they put into little pans or vessels, & poure water thereon: and after they haue well stirred the said ashes with their hands, they suffer it to settle downe to the bottom; which they do oftentimes, alwaies changing the water till such time as a man may perceiue the ashes at the tongues end to be somewhat astringent, but not biting: and they lay vp their ashes for their vse. A great * scourer and cleanser this is, and therefore most effectuall to mundifie the eye-lids.

* *Vitis* sive *infusio* *effica* est, out of *Diosc.* not *septicus*, as is commonly read: for how can it be corrosiue if it bite not at all.

* *Siccatur*, or rather *Saccatur*. *Astreine* it through a linnen bag.

Moreover, the very filthy excrements of sheep, & the sweat sticking to the wool of their flanks, between their legs & the concavities thereof (which they call Oesypum) is thought to haue infinit number of medicinable properties: but the best Oesypum simply is that which coms from the sheeps bred about Athens. This sweet or filthy excrement, call it what you wil, is prepared and ordered many waies; but the principall is that which is gathered from the wooll newly taken from between the legs & shoulders of the sheep, and presently tozed ready for to be carded: others are content to take the sweatie filth of any wooll, so it be fresh plucked or clipped from the sheep; and whether it be the one sort or the other, they let it dissolve ouer a soft fire in a pan of brasse: which done, they set it a cooling, and take off the fat that swims aloft, & gather it into an earthen vessell. As for the rest which remained behind of the first stuffe, they set it on the fire again, that the fatnes may boile forth of it: after this the fat that floated aboue, as wel the former as the later, they wash in cold water, & let * it drie in a linnen cloth, expose it to the heat of the Sun, that it may frie therein vntill it be blanched white and look pure and cleare: then is it put vp in tin boxes or peuter pots, and reserved for vse. The true mark to know which is good Oesypum, after it is thus tried & putrified, is thus: if it haue a rank smel still of the first filthines which it had from the sheep: also, if when you rub it with your hand in water, it melt not, but in

the working look whitish like vnto cruse or white lead: a soueraigne thing it is for the inflammation of the eies: for the hard callosities also that grow vpon the eye-lids. Some there be who torrefie the foresaid greasie wooll into an earthen pot or pan, so long vntill it haue forgone and yeeldeth forth all the sweet and fattinesse; the which they suppose to be the best Oesypum that is for any erosion, fretting or hardnesse of the eyelids: or to cure the scabs and sores, yea, and the watering of the angles of the eies. Well, this fatty excrement thus clarified, incorporat with goose grease, cureth not only the vlcers of the eies, but of the mouth also and members of generation: the same tempered with Mellilot and Butyr, maketh an excellent liniment for all inflammations of the matrice: the chaps also and swelling piles or biggs in the fundament. Many other vertues it hath, which I will digest into their seuerall places, and speake of them accordingly. As touching the filthy excrements hanging to sheeps tails, and baltered together into round pills or bals, if they be dried and so beaten to powder, are singular for the teeth, yea, though they shooke in the head, if they be rubbed therewith; also for the gums, though there were gotten into them a cankerous sore. Now concerning fleece wooll that is pure and washed, either by it selfe alone, or else with sulphervif, it is passing good to be applied to any place in paine, whereof the cause is not euident and known: which also being reduced into ashes, is soueraigne for the accidents which happen vnto the priuie parts. In sum, of such vertue is wooll, that there is no cataplasme, pulstesse, or plaister, in manner applied to a grieued place; but the same hath wooll laid ouer it. The same also hath a singular vertue aboue all things, to recouer the appetite of meat in the very sheep that beare it, in case they haue lost their stomachs and feed not: for pluck the wooll that groweth to their tails, and therewith tie the same as hard as is possible, you shall see them presently fall to their meat: But it is said withall, that the rest of the taile which is vnderneath the said knot where it was bound, will quickly become mortified, and die.

* *Doloribus* *causis*.

CHAP. XIII.

¶ The nature and properties medicinable of Eggs.

Great societie and affinitie there is between wooll & eggs; in this regard, That if they be applied both together in a frontall to the forehead, they repress all violent fluxes & rheums falling into the eies: but you need not take for this purpose any wool that hath bin dressed or clenched with the * Fullers scouring weed: neither is it required, that in this case there should be vsed any more but the white of an egg, and the same ought to be infused or spread vpon the foresaid wooll, with the powder of Frankincense: & in very truth, the white of an egg alone, if it be instilled or dropped into the eies, is sufficient to restraine the flux of humors thither, yea and to coole any hot rheume or inflammation incident to them. Howbeit, some think it better to put saffron thereto, and vse this gleere or white of the egg beaten, in stead of water, for all collyries or medecins appropriat to the eies. The white of an egg incorporat with fresh butyr, is so soueraigne for the red and bloud shortene eies which put little children to pain, as none in the world better; nay there is not in a maner any other vsed in that case. The same beaten and tempered with oile, assuageth the heat of S. *Antonies* fire, if there be leaues of beets laid vpon the place and kept bound thereto. The white of an egg incorporat with salhormoniacke finely puluerized, doth extend and turn backward, the haire of the eyelids which grow inward into the eies: the same with pine nut-kernels, & a little hony mingled withall, and so reduced into a liniment, takes away the pimples that arise in the face: annoint the visage therewith, it will keep it from being sun-burnt. If one be scalded with hot water, lay quickly an egg to the place, yelke, white, and altogether, it will take out the fire and preferue it from blistering: some put thereto barley meale and a little salt: but say the place be blistered & exulcerat with any burne or scald, parched barley with the white of an egg and swines grease, is an excellent medicine to heale the sore: and the same cataplasme is much vsed in the cure of the hæmorrhoids, piles, and chaps of the fundament; and especially in children, for to reduce the tiwill into the right place, if it hang forth, for the rifts and chaps which appeare in the feet, take the white of an egg sodden or roasted, the weight of two deniers of ceruse, as much of lecharge of siluer, and myrrhe, with a little quantitie of wine; incorporat all together into a cataplasme, there is not a better medicine for them: and for the inflammation called S. *Antonies* fire, the white of an egg beaten together with Amydum or starch-floure, is right soueraigne. It is said moreouer, that the white of an egg is very good to conglutinat or sower any wound, yea and two expell the stone and grauell out of the body.

* *Radicula*, called before *Sarothamum*.

The yelke of an egg sodden vntill it be hard, and tempered with a little saffron, with hony also G and breft-milke, and so reduced into a liniment, allaieth the pain of the eies, if they be aointed or fomented therewith: or if the same be incorporat with oile rosat & honied wine, and so spread vpon a quilt of wooll and applied, it workes the same effect. Others there be who take the yelke or an hard egg, mix therewith the poudre of persley seed, adding thereto fried barley meale dried, and honied wine, with which composition they annoint the fore eies. Also the yelk of a soft egg alone, supped off and swallowed down cleare that it touch not the teeth by the way, is singular good for those that be troubled with the cough, with the rheume or catarrhe that hath taken a way to the breft or pectorall parts; yea and the roughnesse of the throat & pipes which causeth hoarsenesse: but principally if one be bitten with a worme or serpent called * Hæmorrhoids, let him both sup off the yelke of an egg raw or soft, and apply it also to the wounded place. It hel- H peth the infirmities of the reins; it healeth the fretting, excoriation, and vlcers of the bladder; yea and cureth those that reach & cast vp blood. Five yelks of eggs supped off raw in one hemin of wine, are singular good for the dysenteric or bloody flux, and namely, with the poudre of the shels from whence they came, the juice of Poppie, and a little wine withall. For the flux of the belly proceeding from a feeble stomacke, they vse to giue the said yelks of eggs raw, with as much in weight of good and full raisins, and the rind of a pomegranat, with direction to the patient, for to take this medicine three daies together by euen portions, and no more one day than another: for which purpose also, there is another way to vse them, namely, to take three yelks of an egg, to incorporat the same in as many ounces of honey and old lard, putting thereto three cyath, also of good old wine, and stamped all together into one composition vntill such time as it be reduced to the consistence or thicknesse of hony, of which the patient must drinke as need requires, with water, the quantity of an hazle nut at a time. Also it is good to lay three eggs in vinegre for three daies together, and vpon the fourth day to eat them, for the foresaid flux of the stomack: after which maner it auaileth much to take them against the oppilations & hardnesse of the spleene: but to such as are subiect to casting and reaching blood vpward, Physicians prescribe to take them in three cyaths of new wine. Some vse the yelks of eggs that haue bin old kept, for to reduce the skin that is blacke and blew to the fresh and liuely colour again; but they incorporat the same in hony with bulbe roots: the same sodden and drunk in wine, doe repress the immoderat flux of womens months: but applied raw with oile and wine, they discusse & resolve the ventosities within the matrice. Incorporat with oile rosat and goose grease, they are good to be applied to the nape of the neck for the cricke and pain thereof: being roasted against the fire hard, and so presently applied hot to the seat, they are good for the griefs and accidents of the fundament: but more particularly for the swelling piles and bigs rising in those parts, they would be laid too with oile of roses. Being sodden in water vntill they be hard, they serue very well for any burne or scald; with this charge, That presently the ashes of the same egg-shels calcined vpon burning coales, be applied to the place, and then to annoint the same with the foresaid yelks and oile rosat mixed together. Now it falleth out somtime, that eggs be all yelke within, & haue no white at all; namely, when the hen hath coued & sitten ouer them three daies together, and then be taken away from vnder her; and such kind of eggs the Greeks call Schista.

Dalechamps would haue the same eggs to be dried and reduced into poudre, &c.

Take the eggs from vnder the hen when they be full of chicken, a little before they spring and the chicke be hatched, together with halfe as much of gal nuts, and giue the same for to streng- then a feeble and weak stomack; with this caution, That the patient haue eate nothing in two hours before. And some doe aduise for the dysentery or bloody flux, to giue the said chickens sodden egg and all together, putting thereto one hemine of austere or sharpe wine, and an equall quantitie of oile and parched barley groats drie. The fine pellicle or skin that is within the egg-shell, being taken from it (whether the egg be raw or sodden it skilleth not) healeth the chaps that are in the lips, if it be applied thereto. The ashes of an egg-shell drunke in wine, stoppeth the issue of blood gushing out at any part: but the same ought to be burnt, or calcined without the pellicle or skin aforesaid; and so it makes an excellent dentifrice also to cleanse and scoure the teeth white: a liniment made with the said ashes and myrrhe together, staies the superfluous M flux of womens terms. And here I cannot chuse but note vnto you by the way, the strange propertie and wonderfull nature that egg-shels haue: for so hard compact and strong they be, that if you hold or set an egg endlong, no force nor weight whatsoeuer is able to break and crush it, so long as it standeth straight and plumb vpright, vntill such time as the head incline to a side and

and bend one way more than another. Eggs entire and all whole as they be [i. white, yelke, shell and skin] taken in wine with rue, dill, and cunin, helpe women in hard traueil to speedie and easie deliuerance. Eggs incorporat with oile & rosin of the cedar mixed together, are singular good for to heale scabs and to kill the itch: put thereto the root of Cyclamin, [i. Sow-bread] it healeth the running skalls of the head: for those that reach vp purulent matter out of the chest, or spit blood, it is good to sup off a raw egg together with the juice of vnsler leeks, and an equall quantitie of Greekish wine; but first all must be warmed, before that it be giuen to the patient. Against a cough, they ordaine eggs sodden and stamped together with hony, and so to eat them; or else to sup them off raw, with wine cuit & oile, of each a like quantity. If a man haue any sore or vlcere in his secret parts seruing for generation, it were very good to inject one egg tempered B with three cyaths of wine cuit, and halfe an ounce of Amylum or starch-floure, presently vpon his coming forth of the baine or hothouse. An excellent linement there is made of sodden eggs stamped together with cresses, for the sting or biting of serpents. How many means there be whereby eggs doe good as meat, there is not one but knoweth: for euen in their going downe, they passe through any tumor or swelling of the throat, and with their kind heat foment those parts by the way. There is not any kind of viand in the world besides it, that nourisheth a sicke man, without any offence or burden at all to the stomacke; and it may go well enough for meat and drinke both. As touching eggs sodden in vinegre, and how their shels may be made soft and tender therby, I haue already shewed: such eggs if they be wrought and knead with meale into a dough or past, do make a kind of bread which is soueraigne for all fluxes of the stomack. Some there be who think it better to take these eggs thus mollified & resolved in vinegre, and to terrifie the same betwene two platters of earth, supposing that being thus prepared, they serued not only to stop a lask, but also to repress the immoderat flux of womens monthly tears: but in case the said fluxions be excessiue and beyond all measure vehement, they are to be supped off raw, with water and meale in maner of a grewell or pottage: or els the yelks may be boiled by themselves in vinegre, vntill they be hard; and then a second time be fried & torrified afterwards with grosse pepper, and in this fort they will die any loosenesse of the bellie. And yet there is another singular remedie for the bloody flux, namely, to put the meat of a raw egg in a little earthen pot that neuer was occupied, and to add thereto as much hony as may amount to the quantitie of the egg, to the end that all be of equall proportion; then, within a while after to temper therewith the like measure of vinegre & oile both, and to beat them all together oftentimes, that they may be well incorporat and vnited in one. In which composition, this is to be obserued, That the better that euery one of these ingredients is that enter into this confectiō, the more excellent operation and speedier remedie wil ensue therupon. Others there are, who in stead of oile and vinegre, put in red rosin and wine, according to the former rate and proportion: howbeit they temper the said medicine after another fort; for they put in of oile, only as much as the egg comes to, adding thereto of the pine-tree bark * two sixtie parts of a Romane denier, and one sixtie part of Sumach, which I called Rus, and five oboli weight of hony; with this charge, That they be all boiled together; and that the patient eat no other meat whatsoeuer for the space of foure hours after. Many there be, who to cure and ease the wringing gripes and torments of the belly, take two eggs and foure cloues of Garlick, which they pun and stamp together; then they heat them ouer the fire in one hemine of wine, and giue this mash vnto the patient to drinke. To conclude, because I would not willingly omit any thing that may commend eggs and giue grace vnto them, know thus much moreouer, That the gleere or liquid white of an egg with quicklime, maketh an excellent sement to soudre or vnite any broken pieces of a glasse together: besides, of such strength and efficacie they are, that neither a piece of wood no nor so much as any parcell of cloath wet or dipped in the white of an egg wil burn, but check the violence of the fire. Howbeit, note that all which I haue spoken of eggs, is to be meant those that hens only do lay: for as touching other birds eggs, I wil write in their due places; for as much as they are not destitute of many peculiar vertues and singular properties of their own.ouer & besides, I wil not ouerpasse one kind of eggs besides which is in great name and request in France, and whereof the Greeke authors haue not written a word: and this is the serpents egg, which the Latins call Anguinum. For in Summer time verely, you shall see an infinit number of snakes, gather round together into an hpape, entangled and enwrapped one within another so artificially, as I am not able to expresse the manner thereof: by the means therfore, of the froth or saluation which they yeeld

yeeld from their mouths, and the humour that commeth from their bodies, there is engendered the egg aforesaid. The priests of France called Druidæ, are of opinion, and so they deliuer it, That these serpents when they haue thus engendered this egg do cast it vp on high into the aire, by the force of their hissing, which being obserued, there must be one ready to latch and receiue it in the fall again (before it touch the ground) within the lappet of a coat of arms or soldiours cassocks. They affirme also that the party who carrieth this egg away, had need to be wel mounted vpon a good horse and to ride away vpon the spur, for that the foresaid serpents will pursue him still, and neuer giue ouer vntill they meet with some great riuer between him and them, that may cut off and intercept their chafe. They ad moreouer and say, that the onely marke to know this egg whether it be right or no, is this, That it will swim aloft about the water euen against the stream, yea though it were bound and enchaufed with a plate of gold.ouer and besides, these Druidæ (as all the sort of these magicians be passing cautelous and cunning to hide and cover their deceitfull fallacies) do affirme, That there must be a certaine speciall time of the Moones age espied, when this businesse is to be gone about, as if (forsooth) it were in the power and disposition of man to cause the moon and the serpents to accord together in this operation of engendering the egg aforesaid by their froth and saluation. I my selfe verily haue seen one of these eggs, and to my remembrance, as big it was as an ordinary round apple: the shell thereof was of a certaine gristly and cartilagineous substance, and the same clasped all about (as it were) with many acetables or concauities representing those of the fish called a Pourcuttle, which thee hath about her legs. And it is the ensigne or badge that the Druidæ doe carry for their armes. And they hold it a soueraigne thing, for to procure readie excesses vnto any princes, and to win their grace and fauour, as also to obtaine the vpper hand ouer an aduersarie in any sute and proccesse of law, if one do carrie it about him. But see how this vanitie and foolish persuasion hath possessed the minds of men! for I am able vpon mine owne knowledge to auouch, that the Emperour *Claudius Cesar* commanded a man of arms and gentleman of Rome, descended from the *Vorantians*, to be killed for no other reason in the whole world, but because he carried one of these eggs in his bosome, at what time as he pleaded his cause before him in the court. This winding and mutuall enfolding of these serpents one within another, putting me in mind of one thing and mutuall enfolding of these serpents one within another, putting me in mind of one thing worth the obseruation, That it was not for nought that forrein nations haue ordained, that their Embassadors who had commission to treat of peace, should carrie with them a certaine rod or mace wherein were pourtraied serpents winding and clasping round about it, to signifie and shew, that these creatures, as sauage, fell, and venomous as they be otherwise, and as it were made altogether of poison, yet otherwhiles they accord and agree well enough together: where it is furthermore to be noted, that the manner was not to represent in these maces and ensignes of peace, any furious serpents with crefts vpon their heads.

As touching geese and their eggs, how good and profitable they are, before I enter into any discourse (for my purpose is to treat of them also in this very booke) I cannot chuse but for the honour due vnto the *Comagenes*, in regard of an excellent composition by them made, write first of it, being of them called *Comagenum*: for that also the principall and best of that kind was most vled and in greatest request in *Comagene*: which is a region belonging vnto *Syria*. It consisteth of goose greace, cinamon, casia or canelle, white pepper, and an herbe called likewise *Comagene*. Now for the better mixture and fermentation of these ingredients and the whole composition, the vessell which containeth the same ought to be buried in snow: a pleasant smell it hath, and is held to be a soueraigne ointment for any through-cold and quivering fit, for conuulsions, for sodain pains whereof no euident cause is known; and in one word, for all lassitudes and what infirmities fower be cured by the medicins called in Greeke * *Acopa*: in such sort, as that it serueth not only for an outward ointment, but also for an inward medicine. This *Comagenum* is made in *Syria* after another maner, namely of the fat or greafe of birds which is cleafed, tried, and purified, according as I haue before said, with an addition of *Erysiceptron*, *Xyloballamum*, the barke or young shoot of the Date tree, and sweet *Calamus*, of each as much as amounteth to the weight of the greace aforesaid; and all these together must be put into wine and set ouer the fire for to siuer and take two or three waulms. Now this is to be noted, that the conuenient time of making it is in winter, because it will neuer jellie and grow to any thick consistence in Summer, vnlesse there be * wax put into it.

Many other good medicines and ointments there be made of Geese, whereat I marueile as

* *Acopa*, so called, because they be good against lassitude or weariness.

* And that delicat much the odoriferous smell.

A much as at * Goats: for it is said, that all Summer long euen vnto the fall of the leafe, Geese and Rauens be continually sicke. Finally, as touching the honour which Geese deserued and woon by discouering the skallade that the Frenchmen made into the Capitoll hill of Rome, I haue written heretofore.

CHAP. IIII.

¶ Medicinable receipts taken from dogs, and other beasts which are not tame, but wild: also from foules. Remedies against the pricke or sting of the venomous spiders *Phalangia*.

B Vpon the foresaid occasion, for the dogs which had the custome of the Capitoll, barked not when the *Gaules* skaled the Capitoll, there is a custome yearly obserued at Rome to trusse certain* dogs to forks, and thus as it were crucified, to hang them alie vpon an Elder tree for exemplarie justice: which execution was performed between the temple of *Ieuentus* and *Summanus*. But seeing I am thus light vpon the mention of dogs, I must needs discourse of them more at large, and the rather, for that our ancestours in old time obserued many ceremonies about this beast. First and foremost, the ancient Romanes thought the flesh of sucking whelps to be so pure and fine a meat, that they vled to sacrifice and offer them as an expiatorie oblation to their gods for to appease their indignation. And verily at this day they make no scruple to sacrifice a yong whelp before it be full a day old, and especially such an one as the bitch puppieth the same morning: yea, and at the solempne festiuall suppers ordained for the honour of the gods, they forget not this day to serue vp at the table certain dishes of yong whelps flesh that sucke their dams. Moreouer, that yong dogs flesh was an ordinarie seruice at those sumptuous feasts called * *Aditiales*, it appeareth plainly by the testimonie of *Plautus* in his * *Comædies*. Certes, it is generally thought, that for the venome called *Toxicum*, there is not a better counterpoyson than dogs blood. It seemeth also that this domesticall creature taught men first the manner of discharging and purging the stomacke by vomit. In summe, there are a number of other medicinable vertues in a dog highly commended, whereof I will write as occasion shall be offered in conuenient place. But for this present I will proceed orderly according to my first intention and purpose.

D To returne againe vnto the stinging of serpents, these remedies following are taken to be effectually, to wit, sheeps treddles and Goats dung fresh gathered and boiled in wine to the consistence of a liniment, and so applied vnto the place: also mice and rats splitted and so laid hot vnto the wound. And verily, how basely fower men thinke of this kind of cattrell and hold them no better than vermine, yet they are not without certaine naturall properties, and those not to be despised: but principally in regard of the sympathy betweene them and the planets in their ascent, as I haue noted heretofore: and namely, considering how the lobes and filaments of their liuers and bowels do encrease or decrease in number, according to the daies of the Moons age. And these magicians do report, That if one do giue vnto hogs the liuer of a mouse or rat within a fig, they will follow the partie that gaue them that morcell. They say moreouer, that the same is able to do as much in a man: but in case a cyath of oile be drunke vpon it, it looseth all the vertue.

E As touching Weasels, there be two kinds of them: for there be wild sort different from the rest in bignes, for they be smaller: and those the Greeks call * *Ictides*: their gall is said to be very effectually against the sting of the *Aspis*, whereas otherwise it is a very poyson it selfe. As for that kind which keepeth about our houses, wandering here and there in euery corner, and * vseth to carie her killings in her mouth to and fro euery day: from place to place and neuer resteth (as mine author *Cicero* doth write) shee is anemie to serpents and naturally persecuteth them. Their flesh being salted, is giuen to the weight of one denier in three cyaths of wine, with great successe, vnto those that be stung by serpents: also their maw farced with coriander seed, and kept in salt or brine, is good for the same purpose if it be drunke in wine. But the yong kitling of the Weasel is best and most effectual.

Other vile creatures there are besides, which for their baseness I bash to name and relate in this place; howbeit, because so many authors with one consent haue so constantly commended their medicinable properties, I make it a matter of conscience to passe them ouer in silence; confide-

* *Ictides*, saith *Cassiodorus* dig. cap. 20. lib. 17. it is such as will not barke and giue warning of strangers coming.

* *Aditiales*, *Festus* quod est in the place in the *Comædies* called *Aditiales* are now extant.

* Which be our Ferrets, * Some take these for our Cats.

considering that all our medicins proceed from that conuenience and repugnancie which is in the nature of all things, whereof we haue so much spoken. As we may see for example in these punies or wall lice (the most ilfavoured and filthy vermine of all other, and which we loth and abhor at the very naming of them) for natually they are said to be aduersatiue to the sting of all serpents, and principally of the Aspis: nay they are thought to be a counterpoysen against any venomous thing whatsoeuer: and folke ground their reason hereupon, because looke what day that Hens do eat a wall-louce, the same day there shall no Aspis haue power to kill them. And it is said moreover, That the very flesh of such hens as haue eaten such punies, is singular good for those that be stung alreadie by the said serpents. Other receipts there be set downe by our great masters in Physicke, as touching this foule vermine: but those which carie most modestie with them and haue greatest respect vnto manhood & humanity, are these, namely, to rub or annoint the place which is stung, with the said wal-lice and the bloud of a Tortoise together: also to chase away serpents, with the smoak or perfume of them: likewise if any beast which hath swallowed down horse-leeches, do take them in drink, they will either kill them or driue them out, yea, and in what part soeuer they are settled and sticke fast, they will remoue them and make them to fall off. And yet some there be who vse this nastie and stinking creature in eie-salues, for they incorporat them in salt & womans milk, and therewith annoint their eies: yea, and drop them into the eares with honey and oile of rose mingled together. Others there be who vse to burne these puniaises or wal-lice, such especially as be of a wild kind, and breed vpon Mallowes, and incorporat their ashes in oile of Roses, and intill them into the eares. Touching other medicinal properties which they attribute vnto them, namely for impostumes and botches that are broken and run, for the Quartan ague and many more maladies; although they giue direction to swallow them down in an egge, or else enclosed within wax or a beane, I hold them for lies, and therefore not worthy to be related in sadnesse. Marie I will not say but there is some probabilitie and apparence of reason why they should put them in those medicines which are ordained for the lethargie: for surely they are knowne to be very proper against that drowines, which is occasioned by the venome of the Aspis: to which effect seuen of them be ordinarily giuen in a cyath of water, or but foure, if the patient be a child. In case of strangurie also, when a man pisseth dropmeale, they vse to put wall-lice into a syringe, and so conueigh them into the passage of the yarde. See the goodnesse and industrie of dame Nature, the mother of all, how she hath produced nothing in the world but to good purpose and with great reason. And yet here is not all that they report of these lice called puniaises: For they say, that whosoever carie two of them in a bracelet about his left arme, within a lock of wooll (but the same forsooth must be stolen from some shepherd) he shall be secured against those agues that come ordinarily in the night season: but say their fits vse to returne by day time, then the said punices ought to be lapped in a reddish clout of a carnation colour. Contrariwise, the worme called Scolopendra is an enemy vnto these wall-lice, and killeth them.

As for the Aspides, look whom soeuer they haue stung, they die vpon it with a kind of deadly sleepeinesse and benumbednesse in all their lims: and to say a truth, of all serpents that creep vpon the ground, they are most mortall, and their wounds least curable. Their venome if it enter once so farre, that it come to bloud, or doe but touch a greene wound, there is no remedie but present death: marie if it light vpon an old sore, the danger is not so speedie, nor the force so quick. Otherwise let the same be taken in drinke to what quantitie soeuer, it is harmelesse and doth no hurt at all: for setting aside that senselesse drowinesse wch it inflieth, putrifaction and infection it causeth none: which is the reason, that the flesh of those beasts which die of their sting is meat good enough. I would pause and make some stay in reporting a remedie that these Aspides do yeeld, but that I haue my warrant from *M. Varro*, whom I know to haue deliuered the same, euen when he was foure score yeres old and eight: namely, That there is not in the world so good a thing to cure the bitings of the Aspides, as to giue the party who is wounded thereby, some of their vrine to drinke.

To come now vnto the Basiliske, whom all other serpents do flie from and are affraid of: albeit he killeth them with his very breath and smel that passeth from him; yea, and (by report) if he do but set his eie on a man, it is enough to take away his life: yet the Magicians set great store by his bloud, and tell wonders thereof: and namely that being of it selfe as blacke and as thick congealed as pitch, yet when it is washed and dissolued, it looketh more cleare and pure than

* At which yershe would haue bene ashamed to tell alie.

* Cinnabaris. Vnto it they attribute strange and admirable effects: For whosoever (say they) carie it about them shall & gracious with princes or great potentats, yea, and at their hands obtaine a grant of all their petitions: they shall find fauour with the gods above, and speed in all their praies: remedie they shall haue of all diseases: and no forcerie or witchcraft shall take hold of them. And some of them there be who call it the bloud of Saturne.

As for Dragons, they haue no venome in them. And if it be true that our Magicians say, if a Dragons head be laide vnder the threshold of a dore, after due worship and adoration of the gods, with praies & supplications vnto them for their fauourable grace, that house shall surely be fortunat. The eies of a Dragon preserved drie, pulverised and incorporat with hony into a liniment, cause (by their saying) those who be annointed all ouer therewith to sleepe securely, without any dread of night-spirits, though otherwise they were fearfull & timorous by nature. Moreouer, if we may beleue them, the fat growing about the heart of a Dragon, lapped within a peece of a Buckes or Does skin, and so tied fast to the arme with the nerues or sinues of a red Deere, is very auailable, and assurth a man good successe in all sutes of law. The first spondyle or turning joint in the chine of a Dragon, doth promise an easie and fauourable access vnto the presence of princes & great states. The teeth of a Dragon lapped within the skin of a roe buck or wild Goat, and so bound fast with the sinewes of a Stag or Hind, do mitigat the rigor of great lords and potentats, causing them to incline to their petitions and requests, who present themselves before them. But about all other receipts, one composition there is which bewraith the impudent and lying humor of these Magicians, who promise vndoubted and infallible victory, to those that haue it about them, and this it is: Take (say they) the taile and head both of a Dragon, the haire growing vpon the forehead of a Lion, with a little also of his marrow, the froth moreover that an Horse someth at the mouth, who hath woon the victory and prize in running a race, and the nailes besides of a dogs feet: bind all these together with a peece of leather made of a red Deere skin, with the sinues partly of a Stag and partly of a fallow Deere, one with another in alternatiue course: carrie this about you and it will worke wonders. Impositions all, and loud lies. And verily, it is as gracious a deed to discouer and lay abroad these impudencies of theirs, as to shew the remedies for the sting of serpents, considering how these deuices be no better than meere mischiefs and forceries, which hurt and bewitch poore patients, and such as trust in them. True it is, that all venomous beasts flie from those that be annointed with Dragons grease. Likewise they cannot abide the strong & virulent saueur of the rat of India called Ichneumon: inso much as they stand in dread of them who are annointed with a liniment made of the ashes of their skin incorporat in vinegre. Moreover, lay the head of a Viper to the place where she hath wounded one, it is a foueraign remedie, yea, though it were the head of any other Viper than it which inflicted the wound, it is infinitely good. Likewise if a man do hold vpon the same Viper that inflieth the sting, at a staues end ouer the smoak of wood burning, or the vapor of seething water (and yet, say they, warie enough they be thereof, and will auoid it) or annoint the place with a liniment made of her ashes burnt, it is sufficient to heal the sore. *Nigidius* mine Author affirmeth, That serpents after they haue stung one, are forced by a certain necessitie and instinct of Nature to returne vnto the party whom they haue hurt. The Scythians yerely vse to slit a vipers head between the eares for to take forth a little stone, which she is wont to swallow when she is affrighted. Others make vse of the whole head as it is. Certaine trochisks there be, made of a Viper, called by the Greeks Theriaci: for which purpose they cut away at both ends as well toward the head as the taile the breadth of foure fingers, they rip her belly also, and take out the garbage within: but especially they rid away the blew string or vein that sticketh close to the ridge bone. Which done, the rest of the bodie they seeth in a pan, with water and dill seed, vntill such time as all the flesh is gon from the chine: which being taken away, and all the prickie bones thereto belonging, the flesh remaining they incorporat with fine flour, & reduce into troches, which being dried in the shade, are reserved for diuerse vses, and enter into many foueraigne antidotes and confections. But here is to be noted, that although these troches be called * Theriaci, yet are they made of vipers flesh onely. Some there be, who after a Viper is cleafed as aboue said, take out the fat, and seeth it with a sextar of oile vntill the one halfe be consumed: which serueth to driue away all venomous beasts, if three drops of this ointment be put into oile, and therewith the body be annointed all ouer. Moreover, this is held for certaine, that there is no sting or bit of serpents so mortall and incurable otherwise, but the entrailles of the

* Trochiscus. For Theriaci in the primitive and naturall significatiō is more general of the or trochiscus, which is any wild or venomous beast.

the same which gaue the wound, applied thereto, will heale it: as also, that as many as haue at any time supped the broth wherein a Vipers liuer was boiled, shall neuer afterwards be smitten or stung by serpents.

As for Snakes, venomous they are not but at some times of the month, when they feel themselves moued by the instigation of the Moone: but contrariwise they be good for those which chance to be stung by them, if they be taken alive, stamped, or braied with water, and therewith the affected place fomented. Certes, they are thought to be medicinable in many respects, as I will hereafter declare: which is the cause that a Snake is dedicated vnto the god of Physick, *Æsculapius*. And *Democritus* verily talketh of many strange and wonderfull compositions made of snakes, by meanes whereof a man may vnderstand the language of birds, and know what they prattle one to another. But to say no more, was not *Æsculapius* brought from Epidaurus to Rome in the forme of a Snake? and keepe we not still many of that race commonly in our houses tame and gentle, feeding them by the hand? Surely if their eggs and young frie were not esteemed so, they should be destroyed with firing them in their holes, the world would be pestered with them, they multiply so fast. The goodliest and fairest snakes to see too, are those which live in the water, and are called Hydri, i. water-snakes: but a more fell and venomous serpent, their liues not vpon the face of the earth. Howbeit, the liuer of these water-snakes, if it be kept in salt, or otherwise preserved, is a soueraigne remedie for those that be stung by the same kind.

Now for the spotted Lizard, called Stellions, a Scorpion stamped is singular good against their poyson. For this you must thinke, that of them there is made a venomous drinke: for let him be strangled or drowned in wine, whoeuer drinke thereof shall find himselfe imployed, in so much as their faces will break forth into certaine spots and pimples & soule morphew. And this is the reason that our jealous dames when they would avert the affection and loue of their husbands from those concubins, vpon whom they suspect them to be enamoured, will if they can possibly, stifle a stellion in the complexion or ointment wherewith such harlots vse to paint their visage; by meanes whereof they become disfigured, and grow both foule and ill-favoured. But what is the remedie to cleanse the skin from such deformities? The yolke of an egg incorporat with hony and salnitre, doth the feat. The gall of these Lizards or Stellions punned and dissolved in water, is said to haue an attractive facultie to draw all the Venefuels about the place to resort thither in companies.

Of all venomous beasts, there are not any so hurtfull and dangerous as are the Salamanders. As for other serpents, they can hurt but one at once, neither kill they many together: to say nothing, how when they haue stung or bitten a man, they die for very grieve and sorrow that they haue done such a mischief, as if they had some pricke and remorse of conscience afterwards; and neuer enter they againe into earth, as vnworthy to be receiued there: but the Salamander is able to destroy whole nations at one time, if they take nor heed and prouide to preuent them: For if he get once to a tree, and either claspe about it or creepe vpon it, all the fruit that it bears is infected with his venome; and sure they are to die, whoeuer eat of that fruit, and that by the meanes of an extreme cold qualitie that his poyson hath, which doth mortifie no lesse than if they had taken the Libard-baine call *Aconitum*. Moreouer, say that shee doe but touch any peece of wood, biller, or hedge stake, wherewith either a loafe is baked, or a shiue of bread tosted, as many as eat thereof, shall catch their bane by it: or if one of them chance to fall into a well or pit of water, looke whoeuer drinke thereof, shall be sure to die vpon it: and that which is more, if there happen neuer so little of the spittle or moisture which shee yeeldeth, to light vpon any part of the body, though it touched no more but the sole of the foot, it is enough to cause all the haire of the body to fall off. And yet as great and dangerous as the poyson of these beasts is, there be some creatures and namely Swine, that eat them safely; so effectually is their contrarietie and repugnancie in Nature, that it conquereth and subdueth the said poyson: And to mortifie this venome, it foundeth to good reason, that those beasts should haue power, which feed vpon them and find no harme thereby. But writers there be who say, that the flies called *Cantharides*, taken in drink, or the Lizard in meat, are good for that purpose: besides other things which are aduerse and contrary thereto, wherof I haue already spoken & will speak more in time and place conuenient. As for that which the Magicians do report of the Salamander, against skarefires (for that there is other beast but it, that scorneth the violence of the fire and quencheth it) surely it had bene put in practise long since at Rome, in case their words

A had proued true. *Sextius* affirmeth, That the body of a Salamander cleansed from the guts and garbage within, and parted from the head and feet, if it be condite in hony, inciteth greatly to fleshly lust those that eat thereof: but he denieth flatly that it doth extinguish and put out the fire.

Now concerning those birds which yeeld any helpe against serpents, the vulture or *Geir de*, serueth to be set in the first ranke: but this hath bin obserued and found by experience, that the black of this kind are not so powerful as others in this behalfe. It is commonly said, that a perfume made with burning their feathers, chaferth serpents away. Likewise, it is an opinion generally receiued, that whoeuer carie about them the heart of this foule, are secured from the violent assault, not of serpents only, but also of other wild beasts, yea, and of the theues & robbers by the high way side. The same also assures them to escape the danger of princes wrath and indignation, howsoever they be set and incensed against them. The flesh of Cocks and Capons dissolved, if it be applied warm (as it was plucked from the bones) to the place which is bitten or stung by any serpent, drawes out the venome, and mortifies the strength thereof, so doth their braines if it be drunke in wine. But the Parthians thinke it better to lay vnto the said fores the braines of an Hen. Also a broth made of such pullein, hath a singular vertue in this case, if it be supped off: like as in many others it workes wonderfull effects, as it is vsed. For first and foremost neither Lions nor Panthers will set vpon those persons who are bathed with their decoction, especially if there were any Garlick sodden therein. Secondly, it is passing good to keep the body loose: but stranger is the operation if it were of an old Cocke. Item, It serueth very well to cure long feauers, the trembling also and nummednesse of the lims, it assuageth the pain of all kinds of gout, easeth the head-ach, staieth the violence of rheumes especially falling into the eies, resolue the ventosities, quickeneth the dull appetite to meat, preuenteth the danger of the inordinat desire to the stoole without doing any thing, if it be taken betimes and in the beginning of that disease; strengtheneth a feeble liuer, comforteth the reins and the bladder, conuoceth crudities in the stomack, and finally, helpeth those who are short winded. In regard of these manifold commodities, the maner of making this broth as it ought to be, is set down in writing, and direction giuen therefore. For more effectually it is found to be, in case there be sodden with the Cocke or Capon the sea wort *Soldanella*, or the hearbe *Cybium*, *Capres*, or *Perfely*, *Mercurie* the herbe, *Polypodium*, or dill. Now the best way of making this broth, is to set the said Cocke or Capon a seething with the abouenamed herbes in three gallons of water, and to suffer the same to boile vntill there remain but three pints of liquor: when it is thus sodden to this height, it ought to coole without dores in the open air: and then it is singular good to be giuen in those cases aboue rehearsed, prouided alwaies, that the patient haue taken a vomit before, for that is the only season. And for as much as I am thus far entred into a discourse of Pullain, I cannot forget one miraculous experiment, although it be nothing pertinent to Physick, & this it is, That if one put the flesh of an hen into gold as it is in melting, it will draw all the mettall into it, and consume it so, as therupon the said flesh is held to be the poyson (as it were) of gold. Moreouer, if you would not haue a Cock to crow and chant, put a wreath or collar of Vine twigs about his necke. But to returne again to our receipts and medicines against serpents: the flesh of young Pigeons newly hatched, as also of swallowes, is very good: so are the feet of a scriche Owle burnt together with the herbe *Plumbago*. But before I write further of this bird, I cannot ouerpasse the vanitie of Magicians which herein appeareth most evidently: For ouer and besides many other monstrous lies which they haue deuised, they giue it out, That if one doe lay the heart of a scriche Owle on the left pap of a woman as shee lye asleep, shee will disclose & vtter all the secrets of her heart: also whoeuer carie about them the same heart when they go to fight, shall be more hardie, and performe their deuoir the better against their enemies. They tell vs moreover, I wot not what tales of their eggs, and namely, that they cure the accidents and defects befalling to the haire of the head. But I would faine know of them what man euer found a scriche Owles nest and met with any of their egges, considering that it is holden for an vnouth and strange prodigie to haue seen the bird it selfe: and what might he be that tried such conclusions and experiments, especially in the haire of his head? Furthermore, they affirme assuredly, That the blood of their young birds will curle and frizzle the same haire: Much like to these toies are their reports also of the Bat: for (say they) if a man goe round about a house three times, carrying a liue Bat with him, and then naile it vpon the window with the head downward, it is a soueraigne

*Hereupō per-
adventure it is

take for the
lesse wild Ta-
zell.

counter charme against all forceries and witchcrafts: and more particularly, if a Bat be borne thrice round about a sheepe-coat, and then hanged vpon the lintell of the dore, with the heeles vpward, it will serue for a singular preservative to defend the sheepe from all such harmes. As for the bloud of a Bat, they commend it highly for healing the sting of serpents: if together with the leaues or seeds of a thistle it be applied to the place.

Touching the venomous spider called *Phalangia, they know not in Italy what it is, for all there be many kinds thereof: for some are like vnto Pismires, but that they be far bigger; their heads be reddish, the rest of their body black, howbeit here and there marked with white spots. The sting of this spider is more keene and sharpe than that of the wespe. It liueth ordinarily about ouens and mils. The best remedie against the prick of their sting, is to present before the eyes of the patient, another spider of the same kind: for which purpose folke vse to keepe them in store, when they find any of them dead. Their cafes or skins brought into powder and taken in drink, haue the like effect to young weazils or kitlings, as I haue declared before. A second sort there is of these venomous spiders Phalangia, which the Greeks distinguish from others by the name of Lupus. Those that be of a third kind, and yet named Phalangia, are the spiders which be couered all ouer with a certain downe, and of all the rest haue the biggest heads. Cut one of them and rip the bellie, you shall find within two little wormes or grubs, which (if it be true) that *Cecilius* hath left in writing) hinder women for conception in case they be knit within a peece of leather of a red deere skin, and tied to their armes or other parts of their bodie before the sunne rising: but this vertue continueth not aboue one yeare. Thus haue I shewed one receipt only, of all those that *keep women from conceiuing; which I may be allowed to do in regard of some wiues, who being too fruitfull and ouercharged with child bearing, haue some reason to play them a while and rest from teeming: and therefore may be pardoned, if they vse some such meanes therefore.

There is another kind of spiders, which the Greeks call Rhagion, for that it resembles a black grape kernill: these haue a very little mouth vnder their belly, and as short legs, as if they were vnperfect and not fully made. Look where they bite, the pain that ensueth is much like to that which is occasioned by the sting of a scorpion: and their vrine who are hurt by them, seemes to shew to the eye, cobwebs floating aloft. I would say, that this spider were the same that Asterion, another kind of them, but that these haue certain eiares or streakes of white. Their sting or prick causeth loosenesse and feebleness of the knees. As for the blew spider, which carrieth a blacke downe or cotton, it is worse than both the former, causeth trouble and dimnesse of the eyes by their pricking, yea, and vomiting of matter resembling cobwebs. And yet there is another Phalangium worse than it, which commeth neare in shape to the Hornet, but that it hath no wings at all, and look whomsoever it biteth, they are sure to become leane and pine away. The venomous spider, called by the Greeks Myrmecion, is headed like vnto an Emmet: the bellie is blacke, howbeit marked with certain white spots: their sting is as painefull as that of Wespes. But as touching that kind of Phalangium which is called *Tetragnatium, there be two sorts thereof: The one, which is the worst of the twaine, hath the head diuided directly in the middle with a white line; whereas in the other, the said line or seame runneth crosse ouerthwart. These make the mouths to swell whom they haue bitten. But those that be of a dead asht colour, and yet whitish behind, are not so quicke with their prick as the rest: Of which colour there is another sort that be altogether harmlesse: and these be our common spiders or spinners which against wals vse to stretch out their large webs as nets to catch poore flies. Now concerning the remedies appropiat to any prick or biting of the foresaid Phalangia, there is not a better thing than to drink in oxycrat, water and vinegre mingled together, the braines of a Cock or Hen with a little pepper. Also to take in drink sue Pismires, is thought to be a singular medicine: and withall to make a liniment of sheeps mucke ashes, tempered in vinegre, and therewith to annoint the grieved place. Moreover, the said spiders themselves (of any kind whatsoever) resolu'd and putrified in oile, serue for the said purpose.

As for the mischeuous mouse called the Hardishrew, the runnet found in a lambes maw taken in wine, healeth the hurt that commeth by her biting: also the application of a salue made with the ashes of a Rams cley incorporat with hony, worketh the same effect: so doth a young weazill or kitling, prepared and vsed in manner aforesaid in the Treatise of serpents. If one of these shrewes haue bitten a horse or other beast, it is good to lay vnto the place a mouse or rat

* Yet *Matthiolus* vpon *Dioscorides* reckoneth *Arantia* to be a kind of Phalangium, whereof there is great store in *Apulia*.

* called *Atocia*

* Having four claws.

A new killed, with some salt, or else the gall of a Bat with vineger. The shrew it selfe being burst, and so laid fresh and warm to the sore, cureth the same: for this is obserued, That if one of them be with yong when she doth bite, presently she cleaueth in sunder. And in truth, the best & surest means to cure the hurt, is to apply vnto the wound the very shrew it selfe that did the deed, if possibly shee may be had; and yet the rest are very good: for which purpose they vse to be kept in oile, or els to be dawbed ouer with clay, to serue in time of need: also the earth taken from a cart-rut where a wheele hath gon, is thought to be a proper remedie for the said biting of a shrew, if it be applied thereto: for it is said, that this creature is by nature so benumbed or dull of mouing, that it will neuer go ouer a cart-track.

As touching Scorpions, the lizard named Stellio (by way of a reciprocall counterchange) is the greatest enemie they haue; inasmuch as at the very sight only of the said lizard, they will be affrighted and astonied and fall into cold sweats: and therefore people vse to putrifie & resolu'e Stelliona in oile, and therewith annoint the wounds that Scorpions haue made. Some there be who make a kind of plaistre of the said oile and litharge of siluer boiled both together, wherewith they rub and annoint the grieved place. This lizard, which we name Stellio, the Greeks call Colores, Acalabotes, and Galeotes: * it breeds not in Italy: but call it what you will, & wheresoeuer it is to be found, full it is of little red spots like lentils; a shrill noise it maketh, that pierceth the eares and goeth through ones head; it doth eat and graze like other beasts, which be marks all contrary to our Stellions or starre-lizards here in Italy. But to come againe vnto the prick of scorpions: it is thought good to rub the same with the ashes of hens dung, mixt with the liuer of a dragon: or to take a lizard that is bursten, and the same to apply vnto the affected place; or a mouse likewise which is clouen in sunder; also to lay to the sore the very same scorpion that did the harm; or to eat him roasted: and last of all, to drinke it in two cyaths of pure wine of the grape. Moreover, this proper qualitie haue scorpions alone by themselves, That they neuer prick the ball of ones hand, nor sting at all vnlesse they may touch some haire. Furthermore, take any little stone whatsoeuer, and apply that side which lay next the ground vnto the wound, it will ease the paine: likewise any shell or potherd which lieth with some part of it couered with earth, if it be taken vp and laid vnto the sore, with earth and all vpon it as it was found lying, is said to heale the same perfectly: but in no wise they that haue the applying of it must looke behind them: they ought also to take heed and be very careful that the Sun shine not vpon them when they are about this businesse. Earth-worms or mads stamped and laid to, are very good to cure the biting of scorpions: and yet they serue besides for many other remedies; in which regard they be ordinarily preferred in hony.

For the sting of Bees, Wesps, and Hornets, for the biting also of those Horseleeches called Bloudsuckers, the Howlat is counted a soueraigne remedie, by a certaine antipathy in nature: also whosoever carry about them the bill of a Woodpecker or Hickway, shall neuer be annoyed with any of the foresaid vermin. The smallest kind of locusts likewise, which are without wings and be called *Atrelabi*, be aduerse and contrarie vnto them all.

Ouer & besides the Insects aboue named, there be in some places certain pismires also very venomous, which *Cicero* calleth *Solpugæ*: but they of Grenado in Spain, *Salpugæ*: howbeit few or none of them are to be found throughout all Italy. But what help is there for them and their poison? Surely the heart of a Remouse, otherwise called a bat, hath an operation which is aduerse not only to them, but to all Ants besides.

As for the flies named *Cantharides*, I haue shewed before how contrarie they be to the venom of the Salamander: and yet considering how hurtfull they be themselves, and a very poison to the bladder, causing intollerable pain if they be drunk down, much dispute & question there is among physitians, * how they should be taken and vsed; for how venomous they be, it may appear by the practise of a certaine Egyptian physitian, whom by occasion that one *Cosinus* a knight of Rome, a great fauorite of the Emperor *Nero*, was infected with the foule tettar called Lichene, the said prince sent for out of Egypt to cure of that disease: but he prepared such a drink of *Cantharides* for his patient *Cosinus*, that it quickly cost him his life and brought him to his graue. Howbeit there is no doubt, but being applied outwardly they are not only harmlesse, but also very good, especially if they be incorporate in the iuice of the blacke wilde Vine called *Vva Taminia*, and sheeps suet or goats tallow. Moreover, albeit well knowne it is that these *Cantharides* be venomous, yet those Authors that write of them be not agreed and resolu'd;

* And yet *Matthiolus* vpon *Dioscorides* saith it is the *Terrantola* which is common in Tuscany.

* Namely, whether they are to be vsed inwardly at all? whether with their wings, head & feet, or without them.

ued, in what part that venom lieth: for some there be who are of opinion, that their feet are poi- G soned; others thinke their mischiefe is all in their head; and there be againe who deny both: but wheresoeuer the said poison lieth, all conclude jointly vpon this point, that their wings be medicinable therefore, and do cure the same. As for the generation of these dangerous flies, they be ingendred of certaine little grubs or wormes; and most commonly vpon the spongyous bals which wee see to grow vpon the stalke or stem of the Eglantine: but surely the greatest plenty of them breed in an Ash tree. As for others that come of a white Rose bush, they are not so vehement in operation as the rest: and of them all, those worke most violently which are spotted and of diuers colours, streaked with yellow lines ouerthwart their wings, and besides are very plumpe and fat. The smaller sort, which also are broad and hairy, are nothing so powerful and speedy in their operation. But the worst of all, and least effectuall in physicke, be those which H are of one entire colour, and leane withall. Now for the manner of preparing and ordering of are of one entire colour, and leane withall. Now for the manner of preparing and ordering of them for physical vses; they would be gotten when Roses be fully out: heaped vp together in one masse, and so bestowed in an arthen pot not pitched, vernished or nealed, the mouth wherof is close stopped with a linnen cloath: then are they to be hanged vp with the mouth of the said pot downward ouer some vinegre boiling with salt, vntill such time as by the fume or vapour thereof steeming through the said linnen clout, they be choked and killed: and afterward they be layd vp and referred for vse. Of a causticke and burning nature they are, in so much as they will raise blisters, yea and leaue an eschar vpon the exulcerat place.

Of the like force be the wormes Pityocampæ, breeding in pitch trees: so is the venomous flie or beetle called Buprestis: and after the same manner be they prepared as the Cantharides: I

All the sort of them in generall be most effectuall to kill the leprosie, and ilfaured terrars called Lichenes. Besides, they haue the name to prouoke womens monethly termes, and vrine, which is the cause that Hippocrates prescribed them to be vsed in a dropsie. To conclude with these Cantharides, I thinke it not amisse to note, That Cato synnamed *Vticensis, was accused and endited for selling of poison; because in the generall portsale of the kings goods, amongst other moueables, he held Cantharides at threescore sesterces a pound, and made so much money of them.

CHAP. V.

¶ Of the Ostrich greace, and of a mad Dog: of Lizards, Geese, Dones, and Weazils, with the medicines that they do yield.

I Cannot chuse but relate also by the way, vpon this occasion ministred, that at the same time Ostrich greace was sold for *eighty Sesterces the pound: and in truth it is much better for any vse it shall be put vnto, than goose greace.

As touching diuers sorts of venomous hony I haue written already: but for to repress the poison thereof, it is good to vse other hony wherein a number of bees haue been forced to die: and such hony so prepared and taken in wine, is a soueraign remedie for all those accidents that may come by eating or surfeiting vpon fish.

For the biting of a mad dog take the ashes of a dogs head burnt, and apply it to the sore, it wil saue the Patient from that symptome of being afraid of water, which is incident to such as be so bitten. [And now by occasion of speech know thus much once for all, That all things which are to be calcined require one and the same manner of burning, that is to say, within a new earthen pot neuer occupied before, well luted all ouer with strong cley, and so set into an ouen or furnace vntill such time as the contents be calcined.] The said ashes made of a Dogs head is singular good likewise to be drunke in the same case: wherfore some haue giuen counsell to eat also a dogs head. Others seeke after the wormes that breed in the carcase of a dead dog, and hang the same fast about the necke or arme of the party that is bitten: or els they lap within a cloath some of the menstrual blood of a woman, and put it vnder the cup or pots bottom out of which the patient drinketh. And there be some againe who burn the haire of the same mad dogs taile, and conueigh the ashes handsomely in some tent of lint into the wound. Moreover it is commonly said, That as many as haue a Dogges head about them, no other Dogges will come neere to do them any harme. In like manner, if a man carry a dogs tongue in his Shooe vnder his great toe, there will no Dogges bay or barke at him. If hee haue

* For that he killed himself at Vtica.

* Some reade thirty.

about him a weazils taile, which hath bene let goe againe after it was cut away. There is to be found under the tongue of a mad dog, a certaine slimy and grosse spittle, which being giuen in drinks to those that are bitten, keep them from the feare of water, which symptome the Greeks call Hydrophobia: but the best and most soueraign remedie of all other, is the liver of the same dog that in his madnesse bit any body, eaten raw, if possibly it may be; if not, yet sodden or boiled any way; or else to cause the Patient for to sup the broth that is made of the same dogs flesh. There is a certaine little worme in dogs tongues, called by a Greeke name Lytta, which if it be taken out when they be young whelpes, they will never after proue mad, nor lose their appetite to meat. The same worme giuen to such as are bitten with a mad dog, preferueth them from beeing mad; but with this charge, that before they take the same, it must be carried three times about the fire. Also the braines of a Cocke, Capon, or Hen, is singular good against the biting of a mad dog: but if one haue eaten the same, the vertue thereof indureth but for that yeare onely, and no longer. It is commonly said, that the crest or combe of a Cocke well bruised and stamped, and so laid in manner of a cataplasme to the place bitten, is very effectuall to cure it: as also the grease of a goose incorporate with honey. Furthermore, some there be who vse to salt the flesh of dogs which haue bin mad, and so keepe it to giue in meat vnto those who chance to be bitten by others. There be, who take some young whelpes, male or female according to the sex of dog or bitch that hath bitten any one, and presently drowne them in water, causing the Patient to eat their liuers raw. The yellow or reddish dounge of a cock or a hen, dissolved in vineger, and applied to the sore, is singular good. The ashes also of an hardy shrewes taile, provided alwaies, that the shrew were let goe aliuie, so soone as the was curt-tailed. Moreover, a piece of clay taken from a swallows nest, made into a liniment with vineger: or the ashes of young swallows newly hatched and burnt: the old skin also or slough which a snake vseth to cast off in the spring time, stamped with a male crab-fish, and with wine brought into a Cataplasme, be all especiall remedies for the biting of a mad dog. As for the skinn or spoile of a snake, if it be put alone in a chist, presse or wardrobe, among cloaths, it will kil the moth. But to come againe vnto a mad dog: his poison is so strong, that whosoever do but tread vpon his vrine, especially if they have any sore or vlcere about them, they shall sensibly feelee hurt thereby. Now what remedie is there for such? None better than the dunge of a caple, well wet and tempered with vineger, and the same laid very hot within a fig to the foresaid sore. These may seeme to some men strange things & monstrous; but lesse will they wonder hereat, when they shall heare and consider that a stone which a *dog hath taken vp with his mouth and bitten, wil cause debate and diffention in the company where it is: and yet this is held for a certain truth, in so much as it is growne into a common prouerbe and by-word, when we perceiue those that dwell in one house together to be euermore jarring and at variance one with another, to say, You haue a dog-bitten stone here among you. Again, whosoever maketh water in the same place where a dog hath newly pissed, so as both vrines be mingled together, shall immediatly find a coldnesse and astonishment in his loines, as folke say.

That kinde of Lizard, which of some Greeks is called Seps, of others Chalidicum, hath a venomous tooth: howbeit, the same worme or serpent taken in drinke, cureth the bit which it selfe inflicted.

If wilde Weazils haue empoisoned any body, let the patient take a large draught of the broth of an old Cocke, he shall finde it to bee a very soueraign remedie therefore: but about all, it is most effectuall against the poison of the herbe Aconitum; hut then it must be giuen with a litle salt among.

Against the poison of venomous Tadstoles and hurtfull Mushromes, hens dounge (I meane that part alone which is white) sodden with *Hyssope or bonied wine, is singular good, for it represseth and killeth the malice thereof. And the same otherwise keepeth downe ventosities, and stuffing of the stomacke, ready to choke one. Whereat I cannot chuse but maruell much, considering that if any other living creatures do tast never so little of the said dunge (but man or woman onely) they shall be exceedingly vexed with winde in the belly, and other grieuous wrings and torments.

The Sea-hare is knowne to be venomous; but goose blood taken with an equall quantity of oile is a soueraign counterpoison for it. Of this blood, incorporat with the best Terra Sigillata of the Island Lemnos, and the iuice of the S. Mary thistle called Bedegnar, there be excellent

* For the manner of a dog is to be angry with the stone that is thrown at him, with-out regard of the party that slung it: whereupon grew the Prouerbe in Greeke, *ὁ κυνὸς ὀργίζεται ἀπὸ τοῦ λίθου*.

* In hyssope decocted, but must be some reade, *cu hyssopo decoctum in mulle*. i. Boiled with tried grease of sheeps wool, in bonied wine.

trochisks made weighing siue drams apeece, which are vsually kept in a readinesse for to be drinke in three cyaths of water as a counterpoison and countercharme, against all venomous confections and diuellish forceries: for which purpose serueth also a yong sucking Weazill prepared in manner aforesaid. The rennet in a lambs maw likewise, is passing good for any such indirect means wrought by poison or witchcraft: like as the blood of ducks and mallards bred in the realm of Pontus: and therefore their blood is ordinarily kept dry in a thicke masse, and as need requireth is dissolued and giuen in wine: but some think, that the blood of the female duck is better than that of the mallard or drake. Semblably, the gesier of a stork, and the rennet or read of a sheep, is thought to be singular good for any poisons whatsoeuer. The broth or decoction of Coleworts boiled with Rams mutton, hath a peculiar vertue against the Cantharides. Ewes milke also drunke warm, availeth much against all poisons, vlesse it be the venomous flie Buprestis, or the deadly herb Aconitum. The dung of wild quoisits or stockdoves taken in drink, hath a speciall vertue to helpe those that haue drunke quicke-siluer. Finally, the flesh of the ordinary or common house weazill kept in salt, is a present counterpoison against all venome that goeth vnder the name of Toxicum, if one drinke of it the weight of two drams.

CHAP. VI.

¶ Medicines to bring haire againe in places that by some disease are bald: also to rid away nits: for
to rectifie and keepe in order the Eye-lids, and the haire growing thereupon: for to cure the
pearle in the Eye: and generally for all the accidents befalling to the Eyes: last-
ly, for the impostumal kernels behind the eares.

THe naked places in head or beard, are replenished again with haire by a liniment made of the ashes of sheeps dung incorporat in Cyprin oile & hony: also with the ashes of mules or mullets houses, applied with oile of Myrtles. Our countryman and Latine writer *Varro* affirmeth moreouer, That the dung of mice (which he by a proper name calleth * Muscerda) is a convenient medicine for the said infirmity and defect: he attributeth also the same operation to the heads of flies applied fresh to the bald place, if so be the same were before rubbed hard, and in some sort fretted with a figtree leafe. Some vse in this case the bloud of flies: others mingle their ashes with the ashes of paper vsed in old time, or els of nuts, with this proportion, that there be a third part only of the ashes of flies to the rest, and herewith for 10 daies together rub the bare places where the haire is gone. Some there be again, who temper and incorporat together the said ashes of flies with the juice of the Colewort and brest-milk: others take nothing thereto but hony. Certes, a strange thing it is of these flies, which are taken to be as senselesse and witlesse creatures, yea, and of as little capacity and vnderstanding as any other whatsoeuer: and yet at the solemne games and plaies holden euery fifth yeare at Olympia, no sooner is the bull sacrificed there to the Idoll or god of Flies called * Myiodes, but a man shall fee (a wonderfull thing to tell) in infinit thousands of flies depart out of that territory by flights, as it were thicke clouds. But to come again to the foresaid infirmity of haire-shedding: the ashes of the heads, tails, yea and the whole bodies of mice burnt, are very good to make it come again, especially if the haire went off by occasion of some venomous matter or poison: so are the ashes of an vrchin or hedgehog medled with hony: or the skin thereof burnt and applied with tar. As for the head alone of an vrchin consumed into ashes, it is thought so effectual for this purpose, that it will cause haire to grow again vpon a skar: but for the cure of the foresaid defect of haire, called Alopecia, the places ought before the application of those topicke medicines, to be well prepared with the razor, and a sinapisme or rubefacatiue made of mustard-seed, vntill the place look red: howbeit, some chuse rather to take vineger vnto it. Here note by the way, that whatsoever vertue we attribute vnto hedgehogs, the same is more effectual in the porkespine. Moreover, Lizards torried yea and calcined as I haue shewed before, with the root of reeds or canes that be green and new drawn (which that it may burne the better with the Lizards, ought to be sliced small) yeeld ashes, which being incorporat well in oile of myrtles, doe retain the haire and keep it from shedding, if the place be annointed therewith: and the green lizards in this cure and operation be simply the best: but if you would haue this medicine to work more effectually, put thereto salt, Bears grease, and Onions stamped. Some there be, who in ten sextars of old oile seeth ten Greene Lizards, and therewith make a liniment, thinking it sufficient therewith to

led in the ho-
ly Scripture,
Beel-zebub.

A to anoint the place once a moneth, and no oftener. The athers of viper skins doth raise haire quickly againe and make it grow aspe, where it was shed. So doth Hens dung that is fresh and new, if the place be plied with anointing. Take a rauens eggs, put mixe it with the dung afore said in a vessell of brasle, and therewith rub and anoint the head (so that it were shaven before) it will cause the new haire to come vp blacke: but untill this vnguent be dried vpon the head, the patient must hold oile in his mouth, for feare lest the teeth also by this means turn blacke: and withall, this ought to be done in the shade or within house, and the foresaid ointment not to be washed off in 4 daies space. Others in this cure, use the blood and brains of a rauē, together with some thick and deep coloured wine. Some boile a rauē thoroughly, untill the flesh be parted from the bones, and in the dead time of the night when euery body is found asleepe, put **B** him vp into some pot or vessell of lead. There be again, who hauing prepared and rubified the skin with salaitre, do anoint the place where the haire is gone or groweth thin, with a liniment made of Cantharides and tar panned & incorporat together. Now forasmuch as Cantharides be of a caustick quality and corrosiue, great heed would be taken that they doe not fret and eat into the skin over deep. Now when the place is thus prepared, and lightly exulcerat, they ordain to apply thereto a liniment made of mice heads and their galls, incorporat and wrought together with their dung, putting thereto Ellebore and Pepper.

The head many times is pestered with nits, but for to rid them away, there is not a better thing than dogs greafe. Some for this purpose make a dish of meat with suakes, dressing and ordering them as eels, and so eat them, or els they take their slough which they slip off in the spring time, and drinke the same.

Otherwhiles there be certaine branny scales called dandruffe, which over-spread the head to
 cleanse it from this scurfe and deformity, it were not amisse to annoint the head with sheeps gal
 tempered with fullers *scouring clay, and let it remaine on the head vntill it be drie.

For the painfull head-ache, it is commonly thought, that the heads of naked snails (I meane those that be found without shels, and are vnsperfect yet and not fully made) plucked from their bodies are a singular remedy to be hung about the neck or tied to the head; with this charge, that there be taken forth of their heads first, a certain stony hard substance, which is made flat and broad like a thin grauell stone: and it the said snails be but yong and small, they vse to stamp them, and in manner of a frontall apply them to the forehead. In like manner, the bones of a Vultures head, whether it be the common Geire, or that which the Greeks call *Aegyptios*, hanged about the neck or fastned to the arms: also the brains of the said soule tempered with the oile of Cedar-rosin, driueth away the head-ache, if either the head be thoroughly annoyned, or the nostrils within forth, therewith. The brains of a crow or of an owle, being foddened and eaten wil do as much. Some think it good in this case, to lap the head and forehead with the feathers or plume pluckt from about the neck of a cocke, or with his crested combe, but it must bee of such a cock as hath bin close shut up as a prisoner and kept from meat and drinke a whole day and a night; but take this withall, the patient who is troubled with the head-ach, must fast as long from all meat and drink. The ashes of a rat or weazill applied to the forehead, ease the pain, so doth a twig or stick taken from a purtocks nest, laid under the pillow of the sick person;

pinion, because that bloud is hotter, and therefore by so much the better. But when the eies bee dressed with this bloud, it would not be forgotten, that there be a thin soldier boiled in honey, laid aloft, yea, and a lock of greafe wooll vpon it, which had bin soaked either in oile or wine. The bloud of the fouls abouenamed helpeth those that cannot see toward a night: the liuer al- so of a sheep doth the same: but if the said sheepe be of a russet or browne colour, the medicine will do the better: for as I obserued before in Goats, those that carry such a coat, bee alwaies e- steemed best. Many giue counsell to foment and wash the eies with the decoction of the said liuer: and if they be in pain and swollen withall, they aduise to annoint them with the marrow of a Mutton. They promise also, That the ashes of frich owles eyes put into a collyrie, will e- rise the sight. Indeed the dung of Turtles consumeth the white pearles in the eyes, so doth the ashes of shell-snailles or hoddidods: as also the metting of the kestrell Cenchris, which the Greeke writers will haue to be a kind of Hawke. As for the spot or pearle in the eie called Ar- gema, it may be cured by all those medicines aboue rehearsed, so that they be applied thereto with hony. But the best hony simply for the eies, is that wherein a number of Bees were forced to die. Whosoever hath eaten a young storke out of the nest, he shall (they say) continue many yeares together, and neuer be troubled with inflamed or bleared eies: like as they that carrie a- bout them a Dragons head. It is said moreover, That the Dragons greafe incorporat in honey and old oile, dispatcheth and scattereth the filmes and webs that trouble the sight, if they bee taken betimes before they be grown too thicke. Some there be who at the full of a Moone put our the eies of yong swallows, marking the time when they haue recovered their sight againe: for then they pluck off their heads and burne them to ashes, which being tempered with hony, they vse for to cleare their owne sight, to ease the pains, and discusse the blearednesse of eies, yea and to heale them, if they haue caught a blow or ruff. As for Lizards, they vse to prepare them many and sundry waies for the infirmities incident to the eies. Some take the green Lizard and put her close within a new earthen pot that neuer was occupied, and therewith 9 of those little stones which the Greeks call * Cinædia, (and these are vsually applied vnto the shere for the swelling glandules and tumors that many times rise there) marking euery one of them respec- tively by themselves: which being done, they take forth of the pot euery day one; & when the ninth day is come, they let out the Lizard, and then they keepe the said stones thus ordered and prepared, as foueraigne remedies to allay the pain and griefe of the eies. Others get a green Lizard and put out her eies, and bestow her in a glasse with a bed of earth vnder her in the bot- tom thereof, and withall, inclose within the said glasse certaine rings, either of solid yron or masse gold: and so soon as they perceine through the glasse, that the Lizard hath recovered her sight againe, they let her forth: but the said rings they keep with great care and regard, as a spe- ciall meanes for to helpe any bleared eies. There be moreover who vse the ashes of a Lizards head in stead of Stribium or Antimonium, for to make smooth the roughnesse of the eye-lids. Some hunt after green Lizards with long neckes, which breed in sandy and gravelly grounds, and when they be gotten, burne them to ashes, with which they vse to repress the flux of wa- terish humors which begin to fall into the eies, yea, and therewith consume the red pearls grow- ing therein. It is said moreover, That if a Weasels eies be pecked or plucked out of the head, they will come againe, and shew will recouer her sight: and therefore they practise the like with rings and them together, as I obserued before in Lizards. Furthermore, it is said, That as many as carry about them the right eie of a serpent tied vnto any part, it is very good for to stay the violent rheumes that haue taken to the eies, but then in any wise the serpent must be let goe a- liue after that she hath lost her eie. As touching those eies which be euermore weeping, and do stand full of water continually, the ashes of the star-lizards head called Strellio, together with Antimonium, helpeth them exceeding much. The copweb which the common Spider ma- keth, that vseth to catch flies; but especially that which shee hath wouen for her nest or hole wherein she lieth her selfe, is foueraigne good for the flux of humours into the eyes, if the same be applied all ouer the forehead, so as it meet with the temples on both sides: but wot you what, none must haue the doing hereof, either to get the said copwebs, or to lay it vnto the place, but a young lad not as yet vndergrowne, nor foueteene yeares of age: neither must he be of the partie whom hee cureth, in three daies after: ne yet during the space of those three dayes must either hee or his Patient touch the ground with their bare feet: VVhich cir- cumstances and ceremonies being duely obserued, it is wonderfull to see what a cure will follow

* Because they
be found in the
sh called Cin-
ædia.

A follow thereupon. Furthermore, it is said, That these white spiders with the long and slender legs, being punned and incorporat in old oile, be singular for to consume the white pearle in the eie, if the same be dressed with that composition. Also those spiders that worke ordinarily vn- der rooves, rafters, and boarded floores of houses, and weaue the thickest webs, if any of them be inwrapped within a piece of cloth and kept bound to the eies or forehead, do refraine for euer the said rheumes and catarrhes that haue found a way to the eies. The greene Beetle hath a property naturally to quicken their sight who do but behold them: and therefore these lapida- ries and cutters or grauers in precious stones, if they may haue an eie of them once & looke vp- on them, take no more care for their eie-sight, how it should serue their turnes when they are at their worke. Thus much of eies.

B As concerning the ears and the infirmities incident vn them, there is not a better thing to mundifie and cleanse them than a sheepes gall with hony: and a bitches milke if it be dropped into them, easeth their paine. Dogs greafe tempered with Wormewood and old oile, helpeth those that be hard of hearing, so doth Goose greafe: howbeit, some put thereto the juice of an Onion & Garlick, of each a like quantity. In this case also there is much vse of Ants eggs alone without any thing els: for as little and silly a creature as it is, yet she is not without some medi- cinable vertues: in so much, as Beares, when they feele themselves sickish or not well at ease, cure themselves with eating Pismires. As for the manner of preparing as well the greafe of a goose as of all other fouls, this it is: first the fat ought to be clenfed and rid from all the skins, veines, and strings that are among it, and then to be laid abroad to the Sun in an earthen pan, covered ouer with a new lid of earth likewise which had neuer bin vsed: this done, the foresaid pan must be fet ouer seething water, that the said greafe may melt: and then it is to passe through linnen bags that it may be tried from all the grosse cratchens: and so they put it vp in a new earthen pot, & set it in some cold place against the time that it is to be vsed: howbeit, this is wel known, That if some hony be put thereto, it is lesse subject to corruption or putrifaction. Moreover, the ashes of burnt mice incorporat in hony, or els sodden with oile of Roses, allaieth the pain in the eares if it be intilled into them. But in case some earwig or such like vermine be crept into the eares, there is not the like means to cause it to come forth again, as is the gall of mice dissolved in vineger & dropped into them. Also when water is gotten into the head by the eares, Goose greafe, together with the juice of an Onion, is singular good to draw it out. Moreover, there is a notable medicine made of dormice for all infirmities of the ears, which otherwise could not be cured, but were giuen ouer by all Physitians: for the making whereof, they take a dormouse and flea it, and after the guts and entrails be taken forth, they seeth the same with hony in a new ear- then vessell. Howbeit, some Physitians there bee who thinke it better to boile the same with Spikenard, vntill a third part be consumed, and so reserue it for their vse: and whensoever after there is need of it, the manner is to infuse the said liquour warme into the eare by a pipe or in- strument called an Otenchyte. This is knowne by experience to heale all the accidents of the eares, though otherwise incurable. Also the decoction of earth-worms boiled with Goose greafe is singular good likewise to be poured into the eares. But if the eares be exulcerat, broken out, and do run matter, the red worms ingendred about trees stamped in a mortar with oile, are very pro- per to heale the same, if they be applied thereto. Lizards that haue hanged vp a long time a dry- ing with their mouths downward, if they be punned with salt, serue to heale the eares that haue caught some hurt either by bruise, crush, or stripe. But aboue all other, the Lizards that haue brown spots vpon them like rusty yron, and are straked along the taile with lines, are most effe- ctual for these infirmities. As touching the Wool-beads or Caterpillers, which some cal Mil- lepedæ, others, Multipedæ or Centipedæ, which are a kind of earth-wormes keeping vpon the ground, all hairy, hauing many feet, & courbing arch wise as they creep, and if you touch them, they wil gather round together: the Greekes, some call them * Oniscos, others Tylos: these * worms (I say) are very effectual to assuage the pain of the eares, if they be sodden with the juice of Porret in the rind of a pomgranat: some put thereto oile of Roses, & giue aduise to poure this medicine into the contrary eare that is not pained. As for that worm or vermin which riseth not archwise with some part of the body in creeping, the Greekes, some cal it Seps, others Scolopen- dra; which though it be lesse than the former described, yet mischievous enough & venomous, The snails that carry shels vpon their backe, and are vsually dressed for good meat, applied with Myrthe or the powder of Frankincense, are very good for the eares that be crackt: so are the lit-

tle and broad shailles brought into the forme of a liniment with hony, and laid too according- G
ly. The sloughs or skins that serpents cast, calcined upon a tile or porthard red hot, and so redu-
ced into ashes and incorporat with hony, are very medicinale for all the accidents of the eares,
if the same be dropped into them; but principally when they stink or yeeld from them a strong
favour; but if they be full of purulent matter, and run withall, it were better to mingle the same
with vinegar in stead of hony: but best of all with the gall of a Goat, a Boeuf, or a sea-Tortois.
The foresaid sloughs or skins if they be above one yere old, or have caught much wet by raine
and water, haue lost their vertue, & do no good, as some are of opinion. Moreover, the bloudie
humour that commeth from a spider, either tempered with the oile of Roses, or els alone by it
selfe vpon a locke of wooll, or with a little Saffron, is very good for the eares: so is the Cricket
digged vp and applied to the place earth and all where it lay. *Nigidius* attributeth many
perties to this poore creature, and esteemeth it not a little; but the Magitians much more a fair
deale: and why so? Forsooth because it goeth as it were reculing backward, it pierceth and bo-
reth an hole into the ground, and neuer ceaseth all night long to creake very shrill. The manner
of hunting and catching them is this. They take a flie and tie it about the midst at the end of
a long haire of ones head, and so put the said flie into the mouth of the Crickets hole: but first
they blow the dust away with their mouth, for feare lest the flie should hold her selfe therein:
the Cricket spies the silly flie. sealeth vp in her presently and clasperh her round, and so they
are both drawne forth together by the said haire. The inner skin of a Hens giser, which the
cook vseth to cast away, if it be kept and dried, and so beaten to pouder and mingled with wine,
is good to be dropped or poured hot into the eares that runne with matter: so is the fat also I
of an Hen. There is a certaine kind of fattinesse to be found in the flie or insect called * Blatta,
when the head is plucked off, which if it be punned & mixed with oile of Roses, is (as they say)
wonderfull good for the eares: but the wooll wherein this medicine is inwrapped, and which is
put into the eares, must not long tarry there, but within a little while be drawne forth againe;
for the said fat will verie soone get life and proue a grub or little worm. Somewriters there be
who affirm, That two or three of these flies called Blattæ sodden in oile, make a soueraigne me-
dicine to cure the eares: and that if they be stamped and spread upon a linnen rag and so appli-
ed, they will heale the eares, if they be hurt by any bruise or contusion: Certes this is but a na-
stie and ill favoured vermine, howbeit in regard of the manifold and admirable properties
which naturally it hath, as also of the industrie of our Ancestors in searching out the nature of K
it, I am moved to write thereof at large and to the full in this place. For they have described
many kindes of them. In the first place, some of them be soft and tender, which being sodden
in oile, they haue proued by experience to be of great efficacie in fetching off werts, if they bee
annointed therewith. A second sort there is, which they call Mylœcon, because ordinarily it
haunteth about mills and bake-houses, and there breedeth: these, by the report of *Musa* and
Pyetion two famous Physitians, being bruised (after their heads were gone) and applied to a bo-
dy infected with the leprosie, cured the same perfectly. They of a third kind, besides that they
be otherwise ill favoured enough, carry a lothsome and odious smell with them: they are sharp
rumped and pin buttock also: howbeit, being incorporate with the oile of pitch called Pisse-
leon, they haue healed those vlcers which were thought, *Nunquam sana*, and incurable. Also L
Leon, they haue healed those vlcers which were thought, *Nunquam sana*, and incurable. Also
led the Kings evil: the botches or biles named Pani, wounds, contusions, bruises, morimals,
scabs, and fellons: but then their feet and wings were plucked off and cast away. I make no
doubt or question, but that some of vs are so dainty and fine eared, that our stomacke riseth at
the hearing onely of such medicines: and yet I assure you, *Diodorus* a renowned Physitian, re-
porteth, That he hath giuen these foure flies inwardly with rosin and hony, for the jaundise, and
to those that were so strait winded that they could not draw their breath but sitting vpright.
See what libertie and power ouer vs these Physitians haue, who to practise and trie conclusi-
ons vpon our bodies, may exhibite vnto their Patients what they list, bee it neuer so home-
ly, so it goe vnder the name of a medicine. Howbeit, some of the more ciuile sort, and who M
carried with them a better regard of man-hood and humanitie, thought it better and a more
cleanelly kinde of Physicke, to referue in boxes of horne the ashes of them burnt, for the vses a-
bouenamed. Others also would beat them (after they were dried) into pouder, and minister
them in manner of a clystire vnto those that were * Orthopnoicke and Rheumaticke.
Certes,

* which Pliny
saith for a
kind of Scar-
bees or Beetle.

* Orthopnoici:
Such as cannot
take their
wind but sit-
ting vpright.

A Certes it is well knowne and confessed, that a liniment made of them will draw forth prickles,
thorns, spils, and whatsoeuer sticketh fast within the flesh. Moreover, the honey wherein Bees
were extinct and killed, is soueraigne for the diseases of the eares. As for the impostumes and
swellings arising behinde the eares, called Pacorides, Pigeons dung applied thereunto, either
alone by it selfe, or with barley meale and oar-meale, driueth them backe or keepeth them downe.
Also the liuer or brains of an Owle being resolued in some convenient liquor, and applied ac-
cordingly, cureth the accidents of the lap of the eare, and the foresaid impostumations, so doth
a liniment made of the wormes called Sowes, together with the third part of rosin: and lastly,
the cricquets about rehearsed, either reduced into a liniment, or else bound to, whole as they be,
are good in these cases. Thus much concerning those maladies about specified: it remaineth
B now to proceed vnto other diseases, and the medicinale receipts respectiue vnto them, drawne
either from the same creatures, or els from others of that kinde: whereof I purpose to treat and
discourse in the next booke ensuing.

THE THIRTIETH BOOKE OF THE HISTORIE OF NATVRE,

WRITTEN BY C. PLINIUS

SEC VNDVS.

The Proem.

CHAP. I.

¶ The originall and beginning of Art Magicke. When it first began, and who were the
inventors of it. By whom it was practised and aduanced. Also other
Receipts or medicines drawne from Beasts.

THe folly and vanitie of Art Magicke I haue oftentimes already taxed and confu-
ted sufficiently in my former books, when and wheresoeuer iust occasion and fit
opportunitie was offered; and still my purpose and intention is to discouer and
lay open the abuse thereof in some few points behind. And yet I must needs say
the argument is such as deferueth a large and ample discourse, if there were but
this only to enduce me, That notwithstanding it be of all arts fullest of fraud, de-
ceit, and couenage, yet neuer was there any throughout the whole world either with like credit
professed, or so long time vpheld & maintained. Now if a man consider the thing well, no mar-
nell it is that it hath continued thus in so great request and authoritie: for it is the onely Sci-
ence which seemeth to comprise in it selfe three professions besides, which haue the command
and rule of mans minde about any other whatsoeuer. For to begin withall, no man doubteth
but that Magicke tooke root first and proceeded from physicke, vnder the pretence of main-
taining health, curing and preventing diseases: things plausible to the world crept and insinua-
ted farther into the heart of man, with a deepe conceit of some high and diuine matter therein
more than ordinarie, and in comparifon thereof all other physicke was but basely accounted.
And hauing thus made way and entrance, the better to fortifie it selfe, and to giue a goodly
colour and lustre to those faire and flattering promises of things, which our nature is most
giuen

The nine and twentieth Booke

giuen to hearken after, on goeth the habit also & cloke of religion: a point I may tel you that G
euen in these days holdeth captiuate the spirit of man, and draweth away with it a greater part
of the world, and nothing so much. But not content with this successe and good proceeding, to
gather more strength and win a greater name, the intermingled with medicinale receipts & Re-
ligious ceremonies, the skill of Astrologic and arts Mathematical; presuming vpon this, That
all men by nature are very curious and desirous to know their future fortunes, and what shal be-
tide them hereafter, perswading themselves, that all such foreknowledge depends on the course
and influence of the stars, which giue the truest and most certain light of things to come. Being
thus wholly possessed of men, and hauing their senses and vnderstanding by this meanes fast e-
nough bound with three sure chaines, no maruell if this art grew in proceesse of time to such an
head, that it was and is at this day reputed by most nations of the earth, for the paragon & chief H
of all sciences: insomuch as the mighty kings and monarchs of the Levant are altogether ruled
thereby. And verily there is no question at all, but that in those East parts, and namely in the
realme of Persia, it found first footing, and was inuented and practised there by * Zoroastres, as
all writers in one accord agree. But whether there was but that one Zoroastres, or more afterward
of that name, it is not yet so certainly resolved vpon by all Auhors: for Eudoxus (who held art
Magick to be of all professions philosophical and learned disciplines, the most excellent and
profitable science) hath recorded, that this Zoroastres, to whom is ascribed the inuention thereof,
liued and flourished * 6000 yeares before the death of Plato. And of his minde is Aristotle also.
Howbeit Hermippus, who wrote of that art most exquisitely, and commented vpon the Poeme of
Zoroastres, containing * a hundred thousand verses twenty times told, of his making; and made I
besides a Repertorie or Index to euery booke of the said Poësie: this Hermippus (I say) reports,
That one Azonaces taught Zoroastres Art Magick; which master of his liued 5000 yeares before
the war of Troy. Certes I cannot chuse but maruell much, first, That this Science and the me-
moriall thereof should so long continue, and the Commentaries treating of it not miscary and
be lost all the while, during such a world of years: considering besides, that neither it was ordi-
narily practised and continued by tradition from age to age; nor the successors in that facul-
tie were professors of the greatest name, and renowned by any writings. For what one is there
of those who are named for the only Magicians in their time, to wit, Apusormus & Zaratus Medi-
ans, Marmaridius of Babylon, Hippocemus the Arabian, and Zarmocenidas of Assyria. For bookes K
haue we none extant of their writing, nor any monuments which beare record and giue testimo-
nie of such clerks. But the greatest wonder of all is this, that Homer the Poet in his Ilias (a poem
composed purposely of the Trojan war) hath not so much as one word of Magick; and yet in
his Odyssey, where he discourseth of the aduentures, trauels, & fortunes of prince Phylles, such
a do and stirre there is with it, as if the whole work consisted of nothing else but magicke. For
what is meant by the variable transformations of * Proteus, or by the songs of the * Mermaids,
whereof he writeth so much; but that the one was a great forcerer, the other famous witches or
Inchantresses. As for that which he relateth of lady Circe, how shee wrought her feats by con-
juration only, and raising vp infernal spirits; surely it fauoreth of art Magick and nothing else. I
must much also, that after Homers time there is no writer maketh mention how this art arriued L
at Telsemus, a city [in the marches of Lycia] wholly addicted to religion, & so famous for the
colledge of priests and soothsayers there: or at what time it made a voiage and passed ouer into
Thessaly; where it reigned to rise, and was so vsually practised in euery towne & city, that with
vs here in these parts of the world it tooke the denomination of * that countrey, and retained
the same a long time, notwithstanding that the word Magicke indeed was appropriate vnto a
strange and far remote Nation. And verily, considering how about the time of the war and de-
struction of Troy, there was no other physick in vse but that which Chiron the Surgeon practi-
sed, and that during the heat and bloudy wars only; it seemeth very strange and wonderfull to
me, That the nation of Thessaly, and the native country of Achilles [and Chiron] should become
so famous for magicke: insomuch as Menander also (a Poet by all mens iudgement so framed by M
nature for deep learning and excellent literature, as that he had no concurrent in his time that
came neere vnto him) entituled one of his Comedies, Thessalica; wherein he deciphered and
depainted liuely vnto vs the whole order and manner of witches, with all their charmes and in-
cantations, by the vertue wherof they would seem to pull the Moon down from heauen. I would

ssalians.

A haue thought that Oshpeus soon after and in the age next ensuing, had brought in first these su-
perstitious ceremonies, by reason of the propinquity and neighborhood of that region, and that
he proceeded therewith to the aduancement of physick, but for one thing which plucketh me
back, namely, that Thrace his naturall country and the place of his birth, was altogether igno-
rant of Magick, and knew not what it meant. But as far as euer I could finde, the first that is re-
corded to haue commented and written of this art, was Oshpeus, who accompanied Xerxes K. of
the Persians, in that voiage and expedition which (in warlike manner) he made into Greece: and
to say a truth, he it was that sowed the seeds of this monstrous Art, and infected therewith by
the way, all parts of the world wherefoeuer he went and came. Howbeit, those Authors, and hi-
storographers who haue searched more neerly into the matter, let down another Zoroastres, born
in the Isle Proconnesus, who wrote somewhat before Oshpeus, of that argument: neuertheless, B
this is held for certain; That Oshpeus was the man, who most of all other for the Greeke nations
not onely in a hor desire, but also in a madding fit and enraged as it were after Magick. And yet
I must needs say that I haue obserued, that not only at first, but also from time to time, the grea-
test name that went of learned men and great philosophers, for their singular skill and profound
knowledge, arose from the opinion that was of their insight in this Science. Certain it is, that
Pythagoras, Empedocles, Democritus, and Plato, were so far in loue therewith, that for to attaine the
knowledge thereof, they vndertooke many voiajes and journies ouer sea and land, as exiled and
banished persons, wandering from place to place, more like trauellers than students; and being
returned againe into their owne countries, this Art they blazed abroad and highly praised, this
they held as a secret and diuine mysterie. As for Democritus, he raised a great name of Apolloni-
ces Captidones, and Dardanus of Phoenicia, as well by the Books of Dardanus his master (which he
fetcht from out of his sepulchre where they were bestowed) as also by publishing commen-
taries of his owne, which were extracts and draughts out of those authors and their writings;
which afterwards, receiued and learned by others, so passed from hand to hand, and were so deep-
ly ingrauen and imprinted in the minds and memories of men, that I assure you I wonder at no-
thing in the world so much, for so full they are of lyes, & so little or no truth, godlineffe, and ho-
nesty is contained in them, that men of iudgement and vnderstanding who approue and esteem
his other Books of Philosophie, will not beleeeve that these workes were of Democritus his ma-
king: howbeit, this is but a vaine conceit and persuation of theirs; for well it is knowne & con-
fessed, that Democritus led away an infinite number of people by this means, & no man so much;
filling their heads with many faire promises, and the sweet impression thereof rauished their
spirits after this Art. Moreouer, there is yet one point more, whereat I wonder as much as at any
other; to wit, that these two professions (Physicke I mean and Magick) flourished both together
in one age, and shewed themselves in their greatest glory, which was about the Peloponnefiack
war in Greece, 300 yeares after the foundation of our citie of Rome; at what time as Hippocrates
professed the one, and Democritus for his part published the other. Now there is another faction
(as it were) of Magicians, which tooke the first foundation from Moyses, * Iannes, and Iotapes,
Iewes; but many thousands of yeares after Zoroastres: and yet the * Cyprian Magicke is later
than so by as many yeares. But to come againe vnto our Magicke aboue said: there was a second
Oshpeus in the daies of K. Alexander the Great, who (by reason that he attended vpon him in his
train, during his journies and voiajes that he made) was himself in great reputation abroad, and
by meanes thereof gaue no small credit and authority to his profession; for that hee had, op-
portunity thereby (as no man need to doubt) to trauell and compass the globe of the earth, and
so to spread and diuylge this learning in all parts. And verily, that this doctrine hath bin here-
tofore receiued in some nations of Italy, it appeareth as well by good euidences and records ex-
tant at this day in the body of our Law written in the 12 Tables, as by other arguments and tes-
timonies which I haue alledged in the former Booke. Certes, in the 657 yeare after the foun-
dation of Rome citie, and not before (which fell out to be when Cn. Cornelius Lepidus and P. Li-
cinius Crassus were Consuls) there passed a decree and act of the Senat, forbidding expressly the
killing of mankind for sacrifice: whereby we may evidently see, that vntill this inhibition or
restraint came forth, our progenitors and ancestors were giuen to those inhumane and mon-
strous sacrifices. No question there is verily, but that this Art of Magicke was professed in
France, and continued vntill our daies: for no longer is it agoe than since the time of Tiberius
Cesar, that their Druidæ (the Priests and Wisemen of France) were by his authority put down,
K k
together

* It should seeme

together with all the pack of such Physitians, prophets, & wizards. But what should I discourse any longer in this wise, of that Art which hath passed ouer the wide ocean also, & gone as far as any land is to be seene, even to the utmost bounds of the earth; and beyond which, there is nothing to be discovered but a vast prospect of Aire and Water. And verily in Brittain at this day it is highly honored, where the people are so wholly deuoted vnto it, with all reuerence and religious obseruation of ceremonies that a man would think, the Persians first learned all their Magick from *them. See how this Art and the practise thereof is spread ouer the face of the whole earth! and how *those nations were conformable enough to the rest of the world in giuing entertainment thereto, who in all other respects are far different & diuided from them, yea and in manner altogether vnknowne to them. In which regard, the benefit is inestimable that the world hath received by the great providence of our Romanes, who haue abolished these monstrous and abhominable Arts, which vnder the shew of religion, murthered men for sacrifices to please the gods; and vnder the colour of Physicke, prescribed the flesh to be eaten as most wholesome meat.

CHAP. II.

¶ The sundry kinds of Magicke. The execrable acts of Nero: and the detestation of Magicians.

Magicke may be practised after diuers sorts, according as *Osphanes* hath set downe in writing: for it worketh by the means of (1) Water, (2) Globes or Balls, (3) Aire, (4) Starres, (5) Fire-lights, (6) Basons, and (7) Axes: yea, and many other means there bee, that promise the foreknowledge of things to come: besides the raising vp and conjuring of ghosts departed, the conference also with Familiars and spirits infernall. And all these were found out in our daies, to be no better than vanities & false illusions, and that by the Emperor *Nero*: and yet was he neuer more addicted to play vpon the cythern, nor took greater pleasure to hear & sing tragicall songs, than to study art Magicke: and no maruell if he were giuen to such strange courses, hauing wealth & world at wil; and his fortunes besides attended vpon & accompanied with many deep corruptions of the mind. But amid those manifold vices whereunto he had betaken and sold himselfe, a principall desire he had, to haue the gods (forsooth) and familiar spirits at his command; thinking that if he could haue attained once to that, hee had then climbed vp to the highest point and pitch of magnanimity. Neuer was there man that studied harder, and followed any Art more earnestly, than he did Magicke. Riches he had enough vnder his hands, and power he wanted not to execute what he would, his wit was quicke and pregnant, to apprehend and learn any thing, ouer and besides other means that he practised to bring about this desseine of his, which were so intollerable, that the world could not indure them: and yet he gaue it ouer in the end without effect: an vndoubted & peremptory argument to conuince the vanity of this Art, when such an one as *Nero* rejected it. But would to God he had conferred with familiars & spirits, yea & taken counsel of all the diuels in hell, for to be resolu'd of those suspitions which were gotten into his head, rather than giuen commission as he did to the professed bawds and common harlots in stinking stewes and brothell houses, for to make inquisition from house to house after those whom he had in ieiouise. Certes, no bloudy and detestable sacrifices (how inhumane and barbarous soeuer) he could haue performed, but they had bene far more easie and tollerable, than those cruel imaginations which he conceived, and wherupon he murdered most piteously so many good citizens, & filled Rome with their restless ghosts. But to return again to Art Magicke, which *Nero* would so faine haue learned: what might be the reason that he could not reach vnto it? Surely these Magicians are not without their shifts & meanes of euasion to saue the credit of their art, if haply they misse and come short at any time of their purpose: for otherwhiles they beare vs in hand, that ghosts and spirits will not appeare, nor yeeld any seruice to those persons who are * freckled & full of pimples: and haply * *Nero* the Emperor was such an one. As for his lims otherwise, he had them all, & found they were: besides, the set daies and times fit for this practise, and prescribed by Magicians, he might chuse at his good will & pleasure. Moreover, an easie matter it was for him to meet with heep, cole black, & such as had not a speck of white or any other colour, for him (I say) who when he list could sacrifice men, and took greatest delight in those sacrifices: furthermore, he had about him *Tyridates*, the K. of Armenia, a great Magitian, to giue him instructions. This prince *Tyridates* being vanquished and

* As it appeareth by our old English Chronicles, which write of *K. Aribur*, the knights of the round table, and *Merlin* the prophet or magician. * No doubt hee meaneth England, Scotland, & Ireland, which seemed to be separt from the rest of the world, where, in old time Magicke bare a great sway, and witches still swarm too much. (1) Hydromantia. (2) Spharomantia. (3) Aeromantia. (4) Astrologia. (5) Pyromantia. (6) Lecanomantia. (7) Animomantia.

* Lentiginosis. * *Suetonius* in *Nero*: *vone: corpora sunt maculosa & fada.* 3. His skin was full of little spots.

A dued by the Romane captains vnder *Nero*, and forced by their capitulations to present himselfe personally at Rome for to do homage vnto the Emperour; travelled thither all the way by land (which was a fore charge to the countries & prouinces through which he passed, bringing with him as he did the whole pompe and train for the triumph ouer Armenia and himselfe) & came vnto *Cesar*. And why would not this *Tyridates* passe the seas and saile ouer into Italy, the nearest and most expedit way? Forsooth, so precise he was, that he made a scruple, and thought it vnlawful (as all magicians do) either to spit into the sea, or otherwise to discharge into it the necessary excrements that passe from mans body, thereby to pollute and defile that Element. Many other magicians he brought with him in his traine. He instructed *Nero* in the principles of Magicke, yea and admitted him to their sacred feasts, and solemne suppers, and all to enter him into that profession: but it would not be: for albeit *Nero* enthronized and entailed *Tyridates* in his kingdom, and gaue him his royalties againe, all would not serue; for neuer could he receiue at his hands by way of remuneration and recompence, the skill of this Science. And therefore we may be fully assured and boldly conclude, That it is a detestable and abhominable Art, grounded on no certaine rules, full of lies and vanities, howsoeuer it carry some shew or shadow rather of veritie: and to say a truth, that certitude which it hath in effecting any thing, proceedeth rather from the diuellish cast of poisoning practised therewith, than from the Art it selfe of Magicke. But what needs any man to seek & hearken after the lies which the magicians in old time haue let flie and sent abroad? When I my selfe in my youth haue seen and heard *Apion* (that great and famous Grammarian) tell strange tales of the herbe *Cynocephalia*, which the Egyptians call *Cyrites*, and namely that it hath a diuine and heavenly vertue, and was a singular preferuative against all poysons, charmes, and enchantments; but whosoever plucked or drew it out of the ground (saith he) could not escape present death. The same *Apion* reported in my hearing, that he hath conjured and raised vp spirits, to enquire and learne of *Homer*, what countryman borne he was; and from what parents descended? many hee durst not report what answer was made againe, either vnto him or them.

CHAP. III.

¶ Of Mould-warps: and of many other medicines taken from sundry beasts, which are in their kinde either tame or wilde: and the same medicines digested according to diseases as they orderly follow.

One speciall argument this may be, to prooue the follie and vanitie of magicians, because of all other liuing creatures, they do admire & set greatest store by these wants or moulds, which Nature seemeth to haue condemned to perpetuall blindness and prison, shutting them vp as it were euermore in a dark dungeon, or keeping them rather vnder the earth, like as they were buried and enterr'd. And yet for all this, these Wise men giue more beleefe to those signes which they spie in their bowels and entrails when they be opened, than to the inwards of any beast whatsoever. This opinion moreouer they haue of a mould-warpe, that there is not a creature more capable of religion, and fitter to be employed in sacrifice and diuine seruice, than it may they beth not to auouch & warrant, That whosoever swallowes down all whole the heart of a moule fresh killed, whiles it is yet warme and panting with life in it, shall haue the gift of diuination, and foretell the euent and issue of any businesse in hand. Moreover, they affirm, that the tooth of a moule-warpe taken out of her head whiles shee is aliue, is singular to allay the tooth-ach, if it be hanged about the necke, or tied to any part of the body. They talke of many other wonders wrought by this poore creature, which I purpose to deliuer as occasion shall be offered, in place conuenient. And yet when they haue all said that they can of them, that which carrieth the greatest likelihood and probability, is this, That they should be good against the biting of these musets or hardishrews, for as you haue heard me say before, the very earth that is pressed down with the wheels in a cart-track, is proper for that purpose. But to leaue these moulds and to follow on still with this maladie of tooth-ach, the said magicians tel vs a medicine made of the ashes of a dogs head (dying of madnesse) that it should be passing good therefore, if it be mixed with the oile *Cyprinum*, & so dropped into the ear on the pained side: howbeit this care would be had, That the said dogs head haue no flesh at all sticking to the scalp or scull, when it is burned and calcined. They say moreouer, that the greatest cie-tooth of a dog growing on the

* *Ad Scitandum Homerum.*

left side of his head serues well for this grievance, if the tooth that is in pain be scarrified round about therewith. Also a bone growing out of the ridge or chine of a Dragon, will do as much; or that of the serpent called Enhydri. Now are these serpents white of colour, and held al to be the male. The greatest tooth of this Enhydri is thought to be singular for to scarrifie or to let the painfull tooth bloud therewith: but in case the teeth in the vpper chaw do ake, they take two of the vpper teeth of this serpent, & apply them fast therto, but contrariwise if the nether jaw. They that hunt after crocodils, vse to greafe themselves with the fat of this serpent. Moreover, it is good by their saying, to scarrifie the gums about the teeth with the bones taken out of a lizards forehead at the ful of the moon, with this regard, that the same in any wife touch not the ground. Some of them there bewho make a collution with dogs teeth sodden in wine till the one halfe be consumed, and therewith wash the teeth that ake; but the ashes of the said teeth incorporated in hony, are singular good for little children which haue much a do in breeding their teeth. The same medicine is holden to be an excellent dentifrice for to make teeth look white. If the teeth that ake be hollow, they vse to put into the concavity thereof, the said ashes incorporated in mice dung, or els the liuer of a lizard dried. Also if one that is troubled with tooth-ach, set his teeth in a snakes heart & bite it, or hang the same about the neck or otherwise, it is thought to be an effectual remedy for the said disease. Others there be of the magicians, who prescribe to chew and eat the flesh of a mouse twice in a month, and they assure vs by this means that we shall preuent and auoid the tooth-ach. Moreover, it is said that a decoction of earthworms boiled in oile & poured into the eare on that side where the tooth-ach is, doth giue great easement of pain. The ashes of the same mads burnt, put into the hole of a tooth that is rotten and worm-eaten, causeth it to fall out of the head with ease; and if the teeth that do ake be found, rub them with the said ashes and the pain will cease. Now the said worms ought to be burnt or calcined vpon a tele or potsherd. Also a decoction of this kind of wormes sodden in squillitick vinegre with the root of a mulberie tree, is a soueraigne medicine to wash the teeth withall when they be in pain. Furthermore, the little grub or worwe which is found in the herb Tazill, called **Veneris Labi*, hath a wonderful operation to cure the tooth-ach, if it be put into the hole of a faulty tooth: and no maruaile, for the caterpillars that breed in coleworts, will presently fall off if they be but touched with this worm. The punaises also or wall-lice that come from inallows, infused into the ears with oile of roses, assuage the tooth-ach. The small sandy grit that is found in the horns of shel-snails, conueied into an hollow tooth, presently allaiies the pain. The bare shels of the said snails, hollow as they be and void, calcined and reduced into ashes, and incorporated with myrrhe, are passing good for the gubs: but the ashes of a serpent burnt and calcined in an earthen pot, with salt among, helpeth the tooth-ach, if it be infused into the eare on the contrary side, with oile of roses. The skin of a snake which she hath cast in the Spring, made hot in oile & the rosin of torchwood, is singular in this case to be distilled into eather of the ears, it makes no matter which: some put therto frankincense and oile of rosat. The said slough or skin of a snake thus prepared and put into an hollow tooth, causeth the same to fall out of their head without any pain or grieue at all. As touching white snakes, how they cast their slough at the rising or apparition of the Dog-star, I hold to be a meere fable; for it was neuer seen or knowne, that they did so in Italy: much lesse therefore it is credible, that in hot countries they should be so late ere they cast their slough. Moreover, it is commonly beleueed, that the said slough kept so late ere they cast their slough. Moreover, it is commonly beleueed, that the said slough kept so long and incorporated with wax, draweth out a tooth most speedily, if it be applied thereto. Also, snakes teeth, either worn about the necke, or laid to teeth in pain, assuage their grieue. Some are of opinion, that a very spider all whole as it is, caught with the left hand, bruised and incorporated in oile of roses, and so dropped into the eare of the same side that the teeth ake, is very good to mitigat the pain. It is said also, that if a man take all the little bones of an hen (and saue those onely of the legs whole that be hollow) and keepe them in the hole or crany of a wall, and with one of the said bones either hit the tooth that ake, or scarrifie the gumble about it, and then presently cast it away when he hath done with it, the paine will immediately be gon. The like effect hath the dung of a rauen, applied hard vnto the place within a Locke of wooll: likewise of sparowes, tempered in oile hot and poured into the eare that is next vnto the pained tooth; but surely it will cause an intollerable itch: and therefore many thinke it a more safe and easie remedy, to burn young sparowes in a fire made of Vine-twigs, and the ashes that commeth from them to temper with vinegre, and therewith to rub the said teeth.

¶ How to procure a sweet breath. Meanes to take away the spots that blemish the face and to amend the infirmities incident to the throat.

It is said, that for to rectifie the offence of a strong and stinking breath, and to make it sweet and pleasant, it is good to rub the teeth with the ashes, of mice burnt, and incorporated with honey. Some there be, who mingle therewith the root of fennell. If the teeth be pricked or scraped with a vulturs quill, it will cause the breath to be lowre; but so doe the same with the quill or prick of a porkepine, is a singular thing to strengthen the teeth and keepe them fast in the head. As touching the sores in the tongue, or the scabs and little ycers breaking out about the lips, a decoction of swallows sodden in honied wine, healeth them; but if the lips be chapped, there is not a better thing than to annoint them with the grease of a goose or hen. For the same purpose serueth the tried or rindled grease of sweatie wooll, being incorporated with the powder of gall-nuts: also the white cobwebs that spiders doe weave, or else the little fine ones which they work vnder the planks and floors of high lofts, or rouses of houses. * If one chance to burne his mouth inwardly with some scalding broth or otherwise, the milke that a bitch giueth is a present remedie therfore.

As touching the spots that infect the skin of the face, the foresaid tried grease of wooll vnwashed, called *oxyfym*, incorporated with the hony of the Island Corfica (which of al other is counted most vnpleasant and vntoothsome) is proper to subtiliat and scoure them: the same also laid to the face vpon a lock of wooll, causeth the scurfe or scales whereby the skin seemeth to pill, for to fall away: howbeit some thinke it better to put hony thereto. But say there appeare vpon the face any foule and thick morpew that hath pierced deep into the skin, it is good to rub the same with dogs gall; but first the place ought to be pricked thick with a needle that the medicine may enter in. If the skin look wan, or black and blew, take the light of rams or other sheep, cut them into thin slices like to skins, and lay them hot to the place, or els apply therto pigeons dung. The fat of a goose or hen, is a singular thing to preserve & keepe soft, smooth, and dilicat, the skin of the face. As for the ringworms or ill fauoured tetter called Lichenes, there is a proper liniment made either of the dung of mice incorporated with vinegre, or the ashes of an vrchin tempered with oile. But in this cure, the face ought to be bathed and fomented before with vinegre and salnitre. For to take away any spots or pimples arising in the face, there is not a better thing to apply to them than the ashes of the little broad snails which are commonly found in euery place, incorporated with honey. And in truth, the ashes of any snails whatsoeuer, are astringent and hot, by reason of a certain absterfue qualitie that they haue; which is the reason that they enter into potentiall cauteries, or caustick & corrosiue medicines: and therefore they serue in liniments for to kill scabs, scurfs, mange, and leprosie; yea and to scoure away the foule spots called Lentils. Moreover, I read in authors of certain pissmires greater than the rest, called *Herculaneæ*, the which being stamped with a little salt put to them, are good for all the infections of the skin mentioned in the former receit. There is a kind of insect or flie called *Buprestis*, passing like to a long legged beetle, but seldom or neuer be any such found in Italy: kine and oxen catch much harme by this flie, for many times as they graze, they lick it vp with the grasse and swallow it down: and hereupon it tooke that name *Buprestis*: for no sooner commeth it to the gall, but it inflameth and setteth the beast into a great heat, wherupon it swelleth vntill it burst againe. So corrosiue it is (as I haue said before) that being incorporated with goats sewer, and so reduced into a liniment, it takes away the tetter called Lichenes that be in the face. The bloud of a vultur [a geire] tempered with the root of white Chamæleon (I mean the herb so called) and the rosin of cedar, heales the leprosie, so that this liniment be couered with colewort leaues. Of the same effect are the feet of locusts braied in a mortar and incorporated with goats tallow. The greace of a cock, capon, or hen, wel stamped & wrought with an onion, is singular to scoure the spots and specks of the visage: also the hony wherein a number of bees were stifed and killed is proper for the said purpose: But aboue all, the greace of a swan is commended both for to cleanse the skin of the face from all flecks and freckles, and also take away wrinkles. As for the markes remaining after the cauterie or hot yron, there is no better means to take them out, than a plastre of pigeons dung and vinegre. If the rheume cause the mur, the pose, or heatineffe in head, I find a pretie medicine to rid it away, by kissing only the little hairie muzzle of a mouse.

As touching the uvula and paine of the throat, they may be both of them eased and cured G with lambs ordure, which passeth from them before they haue bitten grasse dried in the shade. The juice or slimie humor that shels, snails yeeld when they be pricked through with a pin or needle, is singular good in a liniment for to be applied vnto the uvula; provided alwaies, that those snails doe hang after, in the smoke: The ashes that come of swallows calcined & burnt, is likewise very soueraign, being laid to the grieved place with hony; and in that sort prepared, it serueth also for the inflammation and swelling of the tonsils or amygdals of the throat. For the said tonsils and other accidents of the throat, a gargarisme of ewes milke is right soueraigne. There is a certain creeper called, a * Cheeslip, which if it be bruised or stamped, is good for the said infirmities: so is pigeons dung gargarised with wine cuit, or applied outwardly with sal-nitre & dried figs. If the throat be troubled with hoarsenesse, occasioned by rheume or catarrhe, the foresaid shels-snails doe greatly mitigate the same infirmities, being first sodden in milke (all saue the earthy or muddy substance which they must be cleansed from) and then giuen in wine cuit to the patient for to drink. Some hold opinion, that the snails found in the Isle Astypalæa, are the best of all other for this purpose, but principally the abstersiue substance that is found in them. The cricquet called Gryllus, doth mitigate catarrhs & all asperities offending the throat, if the same be rubbed therewith: also if a man doe but touch the amygdals or almonds of the throat, with the hand wherewith he hath bruised or crushed the said cricquet, it will appease the inflammations thereof. To come now vnto the Squinancie: a goose gall incorporat with the juice of the wild cucumber, and hony together, is a most speedie and present remedy for it also the brains of an owle, and the ashes of a swallow drunke in water wel and hot, is good for the said disease: But for this medicine we are beholden to the Poët Ouid. Note that when I speak of any medicine (for what maladie fouer) made of swallows, the young wild ones are alwaies the better and more effectuell in operation: and those you may know easily by the fashion of their nests where they do build. But if you would haue the best indeed, the young ones of that kind which are called Ripariæ, passe al the rest for medicinable vses, for so they are commonly named which build in the holes of banke sides. Howbeit, some there be who assure vs, that we shal not need to feare that disease for a yeare together, if we do but eat any young swallow, it skills not of what kind fouer it be. Now the order of calcining them from their ashes, is to strangle them first, & so to burn them in their blood within an earthen vessell: and the ashes thus made, is vsually giuen either wrought in past for bread, or else to be drunke: and some there be who mingle withall, the like quantiry of the ashes which come of weazils. And this kind of medicine thus prepared, they giue in drink every day against the kings euill, and falling sicknesse. Moreover, swallows kept and condire in salt, are passing good for the Squinancie, taken in drinke to the weight of a dram at a time: and it is said, that their very nest giuen in drinke, cureth the said maladie. It is a common opinion, that a liniment made with the creepers called Sowes or Multipedes, is most effectuell to cure the said Squinancie. And some there be who aduise to take one and twenty of these worms stamped, and to giue them in one hemine of mead or honied water for the said disease; but they must be conceiued downe the throat by a pipe or tunnell, for if this medicine touch the teeth once it will do no good. It is said moreover, that if one drinke the decoction of mice sodden with veruaine, it is a soueraign remedy for that disease: as also that a leather thong made of a dogs skin put thrice about the necke, will doe the deed. And some there be, who in this case vse pigeons dung mixed with oile and wine.

As touching the cricks of the nerues or sinewes that serue the nape of the necke; as also for the cramps that draw the head backward, they say, that a twig or branch of a vine taken out of a puttocks nest, and carried about one hanging to the necke or arme, is a speciall remedie for the abouenamed accidents.

CHAP. V.

¶ Medicines for the Kings euill that is broken and doth run: for the paines lying in the shoulders: as also for the grieve of the bowels about the midriffe and precordiall parts.

The blood of a weazill is good for the wens called the king euill, when they be extulcerat & do run: so is the weazill it selfe sodden in wine and applied; provided alwaies, that they run not

A not by occasion of any launcing or incision made by the Chirurgions hand. And it is commonly said, that to eat the flesh of a Weazill, is effectuell for the cure. So are the ashes of a Weazill calcined vpon a fire made of Vine-twigs, if they be incorporat with Hogs greafe. Item, Take a green Lizard and binde it to the fore; but after thirty daies you must do so with another, & this will heale them. Some make no more ado but in a little box of siluer keep the heart of a Weazill & wear it about them. If women or maids be troubled with the kings euill, it were good to make choise of old shels-snails, and to stamp them shels and all into a plaister or liniment: but especially such as be found sticking to the roots of shrubs and bushes. The ashes of the serpent Aspis calcined, are likewise very good for this disease, if they be incorporat with buls tallow, & so applied. Some vse snakes greafe and oile together: also a liniment made with the ashes of snakes burnt, tempered either with oile or wax. Moreover, it is thought that the middle part of a snake, after the head and taile both be cut away, is very wholesome meat for those who haue the kings euill: or to drink their ashes, being in the same manner prepared and burnt in a new earthen pot neuer occupied; may if the said snakes chanced to be killed between two cart-tracks, where the wheelles went, the medicine will look much more effectually. Some giue counsell to apply vnto the affected place Crickets digged out of the earth, with the mould and al that commeth vp: Also to apply Pigeons dung only without any thing els, or at the most to temper it with Barley meale or Oatmeale in vinegre. Likewise to make a liniment of a Moldwarps ashes incorporat with hony. Some there be who take the liuer of a Moule, crush and bruise it between their hands, working it into a liniment, and lay the same to the fore, and there let it drie on the place and wash it not off in three daies. And they affirme, That the right foot of a Moule, is a singular remedie for this disease. Others catch some of them, cut off their heads, stampe them with the mould that they haue wrought and cast vp aboue ground, & reduce them into certain trochisks which they keep in a box or pot of tinne, and vse them by way of application to all tumors and impostumes which the Greeks call Apostemata, and especially those that rise in the necke: but then they forbid the patient to eat porke or any swines flesh during the cure. Moreover, there is a kind of earth-beetles called tauri, Bulls: which name they took of the little hornes that they carry; for otherwise (in colour) they resemble tickes; some tearme them, Pedunculos terræ, earth lice: These also worke vnder the ground like wants, and cast vp mould, which serueth in a liniment for the Kings euill, & such like swelling, as also for the gout in the feet, but it must not be washed off in three daies space. Howbeit, this is to be noted, that this medicine must be renewed every year, for the said mould wil continue no longer in vertue than one year. In sum, there be attributed to these beetles, all those medicinable properties which I haue assigned vnto the crickets called Grylli. Moreover, some there be who vse in manner and cases afore said, the *mould which ants do cast vp. Others for the Kings euill take iust as many mads or earthworms in number as there be wens gathered and knotted together, and bind the same fast vnto them, letting them to drie vpon the place: and they are persuaded that the said wens will drie away and consume together with them. There be again who get a Viper about the rising of the Dog star, cut off the head and taile, as I said before of snakes, and the middle part betweene they burne: the ashes that come thereof, they giue afterwards to be drunke for three weeks together, every day as much as may be comprehended and taken vp at three fingers ends: and thus they cure and heale the kings euill. Moreover, there be some that hang a Viper by a linnen thread fast tied somewhat vnder the head, so long till she be strangled and dead, and with that thread bind the foresaid wens or Kings euill, promising vnto their patients assured remedie by this means. They vse also the Sowes called Multipedæ, and incorporat the same with a fourth part in proportion to them, of true Turpentine: and they be of opinion, That this ointment or salue is sufficient to cure any impostumes whatsoeuer.

As touching the paines that lie in the shoulders, there is a proper medicine made in forme a liniment, with the ashes of a Weazill shoudered with wax, which easeth the same.

To keepe young boies from hauing any haire growing on their face, that they may seem alwaies young, it is good to annoint their cheekes and chin with Ants egges. Also the marchants or hucksters that buy yong slaues to sell them againe for gaine, vse to hinder the growth of hair as well of the visage, as in the armeholes and vpon the share, that they may be taken for young youths still, by annointing those parts with the blood that commeth from lambs when they be libbed, which ointment doth good also to the armpits, for to take away the ranke and rammish smell

* Multipeda.

* For the martinetts or swallows called Apodes, build not, but lay and breed in chinks and cranies of old walls.

* Of which being raised more & more, come Maure-hills, corruptly called Moule-hills: for Ants were in old English called Maures: and Moules neuer cast vp such.

smell thereof: but first the haire there growing ought to be pulled vpon by the roots.

* The bowels,
as heart, liuer,
lights, &c.

* Prescrib'd
wines, not pre-
fused, vino.

* Because they
were brought
from the Isle
Melita, lying
within the
Sclavonian sea

Now that I am come to speake of the precordiall region of the body, know this, That by this one word *Præcordia*, I meane the inwards or entrailes in man or woman, called in Latine * *Extra*, whensoever then there shall be pain felt in these parts or any of them, apply thereto a yong sucking whelp, and keepe it hard huggled to the place, doubtlesse the said griefe will passe away from the part to the puppie it selfe, as men say: and this hath been found true by experience in one of those whelpes * ripped and opened aliue, and the said bowels taken forth: for looke what part in man or woman was grieved, the very samewas seene infected thereupon, in the puppie. And such whelpes thus vsed for the curing and taking vpon them our maladies, were wont to be enterred with great reuerence and ceremoniall deuotion. As touching the pretty little dogs that our daintie dames make so much of, * called *Melitæi* in Latine, if they be euer and anon kept close vnto the stomacke, they ease the paine therof. And in very truth a man shall perceiue such little ones to be sicke, yea, and many times to die thereupon: whereby it is euident, that our maladies passe from vs to them.

CHAP. VI.

Of the diseases incident to the lights and liuer. Of those that vse to cast and reach vp blood at the mouth.

Mice are very good for the infirmities of the lungs, especially those of Barbarie, if they be first slaied, then sodden in oile and salt, and so giuen to the patient for to eat: Thus prepared and vsed, they cure them that either spit purulent and filthy matter, or else reach vp there blood. But a dish of meat made of snails with shels, is most excellent for the stomacke. But for the better ordering and dressing of them: first they ought to siuer ouer the fire and take a few waulmes till they be parboiled, without touching or meddling one jot with their body: afterwards they must be broiled vpon the coales, without putting any thing in the world vnto them, and then to be serued vp in wine and fish pickle or brine called *Garum*, and so eaten. But the best for this purpose are those of Barbarie. It is not long agoe, that this experiment was found: but since it was once known, many haue done themselves much good thereby. But (that which I had well neare forgotten) many obserue to take them in some od number. Howbeit, as hole some as they are supposed to be otherwise, this discomfortie is found by them, That they cause those to haue a strong and stinking breath that vse to eat them. Being stamped without their shels, and so drunk in water, they helpe them that reach blood vward. But that you may know that there be degrees of them in goodnes: The best snails simply are they of Barbary, and namely, those about the quarter neere *Soli*: Next to them are much esteemed such as are gathered in the Islands *Astypelæa*, and *Sicilia*, for they are of a meane bignesse; for such as be grown very great, haue their flesh hard, and be void of humidity. Then are ranged in a third place, those that come from the *Baleare* Islands, called *Cavaticæ*, because they breed in caues and holes. There be good also brought from the Islands *Capræ*. Holesom these shel-snails may be well ynough: but toothsome surely they are not, whether they be old kept, or new taken. Those that be found in riuers, & which haue white shels, cary a rank and strong sauour with them: so do the wild fort that are not kept vp and fed in stewes & pits, and be hurtfull to the stomack, but good to loosen the bellie: euen so are all the sort of the little ones. But contrariwise, those that breed in the sea are better for the stomack than others: and most effectually to allay the pains therof. Moreover, it is said, that they do most good, of what kind soeuer, if they be swallowed downe aliue & all whole with vinegre. Moreover, there be of these snails called * *Aceratæ*, of a broad making, and growing in many and fundry formes; of whose properties, and how they are to be vsed, I will write elsewhere in place conuenient. The inner skin of a Hen or Capons gesser, preserved till it be drie, and reduced into powder, and so put into a cup of drinke like spice; the same also eaten fresh, & newly roasted or broiled, is singular for the catarrhes that fall into the breast, and for a moist cough. Shel-snails punned raw & giuen in a supping with three cyaths of warm water, serue wel to appease & stay the cough. Take a piece of a dogs skin, and tie the same about any one of your fingers, which you will, it staies all rheumes and distillations. The broth made of Partridges, is soueraigne to comfort and refresh the stomack. As touching the griefe or paine of the liuer, it is said, That the flesh of a wild Weazill, or her liuer eaten, is a singular meat ther-

* Haply so named, because they haue little or no hornes, quasi gibbosus, boves.

A fore: so be Ferrets roasted in manner of little pigs. The worms with many feet called sowes or chesclips, are very proper for them that draw their wind short; but there must be one and twentie of them, neither more nor lesse, dissolved in the best Articke hony, and so giuen in drinke and swallowed down by a pipe or tunill: the reason why they must be thus conueied through such a cane or tunill is this, because looke what cup or boule they so touch, they staine the same black. Some take of them to the quantitie of one sextar, and torrie them vpon a pan or platter, vntill they looke white and be calcined, and then incorporat them in hony: [there be Latine writers who call this worne Centipeda, as if it had an hundred feet] and then giue direction, that they should be taken in hot water. Furthermore, it is said, That if the patient do either eat or drinke for the space of nine daies together one snail hot, stamped shell and all in three cyaths of wine cutt he shall find helpe, if he were giuen either to faint and swoone, or to be lunatick and to go beside himselfe, or else be subiect to the dizziness of the head. Others giue order to take them after another maner, namely, one the first day, the morrow twain, the third day three, the fourth two, and the fift one again: and in this wise they cure those who are shortwinded, or haue an impostume broken within their bodie. There is a kinde of Insect resembling a Locust, but that it hath nowings, which in Greek is called * *Tryxalis*; a Latine name it hath not found yet, as some do thinke: and writers there be not a few, who are of opinion, That it is the same that our Gryllus or crickets. Call it what you will: let there be twenty of them torried and drunk in honied wine, it is reported for to be a singular medicine for those that cannot take their breath but sitting vpright, and for such as spit blood. There is one writer who ordaineth to take snails vn-washed, and to poure vpon them either the Mere-gout of the grape that runneth out first without pressing, or else sea-water, and so to boile them therein, and afterwards to eat them for a cough. And the same Authour giueth counsell, to pun them shels and all, and to take them with the foresaid Mere-gout to the same effect.

Touching inward impostumes broken, the hony wherein a number of Bees haue bin drowned to death, hath a peculiar vertue to heale them. The lungs of a Vulture burned to powder in a fire made of Vine-cuttings, giuen in wine morning & euening, if the patient be free from the ague; so there be put thereto one moitie of Pomegranat floures, and the floures of Quinces and Lillies as much of each, is a very soueraigne remedie for those that cast vp blood out of their bodie: but if he be in a feauer, the same medicine would be taken in the decoction of Quinces.

D As for the paine of the spleene, if we may beleene the receipts and prescriptions of the Magicians, the patient ought to haue the milt or spleen of a sheep spread and laid ouer the place: but the patient that hath the application thereof, must say these words withall, *This I do to cure the spleene*: Which done and said, the same milt of the sheep must be laid vp close and hidden within the wall or behind the feeling of the bed chamber where the sick body lieth, and sealed vp with a signet, for feare it should be taken away: with this charge, that he or she that hath the bestowing of it, repeat the foresaid charme nine times thrice ouer. If a dogs bellie be ripped aliue, and the spleen taken forth, who soeuer eateth thereof, shall find it very good to ease them of the said maladie. But some content themselves with laying it fresh and warme to the region of the spleen. Others giue the spleen of a young whelp but two daies old, in squillitick vinegre, to the patient, but they make not the patient acquainted with the medicine what it is; or else they minister the spleen of an Hedgehog in the same manner. Likewise they giue the ashes of shell-snails with Line seed and Nettle seed, putting thereto some hony: and this cure they continue vntill the patient be thoroughly whole. It is said moreover, That a green Lizard taken aliue, and hanged so in a pot iust before the dore of the patients bedchamber: with this charge, that euer as he goes in and out he touch the same with his hand, will worke the same effect. The ashes of a scritch-owls head reduced into an vnquent with oile, is good for this purpose, so is the honey wherein Bees were stifled: and lastly a spider, but especially that which they call *Lycos*.

The heart of the bird called a * *Houpe*, is highly commended for the paine of the sides. Also the ashes of shell-snails boiled in Prifane or husked Barley water: and some in this case apply the same otherwhiles in a liniment onely without any thing else. The ashes of a dogs head (I meane the bare skalle or skull onely) dying enraged and mad, is good to spice a cup of drinke withall for this disease.

If the loines be pained, it is said, That the starre-Lizards called *Stellions*, comming from beyond sea sodden in wine together with the seed of black Poppie to the weight of halfe a denier

* or *Troxallus*, according to *Alianus*.

* *Prope*.

is very good, so the decoction be drunk: howbeit, this care must be had, that the head be cut off G first, and the garbage taken forth. The green Lizards are good meat in this case, if they be dressed accordingly, and their feet and head cut away: so are shell-snails, braied shels and all together, and sodden in wine with fifteen grains of pepper. Some vse the feet and legs of an Aegle in this disease, pulling them away backward from the knees: and the right foot they apply fast to the paine of the right side: but the other if the contrary side be grieved. The many-foot Sowes or Cheeslips, which I called before Oniscos, help the same pains, if they be taken to the weight of halfe a denarius in two cyaths of wine.

To conclude with the Sciatica, the magicians giue order to put an earth-worm in a treene or wooden dish, which hauing bin cleft, was fitched vp again with iron wier, or bound with a plate or hoope of yron: then to ladē vp some water therewith, and in it to wash & rince the said worme H very well, and then to enterre or burie the same again in the very place from whence it was digged forth: which done, to giue the said water anon to the patient for to drinke out the said wooden dish: and this they hold to be a wonderfull medicine.

CHAP. VII.

¶ Remedies for the dysenterie or bloudie flux. And generally for all diseases of the belly.

THE decoction of a leg of mutton sodden in water with Line seed, is singular good for to be supped off to stay a bloudie flux. So is old Cheefe made of Ews milke: and sheeps suet sodden together in some austere wine. The same is singular for the Sciatica passio, and an old cough. The starre-Lizard Stellio, which breeds beyond sea, being flaid, garbaged, and dressed for meat, so that the head and feet be taken away, and so sodden and eaten, is commended also in this case. Moreover it is said, That two snails and one Hens egg, stamped the one as well as the other with their shels, and afterwards gently sodden in a new earthen pot with some salt & two cyaths of wine cuir, or else with the juice of Dates & 3 cyaths of water giuen to the patient to drink who is tormented with the dysenterie or bloudie flux, will bring great alleuiation of the said disease. It is thought also, That the ashes of the said shell-snails calcined, if they be taken in wine with a little rosin, are soueraigne therfore. As touching naked snails without any shels, they be found plentifully in Affricke. Passing good they be for the bloudie flux, if 5 of them be burnt and calcined together, with halfe a denier weight of Acacia, & 2 spoonfuls of their ashes taken in Myrtle wine or some other austere & astringent wine, and a like quantity of hot water. Some there be who in this sort vse all the snails of * Barbary. Others thinke it better to take five of the said snails of Affricke, or rather as many of the broad and flat sort, and to clysterize them for the dysenterie. But if the flux be exceeding vehement, then they put thereto of Acacia the quantitie of a beane. It is said moreover, That the spoile or slough of a serpent boiled with oile rosat in a vessell of tinne, is singular for the * Dysenterie and * Tinesme, to be injected by a clyster: Or if it be sodden in any other vessell, yet with an instrument or pipe of tin it is to be conueighed into the fundament, that the tiwill thereby may be annointed. The broth of a Cocke cureth these infirmities: but if it be of an old Cocke, it is the more effectuell. And yet if the said broth be any thing saltish, it stirreth the bellie & prouoketh to the seege. The inward skin of an Hens gisier broiled and giuen with salt and oile, doth mittigar and appease the * wrings caused by the flux of the stomacke. But then this regard must be had before, That neither the Hen haue any corne giuen her, nor the patient feed vpon any graine some time before. Pigeons dung being burnt, and the ashes taken in drinke, is of great effect and vertue in these cases. The flesh of a Quoist or Stock-doue sodden in vinegre, is good both for the bloudie flux, and also for the loosenesse, proceeding from the imbecilitie of the stomacke. The Thrush or Mauius roasted with Myrtle berries, is soueraigne for the dysenterie: so is the Merle or black-bird. In which respect, great account also is made of the honey boiled, wherein bees were killed. [Of all the paines that be, the * Uliacke passion is most sharpe and grievous to be endured. But it is said, That the blood of a Bat, torne and plucked in peeces aliue, is very good against it; yea, and if the bellie be annointed therewith, it easeth the torment thereof.] But to come againe vnto the flux of the bellie, shell-snails prepared and made in manner aforesaid for those that be short winded, are singular good for to stop the same, and to knit the bodie. So are their

* Or Affricke.

* Vicer of the guts or bloudie flux.

* A continuall desire to the stoole without doing ought.

* *Dolores colici*. Some read *Colicorum*. 1. of the Collicke.

* Which is the torture, or inflammation of the vpper small guts.

A ashes (if they were burnt and calcined aliue) taken in some austere or astringent wine. The liuer of a cocke roasted, together with the skin of the gisier, which ordinarily the cooke casteth away, dried and kept, and so taken with a little of the juice of Poppy mixed with it, is of great power to remedy these accidents: others take the same skin whiles it is new and fresh, which they broil and torrefie, for to be giuen in wine to drink. A Partridge broth, yea, and the gisier of the bird alone beaten to pouder and taken in some grosse and astringent wine, is singular to stay a flux of the belly. The wild Ring-doue or Quoist, boiled in vineger and water, is of the same effect. The milt of a sheep first torrefied, then puluerized and taken in wine, helpeth much this infirmity. A liniment likewise made of Pigeons dung and hony, is of great vertue, if the patients belly be annointed therewith.

B Touching those that haue feeble stomacks, and cannot concoct and digest their meat. It is said, That the maw or gisier of that kind of Geire or Vulture, which is called in Latine *Ossifragus*, dried, puluerized and drunk, is right soueraigne. Nay, if the patient doe but hold the same gisier in his hand whiles he is at his repast, it will help digestion. And in truth there bee diuers that for this cause weare these gisiers ordinarily about their necks: but I thinke it not wholsome to do so, long, for it maketh them leane as many as vse it, and spendeth their body.

To stay a flux of the belly, the blood of Mallards or Drakes is thought also to be singular good. The meat made of shell-snails, discusseth and scattereth ventosities. The Milt of a Mutton broiled to ashes and giuen in wine, is singular good to allay the wrings and torments of the belly. Of the same operation is the wild Quoist or Ringdove, sodden in vineger and water. The greater kind of Swallows or Martins called Apodes, are no lesse powerfull, if they bee sodden and taken in wine. The ashes of the bird Ibis plucked & burnt without his feathers, & so giuen to drink, work the same effect. But strange it is and wonderfull, if that be true which is reported as touching this malady, namely, that if a Ducke bee applied aliue vnto the belly which is tormented with such wrings, she shal draw away the disease into her own body, and die of the torment, but the patient shal be eased by that means. These painful gripes likewise are cured with sodden hony, wherein Bees sometimes were drowned to death.

As for the Collick, there is nothing so good to assuage the paine thereof, as to eat Larkes, which the Latines name *Galerita*. Howbeit, some giue aduise and think it better to burne and calcine them in their feathers within a new earthen vessel, & so to stamp them to ashes or pouder, and to drink therof foure daies together in water by three spoonfuls at a time. Others make no more ado, but take the heart of a Lark, and bind it to the inward part of the thigh: and there be againe who would haue the same to be swallowed downe whole newly taken out of the bird while it was warme. There is a family of the Asprenates, men of good quality and reputation, for that they had bin sometimes Consuls of Rome: in which house, of two brethren, the one was fully cured of the collick by eating these birds, and by wearing ordinarily the heart of one of them about his arme, inclosed within a bracelet of gold: the other being likewise troubled with the said disease, found remedy by a kind of sacrifice which he offered in a little chappell made with vnbacked bricke, piled vp archwise in manner of a furnace: and so soon as the sacrifice was finished, he stopt vp the same againe. That Vulture which is called *Ossifragus*, hath one gut of wonderful nature, for it is able to concoct and digest whatsoever the said soul deuoureth. And for certain this is known and generally receiued, that the nethermost end thereof cureth the collick, if the patient do but carry it about him. There are other secret and hidden diseases incident to the guts, whereof there be wonders told: and namely, that in these cases, if yong whelpes before they can see be applied for 3 daies together vnto the stomack especially, and the breast, so that they suck milke from out of the patients mouth the while: the said disease shall passe into the body of the poore whelps, whereof in the end they shall die. Let the same be ripped & opened, then it wil appear euidently what the cause was of the foresaid secret malady of the patient. But such whelps ought when they are dead to be enterred & buried. As for the Magicians, they auouch, That if the belly be annointed lightly with the blood of a Bat, the party thus dressed, shall not need to feare any paine of that part for one whole yeare after: or if it chance that one be pained in the belly, let him (say they) indure to drinke the water that runneth down from his feet when his legs be washed, and he shall find help anone.

CHAP.

CHAP. VIII.

¶ Medicines against the stone and grauell: the paines of the bladder. The swellings in the coles and the share. Also for the biles and botches called Pani.

For them that are troubled with the stone, it is good to annoint the region of the belly with Monse-dung. It is said, that the flesh of an Vrchin or Hedgehog is very good meat: & pleasant in tast, if so be he were killed outright in the head at one blow, before that he had time to shed his owne vrine vpon himselfe: and looke whosoever eat this flesh, shall neuer be subject to the disease of the strangury. The flesh of an Vrchin killed in this sort, helpeth the bladder, in case the vrine passe by dropmeale from it. But contrariwise, if the Vrchin chance to wet and drench himselfe with his owne vrine, as many as eat of the flesh shall fall into the infirmity of the strangury or pissing dropmeale. Moreover it is said, That earthworms drunke either in wine or cuit, is of great efficacy to breake or dissolue the stone: as also that snails, prepared in that sort as they are ordained to be dressed for shortnesse of wind, work the like effect. Take snails naked out of their shels, and stamp them; giue 3 of them to the Patient to drinke in a cyath of wine the first day, two the morrow after, and the third day one againe, you shall see how it will helpe the strangurie or pissing dropmeale. But let the empty shels be burnt, the ashes therof wil scoure away and expell the stone. Semblably, it is said, that the same effect followeth vpon drinking the liuer of a water-snake: the eating of the ashes of scorpions calcined, either in bread, or with the locusts. Likewise, to take the little stones or grit that be found in the craw of a cocke, or in the gisier or maw of a stock-doue: to beat the same to powder, and therewith to spice the drinke, is singular good for the infirmity aforesaid. To do the like with the skin of a Cocke or Hens gisier, dried: or if it be new and fresh, to roste and eat it. Also for the stone and other difficulties or impediments of the bladder, it is good to take the dung of Quoists or Stock-doues, with Beane meale. In like manner there is much help found by the ashes of Quoists feathers, such as be of a wilder kind than the rest, taken with Oxymell. Moreover, the ashes of the guts of this bird giuen to the quantity of three spoonfulls: as also the nest of swallows: and Cricquets infused and dissolved in hot water, are commended for this purpose. Some helpe themselves with the gisier of Ossifragis dried: others vse the decoction of Turtles dung boiled in honied wine; or els the broth of the Turtle it selfe. Furthermore, for the difficulty of vrine, it is wholesome to eat blacke birds or Merles, boiled with Myrtle berries: or Grasshoppers fried in a pain: & to drinke the sows or Cheeslips called Oniscoi, folke make it not strange to do themselves good. But if there be pain in the bladder, it is said, That the broth made of Lambs feet, is soueraine. If the body bee bound or costiuie, a Cocke-broth causeth it to be soluble: and the same doth withall lenifie the acrimony of humors that cause the foresaid grieve of the bladder. The dung of Swallows likewise procureth loosnesse of belly, in case it be tempered with hony to the forme of a suppositorie, and so put vp.

* Repellit

Touching the infirmities incident to the seat, the tried greafe of vnwashed wooll, (whereunto some adde Tutie and oile of Roses) the ashes also of a dogs head are soueraine medicines: the slough likewise which a serpent hath cast, applied with vineger, is good, in case there be chaps and fissures in that part. Likewise, the ashes of dogs dung, which looketh white, incorporat with oile of Roses: & this receipt (they say) was the inuention of *Esculapius*; and is besides most effectual to take away werts. The ashes of Mice dung, Swans greafe, & the tallow of Oxe or Cow, are helpfull for this infirmity. If the tuill or gut Longaon be relaxed and hang forth, it is good to annoint the same with the moisture issuing forth of shel-snails that is pricked through with a pin or needle, for it drieth it back againe to the right place. If the seat be galled, it is thought that the ashes of the wood-Mouse cured with hony, cureth the same: or els the ashes of an Vrchin, together with the brains of a Bat, Allum, and the greafe tried out of vnwashed wooll, wil skin it againe. In like manner, Pigeons dung with hony: for the swelling blind hæmorrhoids or piles called Condylomata, there is a proper remedy; namely, to rub the place with a spiders body, after the head and legs be cast away. Against the acrimony and sharpnesse of humors, that they should not fret and burne those parts, there is a faire liniment made with Goose greafe, incorporat with Barbary wax, white lead, and oile rosat. So is the fat of a Swan. These medicines also

A also are said to heale the hæmorrhoids that run.

For the pain of the Sciatica, it is thought that raw shell-snails bruised are good, if they bee taken in Amminean wine and pepper: also a greene lizard eaten as meat, without the feet, garbage, and head: so is the starre-lizard Stellio, but thereto ought to be put the weight of three oboli of black poppy seed.

For ruptures, inward spasmes and convulsions, it auaileth much to take sheeps gal with breft milk. In case the priuities haue an itch & a fretting humor vpon them, or if some offensive werts arise in those parts, the dripping or graue that commeth from a rams lights roasted, doth much good, if the place be therewith annointed. As touching other accidents which happen to those parts, the wooll of a ram calcined and reduced into ashes, euen with all the filthinesse that is therein, is thought to be very good, so that the ashes be applied to the affected place with water. The sewer of the kell of a mutton, but especially that which groweth to the kidnies, incorporat with the powder of a pumish stone and salt, is much commended in this case: also greasie and vnwashed wooll soked in cold water, is good to be applied to the place: the flesh moreover of a mutton calcined, so as the ashes be incorporat with water. Item, the ashes of a mules house: and the powder of caples teeth braied & puluerized, if the grieved place be strewed therewith.

To come lower to the infirmities of the coles: the powder of the bones of a dogs head without any flesh vpon it, puluerized, is singular therefore. If it fall out that one of the genitoirs be relaxed & hang down lower than his fellow, it is good to annoint the same with the waterish slime and some that commeth from shel-snails, for they say it is an excellent remedy: if there be any soule and malignant vlcers in those parts running with filthy matter, the ashes of a dogges head fresh killed are singular to heal the same: so are the little broad and flat shel-snails bruised and incorporat with vineger, if either the same or the ashes be applied thereto, also the honey wherein bees haue been killed mixt with rosin: the naked snails likewise which bred (as I said) in Barbarie, in case they be stamped & incorporat with the powder of Frankincense & the white of an egg, with this charge, that the said cataplasme be not taken off in 30 daies, by which time it will be ready to fall away of it selfe. Some in stead of frankincense, put the bulbous roots of small onions or scallions. For those who be troubled with the * waterish rupture, it is thought that the star-lizards Stilliones be wonderfull good, in case their head, feet, and gurs, bee taken forth, and the rest of the body roasted, but the patient had need to eat of this meat often, and so it helpeth those who cannot hold their water. The like opinion there is of dogs greafe incorporat with * Alumne de plumie, if the patient take thereof to the quantity of a bean: as also the snails * of Barbary burnt, flesh, shell and all, so as the patient drinke their ashes. Furthermore, it is said, that the tongues of three geese roasted and eaten, is a speciall remedy for this infirmity: and *Anaxilans* is he that deuised this receipt. * *Hydrocelicis* * *Alumine* * *scibis*

Touching the biles called Pani, sheeps tallow incorporat with salt torrifacted, is singular good to breake them: but mice dung, with the fine powder of frankincense & orpiment or red Arsenicke, is as proper to resolute them: likewise the ashes of a lizard, and the lizard it selfe split alie and applied hot thereto. In like maner cheeslips or sows stamped and incorporat with the right terpine, to the quantity of a third part, & so brought into a cataplasme. Some there be who to shell-snails punned, adde the common bole-armoniack. Also the ashes of the void shels only alone without the snails mixt with wax, are of a resolutiue and discutient facultie. In like manner, a liniment made either of pigeons dung only, or els incorporat with barley meale or oatmeale. The flies called Cantharides mixed with quicklime, are a good potentiall cauterie, and open such biles as well as the Chirurgians launcet. The botches or swellings in the share, a liniment made with the small shel-snails and hony, doth assuage and mitigate. Finally, to keepe down the veins from swelling which be called Varices, it is good to annoint the legs of children with the blond of a lizard, but this must be don, while both the children and the party who hath be doing thereof be fasting.

CHAP. IX.

¶ Receipts for the gouts of feet and hands: and generally for the pains or diseases of ioints whatsoever.

The tried greafe of vnwashed wooll incorporat with womans milk and white lead, is a very proper liniment to mitigate the pain of the gout: so is the liquid dung of sheep when they

L 1

run

run out behind. Their lights likewise, or a rams gal incorporat with their suet. Some split mice, and lay them hot to the place: also the blood of a weazil reduced into a liniment with Plaintain: and the ashes of a weazill burnt alive, tempered with vinegar and rose water, and brought into a thin liniment, so that the place affected may be dressed with a feather. Others temper wax and the oile of roses together. And there be again who vse dogs gal for this purpose, but in any wise the hand must not touch it, but the place ought to be annointed with a feather: likewise hens dung, and the ashes of earthworms mixt with hony, with this charge, that this cataplasme be not vndone or remoued before the third day. Howbeit it is thought better by some, to apply the same ashes with water: but by others to vse vinegar in measure and with moderation, together with 3 cyaths of hony, hauing before hand annointed with oile of rose for the gouty feet. It is said moreover that to drink broad snails, is a singular medicine to take away the gout of the feet, or the pain H of any other ioint: the manner wherof is to stamp 2 at a time, and drink them in wine: some apply the same in a liniment with the juice of the herb Parietary. Others content themselves to bruise them and so to incorporat them into a cataplasme with vinegar. Many are of opinion, that the gout may be cured, if the patient vse oftentimes to take the salt, which together with a Viper was calcined in a new earthen pot: as also that it is very good to annoint the feet with Vipers greafe. And they affirme constantly of a Kite that hath bin kept long dried, if the patient reduce it into pouder, and drink thereof in water as much as three fingers will well take vp, it cureth the gout thoroughly. But if the feet be full of blood and swollen withall, they vse Nettles thereto. Some there be that take the yong feathers of a Kite so soon as they put forth, and stamp the same with Nettles to a liniment. The very dung likewise that these foules do meut, serueth I in stead of a good liniment to annoint the painful gout in any joint whatsoeuer: so do the ashes of a weazill or of shell-snails burnt or calcined and incorporate either with Amydum or gum Tragacanth.

If a man haue gotten a rap or rush vpon any joint, there is not a better thing for to cure it than copwebs: some chuse for this intention, those which be woven by the spiders of ash colour: like as to vse the ashes of Pigeons dung with parched barley groats and white wine. In any dislocation of joints, the most present remedy that is knowne, is sheeps suet tempered with the ashes of of womens haire burnt. This suet likewise serueth well to bee applied with allum to the kibes of the heels: so do the ashes of a dogs head, or of mice dung. But in case there be any vicer there not yet putrified, adde wax thereto, and it will skin vp and heale the same: and the like effect is wrought by the light ashes of criquets burnt and tempered with oile, or els with the ashes of the wild wood-mice mixt with hony: of earth-worms also incorporat with old oile: & lastly, many apply thereto the snails that be found naked & without their shells. And verily, the ashes of such snails burnt alive, heale all sores of the feet: howbeit, if the feet be galled & but lightly ex-coriated, there is not a better thing for them than the ashes of hens dung, or pigeons dung incorporat with oile. If the shoo hath rubbed off the skin, or fretted any part of the foot, the ashes of an old shoo-sole are singular good to heal the same: so are the lights of a ram or lambe. The pouder of a caples teeth is a soueraigne and speciall remedy for the feet, if there oue out any matter from vnder the nailes. The blood of a green lizard healeth the galls vnder the foot, yea, and cureth thoroughly the sore feet both of man and beast, if they be dressed therewith.

Pura vlcera.
Multi mulieres
Sometime mu-
lis to be the
mule ingen-
dred by a male
asse & a mare:
but Mulagone
that mule that
commeth of
an houle and
female asse.

As for the corns and agnells which arise about the feet, it is good to besmeare them with the vrine of * Mule or mullet, together with the mire in the very place where they italed: also with sheeps dung. The liuer or blood of a greene lizard applied vpon some flocke to the place, or vpon a locke of wooll. Some vse in that order, earth-wormes stamped with oile, or the head of the star-lizard Stellig, incorporat in oile with a like quantity of Agnus Castus. Last of all, others take Pigeons dung sodden in vinegar, and lay the same to the place.

Touching werts, of what sort soeuer they be, there is not a more proper thing to make them fall off, than to bathe them well with the vrine, durt and all, of a dog where he lately pissed: or to apply thereto a salve of dogs dung ashes and wax: it is not amiss also to lay to them sheeps dung, or to rub them wel with Mice blood new killed: or to apply a Moule split along the mids M of a liue: the gall likewise of an Vrchin: the head of a lizard: or the blood: or lastly, the ashes of a li-lizard calcined: the old slough of a snake also. Lastly, hens dung incorporat with oile and salnitre. If all these medicines fail, begin the cure new with Cantharides incorporat with wilde grapes called Vva taminæ: this is a corrofiue, & wil eat them out: but when they be thus fretted & ex-
ulcerat

A ulcerat, the cure must be followed with those appropriat means which I haue set downe before in the healing of vlcers.

CHAP. X.

Medicines appropriate for diuers and sundry diseases which possesse the whole body.

Returne we now to the cure of those maladies which are incident not to this or that member, but to the whole body. First and foremost, the Magitians say, that the gall of a blacke dog (a dog I say and not a bitch) is a singular countercharme and preferuatiue against all B sorceries, enchantments, and poisons, which may indanger a whole house, in case there be a perfume made therewith to purifie the aire thereof, yea, and to hallow and blesse it against all such dangers. The like effect (say they) we are to look for, if the walls of the said house be sprinkled or striked with the blood of the said black dog, with this charge, To burne vnder the threshold or dore fell at the entry of the said house the genitall member of the same dog. Men may maruell well enough at these fooleries and absurdities of theirs: but surely wonder lesse will they thereat, who know what store they set by illfaured ticks, the foulest and nastiest creatures that be: and why do they thus magnifie so filthy a vermine? because (forsooth) this creature onely of all others hath no passage at all for the voidance of excrements, sucke it neuer so much: and no way there is but death with them when they are thus full, but so long only as they continue hungry and fasting: and yet they say, that they wil indure so a long time, euen a whole seuen-night together with abstinence and spary feeding: many let them feed stil to the ful, they wil not hold out so long, but burst again in fewer daies space. Well, this tick, so filthy as it is, and of so admirable and strange a nature in their conceit, they hold to bee of exceeding vertue to appease all paines and torments of the body whatsoeuer, in case a man take one of them, with the left eare of a dog, and carry them hanging to some part about him. And more than that, these Magitians take marks by it, & preface of the life or death of their patients; for they hold it for a certain and assured signe of life, if one hauing a ticke about him, stand at the beds feet where the sicke man lieth, and when he asketh him how he doth, and where he is amiss, &c. if the patient make answer readily vnto him; but in case hee make no answer at all, then surely hee shall die there is D no remedy. But take this withall: this ticke must be plucked likewise from the left eare of a dog, and the same dog ought to be cole-blacke without any specke of other colour. And Nigidius hath left in writing, that dogs will not all day long come neare vnto a man nor abide to see him, who hath lucked a ticke from an hogge. But to returne vnto our Magitians: they affirme, that such as be lunaticke and beside themselves, shall come againe to their right wits and senses, in case they be sprinkled with the blood of a moule. They auouch moreover and say, that if one seeth the tongue, eies, gall, and guts of a Dragon in wine and oile, and permit this decoction to coole all night abroad in the open aire, it is a soueraigne medicine to chase away such bugs, spirits, and goblins, wherewith folke be haunted and affrighted in the night season, if they bee annointed therewith all ouer their bodie, morning and euening. Nicander writeth, that who soeuer E carry about them the serpent Amphibæna dead, or no more but the very skin thereof hanging fast to any part of their bodies, they shall finde it to bee a most soueraigne remedy for any through cold or chilling fitt that hath surprised them. Nay hee staith not there, but addeth moreover and saith, that if the said serpent be bound vnto any part of a tree that is to bee felled and laid along, the workemen that hew at the butt thereof, shall feele no cold all the while; and the tree by that meanes shall the sooner and more easily bee cut downe and ouerthrowne. No maruell therefore, if this serpent aforesaid dare leaue his nest, and commit himselfe to the cold weather, for he venturith first to come abroad, and is to be seene, about ground before the Cuckow begins to sing. But since I haue made mention of the Cuckow, there comes into my minde a strange and miraculous matter that the said Magitians report of this bird: namely, that if a man the first time that he heareth her to sing, presently stay his right foot in the very place where it was when he heard her, and withal marke out the print and just proportion of the said foot vpon the ground as it stood, and then digge vp the earth vnder it within the said compasse, looke what chamber or roome of the house is strewed with the said mould, there will no fleas breed there.

They say moreover, that the fat which is fleeted or skimmed from the broth wherein dormice and rats be sodden, is excellent good for those that be affraid of the palsie, and subject thereto: also that Sowes or Cheeslips called Millipedæ, prepared and taken in drink, in manner as I appointed for the squinancie, are singular for those that find themselves to bealne into a phthisick or consumption of the lungs: so is a green Lizard (by their saying) sodden in three sextars of wine, till there be but one remaining, if the patient take thereof a spoonfull at a time every day, vntill he feele himselfe warished and fully cured. Others assure vs of as great effect, by drinking the ashes of shell-snails in wine.

king the ashes of shell-snailles in wine.
As for the falling sicknesse, the tried greace of sweatie and vnwashted wooll tempered with a little myrrhe, so that the quantitie of them both arise to the bignesie of an hazell nut, cures the same, if it be taken infused and dissolved in two cyaths of wine, presently after the patient haue sweated and be come out of the baine. For the same disease, they ordaine the cullions or stones of a ram which haue bin kept long and dried, to be reduced into pouder to the weight of halfe a denier Romane, and so to be taken in water, or else in one hemine of asses milke, bowbeit with this charge, That the patient forbear drinking of wine fife daies after, and as many before. Furthermore, they do highly commend the drinking of sheeps blood: likewise their gall in milke, but principally if it be the gall of a lambe: a sucking whele is very good in this case, if it be taken with wine & myrrhe; but first the head and feet must be cut away. Some for this purpose drink the surots or rough werts growing to the legs of a mule, in three cyaths of oxymell: others giue order to drinke in vinegre the ashes of the star-lizard Stellion, which breedeth beyond-sea: and the tender skin or slough of the said Lizard (which the casts in the same maner as a snake doth) taken in drink, helpeth much. Some Physicians are so venturous and bold, that they haue giuen to those who be subiect to the falling sicknesse, the verie Stellion it self, after it is rid and clenfed from the garbage or gurs, and so kept dried; appointing their patients to drinke the pouder thereof in some conuenient liquor, through a pipe of a cane: others appoint it to be tosted vpon a wooden broch or spit, and so to be eaten for meat. And seeing I haue occasion thus to write of this Stellio, and the skin thereof, it were very conuenient and necessarie in this place to shew the manner how the said slough (which is growne ouer him in winter) may be gotten from him when he hath turned himselfe out of it, considering that he vseth commonly to deuoure and eat it himselfe, because it should not do any man good; for there is not a beast againe more spightfull to mankind, and enuious of our commoditie: insomuch as this word * Stellio is growne to be a reprochfull tearme among vs. Well, to meet with this skin of his (as craftie as he is to be guile men of it) they vse to obserue in hot summer daies, his nestling hole into which he is wont to retire himself: and ordinarily they find it to be in some hollow crannies about doores & windows, or else vnder vaults and sepulchres: when they haue espied where it is, they wait for the prime of the Spring, they set iust against his hole certaine litle cages or leaps made of clouen and sluied reeds, and the same wrought and wouen good and thicke: and in very truth he delighteth to get betweene the streights and narrow passages of the staues and windings, whereof the said cages are made, for by means thereof he may the better slip himselfe out of that coat which cloggeth his body and maketh him vnweldie: and thus in getting through the said lattices, he leaueth the same behind him: but after he hath thus done, hard bested he is, for back he cannot the same way again for to eat the said slough. Certes, there is not a medicine preferred before it, for the falling sicknes: and yet good reckoning there is made of the brains of Weazles which haue bin kept and dried: yea and of the liuer so prepared, if they be reduced into pouder and so taken in drinke: yea their very genetours, and bagg or matrice wherein they beare and breed their young, or their maw likewise saued, dried and condire with coriander seed, are singular good for this maladie, as I haue heretofore noted: and so are their ashes. Some are of opinion, that it is good eating of them whole as they be, especially the wild kind, without any such preparing & dressing, but others esteeme ferrets to be as effectual as they, for the falling euil. Moreover, it is said: that the green lizard eaten with some sharp sauce that quickneth appetite, is singular good in this case, but the heads and feet must be first taken away. Moreover, the ashes of shell-snailles together with line-seed & nettle-seed, brought into the form of a liniment with honny, cure those thoroughly of this disease who are all ouer annointed therewith. But I like better yet, that for this maladie one should carrie about him the taile of a dragon bound within a buckler, or does skin to some part of his body, with the sinews of a stag or hind: or els to tie vnto the left arme

* *Stellionatus*
c. i. e. as much
as couzenage,
or cony-
catching.

A arme the little stones that be taken out of the craw or giser of yong swallows: for it is said, that so soone as the old swallow hath hatched her birds, she giueth them such little stones to swallow downe: but in case this dose be taken in the very beginning, and that the first time that one is false of this disease, there be giuen to him for to eat, the yong swallow that the dam hatched first, he shall be deliuered from it clearly and neuer haue more fits. But at any time after, swallowes blood and frankincense, or els the heart of a swallow fresh killed, cureth them that be surprized with this malady, if they swallow the same downe. Moreover, it is said, that the little stone found in a swallows nest, if it be but applied vnto man or woman that is false of this sickness, it will raise them out of the fit, and bring them againe to themselves immediately; but if they carry it tied to any part about them, they shall neuer haue fit againe. Much talke there is
B also of a kites liuer, that it should be of singular operation to this effect, if it be eaten: as also of a serpents old skin which she hath cast off, that it wil do no lesse. The heart of a vulture stamp together with the own blood, and giuen in drink 3 weeks together, worketh wonders in this disease. So doth the heart of the yong bird of a vulture, if the patient weare it about his arme, or hang it at his necke: but then they giue counsel, to eat the flesh of the vulture it selfe, & especially when he hath eaten his ful of mans flesh. Some of them ordaine the brest of a vulture to be drunk, but it must be out of a cup or maser made of the wood of Cerrus: and others there be who to this purpose cause the stones of a cock to be kept and dried, and the same to be giuen to the patient in water and milk, after he hath abstained fife daies from drinking wine. To conclude, there haue bin of them, that prescribed vnto their patients in this case, 2 1 of these sandy or reddish flies (but they must be dead ones) for to be taken in drinke: howbeit, if they were but of a feeble complexion, they gaue fewer of them.

СНАР. XI.

¶ *Against the Jaundise and Phrensie. Against Feauers and the Dropsie.*

THe excrement ingendred in the eares, called commonly Eare-wax, mightily withstandeth the jaundise: so doth that ordure also which gathereth about the vdders & tears of sheepe and goats, if the patient drink thereof to the weight of one denier in two cyaths of wine, with some myrrh, though it be neuer so little: the ashes of a dogs head calcined, taken in honied wine: one of these fowes or Cheeslips with many feet, in one hemine of wine: earthworms in honied vineger with myrrh, be all excellent for the said disease. Moreover, it is said, that a hen with yellow feet is very good therefore; in case the said feet be clenfed and washed first in faire water, afterwards bathed and rinsed in the wine that the patient is to drink. The brains of a Partridge Ægle, or other birds of prey, taken in three cyaths of wine, is very proper also therefore. The ashes of dates; those also of the entrails of stock-doues, given in honied wine to the quantity of three spoonfulls, are soueraigne in this malady: likewise the ashes of sparrows burnt in fire made of vine-wod, work the same effect, if they be taken in mead to the quantity of 3 spoonfulls. A bird there is called in Greeke Icterus, of the yellow colour which the feathers carry, which if one that hath the jaundise do but looke vpon, he or she shall presently be cured thereof, but the poore bird is sure to die for it: I suppose that this is the same bird which in Latine is called Galgulus.

As for the Phrensie, it seemes that the lights of a mutton, applied hot round about the head, and so kept fast, is soueraigne to bring their heads againe into temper, who are besides themselves. Say that true it were, that not only the brains of mice giuen in water to drink, or the ashes of a weazil, but also the flesh of an vrchin kept in salt ordred, are very good for such as are bereft of their right wits; who will venture to giue them these medicines, be they neuer so certain and assured? For as touching the ashes verily of Scrich owls eies calcined (which these Magicians so highly commend for the phrensie) I take it to be one amongst many other of their illusions, whereby they mocke and abuse the world. But above all, the course that they take in the cure of Feuers, fauoreth nothing at all of Physick, which indeed is opposit to all their rules and proceedings: for they haue diuided and digested the same into all the 12. signes in the Zodiack; according as the Sun or Moone passeth through any of them. All which, is nothing els but a meere mockerie to be rejected and vtterly condemned, as I will plainly prouoe and shew to the view of the eye by some few examples and instances gathered out of many. For in the first

place they ordain, that when the Sun is in Gemini, the combs, the ears, the nailes, and clawes of G cocks should be burned, and the ashes thereof tempered with oile, wherewith the sicke persons are to be annointed all ouer: but if the moon do passe through the said sign, the same cure (they say) is to be done with the ashes that come of their barbs & spurs: whiles either Sun or Moone say be in Virgo, the cure doth alter, and is to be wrought with barley corns in the same manner vsed. But how if either of these 2 planets bee in Sagittarius: then the wings of a Bat must serue the turne. In case the moone be entred into Leo, they employ the leaues and branches of the Tamariske; may it must be the tame and garden Tamarisk in any case. Lastly, if she be in Aquarius, they prescribe the coles made of box wood, punned and puluerized. Certes, I purpose not to run through all their receipts: such onely as are found and approued good, or at leastwaies carry some shew and probability thereof. I am content to set downe: as namely, when they giue order for strong odours and perfumes to be applied vnto patients lying of a lethargy, for to awaken and raise them out of their dead sleepe: among which peraduenture, the stones of a weazill dried and long kept, or their liuer burnt, may doe some good. And whereas they thinke it conuenient to apply hot vnto their heads all about, the lungs of a Mutton, they speake not altogether besides sense and reason.

As for quartane agues, so far as much as it is often seen, that all the physicke that is vsed about them doth little good or none at all, be a Physitian neuer so Methodical, Rational, & Diligent, yea, though he visits such patients ordinarily, & be present with them by their bed sides: in that regard I will not stick to relate many of their medicines and receipts for this disease; beginning first with those that are local, and outwardly to be applied, hanged, or worne about any part of the body. *Imprimis*, they say, that the dust or sand wherein any hawke or bird of prey hath basked or bathed her selfe, is singular good for the quartane ague, if the patient weare it in a linnen cloth tied with a red thred. Item, the longest tooth in the head of a cole-black dog, is very proper for this purpose. There is a kind of bastard wesps, which the Greeks thereupon call *Pseudospheces*, and ordinarily they do flie alone, and not in troupes as others doe; which, if they be caught with the left hand, and hanged about the neck vnder the chin, do cure quartans, as some Magitians say: howbeit, others attribute this effect to one of these wesps, which a man saw first the same yeare. Cut the head of a Viper off, or take out the heart aliue, and wrap the one or the other within a little linnen rag, and carry it about you, the quartane ague will be gone anon, by their saying. Some of them take only the little pretty snouts end of a mouse, or the very tips of K their saying. Some of them take only the little pretty snouts end of a mouse, or the very tips of the ears, and injoin the patient to lap the same in a red carnation coloured cloth, and so to carry it about him; but then the mouse must in any case be let go again and not killed. Others pluck out the right eie of a green lizard aliue, which done, within a while after they chop off the head: then they infold them both in a piece of goats skin, and giue the patient in charge to haue the same about him: and many there be, who by the direction of magitians carry about them in like manner for the same purpose, one of these flies or Beetles that vse to roll vp little bals of earth: and in very truth, in regard of this kind of beetle, the greater part of Ægypt honour all beetles, and adore them as gods, or at leastwise hauing some diuine power in them: which cerimoniall deuotion of theirs, *Appion* giueth a subtill and curious reason of, for he doth collect, that there is some resemblance between the * operations and works of the Sun, and this flie: and this hee L setteth abroad, for to colour and excuse the superstitious rites of his countrymen. Howbeit, the Magitians employ in the cure of a quartan ague, another kind of them * which hath little horns turning backward, but they must be gotten likewise with the left hand, or els they will doe no good. As for the third sort, spotted with white, and called in Latine by the name of *Fullo*, they appoint one of them to be slit through in two, and the 2 pieces to bee tied to both armes of the patient; whereas those of other kinds, they bind to the left arme only. Semblably they say, that the heart of a snake taken out of her body aliue with the left hand, cureth the quartan, if the patient carry it about him: as also, that whosoever taketh foure of the knots or joints of a scorpion's taile, together with the sting, and carrieth the same about him inwrapped within a piece of black cloth, with this charge, That for 3 daies space hee doe not see either the scorpion which M was let go, nor the party who tied the said cloth and that which is within it about him, hee shall be deliuered from the quartan ague: but after the returne of the third fit, the patient must hide this clout and the joints aforesaid, & bury them in the ground: some there be who lap a caters piller in a little piece of linnen cloth, & bind the same thrice about with linnen thred, making three

* Haply, because all these beetles be collected of the male sex, & none of them female: for in those little roundles of earth there breed grubs, which turne to be in the end beetles. * This beetle hee called before *Taurus*, i. Bull,

A three knots thereof, saying at the knitting of euery knot, that this they do to cure him or her of a Quartane feuer. Others carry about them a naked snail in a little piece of fine leather: or else foure heads of snails cut off and inclosed within a small reed. Many thinke it better to infold one of these fowls or Cheeslips within a Locke of wooll, and so to carry it about them against the quartane, or els the little grubs or worms whereof come the ox-flys, before their wings bee grown. And there be that for this purpose fit themselves with those small worms couered al ouer with a kind of down or Cotton, which are found in thickets, & among bushes or shrubs. Some of these Magitians giue direction otherwhiles to take 4 of the said wormes inclosed within a wal-nut shel, & to bind them to some part of the patient, or els the snails which be found naked without their shels. Others put a liue Stellion or star-lizard in some little casket or box, & lay B the same vnder the pillow or bolster where the patient laieth his head: but when the ague beginneth to decline and is like to go away, they let the Stellion go againe at liberty. They prescribe likewise to swallow downe the heart of a sea-gull or cormorant, taken forth of the bodie without any knife or instrument of yron: if not so, to keepe the same dried, to beat it to powder, and then to drink it in hot water. The hearts of swallows condite in hony, and so eaten, bee excellent good for the quartane ague, as our Magitians say. And yet some of them make no more ado, but giue of their dung to the weight of one dram, in 3 cyaths of goats milke and ewes milke, or els of wine cuit, before the access come. Howbeit, others would haue the Swallows themselves to be eaten whole without any dressing at all. The people of Parthia drink for the quartan ague the sixt part of a denier weight of an Aspis skin, with the like poise of pepper, & they hold C it to be a soueraigne remedy. *Chrysippus* the Philosopher was of opinion, and so he hath put down in writing, That to carry one Phrygianum tied to some part of the body, is excellent for the quartan. But what living creature he would meane by that same Phrygianum, neither hath he himselfe described, nor euer could I meet with any man that knew it: howbeit, I thought it good to set downe this remedy, being thus deliuered by so graue an Author as *Chrysippus* was, to stir vp the diligence of others, if haply there be any so industrious as will take paines to search farther into the thing, and learne what it might be.

In any of these long diseases which be called Chronique, it is commonly thought, That to eat the flesh of a Crow, & to apply vnto their body their * nest, is most excellent to bring them to an end.

D As for Tertian agues, it were an easie matter to try the experiments of such receipts as are giuen out for them: considering how the poore patients in hope of ease are willing enough & delighted to be doing and working conclusions: and namely to see whether the copweb, nest, and all, of that spider which they call * *Lycos*, incorporat with rosin and wax, & so applied as a frontale to the forehead and temples on both sides of the head, will do any good to rid them away. Certes, some vse to wear about them the spider it selfe, inclosed within a quill or piece of a reed: in which sort it is reported to auail much in the cure of other feuers. Also it is thought, That a green lizard hung about the neck aliue in some box sufficient to receiue it, is as effectuell. And these kind of medicines they affirm to be of great efficacy for to driue away those agues which by way of relapse vse often to return againe when they were thought to be cleane gone.

E Touching the dropsie, the tried grease of sweaty wooll taken in wine with a little Myrrh, so that the whole arise to the quantity of an Hazel nut, is supposed to be a singular receipt: but some put thereto Goose grease also and oile of Myrtles. The filthy ordure that gathereth about Ewes vdders, hath the same effect. Likewise, the flesh of an vchin long kept in powder or otherwise, and eaten, doth much good. To conclude, it is thought, that if the belly be rubbed well and annointed with that which a dog doth vse to cast by way of vomit, it helpeth those that bee in a dropsie, for it is reported to haue a speciall vertue to draw a water, and to drie vp the superfluous humidity ingendring that disease.

* *Nidum* Some reade *Nidum*.

* *Lycos*, Supposed to be our common spider that hunteth flies.

CHAP. XII.

Medicines for *S. Antonies fire*, Carbuncles, fellons, burns, crampes, or contractions of sinewes.

THE suet or grease of vnwashed wooll incorporat with oile of Roses and Tutie, is a proper liniment for *S. Antonies fire*: so is the blood of a tike, and earth-wormes reduced into an vnguent with vineger: but especially these *Cricquets*, crushed and wrought within ones hand

hand to the consistence of an vnguent and so applied. And this medicine last mentioned, is passing effectuall for the party himselfe that hath the handling of it: for it assureth him aforehand, that he shall not fall into the said disease in a whole yere following: but this Criquet must bee digged out of the ground with some instrument of yron, and the earth & all to be taken vp with it, for to serue in this cure. Moreover, it is said, That goose grease is very good in this case: so are the ashes of a Vipers head kept dried & then calcined, if the same be afterwards applied in form of a liniment with vineger. The old sloughs that snakes cast off, reduced into an vnguent with Bitumen and Lambs suet, quencheth this burning humor of *S. Antonies* fire, if the body be anointed therewith tempered in water, presently after the baine.

As for Carbuncles, the means to rid them away, is to annoint them either with Pigeons dung alone, or els mixed with Linseed and honied vineger: likewise, it is good to make a cataplasme of those Bees which haue bin drowned or killed in their own honey, and lay the same vpon the fore. Others apply vnto them either a pulstesse of fried Barley groats, or else a powder made with their meale. If there be a carbuncle risen in their priuities, the fattiness of greasie and vnwashed wooll, incorporat in hony and the skales refuse or cinders of lead, into a salve, cureth it: and the same healeth generally all other botches or vlcers in those parts. Sheeps dung that is fresh and greene, they hold to be singular for carbuncles, taken in the very beginning.

All tumors and hard swellings, which had need to be mollified, are made soft and brought downe most effectuall with Goose grease, or the fat of a Swan.

Moreover it is said, That a spider laid to any fellon, before it be once named what thing it is cureth the same; but it must not be removed from the place before the third day. The mouse called an Hardi (hew hangd vp aliue vntill it be dead, is very good for these fellons, in case it touch not the ground afterward, and that there be 3 circles or turnes made with it round about the fore; so that withall both the patient and the party that hath this cure in hand, spit vpon the floore three times in the doing thereof. Also the dung of Cocke or Henne (that which looketh reddish especially) tempered with vineger & laid to a fellon, healeth it: but the said dung ought to be fresh and newly meuted. Of the same operation and effect is the gisier of a Storke boiled in wine. Some there be that take certain flies of some odde and vneuen number, bruise and work them into the consistence of a saue; with their *ring-finger, and therewith apply them to the fellon. Others vse for the said purpose the filth ingendred in sheeps ears: old sheeps tallow mixed with the ashes that come of womens haire, reduced into a liniment, serueth to cure the sayd accident: so doth rams suet mixed with the ashes of a pumish stone calcined, and a like quantity in weight of salt.

As for burns and scaldings, the ashes of a dogs head burnt, are singular good to cure the same: so be the ashes of Dormice tempered with oile: sheeps treddles also mixed with wax: the ashes of mice and shell-snails; and this medicine will skin them so cleane, that there shall no scarre remaine afterwards to be seen. In like manner, the grease of Vipers: or the ashes of Pigeons dung calcined and reduced into a liniment with oile.

Touching the nodosities of the sinewes, the ashes of a Vipers head burnt and brought into an vnguent with the oile Cyprinum, is thought to be a soueraign medicine for to resolute them. Likewise, earth-wormes made into a cataplasme with honey, and so applied vnto the affected place. But if the said sinews doake and be pained, bind vnto them the serpent called Amphip-bena dead, and it will ease the grieve. The like effect you may looke for of Vultures grease, together with the gisier of the said foule, dried or stamped with old swines grease or lard, and so reduced into a liniment. And if we may giue any credit to the Magitians, a drinke made of honied wine, spiced with the ashes of a crich-owles head, together with a Lillie root, wil work the same effect.

In contractions of the sinewes, it is good to eat the flesh of stock-doues, especially if the same hath bin powdered and kept in salt. The flesh likewise of an Hedgehog is as good for crampes and spasmes: as also the ashes of a Weazil. The old slough that snakes leaue off, infolded within a piece of a Bulls skin or leather made thereof, is good to be worn tied about one for to prevent this disease: and more particularly for those spasmes or convulsions that draw the sinews of the neck so, as the head is pluckt backward, there is not a better medicine than to drinke the poise of three oboli of a kites liuer dried, in as many cyaths of mead or honied water.

When the skin turneth vp about the roots of the nails, or the excrescence of the flesh putteth the

A the fingers to pain, which accidents be called in Latine Reduvia, and in Greek Prerygia: it were good to vse to them the ashes of a dogs head calcined, or the matrice of a bitch sodden in oile; with this charge, to annoint them aloft with a liniment of butter, made of ewes milke and hony incorporat together. The burse likewise or little bladder, which containeth in it the gall of any beast, is good for this purpose.

If the snails be ragged and rugged, it is not amisse to apply vnto them Cantharides incorporat with pitch, without reemouing this plaister before the third day: or els to lay vnto them Locusts fried in Goats suet: sheeps tallow also is good therefore. Some mix therewith Birdlime made with Misseleto and Purcelane tempered together: others take Verdegis or rust of brasse and the foresaid birdlime, but they remove not the plaister off in three daies.

B

CHAP. XIII.

Receipts for staunching blood: reprefing or smiting backe the swelling incident to wounds: healing of vlcers and greene wounds: and generally for curing of many other maladies. Remedies all taken from dumbe creatures.

THE suet that commeth from the kell of a mutton, staies any flux of blood, if it be conueied into the place from whence it issueth: so is their rede, especially if it be the rennet of a yong Lambe tempered with water, eit her drawn vp into the nostrils or poured into them: this is thought to be such a soueraigne remedie, that when all others haue failed, it hath done the deed. The earthie substance sticking to shell-snails, hath the same effect: yea, and their verie flesh when they are pulled out of their houses. In case the nose do bleed excessiue, take the said shell-snails, bruse them and lay them to the forehead: they will staunch the bleeding: the copwebs also put vp into the nostrils. As for the brains of a Cocke or Capon, they stop a flux of blood issuing from the braine. But say that blood do gush immoderately out of a wound: it is wonderfull how the ashes of horse dung, together with egg-shells, will stop the same, if it be laid thereto.

As for *wounds, the grease of vnwashed wooll, incorporat with the ashes of torrifed and calcined Barley and Verdegis, of each a like quantitie, and so made into a plaistre, healeth them.

D The same is a soueraign salve for any corrosiue vlcers, be they neuer so maligne & cankerous. It eateth and consumeth the dead flesh about the brims and edges of vlcers, yea, and brings down the excrescence of proud flesh, reducing the same to be euen with the rest about it. The same doth incarnat likewise and skin the place after it is filled vp with yong flesh. If the vlcers proue to be ill fauoured cankers, it is thought, that the ashes of sheeps dung mixed with salnitre, is an effectuall powder for the same: and as great operation is attributed to the ashes of a Lambs leg bones, but principally if the said fores be of the nature of *Nunquan sana*, and will not skin vp, but scorne all healing plaisters whatsoeuer. Much vertue also is attributed vnto Rams lights in these cases, for it eateth away all the excrescences of ranke flesh in vlcers, and there is not the like againe vnto it, for reducing all vnto an equalitie. The very dung also of sheep heat vnder an earthen pan and afterwards wrought into a masse or paste, assuageth the tumour of any vlcers:

E And it serueth likewise to mundifie and heale fistulaes, as also to rid away the chil-blaines or bloody fells, which are our night-foes. But of al other, the ashes of an horse head is most forcible in this case, for it consumes all superfluous flesh growing in fores, and heales vp the same afterwards, no Spodium better. And yet it is said, that mice dung is very good therefore: like as the ashes of Weazils dung. The hard callosities in the bottome of vlcers, the Cheeslips or Sowes if they be stamped fresh and reduced drie into powder, do search thoroughly: like as all cankers also they cure, if they be incorporat with the right Turpentine and common *Bole-Armoniacke. And these medicines abouesaid are singular for those vlcers that be giuen to breed worms, and thereby are dangerous. And seeing I am light vpon the mention of wormes, it would be noted, that there be diuerse sorts of wormes which haue wonderfull properties in these cases: For first and formost, the grosse and fat wormes breeding in wood & timber, which the Latins call Cossi, are soueraigne healers of any vlcers whatsoeuer. But if the same be burnt with an equal weight of Annise seed, and reduced into a liniment by means of oile, they haue a speciall vertue to cure those fores that be corrosiue, which the Greeks call Nomæ. Earthwormes are great healers,

and

*Medico, i. the fourth or next to the little finger.

*Vulueribus. Some read: Viceribus, i. Vlcers.

*Sinopide: Some take it for Terra Sigillata: but it skilltch not much, seeing that Rubrica Sinopica, Terra Sigillata, & Bolus Armena, yea, and Terra Lemnia, little differ in operation, nisi secundum magnitudinem, as the learned think. Vide Encellum de re Metallina.

and soon do soulder greene wounds: in which operation they are so effectuall and speedy withal, G That if the sinewes be cut quite asunder, it is a common opinion, that they will consolidat and whiten them again in lesse space than a week: and therefore, because they should be ready and euer at hand, many preferue them for this purpose condite in hony. Indeed, when they be reduced into ashes, they are effectuall to eat downe the hard callosities growing in the sides and edges of vlcers, if they be incorporat with Tarre, or the Sicilian hony called Hyblæum. Some vie them dried in the Sun and tempered with vineger, for wounds: but this cataplasme they doe not remoue vntill 2 daies be past. After the same manner, the terrene or earthly substance of shel-snails do much good: yea, and taken forth whole as they be out of their shels, stamped and so applied, H they conglutinat greene wounds, and stay the running farther of corrosiue vlcers. Also there is a certain liuing creature, which is called Herpes by the Greeks; the same hath a peculiar property to heale any sore that * runneth on still and corrode as it goeth. For which kinde of vlcers, snails, bruised shels and all, be passing good: and the same incorporat with Myrrh and Frankincense, haue the name to heale sinewes that be cut in two: Moreouer, the fat of a Dragon dried in the Sun, is very effectuall: like as the brains also of a Cock, to heale green wounds, if the patient withall eat salt to his meat, which was calcined together with Vipers flesh: and by this means (they say) that any vlcers will sooner yeeld to the cure, and be healed with more speed. The renowned Physitian Antonius Musa, hauing certain Patients in cure vnder his hand, who had vlcers that were thought incurable, prescribed them to eat Vipers flesh; and wonderfull it is how soone he healed them cleane by that means.

* Which also is called Herpes: as the thingles willoe fire, and wolte.

The ashes of certain Locusts without wings, called by the Greeks Tryxalides, cause the thick rous and escars that grow about the brims of vlcers to fall off, and they consume the hard callosities thereof applied with honey. The ashes likewise of Pigeons dung tempered with Orpiment or Arsenick and hony, serue as a corrosiue to eat away any excrescence that ought to be consumed: the brains of schrich-owls incorporat with greafe, doth wonderfully conglutinat any wounds. As for those morimals, named by the Greekes Cacoethe, the ashes of a rams shank-bones & legs mixt with brest milk, is singular to heale them, so that the said sores were first well and thoroughly washed and bathed with fine linnen cloaths soaked in some conuenient liquour. There is a bird called an Hulat, which if it be sodden in oile, & so resolued, is good therefore, in case the same be incorporat with butyr made of ewes milk and hony. If the sides or brims of any vlcers be growne callous and hard, the Bees that are stifled and killed in hony, doe mollifie very well. The bloud and ashes of a Weazill calcined, doe cure the white filthy leprosie called Elephantiasis. The wounds occasioned by whipping and scourging, the marks also and wales remaining to be seen black and blew after such lashes and stripes, are done away and go presently out, with applying thereto a sheeps skin fresh and newly flaid. If there be any joint bruised or cracked, the ashes of a Sheeps leg bone, burnt, haue a special vertue to help the same: but much better, if they be incorporat into a cerot with wax. Of the same operation there is another plaster made; namely, if there be calcined with the former the jaws of the said Sheep, and a Harts horn: and if the wax be softened and resolued with oile of rofat. When bones be broken, it is good to apply vnto the fracture the brains of a dog spread vpon a linnen cloth or inwrapped therein, covering the said cataplasme with wooll laid aloft, and the same eft-soones moistened and wetting the said cataplasme with some astringent liquor:] this manner of cure doth soulder them lightly in 14 daies at the farthest. The ashes also of field-mice work the like effect as speedily, if the same be tempered with honey, or mingled with the ashes of earth-wormes: which also is able to draw forth spils of bones, and make them to worke out. The lights of a Mutton and of a Ram especially, reduce skars to their liuely colour againe, sutable vnto the skinn about: their tallow also mixed with sal-nitre: so do the ashes of a greene lizard: the slough that snakes cast off in the Spring boiled in wine: and Pigeons dung tempered with honey, and so applied. The same me- dicines do take away the filthy white Morpew, called in Latine Vitiligo, if they be vsed with wine: for which Morpew or infection of the skin, it is good to apply Cantharides, with twice as much of Rue leaues, which the patient must indure and abide, lying still vpon the place in the Sunne, vntill such time as the skinn begin to rise in pimples and little blisters. Afterwards it is needfull to foment and bathe the said place thus offended, yea, and to annoint it wel with oile: which done, to returne againe to the former emplastration, and so hold on this course by turns for many daies together, but in any wise to take heed that the exulceration in this cure

* As oile of rofat, or red wine

A go not ouer deep. For the same morpew, many giue order to make a liniment with flies & the root of docks, and herewith to annoint the places infected with this morpew: also, to apply thereto hens dung, I mean as much thereof as is white: for which purpose they keep the same in oile within horn boxes, for to serue the turne as need requireth. Likewise, to annoint them with the bloud of bats, or the gall of an Vrchin tempered with water. As for the running scalls, the brains of a schrich-owle is very good, incorporat with salt-petre: but dogs bloud hath no fellow to repress the same: like as to kill the itch, the little broad snails stamped and brought into a liniment, are soueraigne. If there be any spill or shiuer of arrowes, if any piece of a dart or whatsoeuer els stick within the flesh, which would bee gotten forth, split a liue mouse in the middest, and lay the same hot to the place, you shall see how it will draw the same out. But a Lizard passeth all the rest, being in this wise slit along and diuided: or if the head onely be stamped with salt, and applied accordingly. There be certain shel-snails that creep in troups together for to deuour the yong spring and green leaues of plants, which serue to this effect, if they be punned with their shels and laid to the place. Those also that we vse to dresse and eat, if they be taken forth of their shels: but if you put thereto the rennet of a yong hare or leueret, it is wonderfull to see how effectuall they will worke. Snakes bones incorporat with the rennet of any foure-footed beast whatsoeuer, within lesse than 3 daies shew the same effect, and draw forth any thing that sticketh within the body. Finally, the flies called Cantharides are much commended for this operation, if they be stamped and incorporat with barley meale.

CHAP. XIII.

¶ Proper remedies for the cure of womens maladies: and to help them for to goe out their full time, and bring forth the fruit of their womb fully ripe and accomplished.

The skin or secundine which an Ewe gleaneth after she hath yeaned, and which inlapped the lambe within her belly, prepared, ordered, and vsed (as I said before) as touching goats, it is very good for the infirmities that properly bee incident vnto women and occasioned by their naturall parts. The dung likewise of sheep, be they rammes, ewes, or weathers, hath the same operation. But to come vnto particulars, the infirmity which otherwhiles putteth them to passe their vrine with difficulty and by dropmeale, is cured principally by sitting ouer a perfume or suffumigation of Locusts. If a woman after that she is conceiued with child, vse eft-soons to eat a dish of meat made of cock-stones, the infant that she goeth with shall proue a man child, as it is commonly thought and spoken. When a woman is with childe, the meanes to preferue her from any shift and slip that she may carry out her full terme, is to drink the ashes of Porcupines calcined: also the drinking of a bitches milk maketh the infant within the womb to come on forward & to grow to perfection, before it seek to come forth vntimely: also, if the child stick in the birth, or otherwise make no haste to come forth of the mothers body when the time is come: the skin wherein the bitch bare her whelps within her body, and which commeth away from her after she hath puppied, hasteneth the birth, if so be it were taken away from her before it touch the ground.

If women in labour drinke milke, it will comfort their loins or smal of the back, Mice dung delaied and dissolued in rain water, is very good to annoint the breasts of a woman, new laied, to break their kernel, and to allay their ouermuch strutting presently after childbirth. The ashes of hedgehogs preferueth women from abortion or vntimely births, if they be annointed with a liniment made of them and oile incorporat together. The better speed and more ease shall those women haue of deliuerance, which in the time of their trauell drinke a draught of Goose dung in two cyaths of water: or else the water that issueth out of their owne body by the natural parts a little before the child should be borne, and that out of a weazils bladder. A liniment made of earth-wormes, if the nouch or chine of the necke and the shoulder blades be annointed therewith, preferueth a woman from the pain of the sinews, which commonly followeth vpon child-bearing: and the same send away the after-birth, if when they bee * newly brought to bed, they drink the same in wine cuit. A cataplasme made of them simply alone without any other thing, and applied to womens sore breasts which are impostumat, bring the same to maturation, breake them when they are ripe, draw them after that they runne, and in the end heale them vp cleane and

* Grauidis, et parturientis, hoc purgatio.

and skin all again. The said earthwormes also if they be drunk in honied wine, bring down milk into their breasts. There be certain little wormes found breeding in the common Coich-grasse, called Gramen, which if a woman weare about her neck, serue very effectually, to cause her to keep her infant within the wombe the ordinary terme: but the mnst leaue them off when she drawes neere to the time when she should cry out: for otherwise, if they be not taken from her, they would hinder her deliuerance. Great heed also there must be taken, that these wormes bee not laid vpon the ground in any hand. Moreover, there be Physitians who giue women to drink 5 or 7 of them at a time, for to help them to conceiue. If women vse to eat snailles dressed as meat, they shall be deliuered with more speed, if they were in hard labour: let them be applied to the region of the matrice or naturall parts with Saffron, they hasten conception. If the same be reduced into a liniment with Amylum and gum Tragacanth, and laid too accordingly, they do stay the immoderat flux of reds or whites. Being eaten in meat, they are soueraigne for their monthly purgations. And with the marrow of a red Deere they reduce the matrice againe into the right place, if it were turned a to-side: but this regard must be had, that to euery snaille there be put a dram weight of Cyperus also. If the matrice be giuen to ventosities, let the same snailles be taken forth of their shells, stamped and laid too with oile of Roses, they discusse the windnesse thereof. And for these purposes before named, the snailles of Aftypalæa be chosen for the best. Also for to resolue the inflation of this part, there is another medicine made with snailles, especially those of Barbarie, namely, to take two of them and to stampe them with as much Fenigreeke seed as may be comprehended with three fingers, adding thereto the quantity of four spoonfuls of hony, and when they be reduced all into a liniment, to apply the same to the region of the wombe, after the same hath been well and thoroughly annointed all ouer with the iuice of Ireos, i. Floure-de-lis. There be moreover, certaine white snailles that be small and long with all, and these be commonly wandering here and there in euery place. The beeing dried in the Sun vpon tiles, and reduced into powder, they vse to blend with bean floure, of each a like quantity. And this is thought to be an excellent mixture for to beautifie their body, and make the skin white and smooth. Also, if the itch be offensive, so as a woman be found euer and anone to scratch and rub those parts, there is not a better thing therefore than the little flat snailles, if they be brought into a liniment with fried Barly groats. If a woman with child chance to step ouer a Viper, shee shall be deliuered before her time of an vnperfect birth. The like accident will befall vnto her, in case she go ouer the serpent Amphisbæna, if the same were dead before. And yet if a woman haue about her in a box one of them aliue, shee shall not need to feare the going ouer them, though they were dead. And one of these Amphisbænes dead as it is, and preserued or condite in salt, procureth safe and easie deliuerance to a woman that hath it about her. A wonderfull thing, that it should be so dangerous for a woman with childe to passe ouer one of them which hath not bin kept in salt: and that the same should be harmelesse and do no hurt at all, if immediatly after it hath bin so kept, she step ouer it. A perfume made with a snake long kept and dried, procureth the desired sicknesse of women. The old slough of a snake, which she kept and dried, applied vnto the loines of a woman that is in labour, helpeth her to better speed: but it must be remoued presently after that she is deliuered. Many vse to giue it vnto women with child for to be drunk in wine with frankincense: for being taken otherwise it causeth abortion. The rod or wand whereby one hath parted or taken off a frog or toad from a snake, helpeth women that be in trauell of childbirth. And a liniment made with the ashes of the vnwinged Locusts called Tryxalides & hony tempered together, helpeth forward their monthly purgations. The spider likewise that commeth downe spinning from aloft, hanging by her fine thred which she draweth in a length, if she be caught with the hollow of the hand, bruised & applied accordingly, worketh the same effect: but take the same spider winding vp her yearne, and returning back to her nest vpward, it wil worke contrariwise, & stay the fleurs of women. The Ægle stone called A tites, because it is found in an Ægles nest, preferueth & holdeth the infant still in the mothers womb to the full time, against any indirec& practise of sorcery or otherwise, to the contrary. If a woman be in hard labor of childbirth, put a Vultures quill vnder her feet, it will helpe her to a more speedy deliuerance. Great bellied women, as it is well knowne & found by proofe, ought to be very chairey and to beware of rauens eggs, for if they chance to goe ouer one of them, they shall fall to labour presently, and slip an vntimely birth with great danger of their life. It seemeth to many, that the meuting of an Hawke drunke in honied wine, maketh women which were

were barren before, to be fruitfull. Certes, the greafe of a goose or swan doth mollifie any hard tumors, schirrh, and impostumations of the matrice and secret parts. Goose greafe mixt with the oile of roses and * Ireos, * preferueth womens breasts after they be newly brought to bed. In Phrygia and Lycaonia it is found by experience, that the fat of the Bistard or Horn-owle is verie good for greene women lately deliuered, if they be troubled with the pricking or shooting paines of their breasts: but for women that are in danger to be suffocated with the rising of the mother, they haue a liniment also made with the beetils or worms called Blattæ. The ashes of Partridge eggs calcined, mixed with brasse ore called Cadmia, and wax, & so reduced into a cerot, preferueth womens breasts plump and round, that they shall not be riuelled or flaggie: and it is thought, that if a woman make three imaginary circles round about them with a partridge egg, they shall continue knit vp and well trussed, and not hang downward if sauoredly: let a woman vse to sup them off, she shall be both a fruitfull mother of many children, and also a good milch nurse for to reare them vp. Also it is a generall receiued opinion, that if womens paps be annointed all ouer with goose greafe, it will allay the grieue and paine thereof: likewise there is not a better thing for to dissolue and scatter Moon-calues and such like false conceptions in the wombe: or to mitigate the scurfe or manginess incident to that member, than to apply to those parts a liniment made of punaises bruised or stamped to the purpose.

Bats blood hath a depilatorie facultie to fetch off haire, and lett the growing thereof; howbeit sufficient it is not alone to worke that feat in boies cheeks and chins whom we would keep smooth and beardless; except the place be rubbed afterward with the seed of rocket or hemlock: and in this manner if they be dressed, either no haire at all will come vp there, or els it will neuer be but soft down: it is thought that their brains also wil work the same effect. Now these brains be of two sorts, to wit, red and white: howbeit some giue counsell to mingle with the said brains both the blood and the liuer. Others there be who seeke in 3 hemines of oile a viper, vntill her flesh be thoroughly sodden, and as tender as may be, hauing before rid her from all her bones; and it they vse for a depilatorie: but first they plucke vp all those haire by the roots which they would not haue to grow any more. The gall of an vrchin is a depilatorie, especially if it be mixed with the brains of a Bat, and goats milke. Item, the ashes thereof simply, mingled with the milk of a bitch of her first litter; so that the haire which we would not haue to come againe be plucked vp; or if those places be annointed therewith where neuer yet grew any, none shall spring there afterwards. The same effect (by report) hath the blood of a tick that was taken from a dog: and finally, the blood or gall of a swallow.

CHAP. XV.

Many Receipts handled together disorderly one with another for sundry maladies.

It is said, that Ants eggs stamped & incorporat with flies likewise punned together, wil giue a louely black colour to the hairs of the eie-browes: also if a woman be desirous that her infant should be born with black eies, let her eat a rat while she goes with childe. To preserue the haire from being gray and grisse, annoint them with the ashes of earth-worms and oile oliue mixt together. If sucking babes be wrung or gnawne in the belly, by reason of some cruddled milk which they draw from their nurses, or doth corrupt so in their stomack, it is good to giue them in water the rennet of a yong lambe to drink: but in case this accident commeth by cailling of the milk, they vse to giue vnto them the said rennet in vinegar for to discusse the same. For the paine that they abide in toothing, the brains of an * hare is soueraigne to annoint their gums withall. It falleth out that yong infants many times be tormented with an vnaturall heat and burning of their head, called Siriasis; for to ease and cure them thereof, they vse to take the bones that are found in dogs dung, and to hang them about their necks or arms. Yong infants are subiect to ruptures and descents of the guts, in which case it is good (some say) to apply a greene lizard vnto their bodies whiles they lie asleepe, and to cause it to bite the place: but then afterward the said lizard must be tied fast to a reed and hung vp in the smoke: for look how it decaieth and dieth by little and little, so shall the rupture knit and heale again. The foamie moisture that shiel-snails yeeld, if childrens eies be annointed therewith, doth not onely reme the moisture, but streight the hairs of the eie-lids which grow crooked into the eies, but also nourisheth & causeth them to grow. The ashes of burnt shiel-snailles reduced into a liniment with frankincense

* Leporis or peris, (i. e.) of a Sheepe.

kincense and the white of an egg, doth in the space of 30 daies cure those that are bursten bellied. In the little horns of shell-snails there is found a certaine hard substance resembling grit or sand, which if it be hanged about a young infant, is a means that it shall breed teeth with ease. The ashes of snail shells when the snails are gon, incorporat in wax, and applied to the seat of the fundament, putteth backe the end of the tiwill that is fallen down and ready to hang out of the body: but you must not forget to mingle with the said ashes the bloody substance that is let out of a vipers brains when her head is pricked. The braines of a viper if they be put in a little fine skin, & worn by a yong child, helpeth it to breed teeth without any great pain: for the same purpose serue also the teeth of serpents, so they be chosen the biggest that are in their heads: rauiens dung wrapped in wool and hung to any part of yong infants, cureth the chin-cough.

Some things there remain as touching this argument, which hardly methinks I should not handle seriously & deliuer in good earnest: howbeit since there be diuers writers who haue put them down in writing, I must not passe them ouer in silence. They are of opinion and doe giue order, to cure the rupture and descent of the guts in little children, with a lizard: but how? first it ought to be of the male kind which is taken for this purpose; and that may soone be knowne, if vnder the taile it haue one hole and no more: then there must be vsed all means possible that the said lizard do bite the tumor of the rupture through a piece of cloth of gold, cloth of siluer, or purple: which done, the said lizard must be tied fast within a new cup or goblet that neuer was occupied, & so set in some smoky place where it may die. If little infants pisse their beds, a readie way to make them containe their water, is to giue them sodden mice to eat. If there be any suspicion of forcerie, witchcraft, or inchantment practised for to hurt young babes, the great horns of beetles, such specially as be knagged as it were with smal teeth, are as good as a countercharm and preferuatiue, if they be hanged about their necks. There is (as they say) a little stone within the head of an ox or cow, which they vse to discharge and spit out when they be in danger of death: the same if it be taken out of one of their heads which is suddenly stricken off before the beast beware thereof, & hanged about an infants necke or other part of the body, is wonderful good for breeding of teeth. Semblably they prescribe their brains to be caried about them in like maner, & for the same purpose: also the little bone or stone found in a naked snails back. Moreouer, the anointing of childrens gums with the brains of a yong sheepe, is singular good and effectual to cause them to breed their teeth with facilitie: like as goose grease instilled with the iuice of basil into their ears, cureth the infirmities therof. There be in many prickly herbs certain rough & hairy worms, which if they be hung about the necks of yong infants, do presently cure them, if haply there were any thing in their meat that sticke and lay hard in their stomack, for they wil cause them to puke it vp. To prouoke sleep there is not a better thing than the tried greafe of vnwashed wool, with some myrrh, be it neuer so little infused & dissolved in two cyaths of wine, or els incorporat with goose grease and wine of myrtles: for which intent they vse to take the bird called a Cuckow, and within a hares skin tie it to the patient, or els to bind the bil of a yong heron to the forehead, within a piece of an asse skin: and they are of opinion, that the same bill alone is as effectual, so it be well washed in wine: contrariwise, the head of a bar dried and hanged about the neck, keeps one from sleep altogether. A lizard drowned to death in the vrin of a man, disableth him from the vse of venery, who * drank the liquor whereof that vrine came: and no maruel, for why? the magicians repose a great thing in a lizard in loue matters. The excrements of snails which resemble dung, as also the dung of pigeons, tempered in a cup of wine and giuen to drink, coole fleshly lust. The right lobe or side of a vultures lungs prouoke men to Venus sports, if they cary it about them enwrapped within a cranes skin. In like maner the yelks of five pigeons eggs incorporat with swines grease to the weight of one denier Roman, and so supped off, work the same effect. Some eat sparrows vsually for this purpose, or sup their eggs. Also there be who carry about them the right stone of a cock, inclosed fast within a piece of leather made of a rams skin, and to good effect, if all be true that magicians say: who affirm also, that those women who are anointed with a liniment made of the ashes of the bird Ibis, incorporat with goose grease and the oile Ireos, shal if they be conceiued with a child go out their full time: and they say, that whosoever be anointed with a liniment made of the stones of a fighting cocke and goose grease, shall haue but little mind to performe the act of generation: or if the same be tied vnto any part of them within a piece of leather made of a rams skinne. In like manner, it is said that the stones of any other dunghill cock are of the same effect,

* Biberis, some
rende fecerit,
i. who made
the said water.

A effect, if together with the blood of the said cock, they be but laid vnder ones bed. If one pluck the haire out of a mules taile while the stallion couereth her, and bind the same together in a wreath or knot, & apply them to the legs or loins during the act of generation, they will cause (women) to conceiue whether they will or no. Whosoever maketh water vpon the very place where a dog hath lift vp his leg and pissed, so as both vrines be mingled together, folke say, he shall find himselfe thereby more vnlustie to the worke of Venus. A wonderfull thing it is (if it be true) which they report likewise of the ashes of a star-lizard or Stellion; that if the same be enwrapped within some lint or linnen rag, & held in the left hand, it stirreth vp the heat of lust, but thrust the same into the right hand, it wil coole one as much. Moreouer, that if one put vnder the pillow where a woman laies her head, a few flockes, or locke of wooll foked well in batts blood, it wil fet her on to desire the company of a man; or if she do take a goose tongue either in meat or drink. The old skin or slough that snakes do cast off in the Spring, whosoever drinketh in his ordinary drink, it will kill all the vermin or lice of the body within three daies: so doth the whey of milke after the cheefe is gathered, if one drinke the same with a little salt. If the braines of a weazill be put into the rendles or rennet that goeth to the making of cheefe, they say that the cheefe so made, shall neither corrupt all summer long, nor be eaten by the mouse. The ashes of the same weazill giuen to chickens or young pigeons among the past that is made for to feed them, secureth them from the weazill. Furthermore, it is said, that if a batt be tied vnto a horse or mare or such labouring beasts that are pained in their staling, they shall soon haue an end of that grieue and impediment: if they haue the wringing of the guts, or be troubled with the bots, there will ensue ease of their paine, presently vpon the making three turns or compasses round about their shap and naturall parts with a stockdoue. But see a maruellous matter! the doue being let go, dieth forthwith; and the beast immediatly is deliuered from paine. Moreouer, if you would know a remedy against drunkenesse, make this experiment; Giue for three daies together to great drunkards the eggs of an owle continually in their wine, they will take a loathing thereto and forbear drinking. Whosoever taketh the lights of a mutton roasted, and eateth the same before he sit downe to drinking, shall not be ouertaken or drunken, how freely soeuer he powreth downe the wine. The ashes of swallowes bills incorporat with myrrhe, will secure any man from drunkenesse, and cause him to beare his drinke well, in case the wine that he drinketh be spiced therewith: And Horus king of the Assyrians, deuised first this receipt against drunkenesse.

Quere besides all this, there by many other singular properties behind, worthy to be noted, which are attributed vnto sundrie beasts, and doe properly pertaine to this present treatise handled in this booke: for these magicians tel vs of a certain bird in Sardinia called Gromphana, like vnto a crane, but I beleue verily that the Sardinians at this day know not what bird it is. Within the said Island and prouince, there is a beast called * Ophion, which in haire only resembleth a stag, but in no place els doth it breed: and the very same authors haue told vs of another by the name of Sirulugus, but they set not downe in writing either the description what manner of beast it should be, nor the place where it should breed. I doubt not verily but such sometime there were, considering that they haue shewed diuers medicines that they do affourd.

E And M. Cicero writeth of a beast named Byturos, which gnaweth the vines in Campania.

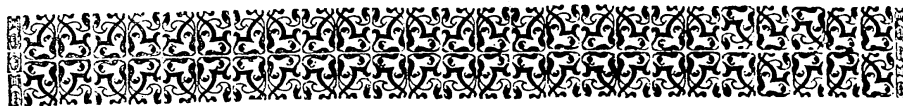

CHAP. XVI.

Strange wonders reported of certaine beasts.

Here remains yet certain wonderfull things to be spoken of, depending vpon those brute creatures, of which I haue treated already: namely, that whosoever haue about them the secondine of a bitch, that is to say, the skin wherein her whelps lay within her belly; or hold in their hands either the hair or dung of an hare, no dogs will bark at them wheruever they come. Also that there be a kind of gnats called Muliones, which liue not aboue a day. Moreouer, as many as haue about them the bill of a woodspecke when they come to take honny out of the hieue, shall not be stung by Bees: againe, let a man giue to swine among their meat, or in a morcell of past or bread, the brains of a rauen, they will follow him whither soeuer he goes. Furthermore, that if one be strewed with the dust wherein a mule hath wallowed & rumbled her self, he shal bewel cooled in loue, how amorous soeuer he were before. Ouere & besides, take a rat & cut

* A Muffie, as
Munster sa-
keeth it.

out his stones, and so let him go againe, he will make all other rats to run away. Make a mass or drench of a snakes skin, salt, red wheat called Far, with some wild running thyme, stamped all together, in one and the same day; put all into wine and conuey the same into the throat of a cow or ox, about the time that grapes begin to ripen vpon the vine, the said beasts will stand to health for a whole yeare after: or giue them young swallowes, and cause them to let the same downe their body in some past or bread at three seuerall times. Gather the dust together out of the place where you see a snake hath gone and made a tract, fling the same vpon a swarme of bees, they shall returne againe to their hieue. Tie vp the right stone or cullion of a ram, he shall get none but ram-lambs. And looke whosoever haue about the strings or sinewes taken from the wings and legs of a crane, they shall not be tired and faint in any labour that they take. If you would haue mules not to winse and fling out with their heels, giue them wine to drinke. Last of all, I cannot ouerpasse one notable and memorable example as touching the house of a mule: when *Antipater* should send the venomous water of the fountaine *Styx* for to poyson king *Alexander* the great, he could meet with no matter that would hold this poyson, without piercing and running through it, but onely the house of a mule: and to the knowledge hereof hee came, by the direction of *Aristotle* the Philosopher, who deuised a cup to be made thereof. A foule staine and blot of *Aristotles* name, for being priue to such vilanie, and setting it forward as he did. Thus much of Land-creatures: it remaineth now to returne againe to those of the Waters, and their vertues in Physicke.

THE XXXI. BOOKE OF THE HISTORIE OF NATURE, WRITTEN BY C. PLINIUS SECVNDVS.

The Proem.

CHAP. I.

¶ The medicinable vertues of creatures lining in water. The admirable nature of waters.

Now followeth the discourse of Water-beasts, and how beneficiall they be vnto vs in regard of Physicke: wherein verily dame Nature (the mother and workemistress of all things) sheweth how little idle shee is, not ceasing euen there also by her continuall operations to make knowne her wonderful power, among the waues and furling billowes, amid the reciprocal tides of the sea, ebbing and flowing in their alternatiue turnes; yea and in the swift course and streames of great riuers. And verily, to say a truth and speak as it is, there is no part of the World wherein the might and maiestie of Nature more appeareth, than in the waters: for this one Element seemeth to rule and command all the rest. Waters deuoure and swallow vp the earth: waters quench and kill the flames of fire: they mount vp aloft into the aire, and seeme to challenge a feignorie and dominion in the heauens also; whiles by a thick feeling and floore as it were of clouds, caused by the dim vapours arising from them, that vitall spirit which giueth life vnto all things, is debarred,

stopped,

A stopped and choaked. And what might the reason els be of thunder and lightnings flashing and breaking forth in that violence, and causing such trouble and broils, as if the world were at war within it selfe? And can there bee any thing more wonderfull and miraculous, than to see the waters congealed aboue in the aire, and so to continue pendant in the skie? And yet as if they were not contented to haue risen thus to that exceeding height, they catch and snatch vp with them into the vpper region of the aire, a world of little fishes: otherwhiles also they take vp stones, and charge themselues with that ponderous & weighty matter which is more proper to another Element. The same waters falling downe againe in raine, are the very cause of all those things here below which the earth produceth and bringeth forth. And therefore considering the wonderfull nature thereof, and namely, how the corne groweth vpon the ground, how trees and plants doe liue, prosper, and fructifie by the means of waters, which first ascending vp into the skie, are furnished from thence with a liuely breath, and bestowing the same vpon the herbs, cause them to spring and multiply; we cannot chuse but confesse, that for all the strength and vertue which the Earth also hath, (hee is beholden to the Waters, and hath receiued all from them. In which regard, aboue all things, and before I enter into my intended discourse of Fishes and beasts liuing in this Element, I meane first to set down in generality the marvellous power and properties of water it selfe, and to illustrat the same by way of sundry examples: for the particular discourse of all sorts of waters, what man liuing is able to performe?

CHAP. II.

¶ The diuersitie of waters: their vertues and operations medicinable: and other singularities obserued therein.

There is in maner no region nor coast of the earth, but you shall see in one quarter or other waters gently rising and springing out of the ground here and there, yeelding fountains in one place cold, in another hot; yea and otherwhils there may be discouered one with another neere adioynning: as for example, about * Tarbelli a towne in Guienne, and the Pyrenæan hills, there do boile vp hot and cold springs, so close one vnto the other, that hardly any distance can be perceiued between. Moreover, sources there be, which yeeld waters neither cold nor hot but luke-warme, and the same very wholesome and proper for the cure of many diseases; as if Nature had set them apart for the good of man only, and no other liuing creature beside. To these fountains so medicinable, there is ascribed some diuine power, inso much as they giue name vnto sundry gods and goddeses, and seeme to augment their number by that means: yea & otherwhiles great towns & cities carrie their names: like as Puteoli in Campanie, Statyellæ in Liguria; Aquæ Sextiæ in the prouince of Narbon or Piemont: but in no countrey of the world is there found greater plenty of these springs, and the same endued with more medicinable properties, than in the tract or vale Baianus within the realm of Naples, where you shall haue some hold of brimstone, others of alume; some standing vpon a veine of salt, others of nitre, some resembling the nature of Bitumen, and others againe of a mixt qualitie, partly soure, and partly salt. Furthermore, you shall meet with some of them, which naturally serue as a stoupe or hot-house; for the very steeme and vapour only which ariseth from them, is wholesome and profitable for our bodies: and those are so exceeding hot, that they heat the baines, yea and are able to make the cold water to seeth & boile again which is in their bathing tubs: as namely, the fountaine Posidianus which in the foresaid territory Bajanus, which name it tooke of one *Posidius* a slave sometime, and enfranchised by *Claudius Caesar* the Emperour. Moreover, there be of them so hot, that they are able to seeth an egg or any other viands or cates for the table. As for the Licinian springs, which beare the name of *Licinius Crassus*, a man may perceiue them to boile and reeke againe, euen out of the very sea. See how good Nature is to vs, who amid the waues and billowes of the sea, hath afforded healthfull waters! But now to discipher their vertues in Physicke according to their seuerall kinds: thus much in generality is obserued in these baths, That they serue for the infirmities of the sinews, for gout of the feet, & sciatica. Some more properly are good for dislocations of ioints, and fractures of bones: others haue a property to loosen the bellie & to purge: and as there be of them which heale wounds and vlcers, so there are again that more particularly be respectiue to the accidents of the head and ears: and among the rest, those which beare the name of *Ciceronianæ*, be so ueraign for the eies, Now there

M m 3

is

is a memorable manour or faire house of plaifance, situat vpon the sea side in the very high way G which leadeth from the lake Auernus to the cittie Puteoli; much renowned for the groue or wood about it, as also for the stately galleries, porches, allies, and walking places adioyning ther- into, which set out and beautifie the said place very much: this goodly house, *M. Cicero* called Academia, in regard of some resemblance it had vnto a colledge of that name in Athens, from whence he tooke the modell and patterne: where he compiled those books of his which carrie the name of the place, and be called * *Academicæ quaestiones*: and there he caused his monument or sepulchre to be made, for the perpetuities of his memoriall, as who would say, he had not suffi- ciently immortalized his name throughout the world, by those noble works which he wrote and commended vnto posteritie. Well, soone after the decease of *Cicero*, this house and Forrest both fell into the hands and tenure of * *Antistius Vetus*; at what time, in the very forefront as it were H and entrie thereof, there were discovered certaine hot fountaines breaking and springing out of the ground, and those passing medicinable and wholesome for the eies. Of these waters, *Laurea Tullius* (an enfranchised vassall of *Cicero*) made certaine verses, and those carying with them such a grace of maiestie, that at the first sight a man may easily perceiue how affectionate and deuout he was to the seruice of his lord and master: and for that the said Epigram is worthy to be read not onely there, but also in euery place, I will set it downe here as it standeth ouer those baines to be seene, in this Decasticon.

* Like as *Tuf- culane quaestio- nes*, which bee made in *Tuf- culano*, i. a ferm or house that he had in *Tusculum*.
* A noble man of Rome, Consult with *D. Laelius Bal- bus*, anno ab urbe condita 747.

*Quo tua, Romana vindex clarissime lingua,
Sylvia loco melius surgere iussa viret,
Atque Academia celebratam nomine villam.
Nunc reparat cultu sub potiore Vetus
Hic etiam apparent lymphæ non ante repertæ,
Languida quæ infuso lumina rore levanti.
Nimirum locus ipse sui Ciceronis honori
Hoc ædedit, hac fontes cum patfecit ope,
Ut quoniam totum legitur sine fine per orbem,
Sint plures, oculis quæ mediantur, aquæ.*

O prince of Romane Eloquence, loe here thy Groue in place
How Greene it is; where planted first it was to grow apace:
And *Vetus* now, who holds thy house, Faire Academic hight,
Spare for no cost, but it maintains and keeps in better plight.
Of late also, fresh fountaines here brake forth out of the ground,
Most wholesome for to bath fore eies, which earst were neuer found.
These helpfull springs, the Soile no doubt, presenting to our view,
To *Cicero* her ancient lord, hath done this honour due;
That since his books throughout the world are read by many a wight;
More waters still may cleare their eyes, and cure decaying sight.

In the same tract of Campaine, and namely toward *Sinuessa*, there be other fountaines called L *Sinuessan* waters, which haue the name not only to cure men of lunacie and madnes, but also to make barrain women fruitfull and apt to conceiue. In the Island *Enaria* there is a spring which helpeth those that be troubled with the stone and grauell: like as another water which they call *Acidula*, within 4 miles of *Teantum* in the *Sidicins* country, and the same is actually cold: also there is another of that kind about *Stabij*, called by the name of *Dimidia*: like as in the territory of *Venafrum*, that which proceeded from the source *Acidulus*, and gaue name to the foresaid water *Acidula*. The same effect they find who drink of the lake *Velinus*, for it breakes the stone. Moreouer, *M. Varro* maketh mention of such another fountain in *Syria*, at the foot of the moun- taine *Taurus*. So doth *Callimachus* report the foresaid operation of the river *Gallus* in *Phrygia*: howbeit they that take of this water must keep a measure, for otherwise it distraets their vnder- standing, & driues them besides their right wits: which accident hapneth to those (saith *Ctesias*) who drink of the red fountain (for so it is called) in *Æthiopia*: as touching the waters neer Rome called *Albulæ*, they are known to heale wounds: these waters are neither hot nor cold; but those which go vnder the name of *Cutiliæ* in the *Sabins* country, are exceeding cold, & by a certain M mor-

A mordication that they haue, seem to suck out the humors & superfluous excrements of the bo- dy; being otherwise most agreeable for the stomacke, sinewes, and generally for all parts. There is a fountain at *Thespia*, a city in *Boeotia*, which doth great pleasure to women that would faine haue children; for no sooner drinke they of the water, but they are ready to conceiue: and of this propertie is the river *Elatus* in *Arcadia*. In which region also the Spring *Linus* yeeldeth water, which if a woman with child do drink, she shall go out her full time & not be in danger to slip an vnperfect birth. Contrariwise, the river *Aphrodisium* in *Pyrhæa*, causeth barrenesse. The lake or meere * *Alphion* is medicinable, and cures the foule Morpew. *Varro* mine author makes mention of one *Tittius*, a man of good worth and sometime lord *Prætor*, who was to bewraied & painted all ouer his face with spots of Morpew, that he looked like an image made of spot- B ted marble. *Cydnus*, a river of *Cilicia*, hath a vertue to cure the gout; as appeareth by a letter written from *Cassius* the *Parmezian* vnto *M. Antonius*. Contrariwise, the waters about *Troezen* are so bad, that all the inhabitants are thereby subject to the gout and other diseases of the feet. There is a citie in * *Gaulle* named *Tungri*, much renowned for a noble * fountaine, which runneth at many pipes: a smacke it hath resembling the rust of yron, howbeit this taste is not perceiued but at the end & loose only: This water is purgatiue, driues away tertian agues, expels the stone and cureth the Symptomes attending thereupon: Set this water ouer the fire or neare to it, you shall see it thick and troubled, but at the last, it looketh red: Between *Puteoli* and *Naples*, there be certain wels called *Leucogæi*, the water wherof cureth the infirmities of the eies, and healeth wounds. *Cicero* in his booke entituled *Admiranda*, i. Wonders, among other admirable things C bath ranged the moores or fens of *Reate*, for that the water issuing from them, hath naturally a propertie from all others, to harden the houses of horses feet. *Eudicus* reporteth, That in the ter- ritorie of *Hestiaz*, a citie in *Thessalie*, there be two springs, the one named *Ceron*, of which, as many sheepe as drinke, proue black: the other *Melas*, the water wherof, maketh black sheepe turn white: let them drink of both waters mingled together, they will proue flecked and of diues co- lours. *Theophrastus* writeth, That the river *Crathis* in the *Thurians* countrie, causeth both kine and sheepe as many as drink thereof, to looke white: whereas the water of *Sybaris* giueth them a black hew. And by his saying, this difference in operation is seene also vpon the people that vse to drink of them: for as many as take to the river *Sybaris*, become blacker, harder, and withall of a more curled hair than others: contrariwise, the drinking of *Crathis* causeth them to look white D to be more soft skinned, & their bush of haire to grow at length. Semblably in *Macedonia* they that would haue any cattell to grow white, bring them to drinke at *Aliacmon* the river: but as many as desire they should be brown or black, drue them to water at *Axius*. The same *Theophras- tus* hath left in writing, That in some places there is no other thing bred or growing but brown and dusky, in so much as not only the cattell is all of that hew, but also the corne on the ground, & other fruits of the earth; as among the *Messapians*. Also, at *Lusa*, a city of *Arcadia*, there is a certain wel, wherein there keep ordinarily land-mice. As for the river *Aleos*, which passes through *Erythræ*, it makes them to grow hairie all their bodies ouer as many as drink thereof. In *Boeotia* likewise, near to the temple of the god *Trophonius* & hard by the river *Orchomenus*, there be two fountains, the one helps memory, the other causeth obliuion, wherupon they * took their names. E In *Cilicia*, hard at the town *Crescum*, there runs a river called * *Nus*: & by the saying of *M. Var- ro*, whoeuer drink thereof, shall find their wits more quicke, and themselves of better conceit than before. But in the Isle * *Chios* there is a spring, which causeth as many as vse the water to be dull and heauie of spirit. At *Zama* in *Africk*, the water of a certain fountain, makes a cleare & shrill voice. Let a man drink of the lake *Clitorius*, he shall take a misliking and loathing of wine, saith *M. Varro*. And yet *Eudoxus* & *Theopompus* report, That the water of the fountains be- foresaid make them drunk that vse it. *Mutianus* affirmes, That out of the fountain vnder the tem- ple of father *Bacchus*, within the Isle * *Andros*, at certaine times of the yere for 7 daies together, there runneth nothing but wine, in so much as they call it the wine of god *Bacchus*: howbeit, re- moue the said water out of the prospect and view (as it were) of the said temple, the tast wil turn F to be waterish again. *Polyclitus* writeth of a certaine fountaine of *Cillicia* neere vnto the citie *Soli*, which yeeldeth an vnction or oleus water, that serueth in stead of oile. *Theophrastus* re- ports the same of another fountain in *Æthiopia*, which hath the like quality. And *Lycus* saith, That among the *Indians* there is a fountain, the water wherof is vsed in lampes to maintaine light. And the like is reported of another water about *Ecbatane* [the capitall citie of *Media*.]

Theopompus

* Otherwise called *Aniger*: but this name itooke of *Al- phi*, which signifieth a kind of white morepew.
* He meaneth the Low- countries, cal- led sometime *Belgica Gallia*.
* Called now the bath of *Spagor* or *Spaw*.
* For the for- mer is called *phos*, or *phos- phos*, the later *phos*.
* *Quasi* sit, wit and vnderstan- ding.
* In *Chios*.

Theopompus writeth, That neere to Scorusa [in Macedonie] there is a lake, the water whereof is so-
 ueraign for the healing of wounds. Moreouer, king *Iuba* hath left in writing, That in the Troglo-
 ueraign country there is a lake, for the hurtful water that it beareth, called the Mad lake, which
 dures country there is a lake, for the hurtful water that it beareth, called the Mad lake, which
 thrice a day becommeth bitter and salt; and as many times for it turneth to be fresh and sweet:
 which course it keeps also in the night season, breeding otherwise white serpents twenty cubits
 long, of which it is crawling full. The same Prince (mine author) reports, That in Arabia there
 is a spring boiling out of the ground with such a force, that it scorneth and checketh any thing
 that is throwne into it, and cannot be kept downe with any weight whatsoever. *Theophrastus* ma-
 keth mention of the fountain Marfyas in Phrygia, neere vnto the town Celæna, which casteth
 vp great stones. And not farre from it be two other springs *Clæon and Gelon, so called by the
 Greeks for the contrary effects which they worke. At Cizicum there is a fountain of *Cupid*, and H
 whosoever drinke of the water thereof, shall lay aside and forget all affection of loue, as *Muti-*
anus doth both report and beleue. At Cranon there is a hot spring, and yet not so boyling as
 many others be: the water thereof, if it be put into a bottle or flaggon of wine, will maintain the
 heat thereof for three daies together, that it shall drinke hot. In Germany beyond the riuier
 Rhene, there be waters so hot, that whosoever drinketh thereof, shall sensibly find the heat in his
 body 3 daies after: The springs that yeeld this water be called *Mattiaci*. This peculiar property
 besides hath this water, that about the edges and brims thereof there engender pumish stones.
 Now if any man suppose some of these strange reports to be incredible, let him learne & know,
 that in no part of the world Nature hath shewed more admirable works than in this element of
 Water. And albeit in the beginning of this mine historie I haue written in ample manner of
 many a wonder obserued in the waters, yet somewhat remaineth still to be related. For *Ctesias*
 saith, That the Indians haue a lake or poole, wherein nothing will swim, but all sinks to the bot-
 tome. And *Calius* also our countryman auoucheth, That the leaues which fall into the lake A-
 vernus will settle downward and not flote aboue: And *Varro* auoucheth moreouer, That what
 birds soeuer flie ouer it, or approach the aire and breath thereof, they will die presently. Contra-
 riwise, in Apuscidamus a lake of Affrick, nothing goes down, but all swims aloft. The like doth
Appion report of Phinthia, a fountain in Sicilie: as also of a lake in Media, and namely the pit or
 well of *Saturne*. The fountain *Limyra* is wont ordinarily to change his seat, and to passe into
 places adioyning, but neuer for nought, prefaging alwaies thereby some strange accident to en-
 sue. And wonderfull it is, that the fishes therein should follow and do the like. Now when this K
 water is thus removed, the inhabitants of the country, desirous to know the issue of things to
 come, repaire thither as to an Oracle, and seek to be resolved by the foresaid fishes, and therewith
 offer to them some meate if they come vnto it and swim away with all, it is a good token, & this
 they take for an affirmatiue answer, as if they said, Yea, to their demands: but in case they refuse
 the meat and flit it away with their tailed, they collect the contrary, and this is their flat nay.
 There is a riuier in Bithynia called *Olachas*, running close to *Briazus* (which is the name both
 of a temple, and also of the god therein honoured) the water whereof will discouer and detect a
 perjured person: for if he that drinketh thereof, feele (as it were) a burning fire within his body,
 take him for a false forsworne villaine. Furthermore, in Cantabria or Biscay the fountains of the
 riuier *Tamaricus*, are endued with a secret vertue to preface and foretell future euents: and three L
 heads or sources there be of them, eight foot distant one from another: they meet all at length
 in one channell, and maintaine the great and mighty riuier *Tamaricus*. Howbeit, twelue times
 euery day, yea and otherwhiles twenty times they are dry, and haue no shew at all or appearance
 of water, notwithstanding there be another fountain or well neere to them, that yeeldeth plenty
 of water, notwithstanding there be another fountain or well neere to them, that yeeldeth plenty
 of water, and neuer giueth ouer running. And this is held for an ominous and fearefull preface,
 if when folke are desirous to see them, they seeme not to run at all: as it was scene of late daies
 by *Lartius Licinius*, sometime lord Pretour and afterwards Lieutenant Generall vnder the Con-
 suls. For within a feuen-night after, a great misfortune happened vnto him. In Iurie there is a
 riuier which euery Sabbath day is dry. Thus much of waters medicinable and miraculous, and
 yet not simply hurtfull. Contrariwise, there be others of as wonderfull a nature, but dangerous M
 they are and deadly withall.

Ctesias writeth, That there is a fountain in Armenia, breeding and bringing forth black Fi-
 shes: wherupon, as many as feed, are sure to die for it immediatly. I haue heard the like reported
 of such dangerous fishes about the head of the riuier *Danubius*, vntill a man come to a foun-
 taine

rairie which presently discharge it selfe into the channell of the said riuier: for beneath that
 place such fishes go not, nor enter lower into the riuier. And hereupon the fountain is by the
 generall voice of people taken to be the very source and head of *Danubius* afore said. The selfe-
 same accident as touching fish, is reported by a poole in Lydia, called the poole of the nymphs.
 In Arcadia neere vnto the riuier *Pheneus*, there floweth a water out the rockes called *Styx*,
 which is present death to as many as drink thereof, as heretofore I haue shewed: And *Theophras-*
tus saith moreouer, that in this water there be certaine small fishes (a thing that a man shall ne-
 uer see in any other venomous fountains) and those likewise are as deadly as the water. *Theopom-*
pus writeth, That in Thracia there be waters about the place called *Chropfos*, which kill those
 that drinke thereof. And *Lycus* maketh report of another fountain in the *Leontines* country;
 wherof as many as drink die within three daies. *Varro* hath left in writing, That neere to the hill
Soraete there is a fountain foure foot large, which at the rising of the Sunne ouerfloweth like
 boyling water: but the birds that haue tasted of the water die presently, and are there to be seen
 lying dead. For this secret mischief, there is besides in many of these waters, that they are faire
 and cleare to see to, and thereby seeme to allure both man and beast to drinke thereof, for their
 owne bane and destruction: as we may see by *Nonacris* in Arcadia, for surely this fountain gi-
 ueth no suspicion at all, wherby we should mistrust a venomous quality, and yet some are of opi-
 nion, That the hurt which commeth thereby, proceedeth from excessive cold; and they ground
 their reason vpon this, That the water issuing out of it into riuers and rills, will congeale and
 grow to a stony substance. It saith otherwise about the vale of *Tempe* in Thessalie, where the
 water of a certaine fountain is fearfull to see to, and there is no man but abhorreth the sight
 thereof, besides the corrosiue quality that (by folks saying) it hath, to fret and eat into brasie, and
 yron: the best is, that (as I haue shewed before) it runneth not farre, and the course that it holdes
 is but short. But wonderfull it is, that a certaine wild Carob should enuiron this source round
 about with his roots, and the same continually beare purple flours, as it is reported to do. Also,
 in the very brinke and edge of this fountain there is another herbe of a kind by it selfe, which
 abideth fresh and Greene from one end of the yeare to another. In Macedonie, not far from the
 tombe of *Euripides* the Poet, there be two riuers run together, the one yeelds water most whole-
 some for to be drunke: the other is as noisome and deadly. Neere to *Perperena*, a towne in *Tro-*
as, there is a spring the water whereof giueth a stonie coat or crust to all the earth that it either
 ouerfloweth or runneth by: of which nature are the hot waters issuing out of a fountain neare
Delium in Euboea, for look what way soeuer the riuier runs, you shall see the stones to grow still
 in height. About *Eurymena*, which is in Thessalie, there is a well, cast into it any chaplets or
 gairlands of floures, they will turne to stones. There runneth a riuier by *Colossi*, a city in *Phry-*
gia, into which if you throw bricks or tiles that be raw and vnbacked, you shall take them forth
 againe as hard as stones. Within the mines of the Isle *Scyros* there is a riuier, which conuerteth
 into stone all the trees that it runneth by or toucheth, as well the boughs as the bodies. In the
 famous and renowned caues called *Corycia*, all the drops of water that distill from the rocke;
 turne to be as hard as stones: and no maruell, for at *Meza* in Macedonie, a man shall see the
 drops of water become stone, as they hang to the very vaults of the rocke, much like to yfickles
 from the caues of houses in Winter time: whereas at *Corycum* abouenamed, the said drops turn
 into stone when they are fallen downe, and not before. In certain caues they are to be seen con-
 uerted into stones both waies, and some of them are so big, as they serue to make columnes and
 pilastres of, and those otherwhiles of diuers colours to the eye: as may be seen in the great caue
 of *Phausia*, which is within the Chersonese of the *Rhodians*. Thus much may suffice by way of
 examples, to shew the varietie of waters, with their sundry vertues and operations.

CHAP. III.

¶ The qualitie that is in waters. How a man may know which be good and wholesome
 from such as be naught and vnwholesome.

Much question there is & controuersie among physicians, What kind of water is best; and
 yet with one generall consent they condemne, and that iustly, all dead and standing wa-
 ters; supposing those that run to be better: for it standeth with good reason, that the very
 agitation and beating vpon the banks as they beare streame in their current, maketh them more
 subtiler.

Rain water.

subtile, pure, and cleare, and by that meanes they get their goodnesse. Which considered, I G
maruaile very much at those who make most account of the * water gathered and kept in ce-
sternes: But they ground their opinion vpon this reason, because raine water is of all others
lightest, as consisting of that substance which was able to rise and mount vp aloft, and there to
hang aboue in the aire. Which is the cause also, that they preferre Snow water before that
hang aboue in the aire. Which is the cause also, that they preferre Snow water before that
which commeth downe in shoures: and the water of yce dissolued, before the other of melted
Snow; as if the water were by yce driuen together and reduced to the vtmost point of finenesse.
They collect hereby, that these waters, to wit, raine, snow, and yce, bee all of them lighter than
those that spring out of the earth: and yce among the rest farre lighter than any water, in pro-
portion. But this opinion of theirs is to bee reputed as erroneous, and for the common good
and profit of mankind to be refuted: For first and formost, that leuitie whereof they spake, can
hardly and vnnearth bee found and knowne by any other meanes than by the sence and feeling
of the stomacke: for if you goe to the weighing of waters, you shall perceiue little or no diffe-
rence at all in their poise. Neither is it a sufficient argument to prouoe raine water to be light,
because it ascendeth on high into the aire, for wee may see stones likewise drawne vp into the
clouds: and besides, as the raine falleth downe againe, it cannot chuse but be infected with the
grosse vapours of the earth. Whereby it commeth to passe, that wee find raine water ordina-
rily to bee most charged and corrupted with ordure and filthinesse: and by reason thereof it
heateth most quickly and corrupteth soonest. As for snow and yce, that they should bee
thought to be composed of the subtile parts of this Element, and yeeld the finest water,
I wonder much, considering the neare affinitie which is betweene them and haile, which might
induce vs also to thinke the same of it: but all men confesse and hold, that the same is most
infertile and pernicious for to bee drunke. Moreover, there are amongst them not a few, who
contrary vnto the opinion of other Physicians their fellows, affirme flatly and confidently
the water of snow and yce to bee the vnwholesome drinke that is, for that all the puritie and
finenesse thereof hath bene drawne and sucked out. And in very truth, wee find it by ex-
perience, that any liquor whatsoever doth diminish and consume greatly by beeing fro-
zen and congealed into an yce. Wee see besides, That ouer-grosse and foggie dewes breed
a kinde of scurfe or scab in plants: white frosts burne and sendge them: and both of these, the
hore frost as well as the dew, proceed from the same causes in a manner that snowes doe.
Certes, all Philosophers agree in this one point, That raine water putrifeth soonest of any
other, and least while continueth good in a ship, as saylers know full well. Howbeit, *Epige-
nes* auoucheth and affirmeth, That the water which hath bene seuen times putrified and as
often purified againe, is subiect no more vnto putrification. And as for cesterne waters, the
Physicians also themselves confesse, That they breed obstructions and schirrhosities in the
bellie, yea, and otherwise be hurtfull to the throat. As also, that there is not any kinde of wa-
ter whatsoever, which gathereth more mud or engendreth more filthie and illfaunoured ver-
mine than it doth. Neither followeth it by and by, that all great riuers indifferently are
the best: no more than those of any brooke, or the most part of ponds and pooles are to
bee counted and esteemed most wholesome. But of these kinds of water wee must conclude
and resolue with making distinction, namely, That there be of euery sort thereof those which
are singular and very convenient, howbeit, more in one place than in another. The kings and
princes of Persia bee serued with no other water for their drinke but from the two riuers, Cho-
aspes and Eulæus onely: And looke how farre soeuer they make their progresse or voyage
from them two riuers, yet the water thereof they carry with them. And what might the rea-
son be therefore? Certes, it is not because they be riuers which yeeld this water, that they like
the drinke to well: for neither out of the two famous riuers, Tygris and Euphrates, nor yet
out of many other faire and commodious running streames doe they drinke. Moreover,
when you see or perceiue any riuier to gather abundance of mud and filth, wote well, that ordi-
narily the water therof is not good nor wholesome: and yet if the same riuier or running streame
bee giuen to breed great store of yeeles, the water is counted thereby wholesome and good
ynough. And as this is a token of the goodnesse, so the wormes called * *Tineæ*, engendered
about the head or spring of any riuier, is as great a signe of coldnesse. Bitter waters of all o-
thers bee most condemned: like as those also which soone follow the spade in digging, and
by reason that they lyesobbe, quickly fill the pit. And such be the waters commonly about

* Which some
take for Sows.

Trozen.

A Troezen. As for the nitrous, brackish, and * salt waters found among the deserts, such as trauell
through those parts toward the red sea, haue a deuise to make them sweet and potable within
two houres, by putting parched barley meale into them; and as they drinke the water, so when
they haue done they feed vpon the said barley grots, as a good and wholsom gruel. Those spring
waters are principally condemned, which gather much mud and fettle grosse in the bottome:
those also which cause them to haue an ill colour who vse to drinke thereof. It skilleth also very
much to mark if a water staine any vessels with a kinde of greene rust; if it be long before pulse
will be sodden therein; if being poured vpon the ground, it be not quickly sucked in and drunk
vp, and lastly, if it fur those vessels with a thicke rust wherein it vseth to be boiled: for all these
be signes of bad water.ouer and besides, it is a fault in water, not only to stink, but also to haue
C any smack or tast at all, yea though the same be pleasant and sweet enough, and inclining much
to the rellice of milk, as many times it doth in diuers places. In one word, would you know a
good and wholsome water indeed? Chuse that which in all points resembleth the aire as neere
as is possible. At Cabura in Mesopotamia there is a fountaine of water which hath a sweet and
redolent smel: setting it aside, I know not any one of that qualitie in the whole world againe:
but hereto there belongs a tale, namely that this spring was priuiledged with this extraordinary
gift, because queen *Inno* (forsooth) sometimes bathed and washed her selfe therein: for other-
wise, good and wholesome water ought to haue neither tast nor odor at all. Some there be who
iudge of their wholsomnesse by their ballance, and they keep a weighing and poising of waters
one against another: but for all their curiositie they misse of their purpose in the end; for sel-
dom or neuer can they find one water lighter than another. Yet this deuise is better and more
certain, namely, to take two waters that be of equal measure and weight: for looke whether of
them heateth and coolerth sooner, the same is alwaies the better. And for to make a trial herof,
lade vp some seething water in a pale or such like vessel, & set the same down vpon the ground
out of your hand, to ease your arm of holding it hanging long in the aire; and if it be good wa-
ter, they say it will immediatly of scalding hot become warm and no more. Well, what waters
then, according to their sundry kindes in generalitie, shall we take by all likelihood to be best?
If we go by the inhabitants of cities and great towns, surely, wel-water or pit water (I see) is sim-
ply the wholsomest. But then such wells or pits must be much frequented, that by the continual
agitation and often drawing thereof, the water may be more purified, and the terren substance
D passe away the better by that means. And thus much may suffice for the goodnesse of water re-
spectiue to the health of mans body.

But if we haue regard to the coldnesse of water, necessarie it is that the Wel should stand in
some coole and shadowie place not exposed to the Sun, and nathelittle open to the broad aire,
that it may haue the full view and sight (as it were) of the sky. And aboue all this, one thing
would be obserued and seen vnto, that the source which feedeth it spring and boile vp directly
from the bottom, and not issue out of the sides: which also is a main point that concerns the per-
petuitie thereof, and whereby we may collect that it will hold stil, and be neuer drawn dry. And
this is to be vnderstood of water cold in the owne nature. For to make it seem actually cold to
the hand; is a thing that may be done by art, if either it be forced to mount aloft, or fall from on
E high, by which motion and reuerberation it gathers store of aire. And verily the experiment
hereof is seene in swimming; for let a man hold his winde in, he shall feele the water colder by
that means. *Nero* the Emperor deuised to boile water, & when it was taken from the fire to put
it into a glasse bottle, and so to set it in the snow a cooling; and verily the water became thereby
exceeding cold to please and content his tast, and yet did not participate the grossnesse of the
snow, nor draw any euill qualitie out of it. Certes, all men are of one opinion, that any water
which hath been once sodden, is far better than that which is still raw. Like as, that after it hath
been made hot, it will become much colder than it was before, which I assure you came first
from a most subtil and witty inuention. And therefore if we must needs occupy naughty water,
the only remedy that we haue to alter the badnesse thereof, is to seeth it wel vntil the one halfe
F be consumed. Now if a man desire to know the vertue and commoditie of cold water: first, it or-
dinarily stancheth any flux of blood, if it be cast vpon the place. Also if one be not able to en-
dure the heate in a bain or hot-house, the best way to auoid this inconuenience, is to hold in his
mouth cold Water all the while. Moreover, many a man hath found by a verie familiar expe-
rience,

* *Salsus*, al-
though some
reade *Salmac-*
das, which be
holden for wa-
ters that will
effeminate the
that drinke
thereof. But
such waters be
impertinent to
this place: ac-
ther doe we
reade of the
fountain *Sal-*
matis to be in
this desert.

rience, that the coldest water in the mouth is not alwaies the coldest in the hand. And contrari-
wise, when it is exceeding cold without to be felt, it is not so sensibly cold within to be drunk.

Of all Waters in the world, that which wee call here in Rome Martia, carrieth the greatest name by the generall voice of the whole City, in regard both of coldnesse and wholesomnesse. And verily we may esteeme this water for one of the greatest gifts that the gods haue bestowed vpon our city. In times past it was called Aufeia, and the very fountaine from whence it cometh, Piconia. The head or source thereof ariseth at the foot of the vniuersall mountains of the Pelignians: it runneth through the Marsians country, and passing through the lake Fucinus, it tendeth no doubt euen then directly toward Rome; but anon it is swallowed vp within a hole vnder the ground, so as it is no more seen vntill it shew it selfe again in the territorie of the Tiburtines; from which place it is conueyed vnder vaults, and so carried through to Rome by arch-works for the space of nine miles. The first that began to bring this water to the city, was

* No manuell
then if it were
called Martia.

Ancus * Martius one of the Roman Kings. Afterwards Qu. * Martius Rex, in his Pretorship finished the said worke: and when in processe of time it was fallen to decay, M. Agrippa repaired it againe: who also brought the water named Virgo to the city, which hath her head eight miles from Rome, in a certaine nouke or by-corner about two miles turning from the great port way leading to Præneste. Neere vnto it runneth the riuer Herculeus: but this water keepeth still behinde, as though it fled from it, whereupon it tooke the name Virgo. Compare these two ri- uers together which are conueyed to Rome, you shall see the difference before said as touching the coldnesse of waters; for looke how cold Virgo is to the hand, so much is Martia in the mouth. But long ago haue we of Rome lost the pleasure and commoditie of these two Rills, through the ambition and auarice of some great men, who haue turned away these waters from the City, where they yeelded a publike benefit to the Commonwealth; and deriued them for their priuat delight and profit, into their owne mannors and houses in the country, for to water their gardens, and serue to other vses.

And here in this place I thinke it not impertinent to adioine to this present treatise, the man- ner and skill of searching and finding out waters. And first to speake in general terms: springs ordinarily be found in Vallies, in the pitch or crest of some little hill where it hath a fall and descent, or else at the foot of great mountaines. Many are of opinion, That in any tract what- soeuer, that side or coast which regardeth the North is giuen to haue water in it. And verily it were not amisse to shew how Nature disposeth her selfe and worketh variably in this be- halfe. First, a man shall neuer see it raine on the South side of the mountaines in Hyrcania, which is the reason, that on that part onely which lieth to the North they are giuen to beare wood, and be full of forests. But Olympus, Ossa, Parnassus, Apenninus, and the Alpes, be re- plenished with Woods on all sides, and are furnished with their Springs and Rivers euerie where. In some countries the hills be Greene, and watered on the South side onely. As for ex- ample in Candy, the mountaines called * Albi: so that there is no heed to be taken by this, for the rule holdeth not alwayes. But to come now vnto particulars: Looke where you see grow- ing Rushes, Reeds, or the * Herbe whereof I made relation before, be sure you shall find water vnderneath. Item, Where soeuer you finde Froggs lying in any place vpon their backs; make account of good store of water there. As for the wilde and wandering Sallow, the Aller tree, Agnus-Castus, or Yvie, they come vp many times of their owne accords, in some low grounds where there is a settling or stay of raine water fallen from higher places: in so much as they that goe by these signes to finde some Spring may soone be deceived. A surer signe yet by farre, is a mist or exhalation, which a man may discouer a farre off a little before the Sunne ris- ing. And for to espie it the better, some there be who get vp into an high place, and lay them- selues grouel long with their chinnes touching the ground; and by that meanes discerneth where any such smoke or vapor doth arise. There is also another speciall means besides to find out Waters, but knowne it is vnto those onely who be skillfull and expert in this feat. For they that are guided by this direction to Water, goe forth in the hottest season of the yeare, and about the noone-tide of the day to marke the reuerberation of the Sunne beames in any place: for if this repercussion and rebounding appeare moist, and namely when the face of the earth looketh dry and thirstie, they then make no doubt but to finde Water there. But they had need to looke so intently and earnestly, that oftentimes their eyes ake

lib. 26.

and be pained withall. For auoiding which trouble and inconuenience, some betake themselves to other experiments, and namely, they dig a trench or ditch fise foot deep within the ground; the mouth whereof they couer all ouer with earthen vessels of potters worke vnbacked, or els with a barbars brazen bason well enuailed; and withall a lamp burning: ouer all which, they make a little arch-work of leaues and boughs, and mould thereupon. Now if they come within a while after to this place, and either see the earthen pots broken or wet, or perceiue a dew or sweat stand- ing vpon the brasse, or finde the lamp aforesaid gon out, and yet no want of oile to maintaine light, or if they feele a lock of wool which they hung within the trench to be moist, they assure themselves they shall find water if they sink the pit deeper. Some there be, who for better assur- ance hereof make a fire in the place, and burne it throughly; for then the vessels aforesaid if they proue to be wet, giue a more infallible hope of a spring. Moreover, the very leire it selfe of the soile, if it be spotted with white specks, or be altogether of a reddish bright colour, promi- seth spring water to be vnderneath; for if the ground look black, lightly the water wil soon fail if there be any spring there found. If you chance to light vpon a vein of potters clay or chalk, make account you shall meet with no spring there, sink as deep as you will: and therefore work- men when they come to it giue ouer presently. For a great regard they haue to obserue the change of euery coat (as I may so say) of the earth as they dig, to wit from the black delfe, vntil they meet by degrees with the veins aforesaid. Furthermore it is to be noted, that the water which is found in cley grounds is alwaies sweet and potable: like as that which a stony and gritty soile doth yeeld, is commonly colder than any other: and such a kinde of ground also is allowable for the prooue of good waters; for it ingendreth sweet and wholesome water, light also of digestion, and pure withal, by reason that as it passeth by a soft grit as it were, through a strainer, all the grossenesse thereof it leaueth behind sticking thereto. As for * thicke sand & gra- uell, it affordeth small and slender springs, and those not durable; besides, the water wil quickly gather mud. Ground giuen to beare * pibbles or the grosser sort of grauell, giue vs no security that the springs therein wil hold all the yeare long, howbeit the water is very good & pleasant. The hard and compact grauell called the male grauel, and the land which seemeth full of black and burnt carbuncle stones, bringeth forth wholesome waters, and the sources be sure and perdu- rable. But red stones yeeld the best simply, and those that we may be sure will neuer giue ouer and faile. And therefore when wee shall perceiue the foot of a mountaine standing vpon such stone, or vpon flint, wee may boldly reckon of wholesome and euerlasting springs; and this gift they haue beside, to be passing cold. Moreover, in digging and sinking pits, marke this for an assured and infallible signe that you approach vnto water, namely, if the earth appeare and shew moist more and more, still as you go lower and lower: also if the spade enter more willingly, and goe downe with ease and facilitie. When pioners haue wrought deepe vnder the ground, and then chance to meet with a veine of brimstone or alume, the dampewill stop their breath and kill them presently, if they take not the better heed: and therefore to foresee and preuent this danger, they vse to let downe into the pit a candle or lampe burning; for if it goe out, they may be sure it hath met with the dampe. Therefore if pits be subiect to the rising of such va- pours, cunning and expert workemen make on either side of such pits, both on the right hand and the left, certaine out-casts, tunnels, or venting holes, to receiue those hurtfull and danger- ous vapours, whereby they may evaporat and breathe forth another way. Otherwhiles it falls out, that the aire which they meet with in digging very low, doth offend the pioners, albeit there be no brimstone nor alume neere: but the ready meanes to amend the same and auoid the danger, is to make winde and fresh aire with continuall agitation of some linnen clothes. Now when the pit is sunke and digged as far as to the water, the bottome must be layd, and the low- est sides of the wall reared of stone simply without any mortar made of [lime and] sand, for feare lest the veins of the source be stopped. Some waters there are, which in the verie prime and beginning of the spring are of this nature, That they grow to be exceeding cold, namely such as haue their source or spring lying but ebb; for they are maintained only of winter rain; Others againe begin to be cold at the rising of the Dog-starre. And verily we may see the ex- perience both of the one and the other about Pella the capitall city of Macedonie: for the wa- ter of the meere or marish there before the towne in the beginning of Summer is cold; and afterward when the weather is at the hottest, the spring water in the higher parts of the Citie is so extreame cold that it is readie to be frozen. The semblable happeneth in Chios, where

N n

there

there is the same reason of the haue and towne it selfe. At Athens, the great and famous fountain named Eneacrunos, in a rainy or stormy summer is colder than the pit water or wel in *Iu-piters* garden, within that city; and yet the said Well water if it be a dry season, will stand with an ice at Midsummer.

CHAP. IV.

¶ The reason of certaine Waters that appeare and be hid againe suddenly.

*.about the beginning of Iune.

BVt about all others, the waters of pits or wels be ordinarily most cold about the * retreat or occultation of *Arcturus*, yea and many times they faile in the mids of summer, and all of them in maner grow very low for the space of foure daies, at the time of the setting of the foresaid star. Many there be which haue little or no water in them all winter long, and namely about the hil *Olympus*, where it is spring first ere the waters return and find the way into their pits. And verily in *Sicilia*, about the cities *Messana* and *Mylæ*, during winter the springs are al- together dry; but in summer time they run ouer the brinks of their Wels and pits, maintaining pretty riuers. At *Apollonia* a city in *Pontus* there is a fen neere the sea side, which in Summer be only overfloweth, and especially about the rising of the great Dog-star, mary if the summer be colder than ordinarie, it is not so free and plentifull of water. Some Springs haue this qualitie with them, to be drier for shoures and raine water: as for example, in the territorie of *Narnia*, a city in the duchy of *Spoleto*, which *M. Cicero* hath not forgot to infer among other admirable things, in his treatise of *Wonders*: for of this territorie hee writeth in these tearmes, That in a drought it was durty, and in rainy weather dusty. Moreover this is to be noted, That all waters are ordinarily more sweet in winter than in summer, but in autumn least of all, and in a dry sea- son lesse than at other times. Neither are the riuer waters most times of like taste, by reason of the great difference that is in their chanel; for commonly the water is such as the earth & soil through which it passeth, and doth participat the qualitie and tast of those herbs always which it passeth and runneth by. No maruell therefore if the water of one and the selfe-same riuer be found in one place more vnholsome and dangerous than in another. It falls out many times, that the brooks and rills which enter into great riuers, do alter their water in the very taste (as we may see by experience in the famous riuer *Borysthenes*) inso much as such great riuers be overcome with the influence of such riuerets, and either their owne taste is delaid by them, or clean drowned and lost. And some riuers there be which change by occasion of rain: the prooue wherof was thrice seen in *Bosphorus*, when by reason of the fall of some salt shoures, the flouds that overflowed the fields destroyed all the corne vpon the ground. The like also fell as often in *Egypt*; for the rain that fel caused all the washes arising from the riuer *Nilus*, which watred the grounds, to be bitter, whereupon ensued a great plague and pestilence to the whole region. It chanceth many times, that presently vpon the cutting and stocking vp of Woods, there arise and spring certaine fountaines which beforetime appeared not, but were spent in the nourish- ment of the tree roots; as it fell out in the mountain *Hæmus*, when as *Cassander* held the * *Gal- logreeks* besieged; for when the woods thereupon were cut down to make a palaisad for a ram- pier, presently there issued forth springs of water in their place. Moreover, it hath bin oft times known, that by occasion of spoiling some hils of the wood growing thereupon, the springs haue met altogether in one streame, and done much hurt in sudden overflowing the vaile beneath; whereas the trees before-time had wont to drink vp, digest, and consume all the moisture & wet that fell and fed the said waters. And verily it auaieth much for the maintenance of water, to stirre with the plough, and to till a ground; thereby to break vp and loose the vppermost callo- sitie and hide (as it were) of the earth, that kept it clunged and bound. Certes it is recorded for a truth, that vpon the raising and destroying of *Arcadia* (a towne so called in *Creet*) wherby the place was dispeopled, all the fountaines waxed dry, and the riuers in that tract (which were ma- bitants fell to earing and ploughing any grounds within their territorie, the foresaid fountaines appeared again, and the riuers returned to their former course.

CHAP.

CHAP. V.

¶ Divers historicall obseruations touching this point.

Moreouer Earthquakes, as they discover sometimes new springs and sources of water, so otherwhiles they swallow them vp that they are no more scene: like as it hapned (as is well knowne) * times about the riuer *Phœnus* in *Arcadia*. And in manner abovesayd, there issued forth a riuer out of the mountains *Corycus*, so soone as the peasants of the coun- try began to break it vp for tillage. But to return again to the change and alteration of waters: wonderfull they mult needs be (no doubt) when there is no euident cause thereof to be knowne: as namely in *Magnesia*, where at the hot waters of the bains suddenly became cold, without any other change besides of the tast (also in *Caria*, where standeth the temple of *Neptune*; the riuer which was knowne before to be fresh and potable, all on a sudden turned into salt water). Quer and besides, is not this a strange miracle, that the fountain *Arcthusa* in *Syracuse*, should haue a sent or smell of dung, during the *Iolenne* games and exercises at *Olympia*? But there is some probable reason to be rendered hereof, because the riuer *Alpheus* passeth from *Olympus* vnder the very bottom of the sea into that Island [of *Sicily*] where *Syracuse* standeth, and so cometh to the foresaid fountain; The *Rhodians* haue a fountain within their * *Chersonese*, which euery ninth yere purgeth it self & sends out an infinit deale of ordure and filthines. And as the tast & smell of waters do alter, so their colours also do change: as for example, there is a lake in the country of *Babylon*, which euery summer for the space of 11 daies, looketh red: and *Borysthenes* also in the summer time runneth with a blewish colour like * violets, or the sky; and yet almost pure and subtil water it is of all other, which is the reason, that it swims aloft and floateth natu- rally vpon *Hypanis* the riuer. In which two riuers, there is another maruell reported, That all the while a Southern wind bloweth, the riuer *Hypanis* is discerned aboue it. But there is one ar- gument more besides, that proueth the water of *Borysthenes* to be passing light & thin; for that there arise no mists out of it, nay it is not perceived to yeeld any exhalation or breath at all from it. To conclude, they that would seem to be curious and skilfull in these matters, do obserue and affirme, That generally all waters grow to be heauier after that mid-winter is once past.

CHAP. VI.

¶ The manner of water-conduits. How and when those waters which naturally are medicinable ought to be used. Also for what diseases it is good to saile and take the aire of the Sea. The vertues and properties of se waters as touching Physicks.

IF a man would convey water from any head of a spring, the best way is to vse pipes of earth made by potters art; and the same ought to be 2 fingers thick, and one jointed within another, so as the end of the vpper pipes enter into the nether, as a tenon into a mortaise, or as a box into the lid: the same ought to be vnited and laid euen, with quicklime quenched and dissolved in oile. The least leuell for to carry and command water vp hill from the receit, is one hundred foot, but if it be conueyed but by one canal and no more, it may be forced to mount the space of two *Agus*, i. 240 foot. As touching the pipes by means whereof the water is to rise aloft, they ought to be of lead. Furthermore, this is to be obserued, That the water ascend alwaies of it self at the deliuerie, to the height of the head from whence it gaue receit: if it bee fetched a long way, the worke must rise and fall often in the carriage thereof, that the leuell may bee maintai- ned still. As for the pipes, ten foot long apiece they would bee, if you do well. Now if the said pipes of lead be but * five fingers in compasse, ordinarily they should weigh sixty pound: * if they be of eight fingers size, they must carry the weight of one hundred pound; but in case they be a round of * 10 fingers, their poise would be at the least 120 pound; and so the rest more or lesse according to this proportion. Those pipes be called properly in Latine *Denaria*, the web or sheet whereof beareth ten fingers in breadth, before it be turned in and brought to the com- passe of a pipe: like as *Quinaria*, when the same is halfe so broad. Moreover, this is to be obser- ued, That in euery turning and twining of an hill, the pipe ought of necessity to be five fingers round and no more, for to repress and breake the violence of the water in the current. Likewise the vaulted heads which receiue and contain water from all the sources meeting together, must

N n 2

*. their demy- island, or rather a place in- uironed round about with sea, save only that it hath one banke or narrow causey leading to the continent.

* *Quinaria*:
* *Omnaria*:
* *Denaria*.

be of that capacity, as need requireth.

And since I am false into the treatise and discourse of fountains, I wonder much at *Homer*, that he hath made no mention at all of hot springs; and yet otherwise throughout his whole poem, hee bringeth in oftentimes those who bathed and washed in hot baines. But it may verie well be, that the reason thereof is, because in those times there was not that use of them in physick as at this present: for now adays, if folk be afflicted with any disease, straightwaies they run to the bath and bath for remedy. And in truth, those waters which stand upon brimstone, be good for the fit news: such as come from a veine of alum, are proper for the palsey, or such like infirmities, proceeding from resolution of the nerues. Moreover, they that hold of bigumen or mire, such as the fountains *Cutilia* be potable and good to be drunke, and yet they are purgative.

To come to the use of natural baines and hot waters: many men in a brauery sit long in a bath, and they take a pride in it, to indure the heat of the water many hours together, and yet is there nothing so hurtfull for the body: for in truth, a man should continue little longer in them than in ordinary artificiall baines or stoups; and then afterwards, when he goeth forth, hee is to wash his body with fresh cold water, not without some oile among. Howbeit, our common people here, thinke this to be very strange, & will not be brought to it, which is the reason, that mens bodies in no place are most subject to diseases: for the strong vapours that steme from thence, stiffe and fill their heads; and although they sweat in one part, yet they chill in another, nor withstanding the rest of their bodies stand deep within the water. Others there are besides, who on the like erroneous conceit, take great joy in drinking a deal of this water, straining away and swolne poure most of it downe the throat. I haue my selfe seen some of them so puffed up, and swolne with drinking, that their very skin couered and hid the rings vpon their fingers; namely, when they were not able to deliuer again the great quantity of water that they had taken in. Therefore this drinking of much water is not good to be vsed, vnles a man do oftentimes eat * salt with all. Great use there is and to good purpose, of the mud which these fountains do yeeld, but with this regard, that when the body is besmeared and bedawbed outwardly therewith, the same may dry vpon it in the Sun.

Well, these hot waters be commonly full of vertue; howbeit, this is not generall, That if a spring be hot, by and by we should thinke it is medicinall, for the experience of the contrary is to be seen in *Egesta* of *Sicily*, in *Larissa*, *Troas*, *Magnesia*, *Melos*, and *Lipara*. Neither is it a sure argument of a medicinall water (as many are of opinion) if a piece of siluer or brasse which hath bin dipped therein, lose the colour: for there is no such matter to be seene by the naturall baths of *Padua*; neither is there perceiued in them any difference in smell from others.

Concerning Sea waters, the same order and mean is to be obserued, especially in such as be made hot, for to help the pains and infirmities of the sinews: and many hold them good to souder fractures of bones, yea and to cure their bruises and contusions; likewise they haue a desiccative vertue, whereby they dry rheumaticke bodies, in which regard, men bath also in sea water actually cold. Moreover, the sea affoordeth other uses in diuers and sundry respects, but principally the aire thereof is wholesome for those who are in a phthisicke or consumption (as I haue before said) and cureth such as doe reach or void blood vward; and verily, I remember of late daies, that *Annius Gallio* after that he was Consul, tooke this course; namely, to saile vpon the sea for this infirmity. What is the cause think ye, that many make voiajes into *Egypt*? surely it is not for the aire of *Egypt* it self, but because they lie long at sea, and be sailing a great while before they come thither. Furthermore, the vomits also which are occasioned at sea by the continual rolling and rocking of the ships neuer standing still, are good for many maladies of head, eies, and breast; and generally they doe cure all those accidents, for which the drinking of *Elleboro* serueth. As for sea water to be applied simply of it selfe vnto the outward parts, physitians are of opinion, that it is more effectual than any other, for to discusse & resolue tumors: & more particularly, if there be a cataplasme made of it and barley meale sodden together, it is singular for the swellings behind the ears, called *Parotides*. They mingle the same likewise in plasters, such especially as be white and emollitiues: and if the head be hurt, and the * brain touched and offended, it is foweraigne to be infused into the wound. It is prescribed also to be drunke: for albeit the stomack take some offence and hurt thereby, yet it purgeth the body well, and doth euacuat melancholick humors and black choler; yea, and if the blood be cluttered within the body, it sendeth it out one way or other, either vward or downeward. Some haue ordained it to

* For to irritate and prouoke the expulsive faculty to send all forth againe.

* *Cerebro* isto.

A be giuen for the quartan feuer; others aduise to saue and keep it a time, for to serue the turne in case of *Tinefines*, which are vnordinat strainings at the stooles to no effect: also for all goutts and pains of joints: and in very truth, by age & long keeping, it forgoeth all that brackish taste, which it had at the first. Some boile it before: but all in generall agree in this, To vse for these purposes that sea water which was taken out of the deep far from the land, such as is not corrupt with any mixture of fresh water with it; and before their patients do drinke it, enioyne them to vomit: and then also do they mingle with it, either vineger or wine for that purpose. They that giue little thereof, and by it selfe, appoint radishes to be eaten presently vpon it, with honied vineger or oxymell, for to prouoke the patient to vomit againe. Moreover, they vse otherwhile to minister a clystere made of sea water, first warmed: & verily there is not a better thing than it for to bath

B and foment the cods withall, if they be swelled either with ventosities or waterish humors. Also it is much commended for kided heels, if they be taken before they are broken and exulcerated: and in like manner they kill the itch, cure scabs, tetter, and ringwormes. Sea water serueth wel to wash the head, & to rid it of nits and filthy lice: yea, and reduceth black and blew marks in the skin, to the fresh and liuely colour againe. In all these cures, after the vse of salt-water, it is passing good to foment the place affected, with vineger hot.ouer and besides, it is thought to be very wholesome and good against the venomous stings of serpents; and namely, of the spiders *Phalangia* and scorpions. Semblably, it cureth those that be infected outwardly with the noysome saluation or spittle of the *Aphis* called *Pryas*; but in these cases it must be taken hot: furthermore, a perfume made with sea-water and vineger, is singular for the head-ach. If it be cly-

C sterized hot, it allaieth the wrings and grindings of the belly; yea, and itaeth the violent morions of cholericke humors working vward and downward. Those that be once chaufed and set into an heat with sea water, shall not so easily feele cold againe. When womens paps are overgrown, and so exceeding great that they meet and kisse one another, there is not a better thing to take them downe, than to bath in a tub of sea-water: the same also may serue to amend the griefe of the bowels and precordiall parts, yea, and to restore those that be exceeding leane and worn away. The fumes and vapors of this water boiling together with vineger, are foweraign for those that be hard of hearing, or troubled with the head-ach. Sea water hath this especiall property, that of all things it scoureth away rust of yron soonest. The scab that annoieth sheepe, it healeth, and maketh their wooll more soft and delicat. But what meane I to say thus much of sea

D water, knowing as I do full well, that for those who dwell far vp into the maine, and inhabit the inland parts, all this may seem needlesse, and superfluous? And yet there hath bin means deuised to make artificiall sea-water, wherewith euery man may serue his own turn when he will. In which inuention, one wonderfull thing is to be seen, namely, if a man put more than one sextar of salt to foure of water, the nature of the water will be so soone overcome, that salt shall not dissolve nor melt therein: but if you mingle one sextar of salt just with foure sextars of water, you shall haue a brine as strong as the saltiest water that is in the sea: but to haue a kind & most mild brine, it is thought sufficient to temper the foresaid measure of water with 8 cyaths of salt: and this water thus proportioned, is very proper for to heat the sinewes, without any fretting of the skin at all. There is a certain compound sea water kept in manner of a Syrrupe, which they call

E *Thalassomeli*, made of Sea-water, hony, and raine water, of each a like quantity. Now the foresaid sea-water they ferch for this purpose out of the very deep, and this composition they put vp in earthen vessels well pitched or varnished, and reserue it for their vse. An excellent purgatiue this is; for besides that it clenseth the stomack without any hurt or offence thereof, the taste and smell both are very pleasant and delectable. As touching the mead called *Hydromell*, it consisted in times past of rain water well purified, and hony: a drink ordained and allowed onely to sick and feeble persons when they called for wine, as being thought lesse hurtfull to be drunke: howbeit, rejected it hath bin these many years, and condemned: for by experience it was found at length, to haue the * same discommodities that wine, but farre short it was of the good and wholesome qualities of wine.

F Moreover, forasmuch as sea-faring men and saylers be many times at a fault for fresh water, and thereby much distressed, I thinke it good to shew the means how to be provided for the supply of this defect. First and foremost therefore, if they spread and display abroad certaine fleeces of wooll round about a ship, the same will receiue and drinke in the vapours of the Sea, and become moist and wet withall; presse or wring them well, you shall haue water fresh enough.

N 3

Item,

* Namely, aduerseto the head & sinews

Item, let downe into the sea within small nets, certain pellets of wax that be hollow, or any other void and empty vessels wel closed & luted, they will gather within them water that is fresh and potable: for we may see the experience hereof vpon the land: take sea-water & let it run through cley, it will become sweet and fresh.

But to proceed vnto the other medicinable properties of water: let there be any dislocation in man or beast, by the swimming in water (it matters not of what kind it be) the bones will very quickly and with great ease be reduced into joint againe.

It falleth out many times that travellers be in feare and danger of some sicknesse, by change of waters, and such especially as they know not the nature and quality of. To preuent this inconvenience, they drink the water cold which they doubt and suspect, so soone as euer they be come out of the baine; for then they shall find it presently.

As touching the mosse which is found in the water, soueraigne it is for the gout, in case it be applied outwardly: mix oile thereto, and reduce it into the forme of a cataplasme or liniment, it easeth the paine, and taketh down the swelling of the feet about the ankles. The mosse & froth that floteth about the water, causeth warts to flie off, if they be well rubbed therewith.

The very sand likewise vpon the sea shore, especially that which is small and fine, & the same burnt as it were with the heat of the Sun, is a soueraigne remedy to dry vp the watery humors a dropsie, if the body be couered al ouer therewith; and to that purpose it serueth also for rheums and catarrhs. Thus much may suffice concerning water it self: it remaineth now to treat of such things as the water yeeldeth. In which discourse, begin I wil (as my order and manner hath bin in all the rest) with those matters which be chiefe and principall, and namely, salt and spunges.

CHAP. VII.

¶ The sundry kinds of salt: the making thereof: the vertues medicinable of salt: and diuers other considerations respectiue thereto.

SALT is either artificiall or naturall: and both the one and the other is to be considered in many and diuers sorts, which may be reduced all into 2 causes: for salt commeth either of an humor congealed, or els dried. In the gulfes or lake of Tarentum, the salt is made of the sea water dried by the heat of the summer Sun; for then you shall see the whole poole converted into a masse of salt: and verily the water there, is otherwise very low & ebbe, and not about knee high. The like is to be seen in Sicily within a lake called Cocanicus; as also in another neare to Gelas: but in these, the brims & sides only about the banks, wax dry and turn into salt, like as in the salt-pits about Phrygia and Cappadocia. But at Aspenchum, there is more plenty of salt gathered within the poole there, for you shall haue the same turn into salt, euen the one halfe to the very mids. In which lake, there is one strange and wonderful thing besides, for look how much salt a man taketh out of it in the day, so much ordinarily will gather againe by night. All the salt of this sort is small, and not growne together in lumps. Now there is another kinde of salt, which of the owne accord commeth of sea-water, and it is no more but the some or froth which is left behind sticking to the edges of the banks, or to rocks. Both the one & the other become thick and hard in manner and form of a candied dew: howbeit, that which is found in the rocks, is more quicke and biting than the other. There is besides of salt naturall, a third distinct fort from the former: for in the Baſtrians country there be two great and huge lakes, which naturally do cast vp a mighty quantity of salt: the one lieth toward the Scythians, and the other bendeth to the Arians country: like as neere to Citium, a city in the Isle Cypros, and about Memphis in Egypt, they draw forth salt out of lakes, and afterwards dry the same in the sun. Moreover, there be certain riuers which beare salt, and the same congealed aloft in their vpper part, in manner of yce, and yet the water runneth vnderneath and keepeth the course wel enough. As for example, about the fluces and straits of the mount Caspius; and thereupon they be called the Riuers of salt: as also in other riuers of Armenia, and about the Mardians country. Moreover, Oxus and Orthus, two riuers passing through the region Baſtriana, carry ordinarily downe with them in their streame, great peeces and fragments of salt, which fall from the mountaines adjoining vnto them. There are besides in Barbary, other lakes, and those verily thicke and troubled, of which ingender and beare salt. But what will you say, if there bee certaine Fountaines of hote Waters which breed Salt? And yet such bee the Baynes or Springs called Pagafai.

Thus

A Thus far forth haue I proceeded in those kinds of salt which come of waters naturally. There are besides certain hills also which are giuen by nature to bring forth salt, and such is the mountain Oromenus among the Indians, wherein they vse to hew salt as out of a quarry of stone, and yet the same groweth still: in so much, as the kings of that country make a greater reuenue by far out of it, than either by their mines of gold, or the pearles which those coasts do yeeld. Furthermore it is euident, that in Cappadocia there is salt * Minerall, digged out of the earth: and it appeareth plainly, that it is a salt humor congealed within. And verily, they vse to cut it out of the ground after the maner of * glasse stone in lumps: and those exceeding heauy, which the peasants commonly call * crums of salt. At Carrihae, a city of Arabia, all the walls thereof, as also the houses of the inhabitants, be reared & built of hard stones: and the same be laid by Masons worke, and the joints closed and sodered by no other mortar but plain water. K. *Protopolus*, at what time as he incamped about Pelusium, a city of Egypt, and cast vp a trench to fortifie the same, found such a mine or quarry of salt as these, which was a president to others afterward to sinke pits betwene Egypt and Arabia, euen in the waste and dry quarters, where vnder the delfe of sand they met with salt. After which manner also they practised to dig in the desert & dry sands of Africk, and found more as they went, euen as far as to the Temple and Oracle of *Iupiter Ammon*. And verily they might perceiue this salt to grow in the night season, according to the course of the Moone. As for all the tract and country of Cyrenæ, famous it is, and much spoken of, for the salt * Ammoniacum, so called, by reason that it is found vnder the sands. In colour and lustre it resembleth that Alumē de Plume, which the Greeks call *Schistos*: It groweth

* Sal Gemma.

* Lapis speculatus, vitrum vel glacies Martis or Lapis Arabicus.

* Micas Salis.

* Of Aquas in Greece, which is found.

C in long lumps or peeces, and those not transparent: the taste is vnpleasant, howbeit, this salt is of good vse in Physicke. The clearest thereof is taken for the best, especially when it will cleaue directly into streight flakes. A strange and wonderfull nature it hath if it be right: for so long as it lyeth vnder ground within the mine, it is passing light in hand, and may be easily welded; take it forth once, and lay it abroad about ground, a man would not beleue or imagine how exceeding heauy it is. But surely the reason thereof is euident: for the moist vapors contained within those mines where it lieth, beare vp the said peeces of salt, and are a great ease to those that deale therewith, much like as the water helpeth much to the stirring and managing of any thing within it, be it neuer so weighty. Well, this Ammoniacke salt is corrupted and sophisticate, as well with the pit-salt of Sicily called *Cocanicus*, as also with that of Cypresse, which is wonderfull like vnto it. Moreover, neare Egelasta, a city in high Spaine, there is a kind of sal-gem or Minerall salt digged: the peeces or lumps wherof are so cleare, as a man may in a manner see through them: and this hath of long time bin in great request and of such name, as the Physitians giue vnto it the price and praise about all other kinds. But here is to be noted, that all places where salt is found, are euer barren, and will beare no good thing els. And thus much may bee said concerning salt that commeth of the owne accord.

E As touching salt artificiall, made by mans hand, there be many kinds thereof. Our common salt, and whereof we haue greatest store, is wrought in this manner: first they let into their pits a quantity of sea-water, suffering fresh water to run into it by certain gutters, for to bee mingled therewith for to help it to congeale, whereto a good shower of raine auailleth very much, but about the Sun shining thereupon, for otherwise it will neuer dry & harden. About Vtica in Barbary they vse to pile vp great heaps of salt in manner of Mounts: which after that they bee hardened and seasoned in the Sun and Moone, scorne all raine and foule weather, neither will they dissolve, in so much, as folke haue enough to doe for to break and enter in with pick-axes. Howbeit, in Candy the Salt is made in the like pits, but of Sea-water onely, without letting in any fresh water at all. Semblably, in Egypt, the Sea it selfe ouerfloweth the ground which (as I take it) is already soked and drenched with the water of Nilus, and by that means their Salt is made. After the same manner they make salt also out of certain welles, which are discharged into their salt-pits. And verily in Babylon, the first gathering or thickening of the water in their salt-pits, is a certain liquid Bitumen or Petroleum, an oleous substance, which they vse in their lamps, as

F we do oile: and when the same is scummed off, they find pure salt vnderneath. Likewise in Cappadocia they do conuey and let in water out of certain welles and fountaines into their salt-pits. In Chaonia there be certaine * Springs of saltish water, which the people of that country doe boile, and when it is cooled againe, it turneth into Salt: but it is but dull and weak in effect, and besides, nothing white. In France and Germany the maner is when they would make salt, to cast

This seemeth to be our Bay-salt.

* This is the order of salt with vs in our wiches here in England. Sea.

quest, that every 2 gallons thereof might not be bought much vnder the price of a thousand sterces. Certes setting aside sweet perfumes & odoriferous ointments, there was not a liquor almost in the world that began to grow vnto a higher rate & reckoning, in so much as some places and people carried the name thereof, and were innobled therein. And verily in all Mauritania, Granade in Spaine, and Carteia, the inhabitants lie in wait to fish for these Scombri, and to take them as they enter out of the Ocean into the straits of Gilbreter, and all for this Garum, being indeed good for nothing els. The city Clazomena in Asia, the towne Pompeij & Leporis, are much renowned for this sauce: like as Antipolis, Thuri, and of late daies, Dalmatia for their pickle. The grosse grounds or dregs of this sauce, before it be strained, purified, and fully finished, is called Alex, euen the very defect & imperfection therof. Howbeit, of late time men haue gone in hand to make the said Alex or Garum of one kind of fishes apart by themselves, which otherwise are good for little or nothing, & of all others be smallest: this fish we in Latin call Apua, the Greeks Aphye, for that it is engendered of rains and showers. In the territory of Forojulium, the fish whereof they make this sauce, they call * Lupus. But in proceſſe of time Garum arose to excesſe, both in price & varietie of use: in so much as there grew an infinite number, of diuers kinds: for one sort there was of Garum that in colour resembled old honied wine, and became so cleare and sweet withall, that it might wel enough haue bin drunk for wine: another kind there was, which our superstitious votaries vse, for to keep themselves chaste & continent; & the Iews also in their holy sacrifices employed the same, especially that which is made of skaly fishes. In like manner, the other sauce, Alex, is come to be made of Oysters, sea Virgins, sea Nettles, Crabfishes, Lobsters, and the liuers of sea Barbles. In sum, thus wee haue deuised a thousand waies to dissolve salt with the consumption of the substance of fish, and all to procure appetite to meat and to content the belly.

Thus much I thought good to note curſarily, as touching those sauces which are so greatly longed after in the world; & the rather for that in some sort they serue in the practise of Physick: for the grosse liquor or sauce Alex, healeth the scab in sheep, if the skin be scarified or skinned, and the same Alex poured therupon. Also it is singular against the biting of a mad dog, or the prick of the sea dragon: the same likewise serues to soke linnen wreaths to be laid in wounds or rents made of lint to bee put into sores. As for Garum, it healeth any fresh burne, if a man drop it vpon the place, without naming it, or saying that it is Garum: good it is besides for the biting of mad dogs, but especially for the Crocodiles rooth: as also for running vlcers which be either corrosiue or filthy. Of wonderful operation & effect besides for the sores of the mouth, and ears, as also for their pains. The pickle Muria likewise, or that salt liquor that cometh from salt fish, called in Latin Salsugo, is astringent, biting, discusse, and drying: singular for to cure the dysentery or bloody flux, yea, though there were an eating vlcere within the guts: for the Sciatica and inueterat fluxes of the stomach, it is soveraign: and to conclude, those that dwell far from the sea in the midland parts of a country, vse to bath and foment themselves with it in lieu of sea water.

CHAP. X.

The nature of Salt, and the medicinable vertues thereof.

SALT, by nature standeth much vpon fire, & yet an enemy it is and contrary vnto fire, it flieth from it, eating and consuming all things whatsoever: astringent it is, desiccative, binding, and knitting. It keeps from putrefaction, bodies that be dead, and causeth them to indure so a world of yeares. In physick it is held for mordant, burning, caustick, and mundificative. It doth subtiliat, extenuat, and dissolve. Contrary it is to the stomach, and serueth not but only to prouoke appetite. With origan, hony, and hyssope, it is singular against the sting of serpents: and more particularly of the horned serpent Ceraſtes, if it be applied with origan, cedar-roſin, pitch or hony. Being drunk with vineger, it helpeth those that be pricked with the Scolopendre: and applied as a liniment with oile or vineger, and a fourth part of line seed, it is good against the sting of scorpions: also with vineger alone, for the sting of hornets or wasps & such like. Incorporated with calues tallow, it serues much to cure the migrim, skals in the head, small pocks, measles, & werts which begin to breed: also for the accidents of the eies, to wit, the excreſcence of superfluous flesh in those parts, or the turning vp of skin about naile roots of fingers or toes. But

But principally for the eyes, and therefore it entreth into collyries and eie-salues. Howbeit for these purposes aboue named it is thought that the salt named Tattarus, of the lake Tatta, is most commended, as also the other lake like it, called Caunites. If the eies be bloud shorten, or look black and blew vpon some stripe, apply salt with an equal weight of Myrrh, & with hony, or els with * Hyssop & hot water, with this charge, to foment or bath the place afterward with a kind of salt brine. But aboue all, Spanish salt would be chosen for this effect: & it is also good against cataracts and suffusions of the eies: if it be ground with milke vpon some touch-stone, whetstone, or hard porphyrit marble. More particularly, it is singular for the black bloud gathered in the eies, if it be folded within a little linnen cloth, & so applied: but the same ought to be dipped oftfoons in hot water, and so the place to be oft times parted withall. For the cankers or sores in the mouth, it is good to lay salt vpon fine lint. In case the gumbs be swelled, it were not amisse to rub them therewith. Being beaten and reduced into small powder, it serueth for the roughnesse of the tongue. Moreouer it is said, That whoſoeuer hold euery morning vnder his tongue while hee is fasting a little salt vntill it be melted, hee shall by that meanes preferue his teeth from being worm-eaten or rotten. The same incorporat in raisins without stones, and in boeuf suet, with a little origan, leuen, or bread, is soveraign for the leprosie, felons, tectars, ring-worms, and the wild scab. But in all these accidents, the salt of Thebais in high Egypt is most commended: and of this they make choice also to kill the itch. A gargarism or collution therof with hony, is passing good for the inflammation of the amygdals and the uvula. There is no kind of salt but it helpeth the squinancie, and the rather if it be vsed inwardly with oile and vineger, so as at the same time it be applied without the throat also in a liniment with tar. If a cup of wine be dressed therewith it softneth the belly being collicue. The same also taken in Wine chafeth out of the body all worms and any hurtful vermin besides. Held vnder the tongue, it inableth them that haue bin weakned with some long disease, and newly recovered, to indure the heate of bains or stoues the longer. Singular it is for the grief of the sinues: but in the practise and vse of this receit, it would be obserued especially, that there be applied about the shoulders and reins of the back, sachels or bags full of salt, and the same made hot oftentimes in seething water: for so it easeth the pain. Being giuen in drink, or laid to exceeding hot in the said bags, it asswageth the collique and other wrings in the belly, yea and the sciatica. Beaten small, and applied in manner of a cataplasme, with meale, hony, and oile, it is soveraigne for the gout in the feet. Where I may not forget the obseruation of this soveraign receit, which putteth vs in mind, that there is nothing better for the whole body [of such especially as be subiect to the gout] than * salt and Sun together. For thus we see, That our fishers at sea ordinarily haue brought as hard and tough as horne. A principall thing this is therefore to be nominated and set downe for the gout in the feet. But salt moreouer takes away cornes of the feet, and kibes in the heels. Being chewed in the mouth and so applied, or els with oile, it healeth any burn or skald, and keeps the skin from rising into blisters. With vineger and hyssop it cureth S. Anthonies fire and all vlcers that be corrosiue. It heals likewise cankerous sores, if it be applied with wild vine grapes. Reduced into fine powder and laid to with barley meale, it is soveraign for vlcers corrosiue such as be called VVolues, and do eat deep to the very bone; so there be laid ouer the same and the part affected, a linnen cloth well soaked and bathed in wine. A proper remedy it is for the jaundise, and riddeth away the itch occasioned thereby, if the patient be rubbed all the bodie ouer with it, oile, and vineger, against a good fire vntill hee doe sweat. But with oile alone it serues for those that feel themselves weary. Many phyſitians haue cured those that be in a drop-sie with salt, and haue ordained to rub their bodies with oile & salt together, who are in an ague, for to auoid the extremitie of heat: and they hold opinion, That there is not a better thing to dispatch an old cough, than to be licking euery anon of salt. They haue giuen order also by way of elistre to minister salt vp into the body, for the Sciatica. To apply the same also to eat away proud or dead flesh in any vlcers. Being lapped within a linnen cloth, and applied to the biting of Crocodiles, it is soveraign, so that the place affected were well parted withall, and pressed hard before. Moreouer, good it is to be taken in honied vineger against the dangerous Opium. Brought into a cataplasme with hony and meale, it is of great effect to rectifie any dislocation of bones which be out of joint: and in that sort it taketh downe all tumors or swelling bunches. A collution or fomentation therewith allayeth the tooth-ache: and a liniment also made with it and Roſin worketh the same effect. For all these accidents before named, the

* Which some take to be, our Pike.

* Hyſſopo. Some read Oſſopo.

* Salt & ſole.

the some of salt found sticking to rockes, or floating vpon the sea water, is thought to be more conuenient than any other salt. But to conclude, any salt whatsoever it is serueth well for those medicines that be ordained either to take away lassitudes, or to enter into those sope balls that are to polish the skin and to rid it from wrinkles. If either a boeue or mutton be rubbed with salt, it will kill the skab or mange in them: for which purpose also they giue it vnto the sayd beasts for to lick: and more particularly it is spurted out of ones mouth into horses eies. Thus you see what may be said as touching salt.

CHAP. X.

¶ Of Nitre, and the sundry kindes thereof. The manner of making Nitre. The medicines and obseruations to it belonging.

I May not put off the treatise concerning the nature of Salnitre, approaching so neer as it doth to the nature of salt: and the rather am I to discourse of it more exactly, because it appears euidently, that the physicians who haue written thereof were altogether ignorant of the nature and vertues of it: neither is there any one of them who in that point wrote more aduisedly, than *Theophrastus*. In the first place this is to be noted, That among the Medians there is a little Nitre ingendred in certain vallies which in time of drought became all hoary & grey therewith and this they call Halmirrhaga. There is found also some of it in Thracia neere vnto the Citie Philippi, but in lesse quantitie, and the same all fouled and bewraied with the earth, & this they name Agriou. In times past men haue practised to make Nitre of oke wood burnt; but neuer was there any great store of it made by that deuise: and long it is since that feat was altogether giuen ouer. As for waters & fountains of nitre, there be enow of them in many places, howbeit the same haue no astrigent vertue at all. But the best Nitre is found about Clyta in the marches of Macedonie, where there is most plenty thereof, and they call it Chalastricum: White and pure it is, and commeth neere to the nature of salt. And verily a lake or meer there is standing altogether vpon nitre, and yet out of the midst thereof there springeth vp a little fountain of fresh water. In this lake there is ingendred Nitre about the rising of the Dog-star for 9 dayes together: then it stayeth as long, and beginneth fresh againe to fote aloft: and afterward giues ouer. Whereby it appeareth that it is the very nature of the soile that breedeth it; for knowne it is by experience, That if it cease once, neither heat of Sun nor shoures of rain wil serue or do any good. Besides, there is another wonderful propertie obserued in this lake, that notwithstanding the foresaid spring or fource do feeth and boile vp continually, yet the lake neither riseth nor ouerfloweth. But during those nine daies wherein it is giuen to yeeld Nitre, if there chance to fall any shoures, they make the nitre to taste the more of salt. And say that the North-East winds do blow the while, the Nitre is nothing so good and cleere, by reason of the mud mingled withall, which those winds do raise. Thus much of Nitre naturall.

As for artificiall Nitre, great aboundance there is made of it in Egypt, but far inferiour in goodnesse to the other: for brown and dusky it is, and besides full of grit and stones. The order of making it is all one in manner with that of salt, saving onely that in the salt houses they let in sea water, whereas into the boiling houses of Nitre they conuey the water of the riuer Nilus. Whiles Nilus doth rise and flow, you shal haue the said nitre-pits or workhouses dry: but as it falleth and returneth again toward the channel, they are seen to yeeld a certaine moisture, (which is the humor of nitre) and that for the space of forty daies together, with no rest or intermission between, as there is about Clyta in Macedonie abovesaid. Moreover, if the weather be disposed to rain during that time, they imploy not so much of Nilus water to the making of Nitre. Now so soon as the said humor beginneth to thicken, presently they gather it in all hast, for feare it should resolue again and melt in the nitre pits. In this nitre, as well as in salt, there is to be found between whiles a certaine oleous substance; which is held to be singular good for the farcin and scab of beasts. The nitre it selfe is laid vp and piled in heaps, where it hardeneth and continueth a long time. But admirable is the nature of the lake Ascanius, and of certaine fountaines about Chalcis, where the water aboue, and which flieth vppermost, is fresh and potable; but all beneath and vnder it toward the bottome is nitrous. The lightest of the Nitre and the finest is reputed alwaies the best; and therefore the some and froth thereof is better than any other part. And yet for some vses the grosse and foule substance is very good, and namely,

for the setting of any colour vpon cloth, and especially the purple die. As touching the vertues of nitre it selfe, & how it is imploied many wayes, I wil write in place conuenient. But to return againe to our nitre pits, and their boiling houses, there be of them very faire and goodly in Egypt. In old time, they were wont to be about Naucratis and Memphis only; but those at Memphis were nothing so good as the other: for there, the nitre lying vpon heapes, groweth to the hardnes of a stone; in so much, as by this means, you shall see mountaines thereof like rockes. Of this nitre they vse to make certain vessels to vie in the house: and many times they melt it with sulphur, & boyle it ouer the coles for to giue a tincture vnto the said vessels: look also when they would keep any thing long, they vse this stone-nitre. Moreover, there be in Egypt other nitre pits also, out of which there issueth a reddish kind of nitre, resembling the color of the earth from which it sweateth and cooeth out. As for the some of nitre (which is commended for the best of all) the antient writers were of opinion, that it could not be made but when the dew fell: at what time as the nitre pits were (if I may so say) great bellied and full of nitre within, but not ready to be deliuered thereof: and therefore if they be neare (as it were) to their time, there can no such froth be gathered, notwithstanding the dew do fall. Others there be of this minde, that the said vppermost coat or crust aloft, is ingendred by reason of the fermentation of the sayd nitre: but the modern Physicians of late daies haue thought and taught, That *Aphro-nitrum is gathered in Asia, and found within certain soft and gritty caues distilling out of rocks: [These caues because they be vaulted and arched ouer head, the inhabitants call *Cochlacas] which afterwards they doe drie in the Sun: and the best is thought that of Lydia. The true marke to know good sal-petre, is to be very light in hand, exceeding brittle, & easie to crumble; inclining also much to the colour of purple: this is brought from thence to vs in trochiscs. As for the Egyptian Aphro-nitre or Salt-petre, it comes in vessels wel pitched, because it should not melt and resolue into water. Those vessels also before named, ought to be thoroughly dried & dressed in the Sun. As for nitre, the best is chosen by these marks; namely, if it bee passing fine & cleare, but withall, spongius & very ful as it were of pipes and holes. Many do sophisticat it in Egypt with quicklime; but this deceit may be easily found by the tast: for the good and true sal-nitre will soone melt and dissolue at the tongues end; whereas the other that is not right, pricketh and biteth in the mouth: moreover, if it haue a sprinkling of lime among, it carrieth a strong smell with it. When it is calcined in some earthen pot, it ought to be well couered with a lid, lest it leap or fly out; otherwise, in the fire it selfe, it sparkleth not nor leapeth forth: neither groweth any thing els in those places where sal-nitre is ingendred, whereas in salt-pits grasse commeth vp. As for the Sea, what a number of liuing creatures breedeth it? and what plenty of reike and weeds besides? And not only by this argument appeareth it, that there is more acrimonie and sharpnesse in sal-nitre than in salt, but also herein, That no shooes will abide the nitre pits, but presently fret and weare; for otherwise wholsome they be and soueraign for the eies: neither was it euer seen, that any men who handled these pits of nitre, and wrought therein, were euer blind. Moreover, this commodity they haue, That if a man come thither hauing a sore or vlcer vpon him, the same will soone be healed vp and skinned cleane: but if one chance to bee wounded or hurt there, long it will be ere he be cured thereof. Salnitre prouoketh sweat, if the body be appointed with it and oile together, and it maketh the skin soft and tender. That which is called Chalastricum, serueth in lieu of salt, in making bread, whereas the Egyptian nitre is vsed with radishes, for it maketh them more tender. As for cates and meats, if they bee powdred withall, they will look white and be worse for it: whereas all woorts either for pot or sallad, will seeme the greener.

To come now vnto physick and the medicinable vertues of salnitre: hot it is of temperature, and dorch extenuat; biting besides, and astrigent: a great drier it is, & doth exulcerat. In regard of which qualities, imploied it is in those accidents which require either drawing to the exterior parts, or to be discussed and resolued: such also as need some gentle mordication, or would be lightly extenuated; as meazils, small pocks, wheals, and pimples. Some for this purpose, first make it red hot in the fire, and then quench it with some astrigent wine: which done, they beat and reduce it to powder, and therewith rub and chaufe the body in the baine, without any addition of oyle to it: mixt with the powder of dried flour-de-lis, & incorporat in green oile oliue, it represseth immoderat sweets: a liniment made therewith & figs together, dorch extenuat the films in the eies; and the asperity of the cie-lids it doth subtiliat: the same operation hath it besides.

if it be sodden in wine cuit to the consumption of the one halfe: and so is it good for the spots G that arise in the eies. The decoction of nitre boiled within the rind of a pomegranat in wine cuth, cure the sore nails and the raggednesse thereof: and reduced into an ointment with honey, it cureth the eie-sight: a collution made therof, sodden in wine with pepper, easeth the tooth-ach. If the mouth and gums be washed therewith: so doth the decoction thereof with leeks. Burn or calcine nitre into powder, it maketh an excellent dentifrice for blacke teeth, and reduceth them again to their naturall whitenesse: annoint the head with nitre & Terra Samia incorporat together in oile, it killeth the lice and nits that breed therein: dissolved in wine, and poured into the ears that run attyr, it cureth them: dropt into them with vinegar, it eateth and consumeth the filthy excrements of that part: conueied dry into the said ears, it discusseth the ringing & ringing therein. A liniment made of nitre and fullers earth, of each a like weight, incorporat with vinegar, taketh away the foule morphew, if the skin be annointed therewith: mixed with rosin, or with raisons of white grapes stamped stones and all, it draweth vncoms and fellons to an head, and breaks them: reduced into an ointment with swines greafe, it preferueth the genitoirs from inflammation, & cureth them: good likewise for the meafils and small pocks which break out in all parts of the body: put rosin thereto, and incorporat them both in a liniment with vinegar, it healeth the biting of a mad dog, so it be taken betimes at the beginning: and in this manner, it cureth also the sores occasioned by the sting of serpents, eating vlcers, which consume to the bone: such likewise as be corrosiue and apt for putrefaction, so it be mixed with quick-lime and tempered with vinegar. Stamp nitre with figs, and bring it into the form of a cataplasme or liniment, it doth much good for the dropsie: the ventosities causing wringings and painful gripes of the belly, it discusseth, if the decoction thereof be drunk: namely, when to the weight of one dram, it is sodden with rue, dill, or cumin. Annoint their bodies all ouer who are weary, with nitre, oile, and vinegar, you shal see how effectually it is to refresh them and driue away their lassitude. Rub and chaufe both hands and feet, with nitre & oile wrought together, is singular good against quaking and shivering cold: giuen with vinegar, especially in a swet, to those who are painted with the jaundise, it represseth the itch that troubleth them: if a man be poisoned with taking venomous mushrooms, he shall find means to auoid the danger thereof by drinking nitre in oxycrat or vinegar & water mingled together. Hath one swallowed down the hurtfull fly Buprestis? let him take a draught of sal-nitre in water, it wil saue him, for it causes vomit: to those that haue drunk bulls blood, it is vsually giuen with the spice Lafer: incorporat with honey and cow milk, it healeth the breaking out and the exulcerations in the face. Torrisie nitre vntill it begin to look blacke, beat it then to powder and cast the same vpon a raw place that is burnt, it wil take out the fire and skin it vp again: for the paine of the belly and the kidneys, for the stiffness and starknesse of the lims, the griuance also of the sinews, it serueth well in a clystire: lay it to the tongue with bread, it is soueraigne for the palseie or resolution of the sinews: it helps those that be short-winded, if they take it in a Ptisan, or with husked barley. The floure of nitre incorporat in Galbanum, and the rosin called terpenitine, of each an equall weight, and reduced into a lochoch, so as the patient swallow down the quantity of a Bean at once, cures an old cough.

* Burn or calcine nitre, temper it afterwards with liquid pitch or tar, and giue it to drink, it cureth the squinancy. The floure of nitre incorporat with the oile Cyprinum, makes a pleasant liniment to annoint the body withal in the Sun, for the gout or any paine of joints: drunk in wine it doth exterminat and driue away for euer, the jaundise: it scattereth and discusseth ventosities, it stoppeth bleeding at the nose, if the patient receiue into the nostrills the vapour of it out of boiling water: mixed well with alumie, it riddeth away an itch: foment or bath the arme pits daily euery day therewith in water, it correcteth the ranke smell thereof. Make a liniment or cerot of nitre and wax tempered together, it healeth the vlcers occasioned by fleame: after which manner it is good also for the sinews. Being injected by a clystire, it helpeth the flux of the belly, proceeding from a feeble stomack. Many Physitians haue giuen direction to annoint the body all ouer with sal-nitre and oile, before the cold fits of agues: which ointment serueth likewise for the leprosie, and the vnseemly spots or freckles that blemish the skin. To sit in a tub of nitre within the baines, & therewith to bath the body, is a soueraigne thing for those that haue the gout, be in consumption, and either draw backward with the crampe, or stretched and plucked so strait and stiffe therewith, that they seem all of one entire piece. Sal-nitre, if it bee boiled together with sulphur, turneth to be as hard as a stone.

* Nitur, not
Cognitur, et
Diest.

Many sorts there be of Spunges, according as I haue shewed already more amply in my treatise of water-beasts, and those especially of the Sea, and their seuerall natures: howbeit some writers distinguish them after another manner, into male and female: for some of them they haue thought to be of the male sex, to wit, those which haue smaller pipes or concauities, and those growing thicker and more compact, whereby they sucke vp more moisture, and these, our delicat and dainty people, die in colours, and otherwhile giue them a purple tincture. Others they count of the female sex, namely such as haue bigger pipes, & the same running throughout one continuity without interruption. Of the male kind, some be harder than others, which they call Tragos; the pipes whereof are the finest, and stand thickest together. There is an artificiall deuise to make spunges look white, to wit, if the softest and tendrest of them be taken while they be fresh in summer time, and so bathed & foked wel in the some of salt: after which they ought to be laid abroad in the moon-shine, to receiue the thick dew or hoary frosts (if any fall) with their bellies vpward into the aire, I meane that part whereby they cleaue fast to rocks or sand where they grew, that thereby they may take their whitening. That spunges haue life, yea and a sensible life, I haue proued heretofore; for there is found of their blood settled within them. Some writers report, that they haue the sense of hearing, which directs them to draw in their bodies at any sound or noise made, and therewith to squeeze out plenty of water which they contained within: neither can they easily be pulled from their rocks, and therefore must be cut away, whereby they are seen to shed a deale of blood, or that which resemblith blood very neer. Many do prefer the Spunges growing in places exposed to the North-wind, before any other: neither doe any hold and maintaine longer in any place their owne breath, as Physicians doe hold; who asirme, that for this regard they be good for our bodies, namely, if wee entermingle their breath with ours by application: for which purpose, the fresher taken and the moister they be, the better they are thought: but this their operation is lesse perceived, in case they be wet in hot water, and so applied: likewise if they be foked in any vnctuous liquor, or bee laid vpon any part of the body annointed. This also is obserued by them, that the thickest of them, to wit, such as haue the least pipes, sticke not so hard to a place as others. As touching the softest and finest spunges, called Penicilli, if they be applied vnto the eies after they haue beene foked in honied wine, they do allay and bring down any swelling in them. The same are abstersiue and singular good to clarifie and cleanse the eies that be giuen to bleednesse: but those (I say) ought to be of the finest and softest kind. For to stay the violent flux of rheumaticke humors into the eies, there is nothing better than to apply spunges of any sort with oxycrat, that is to say, vinegre and water: but with vinegre alone actually hot, they be singular for the head-ach: and otherwise, any sponge that is fresh gotten, doth discusse, mollifie, & mitigat. Old spunges do conglutinat and foulder any wounds. There is a generall vse of all spunges, to wipe and mundifie any place, to foment and bath withall: to keep off the aire also and to couer it after fomentation, vntill another medicine be made ready for to be laid on fresh. Moreover, they be desiccative, & therefore if they be applied to rheumaticke and moist vlcers, and namely in old folke, they dry vp the superfluous humors that find a way thither: neither is there any thing so fit for to foment a fracture or green wound, as spunges. Also, when any part of the body is cut off or dismembred, what is so handy to suck and soke away the blood quickly, (that the cure may be thoroughly seen, & the order thereof) as a sponge? Furthermore, spunges themselues serue to be laid to wounds, sometime drie and sometime dewed or sprinkled with vinegre, one while wet in wine, anotherwhile moistened with cold water, and all to defend them from inflammation: but if they be bathed in raine water, and so applied to members new cut, they will not suffer them to swell and impostumat. They are besides laid vsually to the sound parts, where no skin is broken, if there be any hidden and secret humor that runs vnder the place, and puts it to paine and trouble, such as needeth to be discusse, or resolued: also to impostumes, if they be first annointed with boiled hony. In like manner, for the paine of the joints they are proper to be applied, one while wet in vinegre with salt, anotherwhile dipped in vinegre and water: and if the gout be hot, they would be laid to foked in water only. The same spunges ought for the dissolving of hard callosities, to be wet with

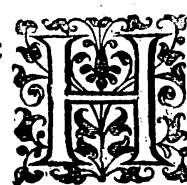

salt water: & against the sting or prick of scorpions, with vinegre. In the cure of wounds, sponges may be vsed in stead of vnwasht greasie wooll, sometimes applied with wine and oile, and sometimes also with the said wooll: this only is the difference, That such wooll doth mollifie, whereas sponges do restrain and smite back: and yet a facultie they haue, to fetch out and sucke away the filthy excrements, attyre, and quitter, that gather in sores and wounds. They may be bound about the body of those that haue a dropsie, either drie, or else wet in warme water or vinegre, according as need requireth, either to goe gently to worke, or to couer and dry the skin. Our and besides, good it is to apply sponges to those accidents and infirmities of the body which require euaporation; namely, if they be well foked and thoroughly wet in hot water, and then pressed and strained between two tables or bords. After which manner, they are good to be laid to the stomack, and in a feauer, against extremitie of heat. For those that be troubled with the oppilation or hardnes of the spleen, there is not a more effectual remedy, than to apply sponges to the place affected, wet in oxycrat or vinegre & water together: like as for shingles and *S. Anthonies euill*, with vinegre only. But in this application of them, consideration must be had that they couer the sound parts also round about as well as the other. Sponges wet in vinegre and cold water, staunch any flux of blood. If there be any place of the skin blacke and blew, vpon a fresh or new stripe, lay thereto sponges well drenched in salt water, changing them often one after another, and it shall recouer the naturall colour againe: in which order, they bring down the swelling of the cods, and allay their paine. Being hacked and cut small, they serue to good purpose for to be laid to the biting of mad dogs; so that estfoones and cuer and anon they be wet and refreshed with vinegre, cold water, or hony good store, one with another. The sponges of Africke or Barbarie being burnt or calcined, doe make soueraigne ashes for to be drunke with juice of vnset leeks in cold water (so there be put vnto a draught thereof, a quantitie of salt) by such as cast or reach blood vward at the mouth. The same ashes reduced into a liniment, either with oile or vinegre, and so applied as a frontall to the forehead, driue away tertian agues. These African sponges haue this peculiar qualitie, to discusse any tumors, if they be applied to them well foked in oxycrat or water and vinegre mixed together. The ashes of any sponges whatsoeuer, burnt together with pitch, staunch the bleeding of any wound: and yet some there be who in this case burn those only with pitch which are of a grosse and loose making, and not so compact as the rest. Moreouer, for the accidents of the eies, sponges are many times burnt and calcined, in an earthen pot vnbacked: and the ashes which come thereof, do much good also vnto the pilling and asperitie of the eie-lids, the excrescence of flesh, and whatsoeuer in those parts needeth attrition, or otherwise to be vnited, fowdred or incarnat: and for these effects, it is much better to wash the said ashes. Furthermore, sponges, in friction and rubbing of crasse bodies, may well stand in stead of currying combs, and course linnen cloaths: besides, they serue right handfomely and fitly, to couer and defend the head against the extreame heat of the Sun. Moreouer, the ignorance of our Physitians, is the cause that all sponges be reduced to two only kinds, to wit, vnder the name of African, which be of more tough and firme substance; and the Rhodiacke, which are softer, and therefore meet for fomentations. At this day the tendrest and most delicate sponges are found about the walls of the citie Antiphellus. And yet *Trogus* writeth, that about Lycia, the softest sponges called Penicilli, do grow in the deep sea, and namely in those places, from whence other sponges beforetime had been plucked and taken away. Finally, *Polybius* doth report, that if sponges be hung about the tester or feeling of a bed ouer sicke persons, they shall take the better rest and repose all night for it. Now is it time for me to returne vnto Beasts of the Sea, and other creatures liuing and bred in the waters.

THE

**THE XXXII. BOOKE OF
THE HISTORIE OF NATURE,
WRITTEN BY C. PLINIUS
SECVNDVS.**

The Proem.

¶ *Medicines taken from liuing creatures of the Sea.*

Having so far proceeded in the discourse of Natures historie, that I am now arrived at the very height of her forces, and come into a world of Examples, I cannot chuse but in the first place consider the power of her operations, and the infinitenesse of her secrets which offer themselves before our eies in the Sea: for in no part else of this vniuersall Frame, is it possible to obserue the like maiestie of Nature: in so much as we need not seeke any further, may we ought not to make more search into her diuinitie, considering there cannot be found any thing equall or like vnto this one Element, wherein she hath surmounted and gone beyond her owne selfe in a wonderfull number of respects. For first and foremost, Is there any thing more violent than the Sea, and namely, when it is troubled with bloustring winds, whirlpuffs, stormes, and tempests? Or wherein hath the wit of man bene more employed (seeke out all parts of the whole world) than in leconding the wanes and billowes of the Sea, by saile and oare? Finally, Is there ought more admirable, than the innarrable force of the reciprocal sides of the Sea, ebbing and flowing as it doth, whereby it keepeth a current also, as it were the streams of some great river?

CHAP. I.

¶ *Of the fish Echeneis, and her wonderfull propertie. Of the Crampe-fish Torpedo, and the Sea-hare. The wonders of the Red sea.*

The current of the Sea is great, the tide much, the winds vehement and forcible; and more than that, ores and sails withall to helpe forward the rest, are mighty and powerfull: and yet there is one little sillie fish, named Echeneis that checketh, scorneth and arresteth them all: let the winds blow as much as they will, rage the stormes and tempests what they can, yet this little fish commandeth, their fury, restraineth their puissance, and mauge all their force as great as it is, compelleth ships to stand still: A thing, which no cables, be they neuer so big and strong, no ankers, how massie and weightie soeuer they be, sticke they also as fast and vnmouable as they will, can performe. Shee bridlith the violence, and tameth the greatest rage of this vniuersall world, and that without any paine that she putteth her selfe vnto, without any holding and purting backe, or by any other meanes, saue only by cleauing and sticking fast to a vessell: in such sort, as this one small and poore fish, is sufficient to resist and withstand so great power both of sea and nauie, yea and to stop the passage of a ship, doe they all what they can possible to the contrary. What should our fleets & armadoes at sea, make such terrors in their decks and fore-castles: what should they fortifie their ships in warlike maner, to fight from them vpon the sea, as it were from mure and rampier on firme land? See the vanity of man! alas, how foolish are we to make all this adoe? when one little fish, not above halfe a foot long, is able to arrest and stay perforce,

perforce, yea and hold as prisoners our goodly tall and proud ships, so well armed in the beake-
head with yron pikes and brazen tines, so offensive and dangerous to bouge and pierce any ene-
mie ship which they do encounter. Certes, it is reported, that in the nauall battell before Ac-
tium, wherein *Antony* and *Cleopater* the queene were defeated by *Augustus*, one of these fishes
stayed the admirall ship wherein *M. Antonius* was at what time as he made all the haile & means
he could deuise with help of ores, to encourage his people from ship to ship, and could not pre-
vaile, till he was forced to abandon the said admirall and go into another galley. Meane while
the armada of *Augustus Caesar* seeing this disorder, charged with great violence, and soone in-
uested the fleet of *Antony*. Of late daies also, and within our remembrance, the like happened
to the roial ship of the Emperour *Caius Caligula*, at what time as he rowed back and made saile
from Astura to Antium; when and where, this little fish detained his ship, and (as it fell out af-
terward) presaged an vnfortunate euent thereby: for this was the last time that euer this Emperour
made his returne to Rome: and no sooner was he arriued, but his owne souldiers in a mutinie
fell vpon him, and stabbed him to death. And yet it was not long ere the cause of this wonderful
stay of his ship was knowne: for so soon as euer the vessell (and a galliace it was, furnished with
fue banks of ores to a side) was perceiued alone in the fleet to stand still, presently a number of
tall fellows leapt out of their ships into the sea, to search about the said galley, what the reason
might be that it stirred not; and found one of these fishes sticken fast to the very helme: which
being reported vnto *Caius Caligula*, he fumed and fared as an Emperour, taking great indignati-
on that so small a thing as it, should hold him back perforce, and checke the strength of all his
mariners, notwithstanding there were no fewer than foure hundred lusty men in his galley; that
laboured at the ore all that euer they could to the contrary. But this prince (as it is for certaine
known) was most astonied at this, namely, That the fish sticking onely to the ship, should hold
it fast; and the same being brought into the ship and there laid, not worke the like effect. They
who at that time and afterward saw the fish, say, it resembled for all the world a snail of the
greatest making: but as touching the forme and sundry kindes thereof, many haue written di-
uerly, whose opinions I haue set downe in my treatise of liuing creatures belonging to the wa-
ters, and namely in the particular discourse of this fish. Neither do I doubt but all the sort of
fishes are able to doe as much: for this wee are to beleue, that *Porcellans* also be of the same
vertue, since it was well knowne by a notorious example, that one of them did the like by a ship
sent from *Periander* to the cape of *Gnidos*: in regard whereof, the inhabitants of *Gnidos* doe
honour and consecrate the said *Porcellane* within their temple of *Venus*. Some of our Latine
writers do call the said fish that thus staieth a ship, by the name of *Remora*.

As touching the medicinable properties of the said stay-ship *Echeneis* or *Remora* (call it
whether you will) a wondrous matter it is to see the varietie of Greek writers: for some of them
(as I haue shewed before) do hold, that if a woman haue it fastened either about her neck, arme,
or otherwise, she shal go out her full time if shewere with child: also, that it will reduce her ma-
trice into the right place, if it were too loose and ready to hang out of her body. Others againe
report the contrary, namely, That if it be kept in salt and bound to any part of a woman great
with child and in paine of hard trauell, it will cause her to haue present deliuerance; for which
vertue, they call it by another name **Odinolion*. Well, however it be, considering that mighty
puissance which this fish is wel known to haue in staying ships, who wil euer make doubt here-
after of any power in Nature her selfe, or of the effectuall operation in Physicke, which she hath
giuen to many things that come vp by themselves. But say we had no such euidence by the ex-
ample of this *Echeneis*; the Cramp-fish *Torpedo*, found and taken likewise in the same sea, were
sufficient alone to proue the might of Nature in her workes, if there were nothing else to shew
the same: for able she is to benum and mortifie the arms of the lustiest & strongest fishers that
be; yea and to bind their legs as it were, how swift and nimble soeuer they are otherwise in run-
ning; and how euen by touching only the end of a pole, or any part of an angle rod, which they
hold in their hands, although they stand aloft and a great way from her. Now if we cannot will
nor chuse, but must needs confesse by the euident instance of this one fish, that there is some
thing in nature so penetrent and powerfull, that the very smell only or breath and aire proce-
ding from it, is able thus to affect, or infect rather the principall lims and members of our bo-
die; what is it that we are not to hope for and expect from the vertue of all other creatures that
Nature (through her bounty) hath endued with medicinable power for the remedy of diseases?
And

* i. Loofe-
throws, or
calf-paine.

A And in very truth, no lesse admirable be the properties which are respected of the sea-Hare: for
to some a very poyson it is, taken inwardly either in meat or drinke: to others againe, the onely
aspect and sight thereof is as venomous. For if a woman great with child chance but to see the
female only of this kind, she shal sensibly therupon feele a sicke wambling in her stomacke, she
shall presently fall to vomiting, and anon to vntimely labour, and the deliuerie of an abortiue
fruit. But what is the remedy? Let her weare about her arme in bracelers, any part of the male,
which ordinarily for this purpose is kept dry and hardened in salt, shee shall passe these dange-
rous accidents. The same fish is hurtfull also in the sea, if it be touched onely. Neither is there
any liuing creature that feeds vpon this fish, but it dieth theron, vnlesse it be the sea Barbell on-
ly: al the harme that this fish catches by eating of it is this, that the flesh is more tender by that
means, and nothing so fast as it was before, besides, the meat is more vnpleasant, & not so much
set by in the market, nor bought vp by Caters for the kitchen. If man or woman chance to be
infected by eating of the sea-Hare, they presently smell and sent of the said fish; and this is the
first signe and argument to proue that they be im poisoned therby; howbeit, they die nor imme-
diatly but may continue so many daies as the said Hare liued after it came out of the sea. And
therefore (according as *Licinius Macer* hath left in writing) this poyson hath no set and prefnit
time wherein it killeth any body. As touching the sea-Hares among the Indians, it is constantly
affirmed, that taken they cannot be aliue, and that by way of counterchange, a man is their poy-
son: for if he do no more but touch one of them with his finger in the sea, it will forthwith die.
And it is said withall, that far bigger he is there than in other seas: like as all other beasts what-
soeuer. King *Inba* in those bookes which he wrote to *C. Caesar*, sonne to *Augustus* the Emperour, as
touching the historie of Arabia, saith, That their limpins, muskles and cockles, are so big in
those seas, that one of their shels wil contain a measure of three hemines. Also that there haue
been known Whales six hundred foot long, and carrying a breadth of three hundred and sixtie
foot, to haue shot themselves out of the sea into the great riuers of Arabia: the fat of which
Whales, (like as the greafe of all other sea-fishes there) is much set by and sought after by mer-
chants, who in all those quarters vse it for to annoint their traouelling cammels, for to driue
away the Breecle or Gad Bee from them, which indeed cannot abide the smell of that oile.

CHAP. II.

¶ The naturall wit, docilitie, and gentlenesse of some fishes. Also where they be so
tractable, that they will take meat at a mans hand. Finally, in
what part of the World fishes giue answer
by way of Oracle.

W Underfull in my conceit is the wit and subtiltie of some fishes, if all bee true which
Ouid the Poet hath reported of them, in that booke of his which he intituled *Halicuti-
con*: For first and formost he saith, That the Goldenie *Scarus* perceiuing himselfe to
be taken in a weire, or enclosed within a wicker-net or leape, neuer striueth to get out againe with
the head forward, or to thrust his muffle betweene the oisiers, for feare he should be caught by
the head: but turning his taile vnto them, keepeth such a flapping therewith, that he makes him-
selfe way by that means, and so breakes forth of prison backward. Now, in case whiles he strug-
gleth and laboureth thus to get out, another Goldenie that is without happen to espie him thus
a prisoner, the same will take hold with his mouth of his fellows taile, and helpe to get him
forth out of the said net, which he endeauours to break through. Also that the sea pike *Lupus*,
when he seeth that hee is compassed about with nets, maketh a furrow with his taile into the
sands, wherein he coucheth and lieth close, that when the fishers draw their nets vnto them, they
may glide and passe ouer him. As for the Lampreis, knowing what a smooth, round, and slippe-
rie back they haue, they make no more adoe, but seeing themselves within the net, get between
the very meshes, which with their much winding and wrigling they will wrest wider and wider
still, vntill they be gotten through and escaped.

The Pulpe fish or *Pourcuttell*, maketh at the very fishhooks which hee searcheth after, and
those he biteth not at, but claspeth hard and gripeeth round about with his clees and armes that
he hath: and neuer letteth he his hold goe, vntill hee hath gnawne and eaten off the bait cleane,
vnlesse before he haue done, he perceiue that he is like to be drawne vp out of the water by the
angle;

angle. The Mullet also knoweth that the bait hath a hook within it, neither is he ignorant that it is laid for to entrap and catch him; howbeit, so greedie he is thereof by nature, that he neuer linneth bearing it with his taile, vntill he hath shaken off the meat from the hook. The Pike is not so wary and prouident in forecaſt, as to keep himſelfe from the danger of the hooke: but of great ſtrength and force he is, when he bethinketh himſelfe and repenteth that he was ſo fooliſh as to be caught: for no ſooner hangs he by the hooke, but he runneth and girdeth with it in his mouth too and fro, forcing and wreſting his wound ſo wide, vntill the ſaid hooke which had faſt hold on him before, be fallen out of his mouth againe.

The Lampricies deuoure the hooke, yea, they gobbie in and ſwallow more than ſo, vntill they come to the very lines, which they ſet their ſharpe teeth vnto, and neuer reſt vntill they haue fretted and gnawne them aſunder. And *Pytheas* is mine Authour, who writeth thus of them beſides, That if they find themſelves to be once vpon the hooke, they turne their bodies and writh ſides, That if they find themſelves to be armed with trenchant and keene edged fins like with their backs, as knowing the ſame to be armed with trenchant and keene edged fins like knives, & ſo with their very ſharpe chine & fins cut the lines atwo. *Licinius Maer* writes of Lampries, that they be all of the female ſex onely, and doe conceiue by ſerpents engendering with them, as I haue heretofore obſerued: which is the cauſe, that fiſhes lure them with hiſſing like vnto ſerpents, and by that meanes call them forth of their holes and catch them. Hee ſaith moreover, That they will feed ſat with milk: and if a man giue them a good knock with a cudgill, they will not die thereupon: rap them onely with a Fennell ſtalke or ſome ſuch wand, you ſhall ſee them dead forthwith. And verily it is held for certaine, that their life lieth in the taile: which if it be ſmitten, they are very ſoone gone and bereft of vitall breath: ſtrike them vpon the head, you ſhall hardly and with much adoe kill them.

There is a fiſh called a Raſoir: looke whatſoeuer toucheth it, ſenteth preſently of yron. Confefſed it is and knowne for certaine, that the Lompe, Paddle, or ſea-Owle, a fiſh called in Latine *Orbis*, of all others hath the rougeſt and hardeſt body. Shaped round it is without ſkales: a man that looketh vpon it, would ſay it were all head.

Trebius Niger mine authour affirmeth, That ſo often as the ſea Kite is ſcene to lance himſelfe and ſlie without the water, it threateneth tempeſts.

The Sword-fiſh, called in Greeke *Xiphias*, that is to ſay in Latine *Gladus*, i. a ſword, hath a beake or bill ſharpe pointed, wherewith hee will driue through the ſides and planks of a ſhip, and bouge them ſo, that they ſhall ſinke withall. The experience whereof is ſcene in the ocean, and the neere vnto a place in *Mauritania* called *Gotta*, which is not farre from the riuer *Lixos*. And the foreſaid writer *Trebius Niger* reporteth, That the ſea-cats or Cuttle fiſhes, called *Loligines*, wil ſlie out of the ſea, and ſettle vpon ſhips in ſuch multitudes, that they force them vnder water and ſo drowne them.

The Emperour *Caeſar* had many faire houſes of pleaſure in the country, where he kept fiſhes that would ordinarily come to hand and take meat. Our anceſters made no ſuch maruell thereat, namely, that they ſhould be ſo gentle & tractable in ſmall ſtewes and fiſh-ponds where they are kept to feed; but they haue written the like of fiſhes in great lakes and ſtanding pooles: And namely, about *Florus*, a caſtle in Sicilie, not farre from *Syracufa*: likewise, in a well or fountaine of *Iupiter Labradus*, there be yeels wil take meat at ones hand, & theſe wear ear-rings alſo about them. Semblably, in *Chios* neere vnto the chappell of the ancients or elders called *Veternum Delubrum*: alſo in a certaine ſpring of *Mefopotamia*, called *Cabura*, whereof I haue alreadie written. As for the fiſhes which keep about *Myrae* in *Lycia*, within the wel or fountain of *Apollo*, called *Curius*, they wil ſhew themſelves of purpoſe to giue preſage & foreknowledge of things to come: and the manner is, to call them to the top of the water with three whiſſes, of a ſife or ſuch like pipe. The order is among thoſe that come to be reſolued by them in ſome future euents, to caſt peeces of fleſh to them: if they ſnatch the ſame & ſwim away therewith, it is a lucky and fortunat ſigne, preſaging a good iſſue of their affaires about which they come; but in caſe and they reſect the ſame, & flurt the meat from them with their taile, that is an ominous token, and foreſheweth ſome unhappie euent to follow. About *Hierapolis*, a citie in *Syria*, the fiſh within the lake or poole of *Venus*, obey the voice of the wardens or ſextons who haue the keeping of her chappell there; and orderly they come at their call, garniſhed with their ornaments of gold about them: they will abide to be ſcratched and clawed, they will wag their tailes like a dog in a fawning and flattering maner; nay, they will gape with their mouths wide open, and ſuffer them

**Laffatus* ſome
reade *laſſatus*
others *laſſatus*,
i. with much
ſtriving and
ſtrugling.

A to thruſt their hands or fingers into them. At *Stabianum* neere to the rocke or cape of *Hercules*, the blacke-tailed ruffles or ſea-breames, which the Greekes name *Melanuri*, if a man caſt crums of bread into the ſea to them, they will catch the ſame, and ſcud away withall: throw them any other meat or bait with a hooke in it, they will not once come neer therto. Neither are theſe to be reckoned among the leaſt wonders and in the laſt place, namely, That about the Iſland *Pele* and the citie *Clazomenae*, all the fiſh that is, taſteth bitter: Contrariwiſe, thoſe that keep about the rock *Scylla* in Sicilie be ſweet, as alſo at *Leptis* in *Affrick*, *Euboea*, and *Dyrrhachium*. Again ſome are ſo ſalt, that they may well be taken for ſalt fiſh that hath lien in brine or pickle, to wit, neer the Iſlands *Cephalenia*, *Ampelos*, and *Paros*: likewise about the rockes and cliffes of *Delos*: and yet in the Bay or hauen of the ſaid Iſland, their meat is ſweet ynough. This difference in the taſt of fiſh, proceedeth no doubt from the diuerſitie of their food. Moreover, *Apion* ſaith, That the greateſt of all other fiſhes is the Mole-bout, which the Latines call *Porcus*, the Lacedaemonians *Orthagoriscos*; and that when he is taken, he will grunt like an Hog, whereupon it ſhould ſeeme he tooke the name *Porcus*. But as touching the foreſaid accident of the variety in the taſt of fiſh, how ſome be ſweet, others ſalt, that it ſhould be a naturall thing (and therefore the more to be maruelled at) appropriat to certaine places, it may appeare by this inſtance, which ſitly proueth the ſame: For take the ſalt fiſh of *Italie*, what kind ſoeuer you will, for certaine it is knowne, That at *Beneuentum* they may be made freſh againe, as if they had neuer bene ſalted.

C That ſea-fiſh hath been vſed at *Rome* from time to time, and euer ſince the very foundation of the citie, it may appeare by the teſtimony of *Caiſius Hemina*: which I will ſet downe word for word as touching that point, in this very place. King *Numa* (quoth hee) ordained, That fiſhes without ſkales ſhould nor be bought vp by Caters for the furniſhing of any ſolemne funerall feaſt. By which inhibition his policie and purpoſe was, that the great dinners, as well publique as priuate; the feaſtiull ſuppers alſo which were kept at the ſhrines of the gods, ſhould not be ſo coſtly and chargeable: for ſeaer alſo leaſt the caters who made prouiſion for ſuch ſumptuous feaſts, ſparing for no coſt, nor ſticking at the price were it neuer ſo high, might foreſtall the markets and buy the ſame vp beforehand.

As touching *Corall*, we (here at *Rome*) ſet not more by the Indian orient pearles (whereof I haue written at large in place conuenient) nor eſteem them at a greater price than thoſe Indians do our *Corall*. And verily, if we deeme aright, it is the opinion and perſuaſion of people only, that ſetteth the price of theſe and ſuch like things. True it is verily, that there is *Corall* bred in the red ſea, but blacker it is than that which we haue: likewise in the Perſian gulfe, & that is named *Iace*. Howbeit, the beſt ſimply is that which is found in the gulfe of *Marſiles* in France, about the Iſlands *Stoechades*: alſo in the narrow ſeas of Sicily, toward *Helia* and *Drepanum*. There is alſo therof growing at *Grauiſca*, & juſt before *Naples* in *Campaine*. But the reddeſt of all other, ſoft & tender withall, and therefore moſt commodious, is engendered about *Erythrae* in *Barbary*. *Corall* reſembles a buſh or ſhrub in forme, & of it ſelfe within the water, is of color greene. The berries thereof vnder the water be white and ſoft: no ſooner be they taken forth, but preſently they wax hard and turne red: much like both in ſhape and in bigneſſe to the grains or fruit of the gentle garden *Cornel* tree. It is ſaid that this plant while it grows and is alieue, if a man touch it neuer ſo little, becomes as hard immediatly as a ſtone. The fiſhers therefore to preuent that inconuenience (as knowing the nature thereof) either pluck it vp with their nets, or cut it with ſome ſharpe edged yron tooles: which is the cauſe that it is commonly called **Curalium*, as ſome make interpretation of the word. The reddeſt *Corall* is taken to be the beſt: the ſame alſo branched moſt, is not rough and ragged vnder the hand to ſeele to, or ſtone-hard: ſo like likwiſe it is and maſſie, nor void and hollow. The berries or beads which it beareth, is of no leſſe account & price with the men of India, than the Indian pearls with our coſtly dames here. And verily among them, their Wiſards, Southſaiers, Priests, & Prophets, haue a religious opinion of them, and attribute great holineſſe to the uſe thereof, as being perſuaded, that whoeuer weare them, ſhall be ſecured againſt all perils and dangers whatſoeuer; and therefore a ſpeciall reckoning they make of them, as well in regard of beautie as deuotion. Before that it was known in what eſtimation *Coral* was with the Indians, the Frenchmen adorned & ſet out their ſwords, targuets, ſhields, morrions, and head peeces therewith: But ſince time that there was a vent into India of this commoditie ſo vendible, great ſcarſitie there is of it, and hardly ſhall a man meet

**En* is *En* ſupis
because it is
cut and ſhorne
(as it were) in
the ſea,

with any Corall, euen in that part of the world where it growes naturally. The branches of Corall hanged about the neckes of infants and young children, are thought to be a sufficient preseruatiue against all withcraft and sorcerie. Calcined by fire, and so reduced into ashes or pouder and giuen to drinke in water, it helpeth those who are troubled with the wringing paines of the belly, the grieue of the bladder, and the disease of the stone. The like effect it hath if it be drunk in wine, or if the patient haue a feauer vpon him, in water for to procure sleep. This would be noted, that Corall doth withstand the power of fire, and long it is before it be burned and reduced into ashes. But surely a singular medicine it is, so prepared and vsed, in so much as (by report) if a man keepe to it still and continue it long, the same will consume the hardnesse and schirrositie of the spleen. The pouder of Corall is soueraign for such as reach and cast vp blood at the mouth. The ashes enter into many mixtures and medicines for the eyes: for astringent they be, and cooling withall. Hollow vlcers and fistulae they incarnate and fill vp againe with new flesh. Skars and cicatrices they do extenuate.

If I should speak of the repugnancie and contrariety in Nature (which the Greekes call antipathie) found in many creatures, there is not to be seen in the whole world any thing more venomous and aduerser to plants than the Puffens or Forke fish of the sea, called *Pastinaca*: for as I heretofore noted, it hath a pricke in the tail, which is able to kill any trees that be pierced or wounded withall. And yet a concurrent and enemy this hath, which doth persecute & plague it, and namely the Lamprey called *Galeos*; so eager is it and greedy of the venome and poyson of that fish. There be other fishes also which it pursueth, but those Puffins especially: and no Weazill hunteth more after serpents. In summe, whosoever be hurt or wounded by the said Puffin, this *Galeos* is a present remedy; so is the Barble also, and the gum *Lasar* or *Benjoin*.

CHAP. III.

¶ Of certaine creatures which liue as well vpon the land as the sea. Of *Castoreum*, or the generatores of a Beuer: the medicinable vertues thereof, and other properties obserued therein.

THE power and majestic of Nature is very conspicuous and visible, euen in those creatures also which liue indifferently on land and in the water: and namely in the Beuers, which commonly the physicians call *Castores*, like as their stones also *Castorea*. Some hold, that these Beuers when they be neuer driuen and pressed by hunters, and at the point to be taken, bite off their owne stones. But *Sextius*, who hath written most exactly in Physicke, denieth it flatly. He saith moreover, that these cods be small, knit short and trussed vp, so as they stick close vnto the chine bone, and cannot possibly be taken from the beast but the life goes away withall. By his saying also they are sophisticated, and the kidnies of the Beuer which are big, be obruded and foisted to vs many times in stead of their stones, which indeed are neuer found but very little & slender. Furthermore he affirmeth, That they be not the right stones of a Beuer when they are seene without a twofold burse or skin, which no liuing creature hath besides. In these two bags there is found (saith he) a certain oleous liquor, which ordinarily is kept & preserued with salt: And therefore among other marks to know false and sophisticated *Castoreum*, is this, If you see a paire of cods, hanging (as it were) knit together by one string in one bag. And yet the best may be falsified by the fraud and cunning of such as put gum thereto with salt *Ammoniack*, because the true Beuers stones ought to beare the colour of *Ammoniack*; to be enclosed also within their seuerall tunicles, and to lie in a certaine liquor resembling cereous hony, standing much vpon wax; to haue a strong and rank smell, a bitter, hot and fiery taste; and withall, apt to crumble between the fingers. The best *Castoreum* & most effectual, is brought out of *Pontus* and *Galatia*: next to it is that of *Affricke* or *Barbarie*. The vertue of *Castoreum* is to prouoke sleepe, if a man hold it to his nose and smell thereto. If the head be annointed with *Castoreum* incorporat with oile of roses and *Harstrang*, it will procure sleep: so will it do alone by it selfe giuen in water to drinke: in which respect, proper it is for the frensie. And yet the perfume or vapor thereof will raise those that lie in a sleepe lethargie: like a suffumigation* or pessarie put vp into the natural parts of women, is soueraign for the rising of the mother, in which fit they lie as it were in a trance and out of the world. *Castoreum* giuen to the weight of two drams with *Peniroyall* in water to drinke, moueth womens monthly sickness, and forceth the afterbirth to come away. It

* *Palmarum*,

the contrary.

helpeth those that haue the dizziness or swimming of the braine, bee drawne backward with cramps, tremble and shake; are plucked with spasmes and convulsions, diseased in their sinews; troubled with the *Sciatica*, sick of a weak and feeble stomacke that keepeth nothing which it takes, and lieth rid of the palfie, if they be annointed throughly therewith in parts conuenient. Or if *Castoreum* be reduced into pouder, and together with the seed of *Agnus Castus*, be incorporat with vineger or oile of rose, and so reduced to the consistence of hony, which being taken as an electuarie, is singular not only for the former maladies, but also for the falling sickness: and if the same be giuen in drinke, it discusse the ventosities, appeaseth the wrings and torments of the belly, yea, and represseth the malice of any poisons. But in this case of poisons it ought to be prepared, mixed, and vsed diuersly, according to the sundry kinds thereof: for against the venome of scorpions it would be drunk in meere wine: to withstand the danger of the *Phalangia* and such venomous spiders, it ought to be giuen in honied wine especially, if the intention bee to cast vp the said poisons by vomit; or with *Rue*, if the drift and purpose be to hold and retain all still. To prevent the perill of the Lizards or venomous wormes *Chalcidice*, it should be taken in Myrtle wine. Against the sting of the horned serpent *Cerafies*, or the fierie vermine *Prester*, with *Panax* or *Rue* in wine. But generally for all other serpents, the only liquor to receiue it in, is wine. Two drams at a time is thought to be a sufficient dose of *Castor* it self, in any of these compositions; but of other drugs that are put thereto, there ought to be a proportion of the half, to wit, one dram. Moreover, a peculiar vertue it hath, if it be drunk in vineger, to resist the venomous gum *Ixias*, growing vpon the plant *Chamaeleon*: but soueraigne it is for the poison of the herb *Aconitum* or *Libard* bane, in milk or faire water. Against white *Ellebre* it is good to be taken with mead of honied water and sal-nitre. Also, if it be puluerized and incorporate with oile, a soueraigne remedy it is to ease the tooth-ach, if it be dropped or poured into the eare of the same side where the grieue is: but better it were to temper it with the iuice of Poppy for paine of the ears. Mix *Castoreum* with the best hony of *Attica*, and bring it into anie salu, it is passing good for to cleare the sight. Giuen in vineger, it staieth and keepeth downe the yex or hiccquet. Furthermore, the vrine of a Beuer is a good counterpoison: and therefore it goeth to the making of *Antidotes* and preseruatiues. But the best way of keeping it (as some think) is in the owne bladder.

CHAP. IIII.

¶ Of the Tortoise. The medicines taken from many fishes, and diuers observations to them pertaining.

SEmblably, Tortoises liue in two places, and haunt both land and waters. Their effectual properties besides are such as deserue like honour, as well in regard of their manifold vses in sumptuous buildings (whereby they carry a great price) as of their sundry vertues and operations which Nature hath giuen them: now of these Tortoises there be many kinds, to wit, land Tortoises, and sea Tortoises. Tortoises found in muddy waters & marraies: Tortoises also that keep in fresh riuer water; and these last named, some Greeke writers call *Emydes*. The flesh of land Tortoises serueth wel in perfumes & suffumigations, for so it is as good as a countercharm to put by and repell all sorceries and enchantments: a singular counterpoison also to resist any venome whatsoever. Great store of Tortoises be found in *Affricke*: where they vse to cut away the head and feet, and then employ the rest of the body as a soueraigne remedy against all poisons. If their flesh be eaten together with the broth wherein they are sodden, it is held to be very good for to discusse and scatter the wens called the kings euil, & to dissipat or resolute the hardnesse of the swelled spleene: likewise to cure the falling sickness, and to driue away the fits thereof. The blood of Tortoises clarifieth the eyesight & dispatcheth the cataracts, if they be annointed therewith. Many incorporate the said blood in meale, and keep them reduced into the forme of pills, which when need requireth, they giue in wine as a present help for the poyson of all serpents, spiders, and such like, yea, and the venome of toads. The gall of Tortoises mixt with *Atticke* hony, serueth to cure the fiery rednesse of the eyes, if they be annointed therewith: The same is good to be dropt into the wounds inflicted by the prick of scorpions. The ashes of the Tortoise shell incorporat with wine and oile and so wrought into a salu, heals the chaps & vlcers of the feet. The skales scraped lightly from the vpper part of the shell giuen in drinke, coole the

the heat of lust. And I maruell the more hereat, because the powder of the whole shell indeed hath the name to heat the appetite and desire to venery. As touching their vrin, I hold it impossible to meet with the same, vnlesse it be found in their bladder when they be cut in twaine. And yet the Magitians hold this to be one of the most rare things in the world, and that which worketh wonders, saying it is right soueraigne for the biting or stinging of the Apsis, howbeit, much more effectuall (say they) if punaises be mixed with it. Tortoise eggs dried and hardened, are good to be applied to the wens called the kings euill, to any exulcerations, caused either by extreame cold or burning: The same being soft, are singular to be supped off in the paine of the stomacke.

The flesh of sea Tortoises, mixed and incorporat with the flesh of frogs, is a soueraign remedy against the venome of Salamanders: neither is there any thing more contrary in nature to the Salamander, than is the Tortoise. The blood of the sea Tortoise serueth to recouer haire in the places naked and bare, by occasion of the disease called Alopecia: it riddeth away likewise the skales and dandruffe, yea, and healeth all the scalds of the head: but the same must dry vpon the head, and be washed off at leisure by litle and litle. If it be dropped into the eares with breaf-milk, it easeth their paine. If it be chewed or eaten, tempered with the fine flour of wheat, it cureth the falling sicknes. But for the better preparing and ordering of this blood in these cases, it ought to be mingled in 3 hemines of vineger, one hemine of wine put thereto, with an addition also of Barly meale, and the same tempered with vineger: of which composition the patient is to take and swallow down the quantity of a bean euery day, morning and euening; and after some daies past, in the euening only: this blood is likewise singular to be dropt into the mouths of those that be fallen of the epilepsie or falling sicknes, so the fit be but smal, for which purpose they must be forced to gape. In case of cramps & convulsions, the same is to be clysterized with Castoreum. Whosoever rubbeth their teeth with Tortoise blood, and vse so to do a whole yeare together, shal be freed from the pain therof for euer. If it be mixed with barley groats, and giuen to them that draw their winde short, it discusseth the cause of that difficultie; yea, helpeth such as cannot breathe but sitting vpright. The gall of Tortoises cleareth the eyesight, it doth subtilize at the cicatrices and films that grow in the eyes: the inflammation of the tonsils it represseth, assuageth the squinancy, and helpeth all the accidents of the mouth: and more particularly, a property it hath to heale the cankerous and corrosiue sores there breeding: as also to cure the inflammation of the genitoirs. The same conueied vp into the nostrils, fetcheth those again to themselves who are in a fit of the falling sicknesse, and setteth them vpright vpon their feet. And with the slough of a serpent incorporat in vineger, and dropt into the ears that run, it is an excellent medicine to scoure them. Some put a Bœufes gall among, together with the broth of the Tortoise flesh sodden, and an addition of a snakes slough in equall quantity; but first they teeth the said Tortoise a long while in wine. Moreouer, the gall of Tortoises mixed with hony, amendeth all the imperfections incident to the eies, if they bee annoiued therewith: yea, if it were a cataract, the gall of a sea Tortoise tempered with the blood of a riuier Tortoise and womans milk, riddeth and scoureth it away. The said gall is very proper to giue a yellow die or colour to womens haire. Against the poison of Salamanders, sufficient it is to drinke the broth or decoction of a Tortoise.

As touching those kind of Tortoises that liue and breed in mud and moorie waters, which I reckoned to be the third kind: broad they be and flat in the backe as well as vpon the brest: neither doth their shell arise arch-wise in manner of a vault: these are ill-favored to see to, and yet as Jouelleffe as they be, they are not without some medicinable vertues and remedies: for take 3 of them and throw them into a fire made of Vine twigs, or their cuttings; when their shells or co-ners begin to diuide in funder and part one from another, pull them hastily out of the fire, pluck the flesh out of their shells, seeth them in a gallon of water, with a little quantity of salt put thereto; thus let them boyle vntill a third part of the liquor be consumed: This broth or decoction if it be drunken, is thought to be soveraign for those that be troubled either with the palfie, gout, or paine of joints. The gall of these Tortoises purgeth also phlegmaticke humours and corrupt blood out of the body. And after that this medicine hath don his part, and set the belly in a loosenesse, a draught of cold water knitteth it againe, and staeth all.

To come now vnto the fourth kind of Tortoises which keepe in freſh riuers, they afford an excellent remedy for to rid away a quartane ague, in this manner prepared and vſed: firſt take
certaine

A certain tortoises, diuide one piece from another & take out the fat within, stamp the same with the herb called houseleek and Linseed, incorporate all into an ointment; let the patients be anointed therewith before the fit commeth, all ouer the body saue the head only, and when they be well lapped with cloathes about them, giue them some hot drink: This (I say) is thought to be a soueraigne medicine against the said ague. But a tortoise to be applied for this purpose, ought to be taken at the full of the moone, because there may be more fat found in her. Mary the sick body must not be anointed (men say) at any time but two daies after. The blood of tortoises which are of this fourth kinde, if it be dropped on the head by way of embrochation, appeaseth the head-ach that vseth to return and come often by fits: the same also applied vnto the kings euill cureth it. Some are of opinion, that the better to let tortoises blood, and according to art, (as requisit it is in such cases of physick) they ought to be laid along with their bellies vpward, and so their heads to be cut off with a brasen knife: and then they giue order to receiue the blood in a new earthen vessel neuer occupied before: which blood is excellent to anoint the shingles, or any kind of *S. Anthonies* fire: likewise the running scalls of the head, and also werts. The same Authors doe promise and warrant, That with the dung of all sorts of Tortoises, the biles called Pani may be discussed and resolu'd. And although it be incredible and not to be spoken, yet some there be who haue written, That any ship maketh way more slowly at Sea, that carrieth within it the right foot of a Tortoise. And thus much shall suffice as touching Tortoises.

C And now from henceforth as touching the fishes and other water creatures, I meane to discourse of them and their medicinable properties, according to euery disease which they serue for. And yet I am not ignorant, that many a one will be desirous to know all at once, the vertues of each liuing creature, which indeed maketh them to seem more admirable a great deal. Howbeit this course that I meane to take, I hold to be more expedient and profitable to this life; namely, to set downe receipts and remedies digested by order, of each disease and malady: considering that one thing may be good for this Patient, and another for that; and some medicines are sooner found and gotten than others.

CHAP. V.

¶ Sundry medicines and receipts taken from those living creatures which conuerse in waters, and the same digested orderly into diseases. And in the first place, such as be appropriat to poisons and venomous beasts.

Heretofore haue I written of venomous honey, and the countries wherein such is gathered and made: now if any be poisoned therewith, good it is to eat the fish called Arata. i. a Guilt-head: Or say one be glutted with pure hony, or haue taken a surfet thereof, being of all other most dangerous, whereby the appetite is clean gon, and the stomack oppressed with crudities: for to preuent farther danger, *Pelopi* ordained for a special antidote or defensive the meat of tortoises boiled, after the head, feet, and taile were cut away. But *Apelles* in this case attributeth as much to *Scincus*. Now what this *Scincus* is I haue declared heretofore. Shewed also I haue oftentimes in many places, how venomous the monthly fleas of women are, but yet (as hath bin said already) the fish called a Barble is a singular remedy against the poison thereof: like as, both applied outwardly in a liniment, and taken inwardly as meat, it is a foueraigne thing for the prick of the Puffin or Forkfish, of Scorpions as well of the land as the sea, and of the malicious spiders Phalangia. The ashes of a Barble fresh taken and calcined, is a generall counterpoison, but more particularly it helpeth those who haue eatendeadly Mushrooms. Also it is said, That if the fish called a Sea-star, wel besmeared and anointed all ouer with the blood of a Fox, be fastned to the lintell, or hanged to the brasen naile or ring of a dore, it will put by all charmes, forceries, and witchcrafts, that none shall come into the house, or if any doe, yet they shall not worke any harme. As for the prick or sting of sea-dragons and scorpions, a cataplasme of Sea-stars flesh applied thereto healeth them: so it doth also the venomous bite of spiders. In sum, the broth of their decoction is thought to be a foueraigne remedie against all

manner of poisons, whether it be that a man haue taken it by the mouth, or be stung and bitten G
by any venomous beast: in Gales they are not without their medicinable vertues: for to eat salt

by any venomous beast: As touching fishes kept in salt, they are not without their medicinable vertues: for to eat salt fish is very good for them who are stricken with serpents, or otherwise bitten or stung by any venomous beast, so they drink to it oftsoons pure wine of the grape, and withal be sure to cast vp again by vomit toward euening their foresaid meat which they did eat that day. The same salt fish more peculiarly serueth for them who haue bin hurt and wounded with the venomous Lizard * Chalcis, the horned serpent Cerafcs, or the venomous horn-fretters called Sepes: being otherwise singular to heale those who haue bin smitten with the serpent Elops, or bitten with the thirty tooth of the worrne Dipfas: but if a man be pricked by the Scorpion, good it is for him to feed fully of saltfish, howbeit in no wise to vomit the same vp again, but rather to indure the drinesse & thirst occasioned thereby: and many hold, that it is a proper remedy to apply to the fore a cataplasme made of the foresaid saltfish. Verily against the biting of Crocodils there is not thought to be a more present and effectual remedy, than it. But to grow vnto particulars, Sports salted haue a special propertie to heal the biting of the beetle or venomous fly Prester: also in case a man be bitten with a mad dog, it is very good to lay salt fish vnto the fore; yea although the wound were not cauterised with a red hot iron, nor the patients body emptied by a clystire, this cataplasme alone of saltfish is thought sufficient to cure it: the same foked in vinegar serueth also to be laid vnto the place that is hurt with a sea dragon. Of the same operation and effect is a * square piece or canton of the fish Tuny salted and condiied. And since I haue named the sea- Dragon, this would be noted, That himself outwardly applied, is a remedie for the venom inflicted by the prick or fin of his ridge bone, wherewith his manner is to strike: yea & his very brains also, if you take nothing els, are as effectual. The decoction of sea frogs fodder in wine and vineger, is a souerain drink for all poisons, but especially for the venome of the hedge toad and salamander. As for the frogs of riuers and fresh waters, if a man either eat the flesh or drink the broth wherin they were sodden, he shal find it very good against the poison of the sea-hare, or the sting of the serpents abouenamed, but more particularly against the prick of the scorpions they would be boyled in wine. Moreover, *Democritus* saith, That if a man take out the tongue of a sea-frog aliue, so that no other part thereof stick therto, & after he hath let the frog go again into the water, apply the said tongue vnto the left pap of a woman while the sleepes, in the very place where the heart beateth, she shall answer truly and directly in her sleepe, to any interrogatorie or question that is put vnto her. But the magitions tell more wonders than fo of the frog, which if they be true, certes frogs were more commodious & profitable to a Commonwealth, than all the positive written lawes that we haue. For they would make vs beleue, That if the husband take a frog and spit her (as it were) a length vpon a reed, so as it go in at the skut or nare behinde, and come forth againe at the mouth, and then pricke the said reed or broch in the menstruall bloud of his wife, she shall neuer haue minde afterwards to entertaine any adulterers, but detest and loath that naughty kinde of life. Certaine it is, That if frogs flesh be put within a net, or that a booke be baited therewith, Purple fishes aboue all others will come flocking thither. Moreover, it is commonly said, That a Frog hath a double liuer, the which ought to be layd before Ants, and lookewhich of the two lobes or flaps thereof they make vnto, and seeme to gnaw, the same is a most singular antidote against all poysons whatsoever.

Some frogs there be that liue only among bushes and in hedges, which thereupon we call in Latine by the name of * Rubetæ: and the Greeks term them Phrynos: the biggest they are of all other, with two knubs bearing out in their front like horns, and full of poison they be. They that write of these toads, striue a-vie, who shal write most wonders of them: for some say, that if one of them be brought into a place of concourse where people are in great number assembled, they shall be all hushed and not a word among them. They affirme also, that there is one little bone in their right side, which if it be thrown into a pan of seething water, the vessel will coole presently, and boile no more until it be taken forth again. Now this bone (say they) is found by this means: if a man take one of these venomous frogs or toads, and cast it into a nest of Ants, for to be eaten and deuoured by them, and looke when they haue gnawed away the flesh to the very bones, each bone one after another is to be put into a kettle seething vpon the fire, and so

A it will soon be known which is the good by the effect aforesaid. There is another such like bone (by their saying) in the left side, as it is with the water that hath done nothing, it will seeme to boile and waite again presently. This bone (for sooth) is called Appocynon, and why so? because ywis, there is not a thing more powerful to appeale and repress the violence and furie of curst dogs than it. They report moreover, that it inciteth unto wanton lous, and yet nathelesse if a cup of drinke be spiced therewith, it will breed debate and quarrell among those that drinke thereof also, who soever casteth it about him, shall be provoked to deadly lust, and contrarywise, if the bone in the right side be likewise used, it will coole as much, and take downe the pride of flesh and heat of concupiscence. Others there be who are of opinion, that if it bee but worn about one, either hanging to the necke, or fastened vnto any other part of the body, infolded within a little piece of a new lambs skin, it will cure a quartan ague, or any other fener sides. The same also to repress the affection of loue. Moreover, they beare vs in hand, that the milke of these teades is a conuersion against their owne venome, but the heart (say they) is much more effectfull.

There is a certaine kind of Serpent or Snake haunting the water, called in Latine Colubus, the fat and gall of which Serpent if they haue about them who vse to hunt after Crocodiles, it is wonderfull (say they) how they be armed and defended against them, for they will not attempt to turne againe vpon the hunters and giue any assault, and yet of greater effect, and force they shall finde it, in case there be incorporated withall, the pond-weed or water-speekel called Potamogeton.

C The ruier Creifishes, if they be taken fresh, stamped and giuen in water to drinke, are sou-
raigne against all poisons: so is their ashes also a counterpoison; but more particularly against
the sting or pricke of Scorpions; if it be drunke in asses milke; or for default thereof, in goats
milke, or any other whatfoeuer: but then the patient ought to drinke wine vpon it. And verily,
so aduerse and contrary are they vnto Scorpions, that if they be punned with Basill into a cer-
taine composition, it will kill them, if the same be but laid vpon them. Of the same force they
are against the sting or biting of any other venomous beast besides, and more especially of the
pernicious hardihearted Scytale, of snakes, sea hares, and hedge-hogs. Many there be who vse to
saue the ashes of Creifishes calcined, as a soueraigne remedy for all such as be in danger to fall
into the symptome of fearfulness to drinke, incident to thole that are bitten by mad-dogs: some
D adde thereto the herbe Gentian, and giue both together in wine to drinke: but if the sayd symp-
tome of Hydrophobie haue surprized them already, then the said ashes or powder ought to bee
reduced (by the meanes of wine) into trofches or pills, which they prescribe vnto their patients
for to be swallowed downe. The Magicians proceed farther, and affirme, that if a man take ten
Creifishes and tie them all together with a good bunch or handfull of basill, all the Scorpions
that be thereabout, will assemble together to that one place; and they giue order, that if a man
be hurt already with a scorpion, there should be a cataplasme made of them, or at least wayes of
their ashes mixed with Basill, and so applied to the place affected. The sea-crabs are nothing so
good of operation in all these causes, as the Land-crabs or Creifishes aforesaid, according as
Thrasillius mine Authour doth report. Howbeit, hee sayth neuerthelesse, that there are no such
E enemies to serpents, as Crabs: and he affirmeth moreouer, That if swine be stung or hurt by ser-
pents, they helpe and cure themselues by feeding vpon sea Crabs onely, and seeke for no o-
ther helpe or remedie. Hee addeth furthermore, and avoucheth, that serpents are ill at ease, yea
and much tormented with paine when the Sunne is in the signe of the crab, called commonly
Cancer.

To come now to the riuer shell-snails : most certaine it is, that their flesh, whether it be raw or boyled, is singular good to resist the venome of scorpions inflicted by their prick or sting : and some there be, who for to haue them in a readinesse to serue in those cases, keep them in salt : and they ordaine them to be applied vnto the very fore it seife, occasioned by their foresayd sting.

As for the [black] fishes named Coracini, they are peculiar and appropriate vnto the river Nilus: howsoeuer my determination and purpose is to deliuer medicines profitable and beneficiall to all parts of the earth in general. Their flesh is good to be applied vnto the fores caused by scorpions.

The Sea-swine or Porpisc, hath prickly fins vpon his back, and those are counted amongst the venomous things that the sea yeeldeth, putting them to much paine that are wounded or hurt thereby: but what help therfore, surely the very muddy time that gathereth about the body of the same fish, is the onely remedy.

The Sea-calf, otherwise named a Seale, hath a certaine grease, wherewith it is good to anoint the face or visage of those, who by reason that they are bitten with a mad dog, are afraid to drink and cannot away with water: but it will worke the better, if there be mingled therewith the marrow of an Hyena, the oile of the Mastich trees and wax, that all may be reduced into a liniment.

As for the biting of a Lamprey, there is not a better thing to heal it than the ashes of a lampreys head. The Puffin likewise or Fork-fish, cureth the wound that himselfe inflicted, namely, if the place be annointed with his own ashes, tempered with vinegar, or mixt with the ashes of any other fish. If a man would make meat of this fish, there ought to be taken out of the backe whatsoeuer is there found like to saffron: likewise the head all and whole would be taken away, and yet to maintain and keep the tast thereof, the same must be washed but a little and no more than all shell fishes, for otherwise all the pleasantness in the eating would be cleane gone.

The mischieuous venome of the sea-hare, [called otherwise Inbriago] is quenched clean and mortified, by taking the flesh of the sea-Horse any way in drinke.

Against the poison of deadly dwale, the meat of sea-vrchins is soueraigne: & whoeuer haue drunk the dangerous juice of * Carpasum, find much ease and help especially by supping their decoction. To conclude, the broth of sea-crabs likewise taken, is thought to be effectual against the foresaid dwale named Dorycnium.

CHAP. VI.

¶ Of oysters and Purple shell-fishes: of Sea-mosses, or Reits: and the remedies which they afford.

Moreover, Oysters haue a speciall vertue to resist the venome of the sea-hare. And albeit I haue written already of oysters, yet me thinks I cannot speak sufficiently of them, seeing that for these many yeres they haue bin held for the principal dieth & daintiest meat that can be serued vp to the table. This fish loneth to haue fresh water, & ioieth to be in those coasts where most riuers do run into the sea: which is the reason, few of them are found in the deep, called therupon Pelagia; and those thrive not, but are in comparison very small. Howbeit, they breed and ingender otherwhiles among rocks, & in such holes which want the recourse of sweet waters: as for example, about Grynna and Myrina. They wax big and full according to the encrease of the Moon, as I haue shewed already in my treatise of creatures liuing in waters: but principally about the spring prime, when they be full of a certain humour or moisture like vnto milk, and in those shallow places where the sun pearceeth with his beams to the very bottom of the water. And this seemeth to be the reason, that in other coasts and parts of the sea, they be found far lesse: for shade hindreth their growth, and for want of the cheerefull sight of the sunne, they haue lesse appetite to meat & feed not: moreover, this is to be noted, that oysters differ one from another in colour. In Spaine they be reddish, whereas in Sclauonia they be brown and dusky: but about the cape Circeij in Italy, their shell and flesh both, be blacke. In what coast or countrey soeuer they be found, the best and principall those are held to be, which be massive and compact; not glib and slippery without, with their owne humour and moisture: and rather bee they chosen which are thicke, than broad and flat: such also as bee taken neither in muddy nor yet in sandie places, but vpon the sound and firme ground in the bottome, hauing their white meat trussed vp short and round, and not flaggie as flesh: the same not jagged and fringed about in the edges with smal strings, but lying all close vnited together as it were couched within the belly. They that be more expert and practised in the choice of oysters, adde one marke more to chuse them by, namely, if there be a purple thread or string that compasseth them about the edges: and by this signe they know the oysters of the best kind and race, from others, and call them by a proper name Calliblephara. Oysters delight (as I may so say) to traueil into strange quarters, to be transported from their naturall seat into other vnkown waters. Thus the oysters bred about Brindis, and remoued from thence to the lake Auernus; and beeing there fed, are suppo-

posed by that means to keep still their own native juice and humidity, and besides to gain nouriture by the moisture of Lucrinus. Thus much as touching the substance and body of Oysters: it remaineth now to speake of those parts and tractes where the best oysters are to be had; to the end that such coasts may not be defrauded of the honour due and appertaining vnto them. But of this point speake I will by the tongue of another, and alledge his speech who is thought to haue written hereof with best judgement of any man in our time. These therefore bee the verie words of Mutianus, which I will put downe as followes: The oysters (quoth he) of Cyzicum taken about the straights of Callipolis, be the fairest of all other, and bigger than those which are fed or bred in the lake Lucrinus, sweeter than those of Brittain, more pleasant in the mouth than the Edulian, quicker in tast than those of Leptis, fuller than the Lucenian, drier than those of Coryphanta, more tender than the Istrian, and last of all, whiter than the oyster of Circeij: and yet there haue not bin found any oysters either more sweet or tender than these last named. The Historiographers who wrote of Alexanders voiaiges and exploits, haue left in writing, that within the Indian sea there be oysters found a foot long euery way. Moreouer, there is among vs a certain Nomenclator or Controller belonging to one of our prodigall and wastful spendthrifts here at Rome, who haue giuen a proper name to certain oysters, and termed them Tridacna: his desire was by that significant name, to expresse thus much, That they were so big as that they would make three good bits or mouths-full a piece.

Now proceed I will to their medicinable vertues, & before I go any further, in this very place set down how far forth they serue in physick. First and formost, they be the only meat to comfort and refresh a decayed stomack: they recover an appetite that was cleane gone. But see the practise of our delicat wantons! to coole oysters forsooth, they must needs whelm & couer them all ouer with snow, which is as much as to bring the tops of mountaines and bottom of the Sea together, and make a confused medley of all. This good moreover do oysters, that they gently loose the belly, and make a body soluble: seeth the same with honied wine, they cure the Tiflome, which is an inordinat and bootlesse desire to the stoole without doing any thing, especially if the tiwil (which is the place affected) be not exulcerat: oysters likewise so prepared, cleanse and mundifie the vlcers of the bladder: eat them in their shel with their water, as they came closed and shut from the sea, you shall find them wondrous good for any rheumes or distillations. The ashes of an oyster shell calcined, and incorporat with honey, be singular for the paine of the vula, and assuage the inflammation of the tonsils: semblably, they repress the swelling kernels that rise vnder the ears, assuage the biles and botches called Pani, mortifie the hard tumours of womens breasts, and heal the sores or scalls of the head, if they be applied accordingly with water: and in the same order prepared, they rid away wrinkles, and make womens skin to lie smooth and euen. These ashes are a soueraigne powder to be cast vpon any place that is raw, by reason of a burne or scalding: and the same is commended for an excellent dentifrice to cleanse & whiten the teeth withall: temper the said ashes with vinegar, it killeth the itch, and healeth angrie wheales; the small pocks also and meazils. Oysters punned raw and reduced into a cataplasme, heale the kings euill and kibed heels, if they be applied accordingly.

Moreover, the Shell-fishes called Purples, are very good against poison. As for the reits Kilpe, Tangle, & such like sea-weeds, Nicander saith, they are as good as treacle. Sundry sorts there be of these reits, going vnder the name of Alga, as I haue already declared: some are long leaved, some large, others of a reddish colour, and some haue curled and jagged leaues: the best simply of all others, be they of the Island Creta; which grow near the ground vpon rocks; and namely for to dye wooll & woollen cloth; for they set so sure a colour, as neuer will shed or be washed off afterwards. Nicander giueth direction, to take the said treacle in wine

CHAP. VII.

¶ Medicines against the shedding of haire. For to colour the haire of the head. Also against the accidents of the eares, teeth, and visage.

IF by occasion of some infirmity the haire be fallen off or grow very thin, the ashes of the fish called the Sea-horse, mingled with sal-nitre and swines grease, or applied simply with vinegar, replenish the bare places with new haire, and cause it to come vp thicke again: and for to apply such medicines for this purpose, the powder of a cuttle bone prepareth the skinne well before-hand.

438
**Muris marini* hand. Also the ashes of the sea-Tortoise incorporat with oile of a sea-vrchin likewise burnt and calcined flesh and all together as also the gall of a scorpion, be appropriat medicines to recover haire that was lost. In like maner take the ashes of 3 frogs burnt together alieue in an earthen pot, meddle them with hony, it is a good medicine to cause haire to grow: but the operation will be the better, in case the same be tempered with liquid pitch or tar. If one bee disposed to colour the haire of the head black, let him take horse-leeches which haue putrified and been resolved together in some grosse red wine for the space of 60 daies, he shall find this to be an excellent medicine. Others there be who giue order, to put as many horse-leeches as a sextar will hold, in two sextars of vineger, and let them putrifie within a vessell of lead as many daies together, and when they be reduced into the form of a liniment, to annoint the haire in the sunshiner for the same purpose. And *Sernatius* attributeth so much power vnto this composition, that vnto lesse they that haue the annointing of the haire with it hold oile in their mouths all the while, their teeth also (by his saying) who haue the doing of it, wil turn black. The ashes of Burrets or Purples shels incorporat in hony, serue passing well in a liniment to heale scald heads: and the powder of the foresaid fish shels (although they be not burnt and calcined) tempered with water, is as good for the head-ach. Of the same operation is Castoreum, incorporat with Harstrang in oile rosat. The fat or greafe of all fishes whatsoeuer, as well those of the sea as riuers, beeing dissolved in oile and tempered in honey, is soueraigne for to cleare the eyes: and of the like effect is Castoreum applied with hony. The gall of the fish Callionymus, healeth the cicatrices or scars that ouergrow the skin about them: and the same careth & consumeth the excrescence of superfluous flesh in the corners of the eies. And verily there is not a fish that hath more gall than it, as testifieth *Menander* the Poet in his comedies: the same fish is otherwise called **V-than* or *scopos*, by reason of the eies which he hath in the vppermost part of his head. Semblably the gall of the black fish *Coracinus* quickneth the eie-sight. Also the gall of the reddish sea-scorpions, mixt with old wine or the best bony of Athens, serueth to discusse the filmes of the eies like to breed a cataract: and thrice must the eies be annointed therewith, letting a day goe euener betweene. The same cure serueth likewise to take away the pearle in the eie. As for Barbel, it is commonly said, that if one do feed ordinarily vpon them, hee shall sensibly feeble his eies to decay and wax dim thereby. The sea-hare it selfe verily is venomous; but the ashes keep the disorderly and hurtfull haire of the eie-lids from growing any more, if they be once pluckt vp by the roots: and for this purpose, the least of this kind are the best. In like manner, the little Scallop kept in salt, and stamp together with the rosine or oile of cedar: the small frogs likewise which vsually they call *Diopetes* and *Calamita*, haue the like effect to hinder the coming vp of hairs in the eie-lids, after they be once pulled vp; in case their bloud be tempered with the gum of the vine-tree, and therewith the edges of the said eie-lids be annointed. The swelling and rednesse of the eies is by nothing better delaied and discused, than by a liniment made of a cuttle bone puluerized and mixt with womans milk. And in very truth, the said cuttle bone simply by it selfe, cureth the asperity and roughnesse of the said eie-lids. But to worke this cure, the chirurghion vseth to turne vp the said eie-lids, and to apply therto the medicine, which he suffereth not to stay there long, but taketh it away within awhile: he annointeth the place also with oile rosat, and ouer night laieth thereto white-bread crums [with breest milke] for to assuage the paine. The selfe same shell or couer of the cuttle-fish beaten to powder and brought into a liniment with vineger, cureth those who can see neuer a whit towards night. The ashes of the sayd cuttle-bone draw forth the scales or films which grow in the eies: the same incorporat with hony, heale the skars of the eies; but tempered with salt or brasse-ore, of each one dram, they rid away the pin and web growing in the eie: the same help horses of the haw that offendeth their eies. Some say moreouer, that the little bones within the cuttle, if they bee stamped to powder heale the eie-lids of any fore or accident befalling vnto them. The sea-vrchins flesh applied with vineger, taketh away the accidents of the eies called *Epinyctides*. The Magirians giue direction to burne the same with vipers skins and frogs, and to spice the drink with the ashes that come thereof, assuring those who vse to drink the same, that they shall haue a very cleare sight. [A fish there is named *Ichthyocolla*, which hath a glewlish skin, and the very glue that is made thereof, is likewise called *Ichthyocolla*. The same glue taketh away the night-foes, commonly named in Greek *Epinyctides*. Some affirm, That the said glue *Ichthyocolla* is made of the belly and not of the skin of the said fish, like as Bulls glue. This fish glue is thought to be best that

A is brought out of Pontus : the same also is white without any veines, strings, or scales, and verie quickly melteth and resolueth. Now the same ought first to be cut or shred small, and then to lie infused or in steep a whole day and a night in water or vineger, which done, to be punned and beaten with the pebbles found about the sea-shore, that the same may the sooner melt and dissolve. This glue thus ordered, is held to be soueraigne for the head ach, and a good thing to enter into those medicines or compositions which are deuised to smoothe the skin & rid away the wrinkles. Take the right eie of a frog, lap it within a piece of selfe russet cloth (such as is made of black wooll as it came in the fleece from the sheep) and hang it about the neck, it cureth the right eie, if it be inflamed or bleared. And if the left eie be so affected, do the like by the contrary eie of the said frog, &c. Now, if it were possible to pluck out these eies as the frog is ingendering, it would heale also the white cicatrices or scars in the eie, if it were hung about the necke of the patient in like sort within an egge-shell. The rest of the frogs flesh applied to the eie, sucketh out and consumeth the blood that is congealed vnder the tunicles of the eie, and lies there black and blew. They asseme moreouer, That the eies of a crab or crafish being hanged about the neck, are a soueraigne remedy for bleared eies.

the neck, are a souveraigne remedy for bleared eyes.
A little frog there is, delighting to liue most among grasse & in * reed plots : mute the same
is and neuer croaketh, green also of colour: if kine or oxen chance to swallow one of them down
with their grasse, it causeth them to swell in the belly, as if they were dew blown. And yet (they
say) that if the flime or moisture wherewith their bodies be charged outwardly, be scraped off
with the edge of some penknife, it cleareth the sight, if the eyes be annoiued therewith. As for
C who take 15 frogs, pricke them with a rish, & draw the same through them, that they may hang
thereto; which done, they put them in a new earthen pot: and the humour or moisture that passeth
from them in this manner, they temper with the juice or liquor which in manner of a gum
issueth out of the whitewine Brionie, wherewith they keep the eyelids from hauing any haire
growing vpon them. But first they pluck vp those disorderly haire which grew there to offend
and hurt the eyes: & with a fine needle point drop the foresaid liquor into the very places where
the haire were fetched out by the roots. *Mezes* the Chyrurgian deuised another depilatory for
to hinder the growing of hairs, made of frogs which he killed in vineger, and permitted them
therin to putrifie and resolve into moisture: and for this purpose his manner was to take many
D fresh frogs, euen as they were ingendred in any rain that fel during the Autumne. The same depilatory
effect, the ashes of Horse-leeches are supposed to haue, if they bee reduced into a liment
with vineger, and vsed accordingly: now must they be burnt and calcined in a new earthen
vessel that neuer before was occupied. And of the like operation is the liuer of the sea-fish Tæ-
nia, if the same bee dried, and thereof the weight of foure deniers Romane incorporate in oile of
Cedar to the forme of a liment, for to annoiue the haire of the eye-lids by the space of nine
moneths together.

moneths together.

The fresh gall of a Ray or Skeat, yea, and the same preserved and kept long in old wine, is an excellent medicine for the eares: so is the gall likewise of the fish * Bancus, which some call Myxon: also of Callionymus the fish aforesaid, if it be dropt into the eares with oile of rose: semblably Castoreum with the juice of Poppie. There be also in the sea certaine creepers ingendred, called Pedunculi, i. sea-lice, which being stamped and tempered with vinegar, they give counsell to drop into the eares. Also a lock of wooll died in the bloud of the purple shell-fish Conchylium, of it selfe alone is a very good thing to be applied to the eares: howbeit, some doe wet the same in vinegar and salniter mixed together. But the foueraigne remedy in the opinion of most Physitians for any grievance and infirmity of the eares, is this, namely, *Recipe* of the best sauce or pickle called Garum Sociorum that may be gotten, one cyath, of hony one cyath and an halfe, of vinegar one cyath, seeth them all together gently over a soft fire in a new por, eistsoon skimming it in the boiling with a feather; and when it hath left casting up a scum and is sufficiently purified, take it from the fire: and of this decoction warm drop into the pained eares. If the eares be swelled withall, they ordain and prescribe to mitigate & assuage the same first, with the juice of Coriander. The fat of frogs dropt into the eares, allaieth their paine presently. The juice or decoction of crafishes incorporat with fine Barly meale, is a singular and most effectuall salve to heale the wounds of the eares. As for swellings and inflammations rising behind the eares, there is not a better thing to cure them, than to apply therto the ashes of Burrets shells tempered with hony.

hony, or of the Purples Conchylia, with honied wine.

If the teethe ake, the ready means to assuage them, is to scarifie the gums and let them bloud
 with the sharp bones of the sea-dragon : and withall, to make a collution with the brains of the
 sea dogfish boiled in oile and faued for the purpose, to wash the mouth and teeth therewith once
 in a yere. Likewise in the paine of the teeth, found it is most soueraigne to scarifie the gums with
 the prickly bone or fin of the Puffin or Forkfish, vntill they bleed againe. The same also beeing
 puluerized, brought into a liniment with white Ellebore, and applied to the teeth, causeth them
 to fall out of the head without any great paine. Moreover, the ashes of salt fish burnt in a new
 earthen vessell, and mixt with the powder of the marble stone, is reckoned among the remedies
 for the teeth. In like maner the quadrants or square cantons of the old Tuny fish, burnt to a cole
 in a new earthen pan, and afterward beaten to powder, are thought to be good for the tooth-ach. H
 Of the like operation and effect (they say) be the pricks and fins of all kindes of salt fish, if they
 be first burnt to a coale, then puluerized, and therewith the teeth well rubbed. Furthermore, to
 make a collution to wash the teeth withall, and to hold the liquor in the mouth, some seeth
 frogs in vinegar, with this proportion, that to euery frog they take one hemine of vinegar. But
 because many a mans stomack lothed & abhorred such a medicin, *Salustius Dionysius* found the
 means to hang many of them by the hinder legs ouer the vessell or pan of seething vinegar, that
 out of their mouth there might fall the humor within their bodies into the said vinegar. But
 to those who had good stomacks & were of stronger complexions, he prescribed to eat the very
 frogs broth & all wherein they were sodden. And in very truth, many are of this opinion, that if
 the grinders and great jaw teeth do ake, this is a speciall medicine for them, but in case they be
 loose in the head, then the best way to confirm and set them fast, is a collution with the vinegar
 afore said. And for this purpose some there be, who after they haue cut off the feet of 2 frogs, lay
 their bodies to infuse and steep in one hemine of wine, and so aduise their patients to wash their
 vnsteedy teeth with the said infusion. Others apply them whole as they be, legs and al outwardly
 to the chawes, and keep them fast thereto. Whereas some again seeth ten of them in 3 sextars
 of vinegar, vntill a third part of the liquor be consumed, and with this decoction thinke to fasten
 the teeth sure that shake in their sockets. Moreover, others you shall haue who take the hearts
 of 36 frogs, and bake or boile them in one sextar of old oile vnder a pan or ouen of brasse ; the
 graue or liquor whereof they poured into the eare of that side where the cheek or jaw doth ake ;
 whereas many others besides seeth the liuer of a frog, and when they haue stamped and incorporat
 it with hony, put it into the hollow teeth, or apply it thereto. But all these medicines aboue-
 sayd you must thinke to be more effectual, if they be made of sea-frogs. Now if the teethe bee
 worne eaten and stinke withall, they giue order to dry a hundred of them in an ouen all night
 long : afterwards to put vnto them as much salt in proportion as they cometo in weight, and
 therewith to rub the said faulty teeth. There is a kind of serpent or water-snake called in Latine
 Coluber, and of the Greeks Enhydrys : diuers there be, who with foure of the vpper teeth of this
 serpent, scarifie the gums of the vpper chaw, in case the teeth therin do ake : and semblably with
 foure of the nether teeth, if the other bee in paine : and yet some there bee who content them-
 selues with the eye-tooth onely. They vse also the ashes of Sea-crabs, and no maruell : for the
 ashes of Burrets is a dentifrice well knowne for to keepe the teeth cleane, and make them neat
 and white.

The fat of a sea-Calf or Seale taketh away the foule tetter called Lichenes, and the filthy leprosie: so do the ashes of Lampreys, if the same be incorporat with hony to the weight of 3 oboli. The liuer also of the Puffin boiled in oile. Finally, the ashes of a sea Horse and a Dolphin mixt with water, so that the part affected be well rubbed withall vntill it blister. Now, when it is thus exulcerat, it must be followed with that manner of cure which is appropriat thereto, and namely, vntill it be healed and skinned againe. Some take the liuer of a Dolphin, and fry or torrifie it in an earthen pan, vntill there come from it a kind of greafe in manner of oile, & therewith anoint the patients in the cases abovesaid.

If women desire to be rid of the foule freckles, spots, and morpew that do injury vnto their beautie; if they would looke young, and haue their skin plump and void of all riuels, let them take the ashes of Burrets and purple shels calcined, incorporate the same with honey into the form of a liniment: within one weeks space if they ply it with anointing, they shal see the effect thereof; namely, the skin cleare and neat, euē and smooth without wrinkles, & the cheekes

not hollow, but faire and full. Mary upon the 8 day they must not forget to foment and bath the place with the white of an egge wel beaten. Among the kinds of Burreis called Murice^s, are to be ranged those shell-fishes which the Greeks some call Colycia, others Corythia, shaped in the shell like to the rest in manner of a turbant, but that they be far lesse, howbeit more effectual: for that besides the other properties abovementioned, this speciall gift they haue, to maintaine a sweet breath. As for the fish or glue called Ichthyocolia, it hath vertue to lay the skin even without ridels, and to make it rise and appear fresh, but then it ought to boile in water the space of 4 houres afterwards to be stamped, * strained, and wrought to the liquid consistence of hony * Colata. and no more. Thus prepared, it must be put vp into a new vessell neuer occupied, & there kept. When time serues to vse it, to every 4 drams weight thereof proportion two of brimstone of Orchanet as much of litharge of flisser 8 drams: put them all together, and stampe them, with some sprinkling of water among. Herewith let the face bee annointed, and after foure houres wash it off againe. For the spots and pimples in the face, called Lentils, as also for all other deformities, the ashes of Cuttill bones are thought singular, if the skin be rubbed therewith: and the same consume the excrecence of proud and rank fleshy like as they dry vp any moist and rheumaticke vlcers.

CHAP. VIII.

¶ *Diners receipts, set downe disorderly one with another, for sundry maladies.*

ONe Frog boiled in five hemines of sea-water, is singular to cause the scurfe of the mange or wild scab to fall off: but sodden so long it must be, vntill the decoction bee risen to the height of honny.

There is ingendred in the sea also that which is called Halcyoneum, made as some thinke of the nests of the birds Halcyones and Ceyces: but as others suppose, of the filthy some of the sea thickened and indurated; and according to the opinion of some, it proceedeth from the muddie slime or a certaine * hoary dry scum or froth of the sea. Foure kinds there bee of it. The first of an ash colour, thick and massie, of a quick and hot smell. The second is soft and more mild, fauoring in manner like to sea weeds. The third resembleth the whiter kinde of checquer worke in marquettry. The fourth is more hollow and fuller of holes in maner of a pumisth stone, & in that respect resembleth a rotten sponge, inclining much to the colour of purple: and this is simply the best, called also by the name of Halcyoneum Milesum; yet in this kind the whiter that it is the worse it is to be liked. The property of them all in generality, is to exulcerat and mundifie. Vsed they are being torrifed, euen without any oile. Wonderfull is their operation, if they bee tempered with Lupines, and the weight of two oboli in sulphur, for to take away the wilde scab or leprosie, the foule tectars Lichenes, and the pimples or spors of the skin called Lentils. Halcyoneum also is commonly emploied about the scars or thick filmes appearing in the eyes. Andreas the Physitian vsed much the ashes of a sea-crab incorporat with oile in curing the leprosie. Attalus occupied as vsually the fat of a fresh Tuny, bew taken, for the healing of vlcers. The pickle of Lampreies, together with the ashes of their heads calcined, and brought into a liniment with hony, healeth the kings euill. And many are of opinion, that to prick the wennes named the Kings euill aforesaid, with the small bone or pricke that sticketh in the tale of that sea fish which is called * Rana marina, with this gage and rule of the hand that it wound not deep, is very good for that disease: but the same must be done euery day vntil they bee thoroughly cured and whole. Of the same operation is the sharp prick in a Puffen: of the sea-hare also applied to them, so as neither the one nor the other be suffered to lie long to the place, but bee soone renewed. Also the shelly skin of the sea-Vrchin stamped to powder and brought into a liniment with vineger: as also the ashes of the sea Scolopendre incorporat with honey: and the riuier crabs fish either puluerized or calcined, and the dust or ashes thereof likewise tempered with honey, are good to be applied to the same disease. Wonderfull effectuall be the bones also of the cuttill fish beaten to powder, and with old swines greafe brought into the form of a liniment: and in this manner they apply this medicine to the tumors behind the ears: like as the liuers of the sea fish Scarus. Moreover, the sheards of such earthen vessels wherein salt fish was powdered & kept, beaten to powder, & tempered with old swines greafe: the ashes also of Burrers shels incorporat in oile, serue in right good stead for the swellings behinde the eares, and the tumours or wenns

* The Frenchmen term it *Diabls de mer*, i. the diuell of the sea.

called the kings euill. The stiffe cricke in the neck is mollified and made pliable againe so as it may turne which way a man would haue it with drinking of one dram weight of those creepers or insects which be called sea-lice; and yet some take for the same Castoreum in honied wine, adding thereto a little pepper, and drinke this composition in the broth of frogs boiled in oyle and salt. After which manner, many Physicians cureth the crampe that draweth the neck backward: the generall convulsion also that stretcheth the body so as if it were of one piece; and other particular spasmes and cramps of any part, so there be some pepper put thereto. The ashes of salt Cackerels heads burnt and reduced into a liniment with honey, discusse and resolueth the Squinancy cleare; like as the broth of frogs boiled in vinegar, and the layd broth is singular also for the inflammation of the tonsils. The Craifishes of the riuer dried and beaten to powder, then put into water (so as there be to euery one a hennie of water) make a good liquor to gargle withall for the squinancy. The same also drunke in wine or hot water, worke the like effect. The sauce made of Maquerels called Garum, put with a spoon vnder the vula, and there held a while, putteth it vp, and reduces it again to the right place. The fish * Silurus eaten at the table either fresh or powdered, helpeth the voice much. The barbels kept vntill they be dried, & then puluerized, prouoke vomit, if a cup of drinke be spiced with the powder. If a man or woman bee short winded, there is not a medicine again so good to helpe that difficulty of breath, as to drinke whiles they be fasting, Castoreum, with a little quantity of Ammoniack in honied vinegar. The same portion taken likewise with honied vinegar hot, allaieth the convulsion of the stomack proceeding from excessiue yexing or hicquers. Item, it is said, that Frogs boiled in some broth between two platters after the manner of fishes, are good for a cough: and beinge hanged by the heeles, after that their saluation and humidity is dropt from them into a pan or platter vnderneath, they are to be rid of their garbage, & when the same is flung away, they ought to be kept and preferred for the purpose aforesaid. There is a little Frog that vseth to climb trees, & from thence crieth and croaketh: if a man spit into the mouth of one of them, & then let her go again, it is thought hee shall bee deliuered by that meanes from the cough. To conclude, many giue counsell for the cough that bringeth vp bloud withall, to drinke in hot water the flesh of a raw perwinckle well punned.

CHAP. IX.

¶ Proper receipts for the accidents of the Liuer and the sides: for the infirmities also of the Stomacke and Belly. Besides other medicines, huddled together confusedly.

Many vse to suffocate and kill in wine a sea Scorpion, and to drinke thereof for the paine of the liuer. For the same purpose many are wont to take in honied wine and water of each a like quantity, the flesh of the long muskles or shell fishes, or if they haue a feuer, in honied water. In case of pleurisie or pain of the sides, the flesh of the sea horse roasted, eases the same: so doth the fish Tethea, which resembleneth an Oyster, taken as meat. The pickle of the fish Silurus injected by way of clyster allaieth the pain of the sciatica. To the like effect there are giuen for 15 daies together, Cockles, or Muskles, to the weight of 3 oboli infused in two sextars of wine. The broth of Silurus softneth the belly: like as the crampefish Torpedo, eaten as meat. The * sea-wort is like to that of the garden, hurtful to the stomack, but most easily it purges the belly. In regard of the acrimony that it hath, they vse to seeth it with some fat flesh. The broth of any fish whatsoever is laxatiue: the same prouokes vrine, especially if it be made of wine. The best fish broth comes from the Sea Scorpions, and those which they call Iulides: of stonefishes also that keep about rocks, and haue no rank or strong taste; and such must be sodden with dill, parsley, coriander, and leeks, putting therto oile and salt. The squares also or cantons of the Tunie, that haue bin old kept, are purgatiue, for particularly they euacuate crude and waterish humors, besides flegme and choler. The shell-fishes also named Myaces, haue a quality purgatiue: as touching whose nature I purpose to write fully in this very place. They gather together by heaps after the manner of Burrets; they liue in places giuen to breed reits and sea mosse; most delicat and pleasant meat they be in Autumne, & especially in those coasts where good store of fresh water is intermingled in the sea, which is the reason that those of Egypt bee most commendable: as winter grows on, they begin to gather a kind of bitterness, & a red colour besides.

* Olos marini: haply he meaneth brassica marina, a sea-cabbage, yet it is nothing like to our Colewort

The broth of these fishes hath the name to euacuate both the belly & bladder, to scour & mundifie the guts, to open any obstructions whatsoever, to purge the reines, to take down the rankness of bloud and fat. In which regards they be soverain for the dropsy, for the monthly termes of women, the jaundise, all gouts and diseases of the joints whatsoever, and ventosities. Singular they are holden to be for to cleanse the humors either cholerick or phlegmatick, which annoy and stuffe the lights, or which ingender obstructions about the liuer: likewise to cure infirmities of the spleen, and all rheums or descent of humors to any place. Only they be hurtfull to the throat, and make a man to lose his voice, this is al the harm they do. The vlcers that corrode and be full of filthy matter, and require mundification, they heal: so do they all cankerous sores. Being calcined after the order of Burrets, they cure the biting both of dog and man, if their ashes be incorporat in hony: and so they cleanse the leprosie, and rid away the pimples or spots in the skin called Lentils. Their ashes * taken in drinke, haue a vertue to discusse the dimnesse and mistiness of the eie-sight, to cure the accidents of the gums and teeth, and besides, to drie vp the small pocks and such like breaking out of wheals by occasion of flegm. Moreouer, they are as good as a counterpoison against the iuice of the deadly Dwale called Dorycnium, or of Carpasum, which is commonly named Opocarpasum. Besides, this would be noted, that they grow all to be of two kinds of them; the one * Mituli [i. Limpins] which haue a taste of salt, & carry a strong savor, the other * Mycæ, which differ from the other in roundness: lesse also, they be a good deal, and hairy; and as their shells be thinner, so their flesh is more firm and hard. The said Limpins also, as well as Burrets, yeeld ashes when they be calcined, which haue a caustick quality, whereby they serue properly to mundifie the skin from leprosie, lentils, and other pimples and illsuored spots. The same being washed after the maner of lead, be singular for to subtiliat the thick eie lids, to scatter and discusse the pearls in eies, to dissipate the cloudy & misty dimnesse, to cleanse filthy vlcers in any part of the body, and namely the pusses and blisters that arise in the head. As touching the flesh that they haue, it serueth in a cataplasme to be laid vnto the biting of mad dogs. The Palours also do soften and mollifie the belly: so doth Castoreum, being drunk to the weight of two drams in honied water. They that would haue this medicine more quick in operation, and to work thoroughly, put therto of the garden cucumber root dried one dram, & of salt-petre two drams. As for the fishes named Terheæ, they are singular against the wringing torments [and gripings] of the belly and all ventosities. These fishes be found ordinarily about the rocks of the sea, sucking the leaues of Reits and such like weeds, more like indeed to Mushrooms and Puffes, than to fishes. But the same haue a special propertie to cure the Tineime and the accidents of the kidneys.

Moreouer, there grows in the sea a kind of Wormwood, which some call Seriphium, and principally towards * Taposiris in Egypt, the which is more smal and slender than that of the land: it looseth the belly, killeth the worms in the guts, and expelleth them. The Cuttil fish also is laxatiue: and ordinarily giuen it is to be eaten, after it hath bin sodden with oile, salt, and meal. Salt Cackerels likewise prouoke vnto the stoole, in case they be reduced into a liniment with buls gall, and therewith the nauil anointed. Generally, the broth of fish stewed betweene two platters with Lettuce, dispatcheth those sharp and fretting humors which are the cause of the Tineime. Craifishes of the riuer stamped and drunk in water, stop a lask, and be diureticall. But yet in wine they moue appetite to the siege. Take away their feet and armes whereby they crawl, then pun and incorporate the rest of their body with Myrrh, they driue out the stone. But this proportion must be obserued, that to euery dram weight of them there be put three oboli of Myrrh.

To appeale the painefull passion called Iliaca, to allay and resolueth ventosities also and inflammations, there is not a better thing than to take in 4 cyaths of mead or honied wine hot, Castoreum, with carot and parslly seed, as much as may be comprehended with 3 fingers. The same is singular to allay the wrings and torments of the belly, with vineget & wine mixt together. The fishes named Erythini eaten as meat, stay the loosenesse of the belly. For to cure the dysenterie or bloody flux, seeth frogs with the sea onion commonly named Squilla, and thereof make certain trochisks to be giuen to the patient in that case. The same effect hath their gall or heart stamped and incorporate with honey, as Niceratus myne author doth testifie. Eat salt fish with Pepper, so as you abstain from all flesh besides, if you would be cured of the jaundise. Lay the fish named a Sole to the region of the spleene, it doth cure the oppilation and hardnesse thereof.

* Potius, rather illius, that is, brought into a liniment, & vsed outwardly. * Salem. Some read Stilla, i. sea Onion or Squilla. * or Muskles. * Haply Cockles.

* Taposiris.

of: so doth the cramp-fish Torpedo: and a Turbet in like manner, being applied aliue; but after-ward you must let it loose againe into the sea. A sea scorpion killed in wine healeth the infirmities of the bladder, is breaketh and expelleth the stone. The same effect hath the stone which is found in the tail of a sea scorpion, if it be drunk to the weight of one obolus: the liuer also of the water snake Enhydriis, and the ashes likewise of those kind of Mulletts called Blennij, if they be taken with Rue. Moreouer, there be found also in the head of the fish Banchus, certain little stones as it were, which if they be drunke in water, are soueraigne for them which be troubled with the grauel and the stone. And it is commonly said, That the sea fish called a Nettle taken in wine, is very good therefore: like as another named in Latine Pulmo Marinus, boiled in water. The eggs or spawn that the Cuttill fish doth cast be diureticall, and prouoke vrine, whereby also they cleanse the kidnies from the phlegmatick humors there gathered. Riuer crabs or crabs fishes stamped and taken in asses milke especially, doe cure ruptures and inward convulsions. And as for sea Vrchins, if they be stamped prickes and all, and so drunke in Wine, they expell stone and grauell: but to euery Vrchin there must be taken one hemine of Wine, and the Patient ought to drinke it continually vntill he find help: and otherwise their meat is good to be eaten ordinarily for this purpose. To feed also vpon Cockles and Scalops is wholsome for to scoure the bladder. Of these shael-fishes those of the male sex be called by some Donaces, by others Auli, whereas the female are named Onyches. The male do prouoke vrine, but the female are the sweeter in tast, and of one colour. The eggs or spawn also of the Cuttill fish moue vrine, as hath bin said before, and purge the reins. For that rupture wherein the guts fall downe into the cods, it is said, That the sea Hare punned and applied to the place in form of a cataplasm with hony, is singular to reduce them vp into their place. The liuer also of the water-snake or adder, called otherwise Hydrus or Enhydriis, beaten to powder and put in drink, helpeth those that be giuen to breed the stone and grauel. The pickle that comes of the fish Silurus salted, infused or injected by a clistere into the guts, so that the belly were before emptied from the grosse excrements, cureth the Sciatica. The ashes of Barbles and Mulletts heads calcined, heale and skin vp the galls and frets of the fundament. Now the manner of burning or calcining them is in an earthen pot: and reduced they ought to be into a liniment with hony, before the place be there-with anointed. The ashes also of Cackerels burnt do cure and close vp againe the chaps in the feet: which also are good for the swelling piles and bigs in those parts: Like as the ashes of the yong Tunies heads salted, called Pelamides: or the Squares named Cybia, with hony. If the ti-will be slipped down and ready to hang out of the body, apply thereto the cramp fish Torpedo, it presently reduceth it and staieith it vp. The ashes of craifishes brought into a liniment with oile and wax, healeth the chaps and fissures in those parts: so doth the fine powder of the Sea-crab dried and puluerised. The pickle also of the fishes Coracini discusseth and resolueth the biles called Pani. The same effect work the ashes of the garbage and scales of the shadow-like Sciæna. The sea Scorpion also boiled in wine, so that the said biles or impostumes be fomented therewith. But the hard and shael-like skins of sea-Vrchins being wel stamped, and with water brought into a liniment, keepe the said biles downe and repercuss them in the beginning. The ashes likewise of Murrets or Purple fishes serue both waies, whether it be needfull to discusse them in the beginning, or to ripen them, and after they be brought to maturation, for to break them and let them forth. Some physitiens for this intent compound a medicine or ointment in this maner: *Recipe of wax and flax 20 drams, of litharge of siluer forty drams, of Burrets ashes ten drams, of old oile one hemin, fiat unguentum.* The very fishes alone by themselves, salted, foddren, and so applied, serue in this case. Craifishes of the riuers punned into a cataplasm and applied vnto the secret parts, resolute & discusse the pulkes that there arise: so do the ashes of Cackerels heads: their flesh also boiled and laid to the place affected. In like manner, the ashes of Perches heads salted and reduced into a salue with hony. The ashes of yong Tunies heads, whiles they are Pelamides, or the rough skin of the fish called * Squatina, burnt. This is the skin which, as I said before, is proper to polish wood and make smooth any workes made thereof: whereby you may see, that euen the sea also doth afford instruments to fit the Ioiners and Carpenters hand. The small fishes named Smarides applied vnto the pashes of the sayd priuy parts in the forme of a liniment, do much good. As also the ashes of Burrets or Purples shells incorporate with hony: and the same would be more effectually, in case that the Fishes be burned whole, shell, fish and all. Salt fish foddren in hony, and applied, serueth particu-

* Some take it
for a Solc, so-
thers for a
Skeat.

larly to extinguiish the heat of carbuncles & botches in the said secret parts. If one of the cods hang downe hanging vnseemely lower than his fellow, some would haue it annointed with the froth that commeth from shell-snails or periwinkles. The flesh of the sea horse roasted, helpeth them that cannot hold their vrine, in case they vse ordinarily to eat therof: likewise the little fish called Ophidion, so like vnto a Congre, if it be taken with a Lillie root. The small fishes found in the bellies of the greater who haue deuoured and swallowed them down, taken forth & burned to ashes, are good in this infirmity to be drunk in water. The ashes of shael-snails, meat and all, burnt, are prescribed by some physitiens to be giuen in Signine wine against incontineney of vrine, but principally of Barbary snails. For the gout in the feet, & the diseases of other ioints, the oile wherein a frog was boiled, is soueraigne: so are the guts of the said frog, and the ashes of a road incorporat with old oile: some put thereto the ashes of all the three kinds of barley, of ech an equal weight. And they giue direction to rub also the goutie feet, with a Sea-hare: also to be shod with the skins of Beuers, especially those which are bred in Pontus: like as to weare shoes made of Seals skin: the fat of which fish, is likewise very good. Also the sea-mosse or reits called Bryon, like to lettuce, but that the leaues be more riuclled, and grow to no stalke; whereof I haue written heretofore: of a styptick and astringent nature it is; no maruell therefore, if being applied vnto the gout, it mitigat the fury and violence thereof. Moreouer, the common sea-weeds named Alga, of which also I haue treated already; but this caution there would be in the application thereof, That it be not dry. The sea-fish called Pulmo-Marinus, cureth the kibes in the heels: the ashes also of the sea-crab, tempered with oile: yea, and the riuer-crabs or Creifishes burnt and calcined to ashes, if the same be incorporat with oile: like as the fat of the fish Silurus. Moreouer, if other ioints be diseased, it were very good for the easement of their griefe, eft-soons to lay thereto frogs, fresh and new taken: may the best way, by the direction of Physitiens, is to split them through, and so to apply them warme. The broth of Limpins, Muscles, cockles, and Wilkes, is very nutritiue, and maketh them fat that vse it. Those that be subject to the falling sicknesse, vse ordinarily (as hath bin said before) to drinke the rennet of the Seale or Seacalfe, either with mares milke or asses milk, or els with the juice of the pomgranat: and some are wont to take it in oxymell or honied vinegar: and yet there be others that swallow the same downe by it selfe in forme of pills. And for the same purpose, Castoreum is vsually giue vnto such patients fasting, to be drunke in 3 cyaths of honied vinegar or oxymell afore said: but those that eftsoons be surprized with the fits, and oftentimes fall thereof, find wonderfull much good by this clystre following: Take of Castoreum two drams, of hony and oile one sextar, and of water as much. But say that one be presently in a fit, the ready meanes to raise him and set him vpright vpon his feet againe, is to present vnto his nostrills Castoreum with vinegar, for to smel vnto. The liuer also of the fish named the Sea-cat or Weazill, is giuen in like case: euen as the bloud either of Sea-mice or Tortoises.

CHAP. X.

¶ Remedies for feuers of all sorts: also for diuers other infirmities.

The liuer of a Dolphin eaten before the accesse, cureth all those agues which be not continuall, but returne by fits and keepe their course. Oile rosat wherein the fishes called Sea-horses were suffocated and killed, is singular good to annoint those that be sicke of such agues as come with a cold fit: and the very fish it selfe is most effectually to rid away the same, in case it be hanged about the necke, or to the arme of the patient. Semblably, the little stones which are found in a Haddock's head at the full of the moone, if they be taken forth and hung about the patient, lapped handfomly in a little linnen bag, serue to driue away such feuers. Moreouer, it is said, that the longest tooth in the head of a riuer Fish called Pagrus, tied to one of the hairs of the patients head, so as he do not see the party who fastened or hung it therto, in 5 daies space will doe the deed: as also the oile wherein a frog hath beene boyled in some carrefour or crosse street turning three waies, cureth those who are sicke of a quartane ague, if they be all o-uer annointed therewith; prouided alwaies, that the flesh be first throwne away. And yet some ordaine, that they should be strangled or stifled in oile, and then the bodies hung priuily about some part of the patient without his knowledge; and that he be afterwards well rubbed and annointed with the foresaid oile. If one carry about him the heart of a frog either hanging by his necke

necke or tied to his arme, surely it will diminish and shorten the cold fit of an ague: like as the oile will do no lesse, wherein the entrails of the said frog were boiled, in case he be annointed therewith. But above all, either frog or toad (the nailes wherof haue been clipped) hanged about one that is sicke of a quartan ague, riddeth away the disease for ever: also, whosoever haue about him hanging to any part of his body the heart of a toad, infolded within a piece of cloth of a white russet colour, he shall be deliuered from the quartan ague. Stampe riuier crabs or creifishes, conorporat them with oile and water, and herewith annoint the patient all ouer before the fit of any ague, you shall find it to do very much good, but some put pepper thereto: other for the quartan particularly, boile the same in wine vntill a fourth part be foddren away, & then giue counsell vnto the sicke parties to drinke of that broth, presently after they be come out of the baine. You shall haue some aduise, for to swallow downe whole, the left eie of a creifish in this case. Moreover, the Magitians seem to assure vs, that whosoever be sicke of a tertian ague, shall be rid of it, in case the eies of the said creifishes be tied or hanged about them one morning before the Sun be vp; so as withall, they that haue the doing hereof, let them go again blinde as they are, into the water: and they would beare vs in hand, That if the said eies plucked out of the head of a creifish, be wrapped together with the flesh of a Nightingale, within a piece of a stags skin, and sowne either about the neck, or otherwise tied fast to some part of the bodie, they will cause him or her that weareth them, to be watchfull & not inclined one whit to sleep. They vse likewise the rennet of a Whale or els of a Seale, giuing it vnto those that be growing into a lethargie, for to smell vnto: and some of them annoint those that be already in a lethargie, with the blood of tortoises. The fish likewise called Spondylus, is said to rid away the tertian ague, in case the patient weare one of them without anything else, about the necke: like as the riuier shel-snails eaten fresh and new gathered, cure the quartan: howbeit, some there bee, who for that purpose keep them condite in salt, and giue them after they be punned for to drink. The wilks also or wrinkles called Strombi, suffered to lie and putrifie in vineger, dowith their very smell awaken and raise those that lie in a lethargie. The same are good likewise for such as be ready to faint and fall into cold sweats, through feble nesse of the heart and stomacke. The fishes named Terrea, eaten with rue and hony, are soueraigne for to restore them whose flesh is fallen away in a consumption. The fat of a dolphin melted and drunk in wine, cureth such as be in a dropsie. In case the head be heauie and ready euermore to fall asleepe, there is not a better thing than to rub the nostrils with some conuenient ointment, or to hold thereto some perfume, or els to stop the same any way it makes no matter how. Also, the meat of the foresaid wilks or wrinkles, stamp & giuen in 3 hemines of bonied wine, with as much water, or in mead or honied water if the patient haue a feuer wichal, is singular good against the said drowiness: likewise the iuice or decoction of creifishes with honey. Moreover, water-frogges boiled in old wine with the red wheat Far, and eaten as meat, so as the patient drinke also of the broth out of the same vessell where they were foddren, are thought to be soueraigne for such sleepe diseases: or else take a tortoise, cut away his head, feet, and taile, plucke out his guts and garbage, the rest of the flesh condite, so as it may be taken without any lothing or rising of the stomack, for this is held to be singular in this malady. Moreover, fresh-water creifishes eaten with their broth, haue the name to restore such as be in a phthisicke or consumption of the lungs. The ashes either of a sea-crab or riuier creifish, be excellent either for burne or scald, and this manner of cure also serueth for to restore haire again, but then they hold opinion, that together with the ashes of the riuier creifishes, there be wax vsed & beare grease. Also the ashes of frogs gal is thought good for a feuer. As for Shingles and *S. Anthopis* fire, the bellies of liue frogs applied to the place, doe extinguish and quench the extremitie of their heat: but in any case order is giuen, that they be tied by the hinder leggs with their mouths bending forward; to the end, that their often breathing also vpon the place, may coole and do good. Furthermore, many there be who vse for that purpose, the ashes of the heads of the fishes called Siluri: as also of saltfish with vinegre, and apply the same to such wildfires and inflammations. The liuer of a Puffen or Forkefish foddren in oile, being outwardly applied, killeth not onely the itch and scab of men, but also the scurfe and mange of four-footed beasts, most effectually. The callositie or thick skin wherewith Purple fishes couer their heads and hollow concauitie, if it bee punned and applied vnto wounded sinews, doth consolidat and sowerd them againe though they were cut asunder. The rennet of a Seale or Sea-calf taken in wine to the weight of one obolus, helpeth those that lie

in a lethargie: so doth fish-glew Ichthyocola. Such as are giuen to the shaking and trembling of their lims, find much benefit by Castoreum, if they bee rubbed and annointed with it and oile together. I read, that Barbles are hurtfull meate for the sinews: and many are of opinion, that as much feeding vpon fish * causeth bleeding, so the same may be stanchd with the poultre or pourecuttle, if it be stamped and applied to the place: of which fish, thus much moreouer is reported, That of himselfe he yeeldeth a certain salt pickle, and therefore there should be no salt put into the liquor while he is seething: *Item*, that it ought to be sliced and cut with an edged reed, for with an yron knife it will take infection, and the nature of it is such as to * keep and re-
taine it still. For the stanching of blood, they vse also the ashes of frogs, or els their blood dried, to be applied accordingly. But some would haue the ashes to be made of that kind of frog, which the Greeks name Calamites, because it liueth among reeds, bushes, and shrubs, & of all others is the least and greenest: and yet many do ordain, if the flux of blood be from the nostrils, to take the ashes of young frogs breeding in the water, while they be tadpoles, and haue little wriggling tailes, (and those must be calcined for that purpose in a new earthen vessell) & to put vp the said ashes into the nose. On the contrary side, the horseleeches which we call in Latine Sanguisugas, [i. Bloodsuckers] are vsed for to draw blood. And verily it is iudged that there is the same reason of them, as of ventoses and cupping-glasses vsed in physicke, for to ease and discharge the body of blood, and to open the pores of the skin. But here is all the harme and discomfort of these horseleeches, That if they be once set too far to draw blood, the body will looke for the same physick again euery yere after, about the same time, & be ill at ease for want thereof. Many physicians haue thought it good to vse them for the gout of the feet also. Well; set them to the hamorrhoids, and where you will, they fall off lightly when they are full and satisfied, euen with the very weight of the blood which pulleth them downe; or els by strewing some salt about the place where they sticke too: and otherwhiles it falleth out, that they leaue their heads behind them fast fixed in the place where they settled, and by that means make the wound incurable and mortall, which hath cost many a man his life: as it happened to *Messidanius* a noble man of Rome, and who in his time had bin a Consull, whose fortune it was to die thereupon, hauing set them to his knee: whereby we may see, that oftentimes they bring a mischief for a remedy: and the red ones are they that in this respect ought to be feared. To preuent therefore this dangerous inconuenience, they vse with a paire of fizzers to clip them at the very mouth as they be sucking; and then shall you see the blood spring out, as it were at the cocke of a condir, and so by little and little as they die, they will gather in their heads, and the same will fall off, and not tarrie behind to do hurt. These horseleeches naturally are enemies to Punaises, in so much as their perfume killeth them. Furthermore, the ashes of Beuers skins burnt and calcined together with tar, stancheth blood gushing out of the nose, if the same be tempered & mingled wel with the iuice of porret. The shels of cuttles applied to the body with water, draw forth arrow-heads, pricks, or spils, that sticke deepe within the flesh: so doth any saltfish if the fleshie side be laid thereto, yea, and fresh-water creifishes haue the same effect: likewise the flesh of the fresh water Silurus (for this fish breedeth in other riuers besides Nilus) applied to the place, either fresh or salted it makes no matter, worke with the same successe. The ashes of the same fish, and the fat, be of the same operation; and very attractiue. As for the ashes of their ridge-bone, and prickie finnes, they are taken to bee as good as: Spodium, and are vsed in stead thereof. As touching those vlcers which be corrosiue, as also the excrescence of prond flesh growing in such sores, there is not a better thing to repress and keepe them downe, than the ashes of Cackerels or the fish Silurus aforesaid. The heads of salted Perches be singular good for cancerous vlcers: and the more effectually they will work, in case there be salt mingled with their ashes, and together with knopped Majoram or Sauorie and oile, be incorporat into a liment. The ashes of the Sea-crab burnt and calcined with lead, repress cancerous sores: and for this purpose sufficient it were to take the ashes only of the riuier creifish, medled with hony and lint: but some chuse rather to mingle alume and hony with the said ashes. As for the eating sores called in Greeke Phagedaene, they may be healed well with the fish Silurus, kept vntill it be dried, and so together with red orpiment, reduced into a powder. Likewise morimals, and other consuming cankers, and those sores which be filthy and growing to putrefaction, are commonly healed with the old squares of the Tunie fish. Now if there chance to be wormes and vermine breed in the said vlcers, the only means to cleanse them is with the gall of frogs.

*Hyssop, other-
wile *Oxypho*,
is the tried
greace of vn-
washed wooll.

But the hollow fores commonly knowne by the name of Fistuloes, are enlarged, kept open, yea and brought to drines, with tents made of saltfish conueied into them with in fine linnen rags: and within a day or two at most, they will rid away all the callositie, together with the dead and putrified flesh within the fores, yea and repress the eating and corrosiue humor in them, if they be wrought into the forme of a salve or emplaister, and so applied. To mundifie vlcers, there is not a fitter thing than stockfish made into a tent with fine lint of rags, and so put into the fore. Of the same effect are the ashes of the sea-vrchins skin. The pieces of the fish *Coracinus* salted, discusse and resolue the hot apostems named carbuncles, if they be applied: so doe the ashes of the Barble salted and calcined. Some vse the ashes of the head of the said fish onely with hony, or els the very flesh of *Coracinus*. The ashes of murets tempered with oile, delay & take down any swelling. The gall likewise of the Sea-scorpion, taketh off the rouse of fores, and bringeth skars that ouergrow the flesh vnto the leuell of the other skin. The liuer of the fish *Glanus*, causeth werts to fall off, if they be rubbed withall. Also, the ashes of Cackerell heads do the like, if they be tempered with garlick: but for the thymewerts particularly, they vse them raw: the gall likewise of the reddish sea scorpion, and the small sea fish *Smarides*, punned and brought into a liniment do the like. The grosse pickle sauce called *Alex*, if it be made through hot, cures the raggednesse of nails: the ashes also which come of Cackerell heads, do extenuate and make them fine. The fish *Glauciscus* eaten in the own broth, causeth women to haue store of milke: so doe the small fishes called *Smarides*, taken with prisan or barley gruell, or els boiled with fennell: and in case they haue sore breasts the ashes of Burrets or Purple shells incorporat with honey, doe heale effectually. A liniment made of Sea-crabs or fresh-water Creiffishes, takes away the offensive haire that grow about womens nipples or breast heads: the fleshie substance also of the Burrets applied to them, work the same effect. A liniment made of the fish called a Skate, will not suffer womens paps to grow big. A candle-weike or match made of lint, and greased al ouer with the oile or fat of a dolphin, and so set a burning, yeeldeth a smoake which will raise women againe, lying as it were in a trance and dead vpon a fit of the mother: the same do *Macquerels* putrified in vinegre. The ashes either of *Pearch* or Cackerell heads tempered and incorporat with salt, fauerie and oile, serue for all the accidents of the matrice, and more particularly in a perfume, bring down the after-birth. Semblably, the fat of a Seale or Sea-calf, conueighed by meanes of fire in a perfume vp into the nostrils of a woman lying halfe dead vpon the rising and suffocation of the matrice, bringeth her to her selfe againe: so doth it also, if with the rennet of the same Seale, it be put vp in wooll after the manner of a pessarie, into the priuie parts. The ashes of the Sea-fish called *Pulmo*, applied conueniently to the region of the matrice, and kept fast thereto, purgeth women passing well of their monethly fleurs: of the same operation are Sea-vrchins stamped aliue, and drunk in some sweet wine: but the riuier Creiffishes likewise punned and taken in wine, do contrariwise stay the immoderat flux thereof. Likewise it is said, that a suffumigation of the fish *Silurus*, especially that which breedeth in Africa, causeth women to haue more speedie and easie deliuerance in childbirth: as also, that Crabfishes drinke in water, doe stop the excessiue ouerflowing of their monethly terms; whereas with *hyssop they set them a going and purge them away. Say that the infant sticke in the birth, and by reason of painfull labour be in danger of suffocation, let the mother drinke the same in like manner, there will present help ensue. Women with child vse also either to eat them fresh, or drink them dried, that they may go out their full time, and not slip an abortiue fruit. *Hippocrates* vseth the same, and prescribeth vnto women for the bringing down of their sicknesse, and likewise to thrust out the infant dead in their wombs, to drinke them in honied wine with fine dock roots, stamped together with rue and foot: and in very truth, sodden with sorrel or docks and parsley, they force womens months to come downe speedily, if the broth be drunke; and withall, bring plentie of milke into nurces breasts. If women haue an ague, and the same accompanied with head-ach & much twinkling or inordinat palpitation of the eies, it is thought they shall find much good by drinking them in some hard and austere wine. Castoreum taken inwardly in honied wine, is singular to helpe forward womens monethly purgation: the same being held to their nostrils with vinegre and pitch to smell vnto; or put vp beneath in manner of a suppositorie, after it is reduced into the forme of trochisques, helpeth them when by rising of the mother they are in danger of strangulation. For to bring away the after-bitth, it auaieth much also for women to drinke the said Castoreum with Panaces in foure cyaths of wine: as also it is certaine, that who-

foeuer

A foer take the weight of three Oboli thereof, shall auoid the danger that may come to them by extremitie of cold. Moreouer, if a woman great with child chance to goe ouer a place where lieth Castoreum, or to step ouer the Bearer it selfe (which is the beast that beareth it) she shall be deliuered before her time; yea she shall be in great danger vpon her deliuerance, if the same be but born ouer her where she lieth. A wonderfull thing it is, that I read of the crampfish *Torpedo*, namely, That if it be taken while the moone is in the signe *Libra*, and be kept for three daies together abroad in the open aire; so often afterwards as it is brought into the rounge where a woman is in tranell of childbirth, she shall haue easie and speedie deliuerance. In this busines also it is thought expedient, that the prick which a Puffin or Forkfish hath in the taile, be applied and tied fast to the nauell of a woman; provided alwaies, that if it be taken forth of the fish aliue, and then the same fish be let goe againe and throwne into the sea. I read in some writers of that which they call *Ostracium*, to be the same that others name *Onyx*; but call it what you will, a suffumigation made thereof, is of wonderfull effect to ease the pain and griefe of the matrice. I find, that it hath the smell of Castoreum, and if it be burnt together therewith in a perfume, the more good will ensue; as also that the ashes thereof calcined, heale all inueterat vlcers, and such as are mortuall, and scorne any ordinary cure. And verily, the same authors doe report, that for carbuncles, cancers, and such vntoward fores, as arise sometimes about the priuities of women, the most present & assured remedy that is to heale them, is the female Sea-crab, stamped after the full of the moone with the finest powder of salt, called the flour thereof, and water together, and so reduced into the forme of a salve or liniment. The bloud, gall, and liuer of the fish *Tunic*, ether taken fresh or old kept, be all of them depilatories, for they fetch away hair and hinder it from growing: the liuer thereof punned, and together with the rosin or oile of cedar incorporat and kept in a leaden box, hath the same effect. This was the deuise that the famous midwife *Salpe* had for boies, to make them beardless and appeare alwaies young, and to set them out the better for sale. Of the same operation is the fish called *Pulmo Marinus*, the Sea-hare likewise, I meane the bloud and gall of them both: and as for the said Sea-hare, being but stifled & killed in oile, it is as effectual. The ashes of the Sea-crab and *Scolopendre* both, the Sea-nettle [a fish so called] incorporat with vinegre squillitick, the brains of the crampfish *Torpedo* tempered with alum, be all depilatories, if the place be anointed therewith the morrow after the moon is at the full. The bloody moisture that comes from the little frog, which I described heretofore in the cure belonging to eies, is the strongest depilatorie that is, and worketh most effectually, in case the part be dressed therewith while it is fresh and new: and the frog it selfe dried and stamped, and anon after boiled in three hemins of vinegre, till one of them be consumed; or in oile after the same manner in some brazen pan, is a sure medicine to take away haire, and hinder the coming vp of it againe. In the same measure of liquor, some put fiseene frogs, and make thereof an excellent depilatorie, like as I haue said already among the remedies appropriat to the eies. Moreouer, horseleeches torrified in some earthen pan, and brought into a liniment with oile, worke the same effect in the hairs: the very perfume or smoke which they cast as they be burnt or torrified, killeth Punaises, if they either flie or be brought into the aire thereof. Furthermore, diuers haue bene knowne to vse Castoreum and hony in a liniment for many daies together, as a notable depilatorie. But in vsing any depilatorie, whatsoever, this one point is generally to be obserued, That the haire be first pulled vp by the roots, in any place, where they would not haue them to grow.

To come now vnto the gumbs of children, and their breeding of teeth: the ashes of dolphins teeth mixed with hony, is a soueraign medicine: yea, or if you do but touch their gumbs with a dolphins tooth all whole as it is, the effect thereof is admirable: the same hanged about their necks, or tied to any part of the body, riddeth them of sodain frights, wherunto infants are much given. Of the same effect is the tooth also of a dogfish. As for the vlcers or sores incident to their eares, or any other part of their body, the broth of riuier creiffishes thickned with barley meale, heales them. For other diseases also of breaking out, a liniment made of them and oyle incorporat together in a mortar, is singular good, if they be anointed all ouer therewith. Touching the hot distemperatures and inflammations of the head, wherunto little babes be much subject, a sponge actually cold applied to the place, and oftentimes wet, is a good meane to cure the same: but a frog turned inside outward hath no fellow, if it be bound fast vnto the head; for they say, that it may be found all drie vpon the head with drawing the head so forcibly to it.

Q. 93

A Barble

A Barble drowned in wine, or the fish called a Rochet, or also two Eccles, likewise the fish named the Sea-grape putrified in wine, do infuse this vertue into the foresaid wine, That whosoever drinke thereof, shall haue no mind afterwards to any wine besides, but fall into a dislike and loathing thereof.

The stay-ship Echeneis, the skin of a Sea-horse forehead, especially toward the left side, wrapped within a little linnen cloth, and so hanged about one; or the gall of a liue Crampe-fish, applied vnto the genitall members in manner of a liniment, be all means to coole the wanton lust of the flesh: contrariwise, the flesh of riuier Creisfishes powdered and kept in salt, giuen in wine to drinke, do stir and prouoke the appetite vnto veneric. Moreover, to feed vpon the fishes called Erythrines ordinarily at the table: to hang about the necke the liuer of the frog called Diope-tes or Calamita, within a little piece of a cranes skin, or the jaw tooth of a Crocodile fastened to any arme; either els the Sea-horse, or the finewes of a Toad, bound to the right arme, incite greatly to wantonnesse and lecherie. Put a toad within a piece of a sheeps skin newly slaid, and let one weare it tied fast about him, he shall forget all loue and amitie for euer.

The broth of frogs boiled in water, do extenuat the scurvie thicke rouse in the farcins or mange of horses, and make way that they may be bathed and anointed: and verily it is credibly affirmed, that if they be cured after this manner, the scab will neuer returne againe. The expert midwife *Salpe* affirmeth for certain, That doggs will not barke, if there be giuen vnto them in a morcell of bread or gobbet of flesh, a liue frog.

In this discourse of Water, and the things concerning it, somewhat ought to be said as touching Calamochnus, which otherwise in Latine is named *Adarca*: it groweth about small canes or reeds, and is engendred of the froth of sea water and fresh water together, where they both meet and are intermingled: a causticke qualitie it hath, in regard whereof, it entreteth into the compositions called *Acopa*, which serue for lassitude, and those that are benumbed with cold. It is employed also in taking away the pimples, or spots in womens faces like to lentils.

As for Reeds and Canes, this is their very proper place also, wherein they should be treated of. And to begin with that reed or cane called *Phragmitis*, which is so good for mounds & hedges; the root thereof greene gathered and punned, is singular for dislocations, and the paine of the backebone, if the place affected be annointed with it, incorporat in vinegre. But the rind of the Cyprian cane, which also is named *Donax*, burnt into ashes, is singular for to recouer haire againe where it was shed by occasion of sicknesse, and to heale old vlcers. The leaues also serue very well to draw forth any spills, pricks, or arrow heads that sticke within the flesh, yea and to extinguish *S. Anthonies* fire. As for the floure or downe of their catkins, if it chance to enter into the eares, it caueth deafenesse. The blacke liquor resembling inke, which is found in the cuttle-fish, is of that force, that if it be put to the oile of a lamp burning (*Anaxilans* saith) it will drown and put out the former cleare light, and make all those in the room to looke like blackamores or *Æthiopians*. The hedge frog, otherwise called a toad, boiled in water and giuen to swine among other drasse to drinke, cureth all their diseases: and of the same effect are the ashes of any other frogs besides. Rub a piece of wood with the fish called *Pulmo Marinus*, it will seem as though it were on a light fire; in so much as a staffe so rubbed or besmeared with it, may serue in stead of a torch to giue light before one.

CHAP. XI.

¶ That there be of fishes and other creatures living in the Sea, one hundred seuentie and six severall and distinct kinds.

HAuing thus treated before sufficiently of the natures and properties of Fishes, and such creatures as the water doth yeeld; it remaineth now for a final conclusion, to present vnder one view, all those fishes name by name, which are engendred and nourished not only in those mediterranean and inland arms of the sea, which for many a mile take vp a great part of the continent and firme land, but also in that vast and wide ocean without the main, bounded as it were limited onely by the compasse and circumference of the heauen: and those, namely as many as be knowne, may be reduced all into 176 kinds: a thing which cannot be done either in the beasts of the land or foules of the aire. For how is it possible to decipher & particularize the wild beasts and foules of India & *Æthyopia*, of the desarts, and of *Scythia*, which we are not

come

A come to the knowledge of, seeing we haue found so many different sorts in men, of whom wee haue some notice and intelligence: to say nothing of *Ta probane*, and other Islands lying within the Ocean, whereof so many fabulous reports are deliuered: certes, there is no man but hee must needs confesse and agree to this, that it was not possible in this historie of Nature to comprise all sorts of creatures which the earth & aire do yeeld. Howbeit, those that are bred in the Ocean, as huge and vast as it is, may be comprehended vnder a certaine number: a wonderfull matter that we should be better acquainted with those, considering how Nature hath plunged and hidden them in the deepe gulfes of the maine sea!

To begin then with the greatest monsters and beasts that this vnruely Element of the water doth breed: we find therein the sea-Trees, Whirlepooles, greater Whales, Priests, Tritons [*i. sea Trumpetters*] *Nereides* [*i. Mermaids*] Elephants, sea Men and Women, Wheelles, sea Tuns or Pipes, Rams, and smaller Whales accompanying the bigger. Besides, other Rams that resemble the ordinary shape of fishes, Dolphins, and the sea Calues or Seales, whereof the Poet *Homer* writeth so much. Furthermore, the sea Tortoises, which serue for roiot, wantonnesse, and excess: the Beuers, which are so much in request among Physicians. As for the Otters, albeit a kind of Beuers they are, yet because I neuer heard that they came into the salt water, I make no great reckoning of them; for my purpose is to rehearse those only which inhabit or haunt the sea: moreover, the sea Dogs: the Curriers, Posts, or Lacquies of the sea: the horned fishes: the Swordfish or Emperour of the sea, and the Saw fish.ouer and besides, those which liue indifferently in the sea, the land, & the riuier, to wit, the water Horses and the Crocodiles: others again that ordinarily keepe in the sea, and yet come vp into the riuers, but neuer land, to wit, the Tun-

nies, as well the growne Thunnies, as the yonger sort, Thunnides or Pelamides. The Siluri, the blacke Coracini, and Perches. As touching those that neuer came forth of the sea, the Sturgeon, the Guilthead, the cod, the Acarne, Aphyia, Alopecias, the Yeels, and Araneus. The billowing fish Box, Batis, Banachus, Barrachus, and Belone, with all the kind of those which wee call Needle fishes, and also Balanus. The sea Rauē Corvus, and Cytharus: all the sorts of the Chrombi: the Carpe, Chalcis, and Cobio: Callarius of the Cods kind, but that it is lesse: Colias, whether it be Parianus [of Parium the Colony] or Sexitanus, so called of a city in Granado or Bætica, a fish resembling Lizards: of which and of the young Tunie Pelamis (both bred in Mœotis) being chopped and cut into pieces & so salted, are made those Quadrants or Square-lands, called Cybia. For this you must vnderstand, that the Tunie is called Pelamis, when after 40 daies he returneth out of Pontus or the Euxine sea into Mœotis: whereas the said smal Pelamis taketh the name of Cordyla, when it goes first forth of the said great lough or lake Mœotis, and enters into the sea beforenamed. Moreover, in the said meer Mœotis be these fishes besides, to wit, Cantharus, Callionymus, otherwise named Vranoscopus, and Cinædi, which be the only fishes that be all ouer yellow; Cnide, which we in Latin call *Vrtica*, the Nettle: al the sorts of Crabs, the gaping smal Cockles and Muskles, whether they be the rough *Chamæ-trachæ*, the smooth *Cnamæ-leoi*, or the *Chamæ-peloides*: which be of diuers kinds distinct one from another, both in forme of roundnesse, and variety of colours: as also the Cockles named *Chamæ-glycimerides*, which be bigger than the former Peloides, together with those that the Greekes call *Colycia* or *Corophya*. Moreover, sundry sorts of other shell fish, and among them those that engender and beare pearles, and thereof be called Mother-pearls. The wilkes also and winckles which resemble shell-snailles: of which kind are the *Pentada&yles*, *Meliscembales*, and the prickly *Echinophoræ*, whose shells serue to sound or wind withal.ouer & besides these shell fishes, are those winkles of a round forme, the shells whereof are much used to lade vp oyle. Furthermore, the sea Cucumber and Cynopus; the sea Craifish *Cammarus*, *Cynofdexia*, and the sea Dragon. As for that which is named *Dracunculus*, some are of opinion, That it differeth from the foresaid *Draco*, and like it is to the Chough-fish *Gracculus*, sharpe prickles it hath in the gills, and those pointing toward the taile: like as the sea Scorpion, which thereby woundeth and hurteth those that would seem to take it vp in their hands. There is besides the *Erythinus*, the stay-ship *Echeneis*, & the sea Vrchin. The black Elephants also, which be the black kind of the Lizards, hauing foure feet, and those clouen & two-forked, besides two arms with two joints apiece, and each of them armed with a little forked cley, and closing in manner of teeth. Then haue you the fish called *Faber* or *Zeus*, that is, the Goldfish or *Doree*. All the sorts of *Glauciscus*, the *Glanis*, the *Gonger*, or *Conger*, the *Hearing* or *Pilchard* *Gerries*, *Galeos*, and *Garus*. Also

¹ So called of the forme of warlike engines of batterie, called in Latin *Arctites*.

² And yet haue some proportion of the land beast so called.

³ *Luxurie*, happily because the form of a Lute was deified first by the shell thereof or sumptuous buildings etc.

⁴ ther framed archlike according to the or els adorned & sealed with their shells by Maquetage.

⁵ By reason of their stones, which yeeld Castoreum.

⁶ Some take Thunni for the Milters, and Thunnides for Spawners.

⁷ *Acipenser*, a kind of Crab, which some call *Spar-nard* the Heremite.

⁸ *Diable de mer*, a kind of urbot.

⁹ A Gougone, a lace, *trium emulus*, as *Delectampus* readeth.

¹⁰ *Dactelampus* readeth & conuatiuise, and correcteth the place out of *Arifalio*.

¹¹ Which some take for the Pike, etc.

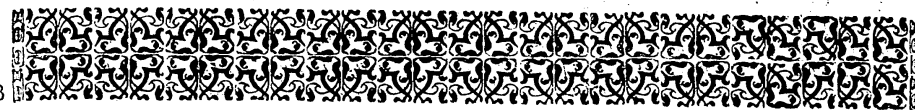

Also the coast Crabfish called Hippeus, or Sea-horseman Hippuros; the sea Swallow fish, Halpleumon, or Pulmo Marinus; the sea-lights, heart-fish, the liuer of the sea, and Helacathenes. All the sorts of the sea-Lizards: the flying Calamariæ: the Locusts and Lanternes of the sea, Ly-paris, Lamyrus, the sea Hare and sea Lions, which haue cleies or armes in maner of Crabfishes, but in other respects resembling Locusts. The Barble, the Merling or Whiting (among stone-fishes well esteemed) and the Mullet: the blacke taile Perch [which some take for a Ruffe, others for a sea Breame:] the Cackerell, the Meryx, the Lamprey, the little Muske, the Limpin, the Myscus, and the Burret. The seven-eye Oculata, the Ele-pout Ophidion, the Oistre, the * eares of the sea called Otia, & Orcynus. This fish of the Tunie kind named Pelamides is the biggest, and neuer returneth again into Mœotis, like vnto a Triton; & the meat therof is the better for age. The Lompe, Padde, or sea Owle, and the grunting Molebout: moreover, the fish Phager, the Mole or Lepo counted among stonefishes, and the Pelamis, the greatest of which kind is called Apolectus, and harder it is than the Triton, also the sea-god Phorcus, and Phritharus: the Plaice or Hallibut, & the Puffin: all the kinds of Pulpes or Pourcuttills. The greatest Scallops also, and those which during Summer be blackest, whereof the best sort be those, which are taken about Mytlenæ, Tyndaris, Salonæ, Altinum, Antium, and the Island Pharos neere to Alexandria in Ægypt. Also the little Scallops, the Purples, & the sea Perches, named Percides: the Nacres and their hunters, called Pinnothæ. Ouer and besides, the fish called Skate, which some will haue to be Rhina in Greek, & named by vs in Latine, Squatus, and the birt or Turbot: the Guildhead Scarus, which at this day is thought to be a principal fish: the Sole, the Sargus, the Shrimp, and the Sarda, for so they call the long Pelamis when he comes out of the Ocean. The Maquerel or Scomber, the Stockfish, the Sparus, Scorpæna, Scorpis, Sciæus, Sciæna, the Scolopendra, the serpent fish Smyrus, the Scepinæ; the shel-fish pointed like a Turbant, Strombus: & Solen, otherwise called Aulus, Donax, Onyx, or Dactylus, all shel-fishes made like kniues: the asle-houfe oyster Spondilus, and the shel-fish Smarides, the Star, and the Sponge. Then follow the noble stonefish Turdus, and the Thomas Thurianus, sold in pieces or rands cut forth, which fish some call Xiphia, or the Sword-fish. The Thessa, Torpedo or Crampfish, and Tethea. Triton also, which is reckoned among the greater kind of the Pelamides, whereof are made those square taile-pieces of the Tunie, called Vraa Cybia. Last of all, the Vrenæ, the sea Grape or the Empe-rour with a sword, called Xiphias. And here I thinke it not amisse to annex the names of diuerse fishes set downe by the Poet Ouid, which are not to be found in any other Authour: But haply those breed in the great sea of Pontus, in which realme he began that booke *De Ponto*, in his latter daies. In the first place he nameth * Bopgyrus, which liueth among the rockes: the red Or-phus, and the blacke Rhacinus, the painted and streaked Mormyræ, and the golden coloured Chryfos. Moreover, the little Teragus, and Labrus with the faire & pleasant taile. Likewise the Epodes, which are of the broad or flat kind, named Lati. All these be notable fishes: but ouer and besides, he reports the speciall properties and nature of some: as namely that the Chaune doth conceiue of it selfe without a male: that the Glaucus neuer is to be seene in Summer: that Pompilus alwaies accompanieth the ships vnder saile: and Chronius buildeth a nest in the very water. He saith moreover, That Helops is a stranger to vs in this part of the world, and not known in our seas: whereby it is euident that they be deceiued who take it for the Sturgeon Acipenser, and yet many reckon this Ellops to haue the daintiest tast, and to be the most delicate meat of all fishes. There are ouer and besides other fishes, named as yet by no writer, to wit, that which in Latine wee call Sudis, the Greekes Sphyræna, which (as it should seeme by the name) hath a snout or muffle resembling a sharpe stake or spit, and may for quantitie be counted among the biggest: a rare fish, but of no base and bastard kind. There be also of the Nacres those which are called Pernæ, taken and gathered in exceeding great plenty about the Islands of Pontus: their manner is to stand or sticke fast planted vpon the sea sand, and made they are in fashion of the long shanke of a swine; they gape alwaies toward the coast which is cleare; and neuer doe they hunt for their food, but they yawne at least a foot wide. Teeth there be growing round about the edges of a shell, and those stand thicke together, and when they shut or close their shels, the foresaid teeth run one betwene another in manner of acombe. In stead of a callositie within, they haue a great lumpe of flesh. As for the fish Hyæna, I my selfe haue seen one of them taken in the Island Enaria, which vsed to put forth and draw in his head at his pleasure.

* Which are a kind of oysters

* Some read Bos-piger.

Thus

A Thus much of Fishes worth the naming. For besides these, I am not ignorant that there be other base excrements that the sea voideth and purgeth, which I hold to be very vnfit and not worthy to be ranged among Fishes and liuing creatures, but rather to be reckoned as Kilpes, Reike, and other sea weeds.

THE XXXIII. BOOKE OF THE HISTORIE OF NATURE, WRITTEN BY C. PLINIUS SECVNDVS.

Of Mettals and Minerals, and their natures.

The Proem.

Now is it time to enter into the discourse of the Mettals and Minerals, the very riches and precious treasure of the World, which men so curiously and carefully seeke after, as that they sticke not to search into the very bowels of the earth by all the means they can devise: for some you shall haue (to enrich themselves) for to dig into the ground for mines of gold and siluer, base metall Electrum, Copper and Brasse: others againe vpon a desire of daintie delights and brauerie, to lay for gems and precious stones, for such Minerals (I say) which may serue partly to adorne their fingers, and partly to set out the walls of sumptuous buildings with costly colours, rich marble, and porphyries. Lastly, there bee many, who maintaine rash quarrels, and audacious attempts, spare for no labour to get yron and Steele, and esteeming it better than gold, for cruell warres and bloudie murders. In summe there is not a vaine in the whole earth but wee prie and search into it: we follow it also so farre as it goeth. Thus hauing undermined the poore ground, wee lye and goe aloft vpon it, as ouer hollow vaults and arches vnder our feet: and yet we would seeme to wonder, that otherwhiles she cleaueth asunder into wide and gaping chinkes, or else trembleth and quaketh againe: and wee will not see how these be apparant signes of the wrath of this our blessed mother, which we bring and force from her, to expresse the indignation that she taketh for this wrong and misusage. We descend into her entrails: we goe downe as far as to the seat and habitation of the infernall spirits, and all to meet with rich treasure: as if the earth were not fruitfull enough and beneficiall vnto vs in the upper part thereof, where she permitteth vs to walke and tread vpon her. Howbeit, in all this paines that wee take to ransacke the mines thereof, the least matter of all other is to seeke for any thing that concerneth Physick and the regiment of our health: For among so many masters as there be of mines, where is there one that would be at such expence of digging, in regard of any medicines. And yet I must needs say, that as the earth otherwise is, no niggard, but bounteous and liberall, readie also and easily entreated to bring forth all things good and profitable for vs: so in this behalfe she hath furnished vs sufficiently with wholesome drougs and medicinall simples growing aboue and fit for our hand, without need of digging deepe for the matter. But the things that shee hath hidden and plunged (as it were) into the bottome, those be they that presse vs downe, those drine and send vs to the duell in hell: even those dead creatures (I say) which haue no life nor doe grow at all. In such sort, as to consider the thing aright, and not to captivat our spirits to such base matters, How farre thinke wee, will conuicious minded men pierce and enter into earth? or when will they make

an

* Chrysocolle,
is Gold-fodder.

an end of these mines, hallowing the ground as they doe in all ages from time to time, and making it void G
and emptie? Oh how innocent a life, how happy and blessed, nay, how pleasant a life might we lead, if we
coueted nothing else but that which is above the ground: and in one word, if we stood contented with that
which is ready at hand and euen about vs. But now, not sufficed with the gold which we fetch out of the
mines, we must seeke for the greene earth *Borrax* also, which lieth hard by, yea, and giue it a name respectiue
vnto gold, whereby it might be thought more deare and pretious. For why? we thought not the inuention
and finding out of gold alone to be enough for to infect and corrupt our hearts, vntlesse we made great ac-
count also of that vile and base minerall, which is the very ordure of gold and no better. Men vpon a co-
uetous mind would needs seeke for siluer, and not satisfied therewith, thought good withall to find out *Mine-*
rall vermilion, deuising meanes how to vse that kind of red earth. Oh the monstrous inuentions of mans
wit! What a number of waies haue we found to enhaunce the price and value of euery thing! for painters H
of the one side with their artificiall painting and enameling: the grauers on the other side with their cu-
rious cutting and chasing, haue made both gold and siluer the dearer by their workmanship: such is the
audacitie of man, that hee hath learned to counterfeite Nature, yea, and is so bold as to challenge her in her
workes. And wherein is the art and cunning of these artificers so much seene, as in the workmanship
of such portraictures vpon their gold and siluer plate, which might incite and prouoke men to all kind of vi-
ces: for in proceesse of time we tooke pleasure to haue our drinking boles and goblets engrauen all ouer with
those workes which represent lust and wantonnesse: and our delight was to drinke out of such beaustly cups
which might put vs in mind of sinfull and filthy lecherie: but afterwards these cups also were cast aside
and laid away, men began to make but base account of them: gold and siluer was so plentifull and common,
that we had too much thereof. What did we then? Forsooth we digged into the same earth for *Cassidone* I
and *Crysell*, and we loued to haue our cups and other vessels of such brittle minerals; and the more preci-
ous we held them, as they were more subject to breaking: so as now adates hee is thought to haue his house
most richly furnished, who hath his cupboards best stored with this ticklish ware: and the most glorious
shew that we can make of excessse and superfluitie, is this, To haue that which the least knocke may breake,
and being once broken, the pieces thereof might be worth nothing. Neither is this all, for stay we cannot
here, we are not yet at cost enough, vntlesse we may drinke out of a deale of precious stones. Our cups other-
wise chased, engraued, and embossed in gold, must be set out with *hemeraulds* besides: to maintaine drun-
kennesse, to make a quarrell to carouse and quaffe, we must hold in our hand and set to our mouth the riches
of India. So is, to conclude, our golden plate comes behind pretious stones and pearles, and we count it but
an accessorie and dependant, which may be spared.

CHAP. I.

¶ When mines of gold grew first into request. The beginning of gold rings. The quantitie
of gold in treasure among our ancestors in old time. Of the Cavallerie and
Gentrie of the Romanes. The priuiledge of wearing
golden Rings.

* It is thought
that thereby are
meant certaine
pieces of siluer
coine, stamped
with the por-
traiture of a
bull or ox, cal-
led *Didachma*
& were worth
two drams or
deniers Rome.
Xenophon
describes inter-
change.

H that the vse of gold were cleane gone: Would God it could possibly
be quite abolished among men, setting them as it doth into such a cursed
and excessiue thirst after it, if I may vie the words of most renowned writ-
ters: a thing that the best men haue alwaies reproched and railed at, and the
onely meanes found out for the ruine and ouerthrow of mankind. What
a blessed world was that, and much more happier than this wherein wee
liue, at what time as in all the dealings betweene men, there was no coine
handled, but their whole trafficke stood vpon bartering and exchanging
ware for ware, and one commoditie for another, according as the practise was in the time of the
Troiane war, as *Homer* (a writer of good credit) doth testifie. And in that manner (as I take it)
began first the commerce of negotiation among men for the maintenance of their societie and
liuing together: for so he reporteth, That some bought that which they stood in need of, for
Bœufes hides, others, for yron or such commodities as they had gotten in bootie from their ene-
mies. And yet I must needs say, that euen *Homer* himself esteemed gold of great price, as may
appare by the æstimate that he made thereof in comparision of brasle, when he saith, That *Glauc-*
cus exchanged his golden armour, worth 100 * oxen, for the [braisen] harness of *Diomedes*,
which

A which was valued but at nine *Bœufs*: according to which manner practised in those daies, euen
at Rome also (as may appeare by the old records) there were no other penalties and fines impos-
ed vpon those that transgressed the lawes, but such as consisted in *Bœufes* and *Muttons*, and
vnder that name passed all the amercements that were leuied. Well, a bad example and pres-
ident gaue he vnto the world, who first deuised to wear rings vpon the fingers: but who he was
that did this harm vnto mankind, it appeareth not for certaine vpon any record. For as touching
the reports that go of *Prometheus*, I hold them all but fabulous tales: and yet in all the antient
pictures and portraitures of him, he is to be seene by a generall consent of antiquity, with a ring
of yron: howbeit, I suppose that they represented thereby his bonds and his imprisonment, ra-
ther than any custome that he had to weare a ring as an ornament vpon his finger. And verily
B concerning the ring of *K. * Midas*, which if the collet were turned about toward the palm of the
hand, caused them to go inuisible that sware it: is there any man (thinke you) that judgeth it
not more fabulous than the other of *Prometheus*? But to come more particularly vnto gold, the
greatest credit and authority that it got, was by wearing it in rings vpon the fingers, and those
only and altogether vpon the left hand. And yet this was no fashion at first among the Romanes,
whose manner was to vse no other but of yron, to shew that they were good fouldiers, skilfull
and expert in feats of arms. Whether the antient kings of Rome werewont to haue gold rings
vpon their fingers, I am not able to say for certaine. Sure it is, that the statue of king *Romulus* in
the Capitoll hath none. Neither is there any to be seene in the other statues of the Roman kings,
saue only of *Numa*, and *Servius Tullius*; no nor in that of *Lucius Brutus*: Whereat I maruel much,
and especially at the two *Tarquines* kings of Rome, considering that they were descended of the
Greekes, from whence came vp the first vsage of these gold rings, how soeuer yet at this day in
Lacedæmon there be none worne but of yron. Howbeit, this is recorded and known for a truth,
That *Tarquinius Priscus*, the first of all the *Tarquins*, honoured a sonne of his with a brooch or ta-
bler of gold pendant at his neck, for that whiles he was vnder 16 yeares of age, and as yet in his
Prætexta, hee had killed an enemy in plain fight. And thereupon was taken vp the manner first,
(which also continued afterward) to hang that * ornament about the necks of those gentlemen
sonnes who were men at armes and serued in the wars on horse-backe, in token of knighthood
and cheualrie: whereas other mens sonnes were a riband onely. And therefore great maruell I
haue at the statue of the said prince king *Tarquinius*, surnamed *Priscus*, that it should be without a
D ring on his finger. And yet besides all this, I read, that there hath been some variance and diffe-
rence in old time about the naming of rings: The Greekes imposed a name deriued from the
finger, and called it *Dactylus*. The Latines here with vs in old time named it *Vngulus*: but af-
terwards, as well we as the Greekes termed it *Symbolum*. Certes, long it was first (as appeareth
evidently by the *Chronicles*) ere the very Senators of Rome had rings of gold. For plaine it is,
that the State allowed and gaue rings only to certain especial lieutenants when they were to go
in embassage to forreign nations: and in mine opinion, it was for their credit and countenance,
for that the most honorable personages in strange countries were distinguished from others by
that ornament. And verily, no person (of what degree soeuer) was wont to weare rings, but such
as had receiued them first from the common-wealth vpon that occasion: & so it serued them or-
dinarily in triumph, as a token and testimoniall of their vertue and valour. For otherwise, he that
triumphed in Rome, although there was a Tuscan coronet al decked with spangles of gold, born
vp behind and held ouer his head, had no better than a ring of yron vpon his finger, no more than
the slaue at his back, who haply carried the said Tuscan chaplet. For certainly in that maner tri-
umphed *C. Marius* ouer *K. Incurtha*: and as the *Chronicles* do shew, receiued not a golden ring,
nor tooke vpon him to weare it before his third Consulship. And euen those also who from the
State had golden rings giuen them, in regard of embassage aforesaid, i neuer vsed them but when
they came abroad into open place, for within dores they might wear none but of yron: which is
the reason, that euen at this day the wedding ring which the bridegroom sendeth as a token * of
espousals to his bride, is of yron simply without * any stone set in it. Neither, so farre as I can
F finde by reading, were there any golden rings in vse and request about the time of the Troiane
war: for sure I am, that the Poet *Homer* maketh no mention of them at all, who otherwise spea-
keth of the brauery and rich attire of those times. And when he talketh of writing tabletts, sent
ordinarily in stead of letters missiue, when he writeth of cloths and apparels bestowed in chifts
and coffers, when he telleth vs of vessels, as well gold as siluer plate, he saith they were all bound
and

* Gyges rather,

lus*
* *Antimus* *Antus*

and trussed fast with some sure knot, and not sealed vp with any mark of a ring as the order is in these daies. Moreouer, when he reporteth of any challenge made by the enemy to single fight, and sheweth how the captains fel to cast their seuerall lots for the choise of them which should performe the combat, this was neuer done by the signet of rings, but by some other especiall marks that every one made. Also, when he taketh occasion to speak of the workmanship of the gods, he rehearseth buckles, clasps, and buttons of gold, other jewels and ornaments also belonging to the attire of women, as eare-rings and such like of their making, which at the beginning were commonly made, but he speaketh not one word of golden rings. And verily in my conceit whosoever began first to weare these rings, did it covertly by little and little, putting them vpon the fingers of the left hand, the better to hide them, as if they were ashamed to haue them openly seene: whereas if they might haue auowed the honouring of their fingers by that ornament, they should haue shewed them at the first vpon the right hand. Now if any man object and say, that the wearing them on the right hand might be some impeachment to a soldier for vsing his offensive weapon which he beareth in that hand, I alledge again, that the hinderance was more in the left hand, which serueth to hold and manage the targuet or buckler defensive. I read in the same Poet *Homer* aforesaid, that men vsed to plait & bind vp the tresses of their haire with gold: and therefore I wot not well whether men or women first began the manner of such braiding the locks of the haire.

As touching gold laid vp for treasure, little was there of it at Rome for a long time; for surely, when the city was taken & sacked by the Gauls, and that the Romans were to buy & redeem their peace for a sum of mony, there could not be made in all Rome about one thousand pound weight of gold. Neither am I ignorant, that in the third Consulship of *Cn. Pompeius* there was embezeled and stolne 2000 pound weight of gold out of the throne or shrine of *Iupiter* within the Capitoll, which had bin there bestowed and laid vp by **Camillus*: whereupon many men haue thought, that there was 2000 pound weight of gold gathered for the ranfome of the city. But surely looke what ouerplus and surcrease there was about the foresaid weight of one thousand pound, it was of the very booty and pillage of the French, and taken out of the temples and chappels in that part of the city whereof they were masters. Moreouer, that the Gauls themselves were wont to goe to the wars brauely set out and enriched with gold, it appeareth by this one example of *Torquatus*, who slew a Gaule in combat, and tooke from him a masse collar of gold. Apparant it is therefore, that all the gold, as well that of the Gauls, as that which came from the temples abovesaid, amounted to the said sum, and no higher: to the light and knowledge whereof we come by means of reuelation from Augurie, which gaue vs to vnderstand, that *Iupiter Capitolinus* had rendered againe the foresaid sum in duple proportions. And here by the way there commeth to my remembrance another thing, not impertinent to this place: considering I am to treat againe of rings: when the sexton or keeper of this cell was apprehended, and the question demanded, What was become of the treasure aforesaid of 2000 pound which *Iupiter* had in custody, and which now was out of the way and gone? Hee tooke the stone that was in the collar of his ring which he ware, crackt it between his teeth, and presently dyed thereupon: whereby the truth was not bewraied and reuealed, as touching the theefe that robbed the said treasure. Wel, reckon the most that can be, surely there was not about 2000 pound weight of gold to be had in Rome, when the city was lost, which was in the 364 yere after the first foundation thereof, at what time (as appeareth by the rolls of the Subsidie booke) there were in Rome to the number of 152580 free citizens. And what was 2000 pound in proportion to such a multitude of people. Three hundred and seuen yeres after, when the temple of the Capitoll was on fire, all the gold to be found therein, as also in all the other chappels and shrines arose to thirteen thousand pound weight, which *C. Marius* the yonger seized vpon and conueied away to the city Præneste. And all the same was recovered againe and brought backe againe by *Sylla* his enemy, who vnder that title carried it in triumph, besides seuen thousand pound weight of siluer, which he raised out of the spoile of *Marius*. And yet neuertheless, the day before hee had caused to be carried in a pompe of triumph fiftene thousand pound weight of gold, and one hundred and fiftene thousand pound of siluer, which came of the rest of the pillage gotten by that victorie of his.

But to returne againe vnto our discourse of gold rings: I doe not read that they were ordinarily vsed, before the daies of *Cn. Flavius* the sonne of *Annus*: This *Flavius* beeing otherwise a

man of mean and base parentage, as whose grand fire by the fathers side had bin no better than a slave infranchised: howbeit hauing a pregnant wit of his own, & brought vp daily vnder a good schoolmaster *Appius Claudius* surnamed the Blind (whom he serued as his Scribe, Clerke, or Secretarie) he grew into inward credit and fauor with his master, that for his better aduancement he opened vnto him the whole course of dayes pleadable and not pleadable, exhorting and persuading him withal, to publish that secret and mysterie to the view & knowledge of the whole city: which the said *Flavius* (after much conference and consultation had with *Appius*) did, and effected accordingly, whereupon he became so gracious with the whole body of the people (who were alwaies before wont to hang every day vpon the lips of some few of the chief & principal Senators, for to haue the information and knowledge of the said daies) that in the end a bill promulged by him, passed by generall assent of them all, for to be created *Ædile Curule* together with *Q. Annicius* of Præneste (who not many years before had bin a professed enemy, and born armes against the Romans) without any regard had in this election, either of *C. Petilius*, or *Domitius*, who were nobly born, & had two Coff. to their fathers, who notwithstanding stood for the said dignitie and honorable place. Nay more, This *Flavius* had a speciall grace besides granted, To be at the same time one of the Tribunes also or Prouosts of the Comminaltie. At which indignitie the Senat took such disdaine, and chafed so for despight and anger, that as we read in the ancient Annals and Chronicles of our city, there was not one Senator of them all but laid away his golden rings and gaue vp his place. Many are of opinion (although they be farre deceiued) that the knights and men of arms also did the semblable, and left off their rings the same time. And this likewise goeth current and is generally receiued, That they cast aside the caparifons and trappings of their bard horses; for these be the two badges or markes which cause them to be called Equites, as one would say, knights, men of arms, or horsemen. True it is besides, that in some annals we find it recorded, that it was the nobility only of Rome that gaue ouer their gold rings, and not generally the whole body of the Senat. Wel, how focuer it was, this hapned when *P. Sempronius Longus* and *L. Sulpitius* were Consuls. But *Flavius* abovesaid, seeing what trouble and discontentment was risen hereupon throughout the city, vowed to erect and build a temple in the honor of *Concordia*, if he could reconcile the estate of the Senat, and the order of the gentlemen againe to the common people. And seeing that he could not be furnished with mony out of the common treasure of the city, for defraying of charges requisite to this piece of work, he made means to haue certaine extreme vsurers condemned to pay good round sums of mony: & with these fines a little chappell he caused to be made all of brasie, and reared it in the place appointed for Embassadors out of strange countries to wait and giue attendance in, called *Græco-stasis*, the which was at the head of the publique grand place or hal of assemblies called *Comitium*: where in a table of brasie he tooke order there should be cut and engrauen the verities of the dedication of the said temple, which was 104 yeres after the temple in the Capitoll was dedicated, and in the 448 yere from the foundation of the city. This is the first and most ancient euidence that may be collected out of all the antiquities of Rome now extant, as touching the vsage and wearing of Rings. Another testimonie we haue thereof in the second Punicke War: which implieth, that rings in those daies were vsed more ordinarily, as well by commons, as gentlemen and Nobles: for otherwise, if they had not bin so vsually worn as well by one as another, *Annibal* could neuer haue sent to Carthage those three Modij of rings, which were pluckt from the fingers of those Romans who were slain in the battell of Cannæ. Moreouer, the Chronicles beare witnesse, that the great quarrell betwene *Cepio* and *Drusus* (from which arose the sociall war of the Marsians, and the ruin of the state) grew by occasion of a ring sold in portsale, which both of them would haue had, the one as well as the other. Neither at that time verily did all Senators weare gold rings; for known it hath bin within the remembrance of our grandfathers, that many of them (and such as beare the Pretorship) in their old age, and to their very dying day, neuer wore any other rings but of iron. The same doth *Fenestella* report of *Calphurnius*; and of *Manilius* also, who was Lieutenant vnder *Caius Marius* in the war against King *Iugurtha*. And many other historians affirme the like of *L. Fufidius*, him I meane vnto whom *Scaurus* dedicated that Booke which he compiled of his Life. There is a whole house or family at Rome of *Quintij*, wherein (by ancient custome and order) there was neuer any known, so much as the very women, to weare any gold about them. And euen at this day, the greater part of those nations and people who liue vnder the empire of Rome, know not what these rings mean. All the coun-

tries of the East throughout, and Egypt generally, at this time content themselves with simple writings and bare scripts, without any seale or signe manuel set vnto them. But so far off are we in these daies from keeping vs to the plain hoop rings of our ancestors, that as in all things els, so in them also we loue to change and alter euery day, so giuen we are to excesse and superfluitie: for now, many must haue curiously set in their rings, pretious stones of excellent beautie and most exquisite brightnesse; and vnlesse their fingers be charged and loden again with the riches and reuenues of a good lordship, they are not adorned and decked to their mind. But I purpose more fully to speake hereof in my treatise of gems and pretious stones. Others again will haue in their rings and stones sundry figures and portraictures as they list themselves engrauen, that as there be some rings costly for the matter, so others again should be as pretious for the workmanship. Yee shall haue many of these wantons and delicate persons make conscience (forsooth) to cut and engraue some of their pretious stones, for hurting them; and (to shew that their rings serue for somewhat else than to seale and signe withall) doe set the said stones whole and entire as they be. And diuers there are who will not enclose the stone with gold on the inside of the collet which is hidden with the finger, to the end (forsooth) that it may touch the naked skin and be seene through. And such an opinion they haue of these stones, that gold is worth nothing in comparifon of many thousands of them now in vse and request. Contrariwise, many there are who will haue no stone at all in their rings, but make them all of massiue gold, and therewith do seale: a deuise that came vp in the time of *Claudius Caesar* the Emperor. Furthermore, in these our daies some slaues set iron within a collet of gold, in stead of a stone; and others again hauing their rings of iron, yet they adorn and set them out with the most pure and fine gold that may be had. This licence (no doubt) and libertie of wearing rings in this order, began first in Samothrace, as may appeare by the name of such rings, which therefore are called Samothracia. Now to come again to our golden rings: The manner was in old time to weare rings but vpon one finger onely, and namely that which is the fourth or next to the little finger, as we may see in the statues of *Numa* and *Servius Tullius*, Kings of Rome: but afterward they began to honour the fore-finger which is next vnto the thumbe, with a ring, according to the manner which we see in the images of the gods: and in proceffe of time they took pleasure to weare them vpon the least finger of all: and it is said, that in France and Brittain they vsed them vpon the middle finger. But this finger now adayes is excepted onely and spared, whereas all the rest be sped and charged with them; yea and euery joint by themselves must haue some lesser rings and gemmalls to fit them. Some will haue the little finger loden with 3 rings; others content themselves with one and no more vpon it, wherewith they vse to seale vp the signet that is to signe ordinarily, for this signe manuel (I may tell you) the manner was to lay vp safe among other rare and pretious things: this might not come abroad euery day, as beeing a jewell that deserued not to be misused by handling commonly, but to be taken forth out of the cabinet or secret closet neuer but when need required: so that whosoever weareth one ring and no more vpon the least finger, hee giueth the world to vnderstand, that he hath a secret cabinet at home stored with some speciall things more costly and pretious than ordinarie. Now, as some there be that take a pride and pleasure to haue heavy rings vpon their fingers, and to make a shew how massiue and weighty they are; so others againe are so fine and delicat, as they thinke it a paine to weare more than one. Some hold it good, for sauing of the stone or collet (if the Ring should chance to fall) to haue the round hoope or compasse thereof wrought hollow or enchased within, yea and the same filled vp with some lighter matter than is gold, that it may fall the softer. You shall haue many that vse to carry poyson hidden within the collet vnder the stone, like as *Demosthenes* did, that renowned Prince of Greeke Orators; so as their rings serue for no other vse or purpose but to carry their owne death about them. Finally, the greatest mischiefs that are practised by our mighty men in these dayes, are for the most part performed by the meanes of rings and signets. O the innocence of the old world! what a heavenly life led men in those dayes, when as there was no vse at all of seale and signet? But now we are faine to seale vp our ambries and hogsheads with our signets, for feare we be robbed and beguiled of our meat and drinke. This is the good that commeth of our legions and troupes of slaues, which we must haue waiting and following at our heeles: this commoditie we haue by our traine and retinue of strangers that wee keepe in our houses: inso much as wee are driven to haue our Controuerses and Remembrancers to tell vs the names of our Seruants and people

* Remembrancers.

people about vs, they are so many. It was otherwise ywis by our ancestors and fore-fathers daies, who had no more but one yeoman or groomer a piece, and those of the linage and name of their Lords and Masters: as may appeare by the ordinary names of *Marci-pores*; and *Luci-pores*: and these had all their vituals and diet ordinarily at their masters board. And therefore there was no great need to keep safely any thing vnder lock and key from such household seruitors: whereas now adayes the cater goeth to the market to provide cates and viands for to be stollen and carried away as soon as they come home, and no remedy there is against it: for no seale will serue to make sure either such lurchers themselves for fishing, or keep the very locks and keyes safe and whole that lead to the prouision. And why? an easie matter it is to plucke the rings from their lord and maisters fingers that are oppressed with dead sleep, or when they lie a dying. And verily we hold in these daies a seale to be the best assurance in contracts that may be: but I wot not how long it is since that custom first came vp. And yet if we consider the fashions and manners of strange Nations, we may peradventure find how these signets came into such credit and authoritie: and namely by the History of *Polyrates* the Tyrant or King of the Ile Samos; who hauing cast into the sea a ring which he loued and esteemed aboue all other jewels, met with the same againe by meanes of a fish which was taken in the belly wherof the said ring was found. Now this king was put to death, about the two hundred and thirtieth yeare after the foundation of our citie. Howbeit, the ordinarie vse of these signets (as I suppose by all reason and likelihood) began together with vsurie: for prooue whereof, marke how still at this day, vpon any stipulation and bargaine passoll made, off goes the ring presently to confirme and seale the same. The which custome no doubt came from old time, when there was no earnest nor gods-pennie more ready at hand than a signet. So as we may conclude assuredly and affirme, That amongst vs here at Rome, when the vse of money and coyn was taken vp, soone after came the wearing of rings in place. But as touching the deuise and inuention of money, I will write anon more at large.

And now to return againe to my discourse of rings: after they began once to bee in any request, there were none at Rome vnder the degree of a knight or gentleman that carried rings on their fingers; inso much, as a man might know a gentleman from a commoner by his ring, like as a Senator was distinguished from the Gentlemen, wearing rings, by his coat embroidered with broad gards and studs of purple. Howbeit, long it was before this distinction was obserued: for I find that the publicke criers were ordinarily such coats likewise embroidered, as Senators do: as appeareth by the father of *L. Atilius Stilo*, tyrannized vpon that occasion *Praconimus*, because his father had bin a publicke Crier. Certes, these rings certified the middle degree, inserted between the Commons and the Nobles; and that name which in times past horses of seruice gaue to men of armes and gentlemen of Rome, the same now adayes sheweth men of worth, and those who are of such and such reuenues. But long it is not since this disorder and confusion begun. For whenas *Augustus Caesar* late Emperour of happy memory, ordained decuries of Iudges in criminal matters, the greater part of them consisted of those who were no other rings but of yron: and those were simply called Iudges, and not Knights or Men of armes; for this name continued still appropriat to the troupes of those gentlemen who serued vpon horses allowed by the Senat. Moreover, at the first there were no more but foure decuries of Iudges, and hardly might there be found in each of those decuries, a bare thousand foras yet those of our prouinces might not be admitted to this estate to sit and iudge vpon criminal causes: and even at this day precisely obserued it hath bin, That none but ancient citizens might be Iudges: for euery one that came newly to their free burgeoisie, were taken into this order and degree.

* the pages or groomes of Marcus or Lucius.

* Who theretofore were called Equites.

* Iudges of the new burgh.

CHAP. II.
Of the Decuries or Chamber of Iudges vpon record at Rome. How often the name and title of the Roman Cavallerie changed; The gifts and rewards represented vnto valiant soldiers for their brave service. And at what time Coronets of gold were reene.

The chamber of the fore said Iudges consisted of diuers estates and degrees, distinguished by severall names: for first and foremost, there were of them called *Prætoribus*, and *Quæstibus* Generall

Generall receiueurs or Treasurers: secondly, *Selecti*, chosen from among the Senators: and last of all, those who simply were named *Iudices* or Judges, taken from among the knights or men of armes.ouer and besides these, they had others called *Nongenti*, choice men selected from out of all the estates, who had the keeping of those chests or caskets wherein were put the voices of the people in their solemn elections. And by reason of a proud humor in men, choosing themselves names to their owne liking, great diuisions and factions arose in this house and chamber of the foresaid Iudges, whiles one would needs be called *Nongentus*, another *Selectus*, and a third gloried in the title of *Tribune* or *Receiuer*. But at length, in the ninth yere of the reigne of the Emperor *Tiberius Caesar*, the whole estate of the gentrie or cauallerie of Rome, was reduced to an vniformitie: and an order was set downe whereby it was knowne who might wear rings, and who might not: which fell out to be in that yere when *C. Asinius Pollio*, and *C. Antistius Vetus* were Consuls together, and in the 775 yere after the foundation of Rome city. And verily this vniforme regularity was occasioned by a trifling cause to speak of, and whereat wee may well maruell: and thus stood the case: *G. Sulpitius Galba* desirous in his youth to win some credit with the foresaid Emperor *Tiberius*, and namely, by deuising meanes how to bring *Taverns*, *Cooks shops*, and *vitualing houses* in danger of the law, and to forfeit penalties; pleaded against them, and complained before the Senat. That those who were the vnder-takers and Tenants as it were of the foresaid *Taverns*, &c. and made their gaine thereby, had no other meanes to beare themselves out, nor plea to defend their faults and disorders, but their rings. The Senat taking knowledge hereof, ordained an act, That none from that time forward might be allowed to weare the said rings, vnlesse he were free borne, and that both himselfe, his father, and grandfire by the fathers side were assessed in the Censors booke 400000 sesterces; and by vertue of the law *Iulia* as touching the publicke Theatre, had right to sit and behold the plaies in the first and foremost 14 ranks of seats for knights appointed. Howbeit afterwards, euery man labored and made means one with another, to be allowed to weare this ornament of a ring. Now in regard of these disorders and variances aboue rehearsed, prince *Caius Caligula* the Emperour, adjoynd to the former foure, a fifth Decurie. And shortly after, men grew to that height and pride in this behalfe of wearing rings, and the company so surcreased, that whereas in *Augustus Caesars* dayes there could not be found knights and Gentlemen sufficient throughout all Rome to furnish those Decuries, by this time they could not be contained all within the Chamber of Iudges or Decuries aboue said: insomuch as now adayes, no sooner are there any slaues manumifed and enfranchised, but presently (by their good will) they must be at their rings. A thing that neuer before was knowne in Rome: for aforesime when a man spake of the iron ring, he was vnderstood presently to point at the Gentlemen and Iudges before named: but the said ornament or badge became so commonly to be taken vp by one as well as another, that a gentleman of Rome (*Flavius Proculus* by name) indicted 400 at once before *Claudius Caesar* Censor for the time being, and declared against them for this abuse and offence. See what inconuenience infused vpon the act of rings! for whilste thereby a distinction was made between that degree & other free-borne citizens, straight waies base slaues leapt in, and were so bold as to take that ornament vpon them: And hereby the way is to be noted, that the two *Gracchi*, *Tiberius*, and *Caius*, brethren, vpon a certain desire and inbred affection that they had to maintaine and nuzzle the people in sedition, and to beare a side alwaies against the Senat, for to counter-balance with the Commons and to do them a pleasure, deuised first to haue all themselves called Iudges, who by vertue of the foresaid statute or edict, might wear rings: and this he did to cross and beard the *Schat*. But after the fire of this sedition was quenched, and the popular authors thereof who stirred & blew the coles were murdered, the denomination of these criminal Iudges (after diuers troubles and seditions with variable and alteratiue fortune) fell in the end to the Publicans and Farmers of the reuenues of the State, and being thus deuolued vpon them, there continued: insomuch as for a good while the said Publicans made vp the third degree betweene the Senators and the Commons. Howbeit, *M. Cicero* when he was Consul re-established the Knighthood & Cauallerie of Rome in their former estate and place, and so far perswaded, that hee reconciled them againe vnto the Senat: giuing out openly, that he himselfe was come of that degree, and by that means by a certain popularity, sought to draw them all to side with him. From this time forward, the men of armes were installed as it were in the third estate of Rome, insomuch as edicts and publick acts passed in the name of the Senat, People, and Cauallerie of the citie. And for that

* Who onely indeed were to judge causes,

A that these knights or gentlemen were last incorporated into the body of the Common-weale, this is the only reason that euen now also they are written in all publicke Instruments, after the People.

As touching the name or title, attributed to this third estate or degree of Horsemen or men of Arms, it hath bin changed and altered oftentimes: for in the daies of *Romulus* and other *KK*. of Rome, they were called *Celeres*, afterwards *Flexumines*, and in proesse of time *Trossuli*, by occasion that these horsemen without any aid at all of the Infanterie, had woon a towne in *Tuscane* nine miles on this side *Volfinij*, called *Trossuli*: which name continued in the Cauallerie of Rome, vntill the time of *C. Gracchus* and afterward. And verily *Iunius* (who vpon the great amitie betwene *Gracchus* and him, was surnamed *Gracchanus*) hath left these words in writing as touching this matter: concerning the degree of knights (quoth hee) those who now are called Equites, [*i. Horsemen*] beforetime had to name *Trossuli*: the change of which name arose vpon this, that many of these Gentlemen, ignorant in the original and first occasion of the foresayd name *Trossuli*, and what the meaning thereof was, were ashamed so to be called. He alledgeth moreouer the cause of the said name: and yet notwithstanding (quoth hee) they cannot away with the name at this day, but are so called against their wils.

To come again vnto our former discourse of gold. There be yet some other points besides, to be considered therein, which cause distinction in diuers conditions of men: for our ancestours, willing at all times to honour those souldiers who had borne themselves valiantly in wars, were wont to bestow chains of gold vpon strangers and auxiliaries, such I meane as came to ayd and succour the Romans: but vnto their owne naturall citizens they gaue none other but of siluer: and true it is, that Roman citizens had bracelets giuen them ouer and aboue, which forreiners had not. They were wont also (a thing to be maruelled at) to giue vnto citizens, coronets of gold: but who he was whom they honored first with this reward, I could neuer find in any Chronicle: and yet *L. Piso* hath set downe in his Annals, the first giuer thereof: for *A. Posthumus L.* Dictator (quoth he) vpon the winning of the fortified campe of the Latines neare the Lake *Regillus*, was the first that bestowed vpon that souldier, by whose valorous seruice principally the said bold was forced, a coronet of gold; which he caused to be made of the pillage taken from the enemy. *L. Lentulus* in like manner, being Consul gaue a crowne of gold vnto *Sergius Cornelius Merenda*, at the winning of a certaine towne within the Samnites countrey. Semblably *Piso* surnamed *Frugi*, bestowed vpon his owne sonne a Coronet of gold weighing siue pound, which hee caused to be made of his owne priuate money: and yet amongst other Legacies in his last Will and Testament, the said Coronet hee bequeathed to the State and Common-wealth of Rome.

CHAP. III.

Other uses besides of gold, as well in men as women. Of Gold, in money. When Brasse, Siluer, and Gold, were first stamped and coined. Before Brasse was conuerted into stamped money, how they used it in old time. At what rate and proportion of money were assessed the best houses of Rome, at the first leuying of Subsidies. And at what time gold came into credit and request.

ALL the gold imploied in sacrifices to the honor of gods, was in gilding the horns of such beasts as were to be killed, and those onely of the greater sort. But in warfare among souldiers, the vse of gold grew to excessiue, that the field and campe shone againe withall, insomuch as at the voiage of Macedonia, where the Marshalls of the field and colonels bare Armour set out with rich buckles and clasps of gold, *M. Brutus* was offended and stormed mightily at it, as appeareth by his letters found in the plaines about Philippi. Well done of thee, *O M. Brutus*, to find fault with such wastfull superfluitie: but why saidst thou nothing of the gold that the Roman dames in thy time, wore in their shooes? And verily this enormity and abuse, I must needs impute vnto him (whosoever he was) that first deuised rings, and by that means caused gold to be esteemed a metall of much worth: which euill precedent brought in another mischief as bad as it, which hath continued a long time; namely, that men also should weare about their arms, bracelets of gold next to their bare skin: which deuise and ornament of the arm

is called Dardanium, because the inuention came from the Dardanians: like as the fine golden carkanets Viriæ, we teame Celticæ; and the necke-laces of gold Viriolæ. Celtibericæ. Oh the monstrous disorders that are crept into the world! But say that women may be allowed to weare as much gold as they will, in bracelets, in rings on euery finger and joynt, in carkanets about their necks, in earings pendant at their ears, in staies, wreaths, & chinbands; let them haue their chains of gold as large as they list vnder their arms or crosse ouer their sides, scarfe-wife, be gentlewomen and mistresses at their collars of gold, beset thicke and garnished with massie pearls pendant from their necke, beneath their waist; that in their beds also when they should sleepe they may remember what a weight of gold they carried about them: must they therefore weare gold vpon their feet, as it were to establish a third estate of women answerable to the order of knights, betwene the matrons or dames of honour in their side robes, and the wiues of meane commoners? Yet me thinkes, we men haue more reason and regard of decencie, thus to adorne with brooches and tablets of gold, our youths and yong boies, and a fairer sight it is to see great men attended vpon to the baines by beautifull pages thus richly decked and set out, that all mens eies may turne to behold them. But what meane I thus bitterly to inueigh against poore women; are not men also growne to such outrageous excesse in this kind, that they begin to weare vpon their fingers either Harpocrates, or other images of the Ægyptian gods engrauen vpon some fine stone? But in the daies of the Emperor Claudius there was another difference and respect had, That none might carrie the pourtraiture of that prince engrauen in his signet of gold, without expresse licence giuen them by those gracious enfranchised slaues who were in place to admit vnto their lord the Emperor, whom it pleased them: which was the occasion and means of bringing many a man into danger, by criminal imputations. But all these enormities were happily cut off as soon as the Emperour Vespasian (to the comfort and joy of vs all) came once to the crowne: for by an expresse edict, he ordained, That it might be lawfull for any person whatsoever to haue the image of the Emperour in ring, brooch, or otherwise without respect. Thus much may suffice concerning rings of gold, and their vsage.

To come now to the next mischiefe that is crept into the world; I hold that it proceedeth from him who first caused a denier of gold to be stamped: although, to say a truth, I know not certainly who he was that deuised this coine. As for the people of Rome, sure I am that before king Pyrrhus of Epirus was by them vanquished, they had not so much as siluer money stamped and currant. Well I wot also, that in old time the manner was to weigh our brasse by the Asse, which was a pound weight, and thereupon called As Libralis, and yet at this day, Libella: like as the weight in brasse of two pound, they named Dipondius [As.] And hereupon came the custome of adjudging any fine or penaltie vnder the teame of [Æris grauis] that is to say, of brasse Bullion or in Masse. From hence it is also, that still in reckonings and accounts whatsoever hath bin laid out or deliuered, goeth vnder the name of Expensa [id est, Expences] as a man would say, weighed forth, because in times past all payments passed by weight. The Latines likewise vse the nowne Impendia, for cost bestowed, or the charges of interest in vsurie about the principall; euen as the verbe Dependere, betokeneth (to pay) because payments ordinarily were performed by poise. Moreover, the vnder treasurers of war, or paymasters in the camp, were in ancient time named Libripendes, for weighing out vnto the souldiers their wages; and their very pay thereupon was called Stipendium, from whence cometh Stipend, a word commonly receiued. According to which manner and custome, all buyings and sellings at this day which passe with warrantise, are vsually performed by interposition of the ballance, which serueth to testifie the realitie of the contract and bargain on both parts.

Touching brasse money, Seruius Tullius a king of Rome, caused it first to be coined with a stampe, for before his daies, they vsed it at Rome rude in the masse or lumpe, as Remus mine author doth testifie. And what was the marke imprinted thereupon? euen a sheepe, which in Latine they call Pecus: and from thence proceedeth the word Pecunia, that signifieth money. And note here by the way, that during the reigne of that king, the best man in all Rome was valued to be worth in goods not about 100000 Asse in brasse: and at this rate were assessed the principall houses of the city in the kings bookes: and this was counted the first Classis.

Afterwards, in the 485 yere from the foundation of the city, when Q. Ogulnius and C. Fabius were Consuls, five yeres before the first Punicke warre, they began to stampe siluer money at Rome, and three feuerall pieces were coined. At what time ordained it was, That the Denarius

* Called also Sigalion.

* He speaketh
nam sequente,
as I take it; for
Denarius was
a siluer piece:
but he meaneth
any piece
of coine.

or Denier should goe for tenne Asse or pounds of brasse money; the halfe Denier, Quinarius, should be currant for five; and the Sesterce reckoned worth two and a halfe. Now, for as much as during the first Punicke war against the Carthaginians, the city was growne much behind hand and farre indebted, so as they were not able to goe through the charges which they were to defray, agreed it was and ordained to raise the worth of the brasse money by diminishing the poise: whereas therfore the Asse weighed a pound of twelue ounces, they made the Asse of two ounces: By which deuise, the Commonwealth gained five parts in six; and the Fisque or city chamber by that means was soone acquit of all debts. But if you would know what was the marke of this new brasse Assen of the one side it was stamped with a two faced Ianus, on the other side with the beake-head of a ship, armed with brasse pikes. Other smaller pieces there were, according to that proportion, to wit, Trientes, the third part of an Asse; and Quadrantes the fourth; which had the print of * punts or small boats vpon them. As for the piece Quadrans, it was before time called Triuncis, because it weighed three ounces. Howbeit in proceesse of time, when Anniball pressed hard vpon the city, and put them to an exigent for money to maintaine the wars against him, driuen they were to their shifts and forced (when Q. Fabius was Dictator) to bring downe the foresaid Asse of two ounces vnto one. Yea, and enacted it was, That the siluer denier, which went before time for ten Asse, should be worth * sixteene; the halfe Denier or Quinare, eight; and the Sesterce foure: and by this means the State gained the one halfe full. And yet I must except the money paid to souldiers for their wages: for a Denier vnto them was neuer reckoned about ten Asse. As for the siluer Deniers, stamped they were with the pourtraiture of coches drawne with two horses or foure horses, whereupon they were called Bigati and Quadrigati. Within a while after there passed an act promulged by Papyrius, by vertue whereof the Asse weighed not about halfe an ounce. Then came Livius Drusus in place, who being one of the Prouosts or Tribunes of the commons, brought in base money, and delated the siluer with one eighth part of brasse. Touching that piece of coine, which now is called Victoriatus, stamped it was by an Act propoed by Clodius, for before his time, those pieces of money were brought out of Sciaonia, and reckoned as merchandise: and stamped it is with the image of Victorie, of which it tooke that name.

Concerning gold coined into money, it came vp threescore and two yeres after the stamping of siluer pieces: and a scripture of gold was taxed and valued at twenty sesterces, which ariseth in euery pound according to the worth of sesterces as they were rated in those daies, to nine hundred Sesterces. But afterwards it was thought good to cast and stampe pieces of gold, after the proportion of fiftie to a pound: And those, the Emperors by little and little diminished still in poise, till at length Nero brought them downe to the lowest, and caused them to be coined after the rate of five and fiftie pieces to the pound. In summe, the very source and originall of all auarice proceedeth from this money and coine, deuised first by lone and vsurie, and continued still by such idle persons that put forth their money to worke for them, whiles they sit still, and find the sweetnes of the gaine comming in so easily. But this greedy desire of hauing more still, is growne after an outrageous manner to be excessiue, and no more to be named couetousnesse, but rather insatiable hunger after gold: in so much as Septimuleius, an inward and familiar friend of C. Gracchus, forgat all bonds of amitie, and hauing cut off his friends head, vpon promise to haue the weight of it in gold, brought the same vnto Opimius: howbeit, he poured molten lead into the mouth thereof to make it more heauie, and so together with this parricide and vnnatural murderer, couened also & beguiled the Commonweale. But to speak no more of any particular citizen of Rome, the whole name of the Romanes hath beene infamous among foraine nations for auarice and corruption in this kind: as may appeare by the conceit that king Mithridates had of them, who caused Aquilus (a Generall of theirs, whose hap was to fall into his hands) for to drinke molten gold. See what couetousnesse brings home with it in the end.

Now when I behold and consider no more but these strange names of our vessell in plate, which are newly deuised in Greek from time to time, according as the siluer is either double or parcell gilt, or the gold enclosed and bound within worke, I am ashamed of it; and the rather, for that in regard of these deuised names and daintie toies, such plate as well of beaten gold, as gilded only, should be so vendible and sell so deare: especially knowing as we do full well, the good order that Spartacus held in his campe, expressly commanding that no man should haue any plate of gold or siluer. A great reproch to vs Romans, that our fugitiues & banished persons should

* And therfore they were called Rattii of Ratis.

* Ordinarily the Romanes siluer Denier had the letter X stamped vpon it, but these Deniers had X P I P S I N I

should shew a more nobler spirit than we our selues. *Messala* the great Oratour hath left in writing, That *M. Antonius* vsed to discharge all the ordure and filthy excrements of the body into vessels of gold; yea, and allowed *Cleopatra* likewise to do the same by her monthly superfluities, most shamefully. Noted it was among forrein Nations for excessiue licentiousnesse, and that in the highest degree, that *K. Philip* of Macedony was neuer wont to go to bed and sleepe without a standing cup of gold vnder his pillow: also, That *Agnon Teius* (a great captain vnder *Alexander the Great*) was giuen to such wastfull prodigality, as to fasten his shooes and pantophles with buckles of gold. But *Antony* about named, to the contumelie and contempt of * Nature, abused gold, and imploied it to the basest seruice that is: an act (as much as any other) deseruing pro- scription and outlawing indeed.

* Which had giuen vs gold for vessels of honour.

* For in al they were to pay 10000 talents: reckon a talent at 60 pound, which is the left. Atticke, * *Folia*, I think rather *folia*, i. bathing vessels.

* Some say 75.

But among diuers things besides, I wonder much at this, That the people of Rome, vpon the conquest of so many Nations, imposed vpon them a tribute to be paid alwaies in siluer, & neuer made mention of gold: as for example, when Carthage was subdued, & *Annibal* vanquished, the Carthaginians were inioined for 50 yeres together to make payment yerely of * [12000] pound of siluer only, and no gold at all. Neither can it be thought that there was little gold at that time to be had abroad in the world; for *Midus* and *Crasus* both, were posselt of infinit sums and huge masses of gold: and *Cyrus* vpon his conquest of Asia, met with 34000 pound weight of gold, besides the golden plate and vessell, and other gold which he found ready wrought: and among the rest, certain * leaues, a Plane and a vine-tree, both of beaten gold. In the pillage also of this victory, he gaue away 500000 talents of siluer, and one standing cup that he tooke from *Semiramis*, that weighed 15 talents. And *Varro* mine Author saith, That the poise of the Egyptian talent ariseth to * 80 pound. Besides, there had raigned before time ouer the Colchians, *Saluaces*, and one *Esiobops*: who hauing newly broken vp a piece of ground in the Samnians country, is reported to haue gotten out thereof great store of siluer and gold: notwithstanding that the whole kingdome is renowned for the golden fleeces there. And verily this prince had the arched and embowed rouses of his pallace made of siluer and gold: the beames and pillars also sustaining the said building, yea, the jambes, posts, principals, and standards, all of the same mettall; namely, after he had vanquished *Sesostres* k. of Egypt, so proud a prince, that (as *Chronicles* make mention) he was wont euery yere to haue one or other (as the lot fell out) of those kings who were his tributaries and did homage to him, for to draw in his charriot like horses, when he was disposed to ride in triumph. These and such like things haue bin thought fabulous tales: but haue not our Romans done semblable acts, which the age and posterity hereafter wil think incredible? *Cesar* afterwards Dictatour, was the first that in his Edileship, when hee exhibited a solemne memoriall in the honour of his father departed, did furnish the whole Cirque and shew-place, with all things meet for such a solemnity, of cleane siluer, in so much as the chafing stauies and bore-speares were of siluer, wherewith the wild beasts were assaulted: a spectacle neuer seene before. And not long after, *C. Antonius* set forth his plaies (when he was Edile) vpon a stage or scaffold of siluer: after whose example, diuers free cities and townes of the empire haue don the like. Semblably, *L. Murana* and *C. Caligula* the Emperor, erected a frame or pageant to go and rise vp of it selfe with vices, supporting images and jewels in the place of publick pastimes, which was thought to haue in it 124000 pound of siluer. *Claudius Cesar* who succeeded Emperor after him, when he rode in triumph for the conquest of Brittain, among other crownes of beaten gold, shewed two that were principall, the one of 7 pound weight, which high Spaine had giuen to him; the other weighing 9 pounds, sent vnto him as a Present from that part of Gaule which is called Comata: as appeared by the inscriptions and titles which they bare. *Nero* his successour, to shew vnto *Tyridates* king of Armenia what abundance of treasure he had, kept the great Theatre of *Pompeius* for one whole day couered all ouer with gold. But what was that furniture in comparisn of his golden house, which tooke vp a great part of the city, and seemed (as it were) to compasse it about. In that yere when *Sex. Iulius*, and *Lucius Aurelius* were Consuls (which fell out to be 7 yeres before the third Punicke warre) there was found in the treasury or chamber of Rome, * 700026 pound weight of gold, in Masse or Ingots; M of siluer likewise in Bullion, 92000 pound weight; besides the coine and ready money, which amounted to 375000 Sesterces. The yere wherein *Sex. Iulius* and *L. Marcius* were Consuls, to wit, in the beginning of the sociall warre against the Marcians and other Romane allies, the treasure of Rome arose to 846 pounds of gold in Bullion. *C. Cesar* at his first entrance into the

* According to *Budens*.

A the city of Rome, when the ciuill war between him and *Pompey* was begun, took out of the citie chamber 150000 wedges or ingots of gold, 35000 lumps or masses of siluer, and in ready money 400000 Sesterces. And to say a truth, neuer was the city of Rome wealthier than at this time. Moreouer, *Amplius Paulus*, after he had defeated and vanquished *Perseus* the Macedonian King, brought into the Treasury of the Citie a boorie of 3000 pound of gold in weight. After which time the common people of Rome had neuer any tributes or taxes leuied of them by the State.

Moreouer, this is to be obserued, That after the ouerthrow and destruction of Carthage, the beames began first to be guilded within the temple of the Capitoll, whiles *Lu. Mummius* was Censor. And now adaies you shall not see any good house of a priuat man, but it is laid thicke and couered ouer with gold. Nay, the brauery of men hath not staied so, but they haue proceeded to the arched and embowed rouses, to the walls likewise of their houses, which we may see euery where as wel and thoroughly guilded as the siluer plate vpon their cupbours. And yet *Catulus* was diuersly thought of in the age wherein he liued, because he was the first that gilded the brazen tiles of the Capitoll.

Touching the first inuentors, as well of gold, as also of all other mettals to speake of, I haue already written in my seuenth booke. As for the estimation of this mettall, that it should bee chiefe as it is, I suppose it proceedeth not from the colour, for siluer hath a brighter lustre, more like to the day, and in this respect more agreeable to the ensignes of war than that of gold, because it glittereth and shineth farther off, and hereby is their error manifestly conuincid, who commend the colour of gold, in this regard, that it resembleth the starres: for well it is knowne that their colour is not reputed richest, either in precious stones or in many things besides. Neither is gold preferred before other mettals, because the matter is more weighty or pliable than the rest, for lead surmounteth it, both in the one and the other. But I hold, that the reputation which it hath, commeth from hence, That it alone of all things in the world, loseth nothing in the fire: for say that a house be burnt wherein gold is, yet it wasteth not: and looke what gold is committed to the funnell flames, it consumeth not with the dead body, but is found all againe among the ashes. Nay, the oftener it hath bin in the fire, the better it is, and the more refined: in such sort, that the best gold which they call *Obryzum*, is knowne by this, if it be of the same deep red colour that the fire is wherein it is tried. And a principal argument this is of fine gold, D if it hardly be kindled, & set on fire red hot. Moreouer, this is wonderful in the nature of * gold: that in a fire made of light straw or chaffe, it wil most quickly become red hot and melt, but the same among the hottest burning coles that can be of wood, ynneath or hardly wil it yeeld to the heat thereof and resolute: as also for the purifying thereof, it ought to be melted with lead. A greater reason there is besides that maketh gold so precious: for that with vs or handling there is little of it lost and wasted, whereas siluer, brasie, and lead, if you draw any lines therewith, colour as they go and leaue somewhat behind: they soile their hands also who occupie the same with the substance and matter that sheedeth from them. Quer and besides, there is not a mettall will be driuen out broader with the hammer, or diuide easily into more parcels than gold, in so much as euery ounce of it may be reduced into 750 leaues, or more, and each one of them foure fingers large euery way. The thickest gold soile beareth the name at this day of *Prænesteum*, for that the image of Fortune at *Præneste* is aboute all other most richly guilded. The next thereto in goodnesse is the soile or leafe of gold named *Quæstoria*. In Spaine they vse to call by the name of *Strigiles*, the small pieces of that fine gold which is found naturally alone aboute al the rest either compact in some masse, or in manner of sand or grauell; whereas all other parcels of gold taken out of the Mines, need to be fined and brought to their perfection by the meanes of fire. But this gold that I speake of, is gold presently at the first, and no sooner is found, but the matter thereof by and by is consummat and accomplished. Loehow gold is found in the owne nature pure and perfect. As for the other manner of finding and fining gold, wherof I meane to speake anon, it is forced (as it were) and vpon constraint. But aboute all other properties to commend the goodnesse of gold, this especially is to be obserued, That there is no rust nor canker, nor any filth besides breeding of it selfe therein, which is able either to corrupt the goodnesse, or diminish the weight and substance thereof. What should I say how firme it continueth and dureable against salt and vineger, scorning all their iniuries: and yee otherwise their moisture is able to eat into any other mettals, yea, and to consume and raine all things else

* This haply may be true in ore, for other, wife in fine gold it is not for & the finer that it is, the stronger fire it asketh to be melted by.

els whatsoeuer. But this passeth all, that spun it may be as wooll and silke, wouen also in manner of yeare, chuse whether you wil work it twisted with [silke] thred, or single in wire by it selfe. *Verrius* the Historiographer reporteth, that *K. Tarquinius*, turnamed *Priscus*, rode in triumph in a robe of wrought gold. I my selfe haue scene the Emperesse *Agrippina*, wife to *Claudius Caesar*, sitting by her husband the Emperor to behold the braue shew of a nauall skirmish vpon the water which he exhibited, all gorgeously arrayed in a roiall mantle, wouen without any other matter saue onely pure gold. Cloth of gold and tisseue I know there is besides, called *Vestis Attalica*, wherein gold is wrought with other stufte: and long since it is, that this inuention hath been deuised by the rich and sumptuous kings of Asia. Furthermore, to guild marble or any other thing that wil not abide to be guilded by the fire, gold foile must be laid on with the white of anegge. As for wood and timber, they vse to guild it by the means of a certaine compound glue or size, which is commonly called * *Leucophoron*: but what a glue this is, and how it is made, I will declare in place conuenient. As touching the manner how to guild brasse, it was performed ordinarily heretofore by quick siluer naturall, or els artificiall named *Hydrargyron*: & herein there hath bin deuised much fraud and deceit; according as I wil hereafter shew in their proper chapters, when I purpose to set down their nature and properties. But now after that brasse hath bin much knocked and beaten, they vse to put it into the fire: and so soon as it is perceiued red hot, they quench it again in salt, vinegar, and allum. Now afterward, when it is well scoured and clenfed with sand, and knowne by the brightnesse and lustre thereof that it hath bin sufficiently frobished and purified, again it must into the fire to take a new heat by the ardent exhalation thereof; that beeing thus (as it were) mortified and besmeared with a size of the pumish stone, allum and quick siluer mixt together, it may take vp gold foile laid vpon it the better, and keep it more surely. To conclude, allum hath the very same vertue to trie and clenfe gold, as I said before Lead had.

*or *Chrysopero*.

CHAP. III.

¶ The manner of finding gold naturally in the Mine. When were knowne the first staines of gold. The medicinable vertues and properties of gold.

IN these parts of the world wherein we liue, gold mines are found: so that we need not to stand so much vpon the gold of India, nor that which the ants cast vp out of the ground, or the grifons gather in Scythia. And verily the gold here with vs commeth naturally in three sorts; to wit, among the sands of some great riuers, like as *Tagus* in Spaine, the *Po* in Italy, *Hebrus* in Thrace, *Pactolus* in Asia, and the Indian *Ganges* do yeeld it: neither is there any gold more fine and perfecte, as being thoroughly polished by that rubbing and attrition which it meets withall, in the course and stream of the water. Another manner there is to come by gold, namely, by digging it out of pits which are sunk of purpose for it, or els to light vpon it within the caues and breaches happening by the falls of mountains vndermined or cut through. And my meaning is to discourse of the one way as well as the other, of searching for gold.

To begin then with those who seek for this mettall: first aboue all they hit vpon a vaine of earth called *Segullum*, and this is it that giueth them the first light and shew that gold is there to be had. This they take vp: the bed and couch wherein it lieth: the grauell likewise & the sand about it they wash, obseruing diligently that which seeth in the bottome; for by it they haue a good guesse and aim that directeth them to gold, whether it lie deep or shallow. And by this coniecture, otherwhiles their hap is so good, as to find that which they desire, aloft, euen ebbe vnder the vprmost coat of the earth: but I must needs say, a rare felicity is this: & yet of late daies during the Empire of *Nero*, there was found in *Dalmatia* a vaine of gold ore within one spades griffe in the first turfe of the ground, which yeelded euery day the weight of fifty pound. This manner of earth, if it be found also vnder a vaine of gold, they call *Alutatio*. Moreover, this is to be nored, That ordinarily the dry and barren mountains in Spaine which beare and bring forth nothing else, are forced (as it were) by Nature to furnish the world with this treasure, and doe yeeld mines of gold. As for that gold ore which is digged forth of pits, some call it in Latine *Canalitium*, others *Canaliense*. And verily this is found sticking to the grit and vprmost crust of hard rocks of marble; not after the manner of drops or sparkes glittering in orient Saphire, or the

The Thebaick marble, and in many other pretious stones, which are marked here and there with specks of gold: but this ore or mettall doth clasp and embrace whole pieces of marble & such like, found in rocks. And commonly these canals (as I may so say of gold ore) follow the veins of such marble and stone in the quarry, diuiding and spreading as they do here and there: whereupon the gold tooke the foresaid name of *Canalitium*: they wander also along the sides of the pits as they are digged, so that the earth had need to be borne vp and supported with posts and pillars for the getting of it, lest by hollow vndermining it fall vpon the pioners. This mine or vein of gold ore when it is once digged vp and landed aboue ground, the manner is to bray and stamp, to wash, buin, and melt, yea and otherwhiles to grind into powder. As for that which (as they pun thus and beat in mortars) is knocked from it, they call * *Apilascus*: but the mettall which sweateth out and commeth forth by the violent heate of the furnace where the foresayd ore is melted, they name *Argentum*, & *Siluer*. The grosse substance cast vp from the pot or vessel, and swimming aloft (whether it be the drosse comming of gold thus tried, or any other metall) is named *Scoria*. Howbeit, this drosse that gold doth yeeld from it in the trying, is set ouer the fire again to take a new melting, & is stamped in maner aforesaid. As for the pans or vessels wherein gold is thus tried and refined, they be made of a certain earth named *Talconium*: and the same is white like vnto a kinde of potters clay. For surely there is no other earth or matter whatsoeuer will abide either the heate of the fire vnderneath, plied continually with the bellows, or the matter within it when it is melted. And thus much of the two first waies of finding out gold.

The third manner of searching for this mettall is so painfull and toilesome, that it surpasseth the wonderfull works of the * *Geants* in old time. For necessary it is in this enterprise & busines, to vndermine a great way by candlelight, & to make hollow vaults vnder the mountains. In which labor the pioners work by turns successiually, after the maner of the reliefe in a set watch, keeping euery man his houres in iust measure: and in many a moneths space they neuer see the Sun or day light. This kind of work and mines thus made they call *Arrugia*, wherein it falleth out many times that the earth aboue head chinketh, and all at once without giuing any warning ferleth and falleth, so as the poore pioners are ouerwhelmed & buried quick: inso much as considering these perils, it seemes that those who diue vnder the water into the bottom of the Leuant seas for to get pearls, hazard themselves nothing so much as these pioners: a strange thing, that by our rashnesse and folly wee should make the earth so much more hurtfull to vs than the water. Wel then, to preuent as much as possibly may be these mischiefes and dangerous accidents, they vnderprop the hills, and leaue pillars and arches as they go, set thick one by another to support the same. And yet say they worke safe enough, and be not in jeopardy of their liues by the fall of the earth, yet there be other difficulties that impeach their work: for otherwhiles they meet with rocks of flint and rags, as wel in vndermining forward, as in sinking pits downe-right; which they are driuen to pierce and cleaue through with fire and vinegar. But for that the vapor and smoke that ariseth from thence, by the means, may stifle and choke them within those narrow pits and mines, they are forced to giue ouer such fire-work, and betake themselves to great mattocks and pickaxes, yea and to other engines of iron, weighing 150 pounds apiece, wherewith they hew such rocks in pieces, and so sinke deeper, or make way before them. The earth and stones which with so much ado they haue thus loosed, they are faine to cary from vnder their feet in scuttles and baskets vpon their shoulders, which passe from hand to hand euer more to the next fellow. Thus they moile in the dark both day and night in these infernal dungeons, and none of them see the light of the day, but those that are last and next vnto the pits mouth or entry of the caue. If the flint or rock that they work into seem to run in a long grain, it will cleaue in length, and come away by the sides in broad flakes, and therefore the pioners with ease make way, trenching and cutting round about it. Howbeit, be the rock as ragged as it will, they count not that their hardest work: for there is a certaine earth resembling a kinde of rough clay which they call white Lome, and the same intermingled with gritty sand so hard baked together, that there is no dealing with it; it so scorneth and checketh all their ordinary tooles and labour about it, that it seemeth impenetrable. What doe the poore labourers then? They set vpon it lustily with iron wedges, they lay on lode vncessantly with mighty beetles; and verily they thinke that there is nothing in the world harder than this labour, vnlesse it bee this vnassatiab hunger after gold, which surpasseth all the hardnesse and difficulty that is. Wel, when

* *Quasi ad pilas eorum*.

* Who were said to reare one mountain vpon the head of another.

when the work is brought to an end within the ground, & that they haue vndermined & hollowed the ground as far as they think good, down they go with their arch-work aboue said, which they builded as they went: they begin first at those props which are farthest off, cutting the heads of the stanchions still as they return backward to the entrance of the work. Which done, the sentinel only, which of purpose keeps good watch without upon the top of the same mountain that is thus vndermined, perceiues the earth when it begins to chink and cleaue, menacing by that token a ruin thereof anon. Whereupon presently he giues a signe either by a loud cry, or some great knock, that the pioners vnderneath may haue warning thereby to get them speedily out of the mines, and runneth himselfe apacedown from the hill as fast as his legs will giue him leaue. Then all at once on a sudden the mountain cleaueth in sunder, and making a long chink, falls downe with such a noise and crack, as is beyond the conceit of mans vnderstanding, with so mighty a puff and blast of wind besides, as it is incredible. Whereat these miners & pioners are nothing troubled, but as if they had done some doughty deed, and achieved a noble victorie, they stand with ioy to behold the ruin of Natures workes which they haue thus forced. And when they haue all don yet are they not sure of gold, neither knew they all the whiles that they labored and vndermined, that there was any at all within the hill: the hope only that they conceived of the thing which they so greatly desired, was a sufficient motiue to induce them to enterprise and endure so great dangers, yea & to go through withall and see an end. And yet I cannot wel say that here is all; for there is another labor behind, as painfull euery way as the other, and withall of greater cost and charges than the rest, namely, to wash the breach of this mountaine (that is thus clouen, rent, and laid open) with a currant: for which purpose they are driuen many times to seek for water a hundred miles off, from the crefts of some other hills, and to bring the same in a continued channel and stream all the way along vnto it. These Riuer or furrows thus deuised and conueyed, the Latines expresse by the name of * Corrug, a word as I take it deriued à *Corruendo*, i. of drawing many springs and rils together into one head & channel. And herein consisteth a new piece of worke as laborious as any that belongs to mines. For the leuel of the ground must be so taken aforehand, that the water may haue the due descent & currant when it is to run: and therefore it ought to be drawn from the sources springing out of the highest mountains; in which conueiance regard would be had as well of the vallies as the rising of the ground between, which requireth otherwhiles, that the waters be commanded by canels and pipes to ascend, that the carriage thereof be not interrupted, but one piece of the work answer to another. Otherwhiles it falleth out, that they meet with hard rockes and crags by the way, which do impeach the course of the water; and those are hewed through, and forced by strength of mans hand to make room for the hollow troughs of wood to lie in, that carrie the foresaid water. But a strange sight it is to see the fellow that hath the cutting of these rockes, how he hangeth by cables and ropes between heauen and earth; a man that beheld him afar off would say it were some flying spirit or winged diuell of the aire. These that thus hang for the most part take the leuel forward, and set out by lines the way by which they would haue the water to passe; for no treading out is there of the ground, nor so much as a place for a mans foot to rest vpon. Thus you see what ado there is. And these good fellowes whiles they bee aloft, * search with the hands and pluck forth the earth before them, to see whether it be firme and fast, able to beare the trunks or troughs for the water; or otherwise loose and brittle, which defect of the earth they call * Vrium: for the auoiding whereof the fountainers feare neither rocks nor stones to make passage for their pipes or trunks aforesaid. Now when they haue thus brought the water to the edge & brow of the hills where these mines of gold should be, & from whence as from an head there is to be a fall thereof to serue their purpose, they dig certaine square pooles to receiue the water, 200 foot euery way, and the same ten foot deep: in which they leaue fise seuerall sluices or passages for the deliuerie of water into the mines, and those commonly three foot square. When the said pools stand full, as high as their banks, they draw vp the floud-gates: and no sooner are the stopples driuen and shaken out, but the water gusheth forth amaine with such a force, and carrieth so violent a streame therewith, that it rolleth downe with it any stones, be they neuer so big, lying in the way. And yet are we not come to an end of the toile, for there remaineth a new piece of work to do in the plaine beneath. Certain hollow ditches are to bee digged for to receiue the fall of the water both from the pooles that are aboue, and the mines also. These trenches the Greekes tearme Agogæ, as a man would say,

Conduits,

Conduits, and those are to be pased by degrees one vnder another. Besides, there is a kinde of shrub or bush, named Vlex, like to Rosemarie, but that it is more rough and prickely, and the same is there planted because it is apt to catch and hold whatsoeuer pieces of gold do passe beside. The sides moreover of these canals or trenches, are kept in with planks and boards, and the same borne vpon arches pendant through steep places, that by this means the canale may haue passage and void away at length out of the land into the sea.

Lowhat a worke it is to search out and meet with gold! and verily by this means Spaine is grown mightily in wealth, and full of treasure. In the former work also of sinking pits for gold, an infinit deale of labour there is to lade out the water that riseth vpon the workemen, for feare it choke vp the pits; for to prevent which inconuenience, they deriue it by other drains. As touching the gold gotten by cleauing and opening mountains (which kind of work I called Arturgia) it needeth no trying by the bloome-smithie, for fine it is naturally & pure of it selfe: and found there be whole lumps and masses of this kind, and in this manner. In pits likewise ye shall haue such pieces, weying otherwhiles ten pounds and more. These grosse and massie pieces of gold, the Spaniards call Palacæ or Palacranæ: but if they be but small, they haue a pretty name for them, and that is Baluces. But to come again to the shrub or plant Vlex, whereof I spake before, after it is once dried, they burn it, and the ashes that come thereof, they wash ouer turfs of Greene grasse, that the substance of gold may rest and settle therupon. Some writers haue reported, that the countries of Asturia, Gallæcia, and Lusitania, were wont to yeeld euery yere 20000 pound weight of good gold gotten after this sort: yet so, as they all doe attribute the greatest proportion thereof to Asturia: and there is not any part of the world comparable to it either for so great fertility of mines, or so long continuance, holding out as they do so many ages. As for Italy, our ancient Senat in old time thought good to haue it spared, and they made an Act, forbidding expressly to break any ground for mines: otherwise there is not, I dare be bold to say, a land more plentiful in gold and other mettals. And here there cometh to my remembrance an Act of the Censors extant vpon record, as touching the gold mine of Ictimulum, a towne in the territory or countrey of Vercelles, which Act contained an inhibition, that the publicanes who fermed that mine of the city, should not keepe aboue fise thousand pioners together at worke there.

Moreouer, there is one deuise to make artificiall gold, to wit, of Orpiment, a minerall digged out of the ground in Syria, where it lyeth very ebbe, and the painters vse it much: in colour it resembleth gold, but brittle it is in substance like as glasse stones. And verily Caligula the Emperour (a couetous prince and greedy of gold) was in great hope to extract gold out of this minerall, and thereupon caused a huge masse thereof to bee boiled, melted, and calcined: and in truth he made therof most excellent gold, but in so smal a quantity, that it would not quit for the cost & pains about it; in so much, as he lost by the bargain: yet his auarice was such, as he would needs make the experiment, notwithstanding that orpiment it selfe was worth fourteene deniers the pound: but he sped so bad, that no man afterwards would go about to try the like conclusion.

Gold vntried is of a diuers touch; & generally there is not any but it hath siluer in it more or lesse: for in some places, the gold ore hath a tenth part in weight of siluer, in others a ninth, and there is again that hath a mixture of the eight part. In one gold mine within France, called Albicarense, there is found in gold the 36 part of siluer, and no more: such metall is not elswhere found to my knowledge, and therefore it passeth all other whatsoever.

There is a base kind of pale and whitish gold, which hath in it a fift part of siluer: and wherefoeuer this is found, they call it Electrum. Such metall lieth commonly in trenches and pits minerall, and namely with that gold which I called before Canaliense. Moreouer, there is an artificiall Electrum made, namely, by intermingling gold with siluer according to the naturall mixture, but if it exceed that proportion of one part to fise, it wil not abide the hammer and the anuill. This white gold also hath bin of great account, time out of mind, as may appeare by the testimony of the Poet Homer, who writeth, that the pallace of prince Menelaus glittered with gold, electrum, siluer, and yorie. At Lindos (a city within the Island of the Rhodians) there is the temple of Minerva, wherein Lady Helena did dedicate vnto that goddesse a cup made of Electrum: and as the story saith moreover, it was framed and wrought iust to the proportion & bignesse of one of her own paps. This property hath Electrum naturally, To shine by candle-light more cleare and bright than siluer. This singularitie and proper vertue it hath besides (if it

ap. 10.

be naturall) to discover and shew any poison: for be there poison in a cup of this mettall, a man shal see therein certain semicircles resembling rainbows, & perceiue besides the liquor to keep a hissing and sparkling noise as the fire doth; which 2 signs do certainly giue warning of poison.

As touching statues of gold: it is said, that the first image that euer was knowne to be solid and massie, was that of the goddesse *Diana* surnamed *Anaitis*, which stood within a temple dedicated to her, which in my *Cosmography* I haue signified vnder that name, and this was before any brassen statue of that making. This temple in those parts was accounted in regard of the diuine power of this goddesse, most holy and sacred; and such a kind of Image they call *Holophyraton*. Howbeit, as religious as the church was, *Antonie* in his voiage into *Parthia*, spoiled it, and carried away the said Image. And here I cannot forget to put downe a pretty speech, which (by report) an old gentleman and souldier of *Bononie* deliuered to *Augustus Caesar*, at what time as he was entertained as a guest and supped with the said Emperour at his owne table: for beeing asked by *Augustus*, whether it was true, that the man who first violated this goddesse, died blind, lame, and bereaued of all his limbs? he answered, Yea sir, that it is; and that me thinks you should know best, for euen now a leg of his you haue at supper, and *all your wealth besides is come to you by that faccage.

* For *Augustus Caesar* defiled *Antonie*, & was mightily enriched by the spoile of him. And yet other writers say, that al Greece erected that image to honor him withall.

The first man that *caused his owne statue to be made of gold, and the same solid & massie, was *Gorgias Leontinus* the great Orator and Rhetorician, which (to immortalize his owne name) he set vp in the temple at *Delphos*; and this was about the 70 *Olympias*: whereby we may see what wealth and gain was gotten in those daies by teaching Oratory and the Art of Rhetorick.

But to come at length vnto the medicinable vertues of gold: certes, diuers waies effectually it is in the cure of many diseases: for first of all, foueraign it is for green wounds, if it be outwardly applied; and if yong children weare it about them, lesse harme shal they haue by any forcery, witchcraft, or enchantments, that be brought into the house, or practised where they are: howbeit, gold it selfe if it be carried ouer one, is thought to be mischieuous and hurtfull: for in that sort it doth harme also to hens that coue and sit, or cws that are great with lambe and ready to yeane. But what is the remedy to preuent this mischiefe? marry take the same gold that is thus brought in place to do a shrewd turn, wash it well, and with that water besprinkle them that you would cure. Moreover, gold may be torried once with cornes of salt taken to the triple weight thereof; and a second time with two parts of salt, and one of the stone which they call *Schistis*: by this manner of preparing, all the venomous and hurtfull quality that is therein, it doth transfuse into the other things that be calcined or burnt therewith (which must be done vpon an earthen vessell) and it selfe continueth pure and incorrupt still. Now the rest of the ashes separated from the gold, saued in an earthen pot, and incorporat with water into the forme of a liniment, healeth the foule tetar that appeareth in the face: it cureth the same disease also, if the face be rubbed with the said ashes and beane flour together, but then it must be afterwards washed off. These ashes thus prepared, cure the hollow vlcers called *fistuloes*, and also the haemorrhoids: but in case you put thereto the *floure of salnitre, it healeth corrupt and putrified vlcers, & such as stink again: the same being boiled in hony with *Nigella Romana*, doth gently loose the belly, if the naual be anointed therewith. To conclude, *M. Varro* saith, that gold wil cause werts to fall off.

* *Nitrispama*, or *nitron*, is a salt.

CHAP. V.

¶ Of *Borras*, and the six medicinable properties that it hath: the wonderfull Nature thereof in sodring one mettall with another, and in bringing all mettals to their perfection.

Chryfocolla, called otherwise *Borax*, or green earth, is found in those pits and mines that are digged for gold: and a humor it is at the first, running along the veine of gold, which as it thickneth and groweth muddy, congealeth at length by the extreame cold of winter to the hardnesse of a pumish stone. Howbeit, the best kind of *Borax* we haue known by experience to be ingendred in mines of brasse; and the next to it for goodnes, in those of siluer: otherwhiles also men meet withal in leaden mines, but the same is not so good as that which the gold mines doe yeeld. Moreover, there may be an artificiall *Borras* made in all the said mettall mines, but far inferior to that which is naturall; namely, by letting water gently to run among their veines all winter long vntill the month of Iune: the which water, in Iune & Iuly wil grow to be dry and

prooue

A prooue *Borras*; whereby a man may perceiue plainely, that *Borras* is nothing els but a putrified vein of mettall. But this Minerall, if it be of the own kind, differeth from this other which is made by art of man, especially in hardnesse, for much harder it is, and called the yellow *Borax*, or in Latine *Lutea*; and yet it may be brought to that colour by artificiall means, namely by dying with an herb called likewise **Lutea*: for of this nature it is, that it will take color & drinke it in, as well as linnen or woollen. But for to dresse and prepare it for the purpose, first they pun it in a mortar, then they let it passe through a fine sece; afterwards it is ground or beaten againe, & so it is serced a second time through a finer sece; whatsoeuer passeth not through, but remaineth behind, must be punned once more in a mortar, & so ground into a small powder: and euet as they haue reduced any into powder, they put it into sundry pots or cruses: then they let the same to lie enufused and soaked in vinegre, till the hardnes therein be wholly resolued: which done, to the mortar it goeth againe, where it must be thoroughly stamped for altogether, and so when it is well washed out of one trey or boll into another, they let it dry: after it is thus prepared they giue it a colour with the herb *Lutea* (before said) and alume de plume: and thus you see it must be painted and died first, before it selfe serue to paint or die withall. And herein it skillerth much how pliable & apt it is to receiue the said color, for vnlesse it haue willingly taken a deep tincture, they vse to put thereto *Schyrtanum* and *Turbystum*, for so they call two drugs which serue to make it take a color the better. This *Borax* thus died, our painters vse to call *Orobitis*: and two kinds they make therof; to wit, *Lutea*, i. the yellow, which they keep for the powder or colour **Lomuntum*; the other liquid, namely when the said grains or pellets be resolued into a kind of moisture, like drops of sweat. This *Borax* of both sorts, is made in the Isle *Cypros*. The principall and best of all other comes from *Armenia*: in a second degree, from *Macedonia*: but the greatest quantity therof is in *Spain*. The excellent *Borax* is known by this mark especially, If it resemble perfectly in colour the deep and full green that is in the blade of corn wel liking. In our time, & namely in the daies of the Emperour *Nero*, the floore of the grand cirque or shew-place at *Rome*, was seen pauced all ouer with greene *Boras*, at what time as he exhibited goodly fights and pastimes to the people; and namely, when he meant himselfe to run a race with chariots, and took pleasure to driue his horses vpon a ground futable to the colour of the cloth or luerie that he wore himself at that time: and in truth, a world of workemen he brought thither to lay the said pauing. Al the sorts of *Boras* may be reduced into three distinct kinds: to wit, the rough, valued at seuen denarij a pound; the meane, which is worth thre; and the poudred *Boras*, called also the grasse-green *Borax*, which costeth not about three deniers the pound. As for the sandie or poudred *Boras*, the painters before they vse it, lay the first ground vnderneath it, of *vitrioll* and **Parætanium*, and then the *Borax* aloft: for these things take it passing well, & besides giue a pleasant lustre to the color. This *Parætanium* (for that it is most fattie & vnctious by nature, & for the smoothnes besides most apt to sticke too and take hold) ought to be laid first, vpon which must follow a course of the *vitrioll* ouer it, for feare least the whitenes of the foresaid *Parætanium* do pall the greenesse of the *Borax*, which is to make the third coat. As for the *Borax* called *Lutea*, some thinke itooke that name of the herbe *Lutea*, which also, if it be mixed and tempered with azure or blew, maketh a greene, which many do lay and paint withall in stead of *Borax*; which as it is the cheapest greene of all other, so is it a most deceitfull colour.

Borax doth not onely serue painters, but is much vsed also by Physicians; and namely, to mundifie wounds and vlcers, if it be made into a salue with wax and oile: and dry as it is of it selfe in powder, it hath a desiccative qualitie, and doth conglutinat and sodder very well: being mixed with hony into an elecuarie, they giue it inwardly vnto those that haue the squinancie, and cannot draw their wind but sitting vpright, and so it prouoketh vomit. Moreover, it encreth into many collyries or eie-salues, especially to consume and discusse the cicatrices and filmes growing within the eie: it goeth also to the making of green plaisters, such as be applied either to mitigat paine, or to heale the skin. And verily this *Borax* not artificially died, thus employed in Physick, the Physicians call *Acefin*, and is not that which men name *Orobitis*, and which receiueeth a tincture from mans hand.

Furthermore, there is a *Borax* or *Chryfocolla*, that goldsmiths occupie especially about sodring their gold: & of this kind al the rest take the name also of *Chryfocolla*. This is altogether artificiall, and is made of *Cyprian Verdegri* or rust of brasse, the vrin of a yong lad, and salnitre, tempered all together & incorporat in a brassen mortar, stamped with a pestill of the same mettall.

S f a

* Some take it to be weld or yellows.

* *Lomuntum*. See the beginning of the next booke.

* For some were called *Prassina* that ran for the price, i. Greenkins.

* A kind of chalkie earth, or clay, growing neare the sea shore.

* Whereupon itooke the name *Chryfocolla*, i. gold, a glew, or solder.

call. Our countrymen in Latin call this Borax Santerna: with it they vse to sodder that gold e. G. specially which standeth much vpon siluer, and is therefore called Argentofum. This kind of gold may be known thus; namely, if it will look bright and cleare vpon the putting of Santerna to it: whereas contrariwise if it hold much vpon brasse (and such gold is named *Ærosum*) it will haue no lustre at all, but looke dim and dusky vpon the laying of Borax vpon it, and besides will hardly be soddered. But to sodder such gold, there is a proper glue or foder made, with an addition of gold and the seventh part of siluer to the rest abouenamed, and all the same stamped and vnited together. And since I am entred into the seat of sodding, it were very meet and conuenient to annex vnto this present discourse, all things els concerning it, that we may vnder one view behold the admirable works of Nature in this kind. The foder of gold then is Borax, which I haue shewed already. Iron is soddered with the stiffe potters clew Argilla. Brasse ore or Chalamine called Cadmia, serues to vnite and knit pieces of brasse together in masse. Alume is good to hold plates of brasse one to another. Rosin doth foder lead, and besides is the proper cement of marble: but black lead will joine well, by the means of the *white: and one piece of tin with another, with the helpe of oile. In like manner, tin will hold sure with a foder of brasse file-dust, and siluer, with tin. Both brasse or copper, & also yron ore, melt best with an yron made of Pine-wood; as also with the Papyr reed in Egypt: but contrariwise gold soonest melts with a fire of chaffe and huls. Quicklime will catch an heat and burne, if water be cast vpon it, and so doth the *Thracian stone: but the same oile doth quench. Fire is most of all extinguished and put out with vinegre, with birdlime, and the white of an egg. No kind of right earth will burn light or flame. Finally, charcole which hath beene once one fire, then quenched and afterwards set a burning againe, is of more force and giueth a greater heat, than that which commeth new from the earth.

* Some take this for Tin-glasse.

* Which some take for pit-cole, or sea-cole rather, such as commeth from Newcastle by sea: or rather a kind of yeast.

CHAP. VI.

¶ Of Siluer, Quick-siluer natural, Stibium, or Alabastrum. The dresse or refines of siluer, and lichearge of siluer.

IT followeth by good order to write in the next place, of siluer mines, from whence proceedeth the second rage that hath set men a madding: where first and formost this is to be noted, that there is but one means to find siluer, and that is in pits sunke of purpose for it: neither is there any shew at all of siluer to giue light thereof, and to put vs in hope of finding: no sparkes shining, like as there be in gold mines which direct vs to it. The earth that engendreth the veins of siluer, is in one place reddish, in another of a dead ash color. But this is a generall rule, that it is not possible to melt and trie our siluer ore, but either with lead, or the veine and ore of lead. This minerall or mettall they call *Galena, found for the most part neer to the veins and mines of siluer. Now by the means of fire, when these are melted together, part of the siluer ore sekerth downeward and turneth to be lead, the pure siluer floteth aloft, like as oile vpon water. In all our prouinces, yea and parts of the world to speake of, there be mines of siluer to be found: howbeit the fairest be in Spaine, and yeeld the finest and most beautifull siluer: and the same also like as gold, is engendred in a baraine soile otherwise and fruitlesse, and euen within mountains: look also where one vein is discovered, there is another alwaies found not farre off: which is a rule obserued not in mines of siluer only, but also in all others of what mettals soeuer; and hereupon it seemeth that the Greekes doe call them *Metalla. And verily, strange it is and wonderfull, that the mines of siluer in Spaine which were so long agoe begun by Anniball, should continue still as they do, and retaine the names of those Carthaginians who first found, discovered and brought them to light: of which, one named then Bebelo, & so called at this day, yeelded vnto Anniball daily 300 pound weight; which mine euen at that time had gone vnder the ground and hollowed the mountain a good mile and a halfe: and all that way the Aquitans at this day standing in water, lade the same vp, labouring night and day by the candle or lampe-light, euery man in his turne; and during the burning of a certaine measure of oile; in such wise as they diuert the water from thence, and make a good big riuer thereof, to passe and run another way. A veine of siluer which lieth but ebb within the ground, and is there discovered, the miners call Crudaria, as it were a raw vein. In old time those that digged for siluer, if they met once with allum, were wont to giue ouer their worke and seeke no farther: but of late daies it happened, that vnder alume there was found a veine of white brasse or laton, which fed mens hopes still, and

* or, Molybdena.

* quassus, as one after another.

A and cause them now to sink lower, and neuer rest so far as they can dig. And yet there is a damp or vapor breathing out of siluer mines, hurtfull to all liuing creatures, and to dogs especially. Moreouer, this point is well to be marked, that gold and siluer both, the softer that they be and tender, the better they are esteemed: and siluer being white as it is, most men maruell how it commeth to passe, that if one rule paper or any thing therewith, it will draw black lines & fully as it doth.

B Furthermore, within these veines and mines abouesaid, there is a certaine stone found which yeelds from it an humor continually, & the same continues alwaies liquid: men call it *Quick-siluer (howbeit being the bane and poison of all things whatsoever, it might be called Death-siluer well enough) so penetrant is this liquor, that there is no vessel in the world but it will eat and breake through it, piercing and passing on stil, consuming and wasting as it goes: it supports any thing that is cast into it, and will not suffer it to settle downward, but swim aloft, vnlesse it be gold only; that is the only thing which it loueth to draw vnto it and embrace: very proper it is therefore to refine gold; for if gold and it be put together into earthen pots, and after often shaking be poured out of one into another, it mightily purifies the gold & casts forth all the filthy excrements thereof; and when it hath rid away all the impurities and grosse refuse, it selfe ought then to be separated from the gold: for which purpose poured forth the one & the other ought to be, vpon certaine skinnes of leather well tewed and dressed vntill they be soft, through which the quick-siluer may passe: and then shall you see it stand in drops vpon the other side like sweat sent out by the pores of our skin, leauing the gold pure and fine behind it: and verily the affinitie betwixt gold & quick-siluer is so great, that if any vessels or pieces of brasse are to be gilded, rub the same ouer first with quick-siluer before the gold soile be laid on, it will hold the same most surely: may this one discommodity there is in it, that if the leaues of gold be either single or very thin, the whitenesse of the quick-siluer will appeare through, and make the gilding more pale and wan: wherefore our cunning goldsmiths who would make their Chapmen to pay for their plate as double gilt, when it is indeed but thin laid and single, and to picke their purses, set a rich and deep colour vpon their work for the time, by laying vnder the gold in stead of quick-siluer natural, the white of an egg, and then vpon it artificial quick-siluer named Hydragrym, whereof I purpose to write in place conuenient. And to say a truth, the right quick-siluer which is of the own kind, is not commonly found in great plenty.

D Ouer and besides, within the same mines and among the veines of siluer, there is found a minerall, which to speake properly is a stone concrete of a certain scum or some, white and shining, howbeit not transparent, which is called by some Stimmi, by others *Stibium, Alabastrum, or Labafon: and hereof there be two kinds, the male and the female; but the female Antimony or Stibium is the better esteemed: for the male is more rude, rough, and rugged, & yet for all that not so weighty, bright and radiant; besides that, it is more charged with sand: whereas the female contrariwise shineth and glittereth plentifully, being also brittle & tender, apt to cleaue easily into plates or flakes, and not to breake into lumps and gobbets.

Touching the vertues of Stibium pertinent vnto physick, astringent it is and refrigerant, but a principal and peculiar medicine to be employed about the eyes, for therupon it was that most men called it Platyophthalmon, for that being put into those ointments that are to beautifie the eyes of women, (named thereupon Calliblephara) it seemes to extend the compasse of the eyes, and make them appeare open, faire, and *large withall. Antimonie puluerised and incorporated with the powder of frankincense, by the means of gum withall, staith the flux of humors into the eyes, and healeth the fretting and exulcerations incident thereto: being otherwise a proper medicine to staunch the blood that gusheth or issueth from the braine. But for to stop the bleeding of any fresh wound, the powder of Antimony alone is thought to be more effectfull if the place be strewed withal: which also is a singular thing to heal the old bitings of dogs. It cureth moreouer any burn occasioned by fire, in case it be tempered in some conuenient fuet and wax, with Lichearge of siluer, and Ceruse or White lead, and so reduced into a salue. But for to prepare Antimonie aright, it ought to be well luted all ouer with a certaine kinde of paste made of Cow-dung, and then dugged and calcined in an ouen; which beeing done, to bee quenched with Womans milke, and then stamped and brayed very well in a mortar, putting thereto raine water also among, and euer and anon the troubled water ought to bee transfused into a vessell of brasse, and clarified therein together with Sal-nitre. As for that which settled in

* or Life-siluer

* We call it Antimonium.

* And therefore Jon called it *Antimonium* when he reckons vp the deuices that *Qu. Omphale* had to paine and trim her selfe.

* Which was counted a grace in old time, as may appeare by *Homer*, who giueth vnto *Qu. Iuno* the Epithet of *Boime*, (*id est*) broad eyed, as is a Cow or Heifer.

the bottome of the mortar, is held to be the drosse and dregs thereof, standing most vpon lead, G and is throwne away as good for nothing: but the pot or vessell whereinto the troubled water aforesaid was poured, after it is well couered and stopped with a linnen cloth, must be suffred to stand all night to take a setling; and the next morrow that which floteth aloft is to be poured out by little and little, and the rest of the liquor to be soaked forth with sponges, and separated from the Antimonie. Now, that which resteth in the bottom is taken to be the floure of Antimonie, and so called; which they lay forth in the Snn a drying, couered with a fine linnen cloth that it should not be ouermuch dried: which done, they beat this fine floure againe in a mortar, and so reduce it into trochiskes. But in this operation of preparing antimonie, about all things regard would be had in the burning thereof, that it be not ouermuch calcined, and so turne into lead. Some in the burning of antimonie vse not dung, as is before said, but rather lap the same about with some grease or tallow: others, after it is well beat and punned, streine it with water H through a threefold linnen cloth, & cast away the dregs remaining behind: but the liquor that passed through, they poure out of one vessell into another, and the residue alwaies they gather and saue, which they mix in the composition of plaisters and cie-salues, or collyries.

As touching the drosse or refuse in siluer, the Greeks call it Helcysma: the nature thereof is restraining & refrigeratiue: it entrencheth into plaistres like as lead ore doth (which is named Molybdæna, and whereof I intend to write in my treatise of lead) especially those that are made to heale, cicatrice, and skin. Also being injected by way of clistere with oile of myrtles, it cureth tinesmus and dysenteries. It is vsed much also in those lenitiue and vntuous plaistres named Lipatie, and serueth likewise for the excrecence of proud flesh in vlcers, & for those exulcerations which come of rubbing and fretting, or the running sore, and scalls in the head.

Within the metall mines aforesaid there is ingendred another mineral, known by the name of Spuma argenti, [i. the some of siluer] commonly called litharge, & three sorts there be found of it. The best litharge, of gold, which they call Chrystitis: the second, of siluer, named Argyritis: and a third of lead, which is Molybditis: and many times all these kinds to distill in color, are found in one and the same lump or puffed loaf of litharge. The best litharge is brought out of the region Attica: the next in goodnesse comes from Spain. Litharge of gold, named Chrystitis, is made of the very mine and vein of siluer; Argyritis, of siluer it selfe; and Molybditis, of the lead which is melted with the siluer: as wee may see at Puteoli, where great store of it is made, and of that place took the name Puteolana. All the sorts of them are made, after that the metall or matter appropriat vnto them, is thoroughly melted and tried; for it runneth downe from K the vpper pan into that vnderneath, out of which it is taken vp with iron broches, and to the end that it might be of a small weight, some wind it about the broch in the very flame of the furnace; and as it may appeare by the very * name, it is no other thing but the scum of the ore or metall boiling and melting ouer the furnace: from drosse it differeth as much as scum or froth about, may from dregges or lees beneath: and as the one is an excrement cast vp from a matter whiles it is purging it selfe, so the other is the refuse or grounds thereof after it is purged and settled. Howbeit many there bee who make but two kindes of this some or litharge; the one

* or rather,
Pntomene

* Spuma argenti,
* or rather,
Steevolis,

* Rumpuntur.

* Steresitis, as it were solid and massiue; the other * Peumene, as one would say, puffed vp and full of wind. As for the third named Molybdæna, they reckon on as a thing by it selfe, to be treated of in the discourse or chapter of lead. Now the litharge aforesaid ought for the vse that it is employed about, for to be prepared in this manner: first the lumps aforesaid are to be broken into small pieces as big as Hasel nuts, and set ouer the fire againe: thus when it is once red hot by the blast of bellows, to the end that the coles and cinders might be separated one from another, there is wine or vinegar cast vpon it, both to wash, & also withall to quench the same. Now if it be Argyritis, to the end it may look the whiter, they vse to break it to the bignes of beans, and give order to seeth it in water within an earthen pot, putting thereto wheat and barley lapped within pieces of new linnen cloth, and suffer them to boil therewith till they * burst: which done, for six dayes together they put it in mortars, washing it thrice euery day in cold water, and in the end with hot, and so at length put to euery pound of the said Litharge, the weight of one Obolus of Sal-gem. The last day of all they put it vp into a pot or vessell of lead. Some there be who seeth it with blanched beans and husked barley, and after that dry it in the sun: others think it better to seeth it with beans and white wool, vntill such time as it colour the wooll no more black: then they put thereto Sal-gem, changing oftsoones the water, and dry it for the space of forty

A forty daies together in the hottest season of the Summer. There be again who think it best to seeth it in water within a swines belly, and when they haue taken it forth, rub it wel with sal-nitre, and pun it in mortars, as before, with salt. Ye shall haue them that neuer bestow seething of it, but only beat it with salt, and then put water thereto and wash it. Well, thus prepared as is before said, it serueth for collyries and cie-salues, in a liniment also, to take away the foule cicatrices or scars, the pimples and specks likewise that mar the beauty of women, yea & our dames with the haire of their head withall, to make it clean and pure. And in very truth, Litharge is of power to dry, mollifie, coole, and attemper; to cleanse also, to incarnate vlcers, and to assuage or mitigate any tumors. Being reduced into the vnguents or plaisters aforesaid, and namely with an addition of rue, myrtles, and vineger, it is singular for S. *Anthonyes* fire. Semblably, being incorporated with oile of myrtles and wax into a cerot, it healeth kibed heeles.

CHAP. VII.

¶ Of Vermilion; and of what estimation it was among the old Romans: the first inuention thereof. Of Cinnabaris, the vse thereof in Pictures and in Physicke. The sundry sorts of Minium or Vermilion: and how it is to be ordered to serue painters.

C T Here is found also in siluer mines a mineral called Minium, i. Vermilion, which is a colour at this day of great price and estimation, like as it was in old times: for the antient Romans made exceeding great account of it, not only for pictures, but also for diuers sacred & holy vses. And verily *Verrius* alledgeth and rehearseth many authors, whose credit ought not to be disproued, who affirm, That the maner was in times past to paint the very face of *Iupiters* image on high and festiual daies with Vermilion: as also, that the valiant captains who rode in triumphant maner into Rome, had in former times their bodies * coloured all ouer therewith: after which manner (they say) noble *Camillus* entered the city in triumph. And euen to this day, according to that antient and religious custom, ordinary it is, to colour all the vnguents that are vsed in a festiual supper at a solemne triumph, with Vermilion. And no one thing doe the Censors D giue charge and order for to be done, at their entrance into office, before the painting of *Iupiters* visage with Minium. The cause and motiue that should induce our ancestors to this ceremony I maruel much at, and canot imagin what it should be. True it is and well known, that in these daies the *Æthiopians* in generall set much store by this colour, and haue it in great request, in so much as not onely the Princes and great Lords of those countries haue their bodies stained throughout therewith, but also the images of their gods are painted with no other colour: in which regard I am moued to discourse more curiously and at large of all particulars that may concerne it.

Theophrastus saith, that 90 years before *Praxibulus* was established chiefe ruler of the Athenians (which falls out iust vpon the 249 yere after the foundation of our city of Rome) *Callias* the Athenian was the first that deuised the vse of Vermilion, and brought the liuely colour thereof into name: for, finding a kinde of red earth or sandy grit in the mines of siluer, and hoping that by circulation there might be gold extracted out of it, he tried what he could do by fire, and so by that means brought it vnto that fresh and pleasant hue that it hath: which was the first original of Vermilion. Hee saith moreover, That euen in those daies there was found Minium in Spain, but the same was hard and full of gritty sand. Likewise among the Colchi, in a certaine rock inaccessible; by reason whereof the people of the country were constrained by shooting at it, to shake and drue it down: howbeit the same was but a bastard Minium. But the best simply (saith he) was gotten in the territorie of the Cilbians, somewhat higher in the country than *Ephesus*: in sum, That the said Minium or Vermilion is a certaine sandy earth of a deepe scarlet colour, which was prepared in this order: first they pun and beat it into pouder, and then washed it being thus puluerified. Afterwards, that which settled in the bottom they washed a second time. In which artificial handling of Minium this difference there is, that some make perfect Vermilion of it with the first washing: others thinke the Vermilion of that making to be too pale and weake in colour, and therefore hold that of the second washing to be best. And verily I won-

* To shew the bloody battels they had fought, and what carnage of their Enemies they had made: for with out much effusion and drawing of their blood they might not triumph.

I wonder not that this colour was so highly esteemed: for euen before time during the state of Troy, the red earth called Rubrica was in great request, as appeareth by the testimony of *Homer*, who being otherwise spary enough in speaking of pictures & colours, yet commends the ships * painted therewith. The Greeks call our Minium by the name of *Miltos*, and yet some terme it Cinnabari: and hereof arose the error occasioned by the Indian name Cinnabari. For so the Indians call the bloody substance of a dragon, crushed and squeezed with the weight of the Elephants lying vpon them ready to die, to wit, when the said dragons are full with sucking out the Elephants blood before: and now their owne and it are mingled together, according as I haue shewed before in the story of those beasts. And verily there is not a color besides, which expresseth the lively colour of blood in pictures so properly as Minium. As for that other Cinnabaris of India, it is most wholsom to be put into antidotes, preseruatiues, and countrepoisons, yea II and other souerain medicines to be taken inwardly. But our physicians (beleeue me) for that by an error Minium or vermilion is called Cinnabaris, vie in stead of Sanguis draconis, the said Minium, which in very truth is no better than a meere poison, as I will shew anon. Wel, in old time they vsed to draw those pictures and pourtrails which consist of one single colour, and be called Monochromata, with this colour Cinnabaris. They painted also with the Minium of Ephesus, but they gaue it ouer in proceffe of time, because such colors were so costly, & required such pains ere they were prepared and made perfect. Besides, both the one and the other were thought to be ouer-quick and stinging in hand; and therefore they betook themselves to the red earth Rubrica and Sinopis, of which colours I will speak more in their proper places. But to returne again to Cinnabaris or Sangdragon, it is sophisticated and corrupted either with Goats blood, or else with the fruit of Seruoises punned. But the true Cinnabaris or Sangdragon is worth fifty Sesterces by the pound. As for Minium or Vermilion aforesaid, *K. Iuba* saith, that it groweth plentifully also in Carmania. And *Hermogenes* affirmeth, that *Aethiopia* likewise is not without good store of it. But from neither of those two countries is it brought vnto vs, nor (to say a truth) out of any other place but Spain. The best and most excellent is that which comes out of the territory of Sisapone in the Realm of Granada or Boetica a part of Spain, euen from a Mine of Vermilion there, which payeth a great custome, and yeelds much reuenue to the people of Rome: and there is nothing looked to more straightly for feare of fraud and imposture; for lawfull it is not there to dresse and refine it, but vncocted and crude is it brought to Rome in the masse as it lay within the vein, sealed by the sworn masters of the mine, which yeelds one in a yeare with another 10000 pound weight or much thereabout. At Rome it is washed, and a price there is set vpon it by an expresse Act, namely, That it should not be sold aboue seuentie deniers the pound. But many wayes is it sophisticated, whereby the societie and fellowship of the Publicanes, who had the ordering of it at Rome, robbed the Commonweale, and gained themselves. For a second kind there is of Minium, found almost in euerie mine of siluer & lead, the which is made of a certain stone intermingled in the veins of those mettals after the same is burnt; and not of that red stone which yeeldeth forth the humor that I named before Quick-siluer: for this stone may it selfe by boiling be brought to siluer, but of other red pieces of earth found together with the said true Vermilion, which are knowne to be barraine and void of the right Vermilion, onely by the leaden hue which they haue: for vnlesse it be in the furnace they neuer wax red, and then being fully burnt and calcined, they are beaten to poulder. This is that Minium of a second sort, and much inferiour vnto those naturall pouders and sands of the true Minium, notwithstanding very few there bee that know it. Well, this is that Minium wherewith the true Vermilion is sophisticated in the Worke-houses and shops of those Publicanes, whose Companie and Fellowship had the ordering of it; like as it is corrupted also with Scyricum. But how this colour Scyricum is made I will in due place write hereafter. Certes our painters, to giue the better lustre vnto Minium, yea and to saue charges, haue deuised to lay the first ground vnder it of this Scyricum. Besides this, they haue another cast to gain (or steale rather) by Minium; for by reason that it sticketh to their pensils euer and anon, they wash it off when they be full: this fetleth down to the bottom of the water, where it remaines, and the painters take it for their auailles; but they were as good pick their masters purse who setteth them aworke. But if a man would know the true and sincere Vermilion indeed, it ought to haue the rich and fresh colour of skarlet. As for the brightnesse that is in the second sort, if a wall bee painted therewith, the naturall moisture and dankenesse that commeth from thence will abate the

* Such are called by *Homer*, *μυλτινός*.

A the lustre soon. And yet this Minium is taken to be but a kind of rust in mettals, either siluer or lead, as they lie in the mines. Moreover, the mineriall Vermilion found naturally in the foresaid Minium mines of Sisapona, haue no siluer mixed therewith, boyle and trie it in the fire as much as you will. Also the way to find true Minium from false, is by the means of gold: for touch the sophisticated Minium with a piece of gold red hot, it will wax blacke, whereas the true Minium keepeth colour still. [Where by the way note, That I read it may be falsified with Quicklime:] And after the same maner, if there be no gold at hand to trie it by, you shal soon see the prooffe and find the falsehood by a plate of yron red hot, and vsed accordingly. Furthermore, this hath bene obserued, That the shining beams either of Sun or Moone, do much hurt to the lustre of Vermillion, or any thing painted therewith. But what meanes to preuent this inconuenience? B Euen to vernish the wall after the colour is dried vpon it in this manner: Take white, Punicke wax, melt it with oyle, and while it is hot, wash the said painting all ouer with pensils, or fine brushe of bristles, wet in the said vernish. But when this vernish is laid on, it must be well chafed & heat again with red hot coales made of Gall-nuts held close to it, that the wall may sweat and frie again: which done, it ought afterwards to be rubbed ouer well with cerecloths, and last of all, with cleane linnen cloths, that it may shine again and be slicke as statues of marble be. Moreover, the workemen that are employed in their shops about the making of Vermillion, doe bind vnto their faces in manner of Maskes, large bladders, that they may take and deliuer their wind at libertie, and yet not be in danger of drawing in with their breath that pernicious and deadly poulder, which is no better than poyson: yet so, as they may see out of the said C masks neuertheless.

To conclude, Vermillion is vsed much in limming the titles and inscriptions of roles and books, it setteth forth the letters also, and maketh them more faire and beautifull, which are written in tables ouer sepulchres, be they enriched otherwise either with gold or marble stone.

CHAP. VIII.

Of quicksiluer artificiall, called Hydragrym. Of gilding siluer. Of Touch-stones for to trie the diuerse kinds of siluer.

D So inuentiue is the wit of man, that there hath bene deuised in the world a means to make an artificiall Quicksiluer in stead of the true and naturall, and that out of the second kind of Minium which before I called Secundarium. I should ere while haue spoken thereof in the chapter of the right Quicksiluer, but deferred it I haue no further than to this present place. First therefore this is to be vnderstood, that made it is two manner of waies, sometimes of the Minium aforesaid punned with vinegre in morters, and with pestles all of brasse; otherwhiles it is drawn by fire for they put secundarie Vermilion in an earthen pot well luted all ouer with cley, vpon which is there set a pan of yron, & the same couered ouer the head with another pot, well cemented, vnder which earthen pot abouenamed, there ought to be a good fire made, & the same kept continually with blowing; and thus by circulation there wil appeare a dew or sweat in the vppermost vessel proceeding from the vapors resolved, which being wiped off, will in substance shew liquid as water and in color resemble siluer. The same liquor is easie to diuide into drops, and as apt again by the lubricitie thereof, to run into an humor. This quicksiluer being by the judgement of all men a rank poyson, I suppose, that al things reported of Minium as medicinalle, be dangerous remedies, vnlesse haply that by inunction of the head or belly, it staies all flux of blood; with this caution and charge notwithstanding, that it neither perce and enter into the inward noble parts, nor touch the wound: for otherwise my conceit is, that it ought not to be vsed. I see that now adaies siluer only, and in maner nothing els, is gilded by the means of this artificiall Quicksiluer: whereas gold soile should be laid also after the same maner vpon vessels, or any workmanship of brasse: but (as I haue before said) the deceit & fraud that is euery where in the world, which makes men so wittie as they be, hath deuised other means of gilding, and of those of lesse dispence & charge than with any Quicksiluer, according as I haue before declared. I cannot thus write as I do so much of gold and siluer, but me thinks I must of necessity speak of the stone which they call in Latin * *Cortica*, which in times past was not vsually found in any place but in the riuer Tmolus, as saith *Theophrastus*: but in these daies we find it euery where: some call it *Heraclius*, others *Lydius*. Now these stones all the sort of them are but small, not excee-

* The touch-stone.

exceeding foure inches in length, and two in bredth. That part or side which lies aboue toward G the Sunne when it is found, is thought better for touch, than the other which lieth to the earth. By meanes of these touchstones, our cunning and expert mine-masters, if they touch any ore of these mettals, which with a pickaxe or soile they haue gotten forth of the veine in the mine, will tell you by and by how much gold there is in it, how much siluer or brasse, and they will not misse a scruple: a wonderfull experiment and the same infallible.

As touching siluer, two degrees there be of it, different in goodnesse, which may be knowne and discerned in this maner: For lay a piece of siluer ore vpon a scilse, plate, or fire pan of yron red hot, if it continue white still, it is very good, if the same become reddish, go it may for good too in a lower degree; but in case it looke blacke, there is no goodnes at all in it. Howbeit, there is some deceit also in this triall and experiment: which may crosse a man in his iudgement: for let the said scilse or plate lie a time in a mans vrine, be the ore neuer so base that is said thereupon when it is burning red hot, it will seeme to take a white colour for the time, and deceiue him on that shall see it. To conclude, there is another pretty prooffe of siluer fine, if it be brought and burnished, and that is by breathing vpon it: for if the breath be seene thereupon presently as a sweate, and the same passe away incontinently as a cloud, it is a signe of perfect siluer.

CHAP. IX.

¶ Of mirrors or looking glasses. And of the Egyptian silver.

AN opinion it was somtime generally receiued and beleueed, That no plates might be driuen by the hammer, nor mirrors made, but of the best and purest siluer: And euen this experiment is falsified and corrupted by deceit. But surely a wonderful thing in Nature this is of these mirrors of siluer, that they should represent so perfectly the image of any thing that is before them, as they do which must needs be (as all men confesse) by the reuerberation of the aire from the solid body of the miroir, which being beaten backe againe from it, bringeth therewith the said image expressed therein. The same reuerberation is the cause that such looking glasses as by much vsage are polished and made subtile, doe in that sort gently driue backe the image represented within them, that it seemes infinitely big in proportion of the body it selfe: such difference there is in them, & so materiall it is, whether they repercuss and reject the aire, or receiue and entertaine it. Moreouer, there be drinking cups so framed and fashioned with a number of mirrors within, that if there do but one look within them, he shall imagine that he saw a multitude of people, euen as many images as there be mirrors. There are deuised looking glasses also, which will represent monstrous shapies; and such be those mirrors that are dedicated in the temple at Smyrna: but this comes by reason that the matter wherof they be made, is in that sort fashioned. For it skilleth much whether mirrors be hollow, either in manner of a drinking pot, or of a Threidian buckler: whether the middle part lie low and inward, or rise and beare out with a bellie: whether they be set crosse and ouerthwart, or stand bias, whether they hang with their heads bending backward, or bolt vpright: For according as the matter which receiueth the image, is disposed to this or that fashion, or set one way or other, so it turneth the shadowes back againe: for verily the said image represented in a miroir, is nothing els but the brightnesse and clearenesse of the matter which receiueth the same, returned and beaten backe againe. But to go through in this place with all things concerning such looking glasses, the best known in old time vnto our ancestors, came from Brindis, and those consisted of tin and brasse tempered together. But when siluer mirrors came in place, those went downe, and these were preferred before them. The first that made them of siluer, was *Praxiteles* in the daies of *Pompey* the great. Of late, men had this opinion of siluer mirrors, That they would represent an image more liuely and truly, in case their backe part were laid ouer with gold.

But to return againe to siluer, the Egyptians vse a deuise to paint it, to the end that they would drinke more deuoutly, seeing their god *Anubis* painted within their pots. And in truth they rest contented with painting their plate, and neuer graue or chase any pieces. This deuise is growne into such credit by the precedent receiued from thence, that the statues of siluer caried in a shew at triumphs, be nought set by, vnlesse they be also enamelled & painted black: & wonderfull it is how much more precious they are thought to be when the natie brightnes thereof, is hid and the light quite put out or blindfolded. The manner of making this black siluer, is thus: They

A They take of siluer and sulphur vif as much of the one as the other, of Cyprian brasse or latton plates (which brasse they call *Coronarium*) as thin as may be, a third part: these they mix together and melt them in an earthen pot wel luted all ouer with cley: and boile they must so long, vntill the lid of the pot doth rise vp and flie open of it selfe. Moreouer, siluer wil look black with the yolke of an egge roasted hard and well beaten with vineger and Tripoli.

To come now vnto those that counterfeit mony. *Antonius* whiles hee was one of the three vsurping Triumvirs, mixed yron with the Roman siluer denier. He tempered it also with the brassen coine, and so sent abroad false and counterfeit mony. Others there be that make money too light (namely, vnder the lawful proportion) which is, to coin and stamp for euery pound weight of siluer 84 deniers. This enormity grew to this passe, that *M. Gratidianus* published a law, by vertue whereof there was an act instituted and ordained for the prooffe and allowance of siluer deniers, what touch and what poise they should haue: by which act of his hee so pleased the Commons of Rome, that there was not a street throughout all the city, but they erected a siluer statue, pourtraied all whole in a gowne in the fauor and honour of *M. Gratidianus*. But strange it is, and a man would not think it, that this art and cunning deuised for the detecting of falshood and forgerie, is the only means to teach deceit and wickednesse, for many a man wil giue too too much for false mony: yea, and many siluer deniers for one counterfeit, well and cleanly made: to take forsooth a pattern thereby, and learne to deceiue others.

CHAP. V.

¶ Of excessive summes of money in mens hands. Who they were in old time that were thought richest. And when there began largesses at Rome, and mony to be scattered and cast abroad to the people.

IN old time men knew no number about 100000: and therefore at this day also in stead of a million we multiply the said number by ten, and say thus in Latine, *Decies centina millia*. A hundred thousand ten times told, and so forward, * repeating alwaies a hundred thousand to the numerall aduerbe, as the sums doth amount. Vsuries, interests, and coined money haue been the cause of these multiplications: and by that occasion also came debts to be called euen vnto this age, by the name of *As alienum*. And thereof arose the proud name of *Dinites*, i. Rich, for great monied men were so called. Yet take this withall, That the first man that euer was knowne by that syname * *Dines*, brought a shilling to nine pence in the end, proued Banquerout, & departedake a * voiage against them. And albeit by his inestimable wealth he vsurped the title & addition of *Optimus*, i. The best, in his time, yet (for me thinks it doth me good to prosecute stil, and inueigh against this insatiable desire of hauing more) we haue known many after him, & those otherwise of base condition, and no better than slaues newly enfranchised, to haue growne vnto greater wealth; and namely three at one time, to wit, during the Empire of *Claudius Caesar*; and those were *Pallas*, *Callistas*, and *Narcissus*, late bond slaues all to the said Emperor. But to let these men passe, as if they were lords still of worldly wealth: in that yeare wherein *C. Asinius Gallus* & *C. Marcus Censorinus* were Consuls of Rome, died *C. Caelius Claudius*, who signified by his last will and testament, bearing date the 6 day before the Calends of February, the yeare about writen, That albeit he had sustained exceeding great losses during the troubles of the ciuil war, yet he should leaue behind him at the houre of his death, of slaues belonging to his retinue foure thousand one hundred and sixteen; in oxen, three thousand and six hundred yoke; of other cattell 257000 head, and in ready coine, H. S. D C, i. threescore millions of sesterces Romane. And besides, he set out for defraying of his funerall charges, * eleuen thousand sesterces, and gaue order expressly, to be entered so sumptuously. But what of all this? Set case these and such like

* To witte twenty times, or a hundred times, a hundred thousand, &c.

* i. *Craffus*.

* In which expedition he was taken prisoner by *Syracus*, lieutenant general for the king of Parthia who strake off his head, and poured gold melted into his mouth to satisfie his hunger after it. * H. S. X. which if you read by the numerall aduerbe (vn. decies) amounts to the said sum a hundred times told.

men gathered together innumerable fums of mony, and an infinit masse of goods, yet they shall come nothing neare to the wealth of K. *Ptolomæus*, who according to the testimony of *M. Varro*, (at what time as *Pompey* the great warred about Iury) maintained 8000 horsemen in pay continually with his own priuat purse: kept an ordinary table within his court of a thousand persons, and those had every man his own cup of gold to drink out of, and at each course and change of meats that came in, new plate was serued vp still to the boord. These guests of his fared so highly, that a man would haue said they had bin franke-fed. But how far short was this mighty and sumptuous prince think ye (for I wil say no more now of kings) in comparison of one *Pythius* a Bithynian, who sent to *Darius* the king a Present of a Plane-tree, all entire of beaten gold, and withall, that famous gold Vine, so much renowned by all writers: feasted the whole army of that mighty monarch, and those were * 788000 men: promising ouer and aboue fise moneths pay for them all, and corne for so long to serue the whole campe, if of fise sons that he had of his owne, the king would spare him but one to beare him company in his old age, and not prest him for to serue in the wars. Certes, a man that heareth thus much of this *Pythius*, might compare him with that rich *Craesus* king of Lydia. But what folly and madnesse in the diuels name is this, to hunger and thirst so much in this life after that, which either is common to base slaues, and may fall vnto them, or els wherof kings themselues can find no end? And thus much of gathering good and heaping riches together.

Vide Andeum

To come now to the scattering thereof, I finde in the Chronicles, That in the yeare wherein *Sp. Posthumius*, and *Qu. Martins* were Consuls, they began at Rome to make largesses, and to sling money abroad to the common people. And at that time such plenty of coine therewas stirring at Rome, that the City bestowed by a generall contribution vpon *Lu. Scipio*, as much as bare out his charges in exhibiting the solemne games and plaies vnto the people. As for that purse which was made for the funerals of *Agrippa Menenius*, wherin every man put his sextant, the sixt part of an As, I take it to haue been no Largeesse, but a beneuolence to testifie how the people honoured *Agrippa*, and a supply of meere necessitie, considering how poore the man died.

CHAP. XI.

¶ Of the superfluitie and frugality both, of men in times past, touching plate and siluer vessels. Of beds and tables of siluer. Also when there were deuised chargers and platters of Siluer to be made of huge capacity beyond all measure.

THE world is giuen to so much inconstancy as touching siluer plate, that a wonder it is to see the nature of men how variable they be in the fashion and making of such vessel: for no workmanship wil please them long. One while we must haue our plate out of *Furnius* his shop; another while we will be furnished from *Clodius*: and againe in a new fit, none wil content vs but of *Gratius* his making (for our cupboords of plate & tables, forsooth, must beare the name of such and such Goldsmiths shops.) Moreouer, when the toy takes vs in the head, al our delight is in chased and embossed plate; or els so carued, engrauen, and deep cut in, as it is rough againe in the hand, wrought in imagery or floure-work, as if the painter had drawne them. And now a daies we are growne to this passe, that our dishes are set vpon the table borne vp with feet and supporters to sustaine the viands and meat therein, but in any wise their sides must be pared verry neere; for herein I may tell you lieth a great matter, and the more that the sides and edges hath lost by the file, the richer is the plate esteemed to be.

As touching the vessell seruing in the kitchen: did *Calvus* the noble Oratour complaine in his time that it was of siluer? Why, wee in these dayes doe more than so, for wee haue deuised that our coaches should bee all siluer, and these curiously wrought and engrauen. And within the remembrance of man, euen in this age, *Poppæa* the Emperesse, wife to *Nero* the Emperour, was knowne to cause her Ferrers ordinarily to shooc her coach-horses and other palfreys for her saddle (such especially as shee set store by, and counted more daintie than the rest) with cleane gold. Towhat excesse and prodigalitie is the world now grown to? *Scipio Africanus* the second of that name when hee dyed, left no more vnto his Heire in Siluer Plate and Coine than two and thirtie pound weight: and yet this worthie Knight, when hee rode in triumph for the conquest

A quest of the Carthaginians shewed in that solemne pompe, and brought into the chamber of Rome as much treasure as amounted to * foure thousand foure hundred and seuenaty pounds weight of siluer, a thousand times old. This was all the treasure in siluer that the whole state of Carthage was able to make in those daies; Carthage (I say) that great and proud city which pretended a title to the Empire of the world, and maintained the same against Rome: and yet see I in this age there is as much laid out in our cupboords of plate, and furniture of our tables. The same *Africanus* afterwards, vpon the winning and final ruine of Numantia, gaue among his souldiers in a triumph, 17000 pound weight of siluer: O braue souldiers, and worthy to noble a captain, who stood contented with such a reward. A brother of this *Scipio*, surnamed *Allobrogus*, was the first knowne to haue in plate, one thousand pound weight: but *Lucius Drusus*, whiles he was but Tribune or Prouost of the comminalty, had in siluer vessell as much as weighed eleuen thousand pounds. Now if I should tell you that the Romane Censors vpon a time disgraced, yea and degraded an antient captain and one who in his time had rode in triumph, only for that he had in plate fise pound weight, it would be taken in these daies for a meere tale and vaine fable: as also that *Catus Aelius* in his Consulship, was found sitting at dinner served with earthen vessell of potters worke, when the Embassadors of the *Ætolians* came vnto him: that he refused also siluer plate presented to him for the furniture of his boord, and to his dying day had neuer in siluer more than two drinking cups, which *Lucius Paulus* his wiues father bestowed vpon him after the defeiture of K. *Perseus*, in regard of his valiant seruice, wehold it now for no lesse than an vntruth and incredible. And here I call to minde a merry conceited speech that I haue read in the chronicles, of certain Carthaginian Embassadors, who said, that no men in the world had more good fellowship in their houses, and liued more friendly together, than the Romanes, for why? when they feasted one another (say they) the same * siluer plate went round about amongst them all from one to another without change. But howsoever this frugality whereof I speak may seeme strange and fabulous to the world wherein we liue, certes wee all know this to be true and no fable, that *Pompeius Paulinus* (the son of a Roman knight or man of armes borne at Arles) was not only banished out of the country and nation where his father was borne, but confined also to the marches of most sauage and barbarous people, and exposed to their cruelty, only for this, That he had in his campe (to the euil example of the army) as much siluer plate as weighed 12 pounds. But long ago it is since the fashion came vp at Rome, that our dames had their beds couered all ouer with siluer, yea, and some dining rooms with tables laid with the same: which inuention came first (as it is reported) from *Caruilius Pollio*, a gentleman or knight of Rome, who deuised to garnish his boords with siluer, not couering them full and whole throughout with plates thereof, nor after the manner of Deliacke workmanship, but onely by parcels, and according to the Punicke or Carthaginian fashion. The same *Pollio* made beds and tables of gold: but not long after, those siluer beds and boords came to the order of those in the Isle Delos. But all this sumptuositie was punished sufficiently and expiat by the ciuill warre of *Sylla*: for a little before those troubles, this excesse and these superfluities came vp: as also about the same time, men set to make great chargers & platters of siluer, weighing one hundred pound a peece; of which there were at Rome (as it is well knowne) when the said warre beganne, to the number of fise hundred and aboue: which was the cause that many a man fell into the danger of proseription and confiscation, for that their rich plate set their enemies teeth on water; who for the loue and desire thereof, practised by all cunning meanes their vtter vndoing. Certes our Historians heretofore, who attributed this cursed and vnhappie ciuill warre betwene *Sylla* and *Marius*, vnto such superfluities and vices of those times which reigned so rife, might be ashamed and blush to say so, for our age hath been more hardy, and hath proceeded farther without any such feare of punishment from aboue. No longer since than in the daies of *Claudius* the Emperour, *Drusillus* a slaue of his surnamed *Rotundus* (the Seneschol or Treasurer vnder him in high Spaine) had a siluer charger of fise hundred pound weight (for the working whereof, there was a forge framed beforehand of set purpose:) and the same was accompanied and attended with eight more of a smaller size, weighing 50 pound a peece. Now would I gladly know (if it might please you) how many of his fellowes (such slaues I meane as him selfe) there must be to carry the said vessell and serue it vp to the table: or what guests they mought bee who were to be served with such huge plate? *Cornelius Nepos* writeth, that before the victorie of the sayd *Sylla* who defeated *Marius*, two dining tables and no more there were throughout Rome, all of siluer.

T t

Fenestella

Fenestella saith, that in his time (and he died the last yere of the reigne of *Tiberius Caesar* the Emperor) men began at Rome to bestow siluer vpon their cupboords and side linary tables: & euen then also (by his saying) Tortoise worke came in request and was much vsed. Howbeit, somewhat before his daies, he writeth, that those cupboords were of wood, round and solid of one entire peece, and not much bigger than the tables whereupon men eat their meat: but when hee was a young boy, they were foure square, and of many peeces joyned together, and then they began to be couered ouer with thin boords or painels, either of maple or citron wood. Soone after, they fel to lay siluer plates vpon them at the corners only, and along the joints where the planks were fet together: but by the time that he was come to be a well grown yong man, they were at their drinking mazors or round-bottomed dishes like balances, whereupon they were called *Statera*: also at those platters, which in old time were named *Magides*. Howbeit, men rested not contented to haue furnished themselves with plenty of siluer in their plaine plate and about their houses, vnlesse the curious workmanship also thereof were more costly than the mettall and matter it selfe. But lest this superfluity should be imputed vnto vs in these daies, be it knowne, that such curiosity was crept into the world long ago: for *C. Gracchus* had in the furniture of his house, certain vessels of siluer called *Dolphins*, which cost him at the gold-smiths hand 5000 sesterces a pound: an exceeding price for the fashion and workmanship, considering *L. Crassus* the Orator had two pots artificially engrauen by the hand of *Menior* that cunning workman, the fashion and making whereof cost * 100 sesterces a pound: and yet he confessed and protested, that hee was abashed to vse them, and durst not for shame bring them abroad. Moreover, knowne it is, that he had in his cabinet pieces of plate, which to be bought and sold were worth every pound 6000 sesterces. Briefly, the conquest and reducing of Asia vnder our Empire, was the first occasion that brought into Italy such wastfull excesses: for *L. Scipio* shewed in triumph of siluer plate, intailed and ingrauen, 400 thousand and 50 pounds weight, besides vessels of gold amounting to the weight of 100 thousand pound: and this was in the yere from the foundation of Rome, 565. But the free * donation and bestowing of the said Asia vpon the city of Rome (which fell vnto the Romans by the death of *K. Attalus*, who in his last will and testament ordained them his full heires) did most hurt vnto our state: and this succession which our Antients injoyed by vertue of that gift, did greater damage to the integrity of manners, and brought more corruption into our city, than the former victory atchieued by force of armes: for from that time forward men grew to be shamelesse, and without regard of modesty every mans fingers itched to be tempering with the treasure of *K. Attalus*, and to buy the same at any price, sold in open port-sale to them that would giue most: which hapned in the 626 yere after the foundation of the city: for in 56 yerres (which was the meane space between the foresaid subduing of Asia and this feoffment of *K. Attalus*) our city was well nuzzled and trained not onely in the admiration of such puissant forrein kings and princes, but also in some affectionate loue to their wealth and riches. About which middle time between, & namely in the 608 yere, reckoning from the first founding of Rome, when Achaia was likewise brought vnder our obedience and subjection, this victory also was a mighty means to bring vs also out of al good order, and to set vs forward to imbrace superfluities and to ouerthrow al honesty and vertue: for now were brought in the stately statues and proud painted tables, that we should want no inticing delights, but that all the pride and pleasure of the world might be found at Rome. Finally, the ruin of Carthage, was the rising of superfluitie with vs, as if the Destinies had so appointed, that at one & the same time we should haue both wil to imbrace vice, & also power & liberty withal to perform sin: so that in regard of our times and the enormities thereof, we may iustifie, yea and honor any of our ancestors who seemed before to offend in this behalfe: for, as it is said, *C. Marius* after he had defeated the *Cimbrians*, contented himselfe to drink in a wooden godet and tankerd, after the example of father *Bacchus*: *C. Marius* I say, who of a good husbandman in the country about Arpinum, & of a common and ordinary fouldier, came to be a braue captaine and commander in the field.

CHAP. XII.

¶ Of Statues and Images of Siluer: of the workmanship in grauing Siluer, and of other things pertinent thereto.

Men commonly haue thought, that the first statues of siluer scene in Rome, were made in the honour of the Emperour *Augustus*, by way of courting and flatterie to winne his grace and

and fauour, as those times did require: but it is altogether vntrue, for before his daies, we finde that *Pompey* the Great when he rode in triumph, caused the siluer statue of *K. Pharnaces* (the first [of that name] that euer raigned in the realme of Pontus) to be carried in a solemne shew: like as the image also of *Mithridates* his father, besides chariots as well of gold as of siluer.

Moreover, it falleth out sometimes, that siluer is vsed in stead of gold also vpon some vrgent cause and iust occasion: as we may see by our proud & sumptuous dames, that are but commoners and artizans wiues, who are forced to make themselves carquans and such ornaments for their shooes, of siluer, because the rigour of the statute provided in that case, will not permit them to weare the same of gold. And I my selfe, as I remember, haue seen *Aurelius Fuscus* (a gentleman of Rome, who being put beside his place, and hauing lost the dignity of a man of armes, by reason of a notable calumniation framed against him, when as young gentlemen sit sons vsed to accompany him because he had the name of a braue souldier) weare his rings of siluer. But to what purpose do I collect these examples, seeing our soldiers make no reckoning of yvorie, but the hilts of these swords and the hasts of their daggers, bee garnished with siluer, damasked and ingrauen; their scabberds and sheaths bee set out with siluer chapes, and their sword girdles, hangers, and bawdricks, gingle again with thin plates of siluer. And do we not see how our yong boies are * kept in and restrained with siluer, during the time that they be vnder maies age? how our fine dames vse to wash and bath in siluer, diidaining and setting light before any other bathing vessels in the baines, in so much as the same mettall and matter which we are serued with at the table, is imployed also in shamefull and vnclenly vses. Oh that *Fabritius* were alive now again to behold these things! if hee saw our women bathing together with men in one and the same baine, and those pained (as it were) vnder foot with siluer so smooth and slipperie that they cannot hold their feet: *Fabritius* I say, who forbade expressly, that any warriours and Generall captains should haue in plate more than one drinking boll or goblet, and a saltcellar: if hee saw siluer (which was wont to be giuen in presents and rewards to braue men and valiant captains) thus to be melted and broken to serue for these purposes, what would he say? but What a world is this! we passe not for *Fabritius*, nay, we are ashamed of him and his frugality.

But to leaue these abuses and complaints: one thing I wonder much at, that among so many excellent artizans as haue been, there is not one who took any pleasure to graue in gold, nor became renowned thereby; whereas many are famous for their workmanship in siluer: howbeit, *Menior* (of whom I spake erewhile) excelled them all in this kinde: and yet I doe not find, that euer he made in all, about eight peeces that were curiously and exquisitely wrought, and those (as it is said) be all lost. And no maruell, for why? the temple of *Diana* at Ephesus lieth along: the Capitoll of Rome likewise, and all within it, hath perished by fire. Howbeit, *Varro* hath left in writing, That among his antiquities, one brazen image he had of *Meniors* hand-worke. Next to him, the world had *Acragas*, *Boethus*, and *Mys*, in great admiration for their excellent skill: and at this day there be extant, peece of all their workmanship, to be seen in the Isle of the Rhodians: for in the temple of *Minerva* which is at Lindus a city in that Island, there is one statue of the said goddesse, of *Boethus* his making: within the temple of god *Bacchus* in the very city it selfe of Rhodes, there are certain cups wrought by *Acragas*, wherein bee ingrauen the religious Priestresses called *Bacchæ*, and the Centaurs. Within the same Church, are the pourtraicts of *Silenus*, and the pretty *Cupids*, expressed liuely in imagerie, by *Mys*. Moreover, *Acragas* pourtraied the resemblance of chaces or hunting, in certain pots, most artificially; for which he became very famous. After these, there are to be ranged in another degree, *Calamis* and *Antipater*, together with *Stratoniceus*, who wrought within a broad-mouthed cup, one of the Satyres found asleepe; but with such dexterity and so liuely, that he is judged and said to haue couched and substituted him to the cup, rather than barely ingrauen him. Then followes *Tauriscus* of Cyzicum: sensibly *Arifus* and *Euniceus*, both Mityleneans, are highly commended: as also *Hecateus* and *Praxiteles*, who flourished about the time of *Pompey* the Great. *Posidonius* also of Ephesus, and *Ledus* the Stratiat, who was in great name for ingrauing of battels and armed men at the point to joyne skirmish. Likewise *Zopirus*, who made two singular cups; in the one, hee represented the honourable Court of the Arcopagites; in the other, the triall and judgement of *Orestes*: which were esteemed worth twelue talents. In another age liued *Pytheas*, a singular Artificer, whose workmanship was so rare and exquisite, that every two ounces of his siluer plate, was sold commonly for twentie thousand Sesterces: and verily a broad goblet or stand-

* Centum sesteris: a small matter to the former, and about 15 or 16 sh of our money. If you read Sesterium centum, or centum sesteris, in the neuter gender, it is a thousand times as much and that were as monstrous. * Donata, not Donata, according to Budens.

* I could see this done more pluely: but in respect of civill minds & cases I am willing enough to leave it as obscure in English, & I found it in Latine.

ding piece there was of his making, with a deuise appendant to it, for to be set too and taken by a vice, and the same resembled *Vlixes* and *Diomedes*, stealing the Palladium out of the temple of *Minerva* in Troy. The same workman deuised to set into little cups, prettie images or mannikins resembling cookes, which he termed *Magiriscia*, but so finely & delicatly wrought they were, that the patterns of them could not be taken out in any mould, without hurting and spoiling; so subject were they to any outward injuries in the handling. Furthermore, *Teucer* was famous in his time, for his dexterity and light hand in shallow imbossing. Well, in as great request as these artificers were in times past, yet this cunning decayed all on a sudden, and grew so far out of vse, that nothing now commendeth such pieces of work, but only antiquity: in which regard, how neare soeuer they be worne with continuall handling, in so much as the shapes and proportions of the imagerie ingrauen cannot be discerned, yet great store is set by any such antique plate where soeuer it is to be had.

Ouer and besides, it is to be noted, that siluer will rust in medicinable waters, such as stand vpon some especiall mine; yea, the salt aire breathing from them, is able to infect it: as wee may see in the Mediterranean parts of Spaine far remote from the sea.

Also, in mines of gold & siluer, there are ingendred certain mineral colours seruing for painter, to wit, * Sil and Azur. As for Sil, to speake properly, it is a kind of muddy slime: the best of this kind is called *Atticum*: and euery pound of it is worth 32 deniers. The next in goodness is hard as stone or marble, and carrieth hardly halfe the price of the other named *Atticum*: there is a third sort, of a fast & compact substance, which because it is brought out of the Island *Scyros*, some call *Scyricum*: and yet of late verily, we haue it out of *Achaia* also, and this is the Sil that painters vse for their shadows: this is sold after two sesterces the pound. As for the Sil which commeth out of France, called the Bright Sil, it is sold in euery pound two asses lesse than that of *Achaia*. This Sil, and the first called *Atticum*, painters vse to giue a lustre and light withall: but the second kinde, which standeth vpon marble, is not imploied but in tablements and chapters of pillers, for that the marble grit within it, doth withstand the bitterness of the lime. This Sil is digged likewise out of certain hills not past 20 miles from the city of Rome: afterwards, they burne it, and by that means do sophisticate and sell it for the fast or flat kinde named *Pressum*: but that it is not true and natural, but calcined, appeareth euidently by the bitterness that it hath, and for that it is resolu'd into powder.

CHAP. XIII.

¶ Of * Sil, * Caruleum, Nestorianum, and Calum. Also that all these kindes keep not the same price euerie yeare.

Polygnotus and *Mycon* were the first Painters who wrought with Sil or Ochre, but they vsed onely that of Athens in their pictures. The age insuing, imploied it much in giuing light vnto their colours, but that of *Scyros* and *Lydia* for shadowes. As for the *Lydian* ochre, it was commonly bought at *Sardis*, the capitall city of *Lydia*, but now it is growne out of all remembrance.

As touching *Caruleum* or Azur, it is a certaine sandy grit or powder: of which, in old time there were knowne 3 kinds: to wit, the *Aegyptian*, most commended about the rest: the *Scythian* which is easie to be dissolued and tempered, and in the grinding turneth into foure colours: namely, the Azur, which is of a pallet colour, called therefore the whiter; the blacker Azur of a deeper blew; there is the Azur also of a grosser substance; and the fourth of a finer. The *Cyprian* Azur is preferred before that of *Scythia*. Ouer and about those Azures before named, wee haue some from *Puteoli* and Spaine, where they be artificiall, and they haue taken to making it, of a kind of sand. All the sorts of these Azurs, receiue first a dye, and are boiled with a certain hearbe appropriat to it, called *Oad*, the colour and iuice whereof Azur is apt to drinke in and receiue. As for all the preparation and making of it otherwise, it is the same that belongeth to *Chrysocola* or *Borax*. Of Azur there is made that powder which wee call in Latine *Lomentum*, for which purpose it must be first punned, puluerized, and washed; and this is whiter indeed than the Azur it selfe: sold it is after three and twentie deniers the pound, whereas Azur may be bought for eightene. Herewith they vse to paint walls that be ouercast with plasters, for lime it will not abide. Of late daies there is a kinde of Azur growne into request, called *Nestorianum*,

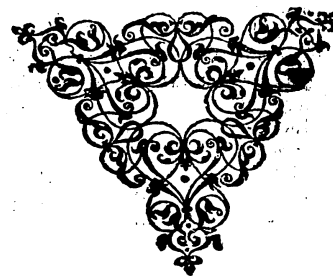

num, taking that name of him who first deuised it: made it is of the lightest part of the *Aegyptian* Azur, and it costeth 40 deniers the pound. Of the same vse also is the Azur of *Puteoli*, laue only in windows; and this some call *Coelon*. It is not long, since another kind of Azur or blew named *Indico*, began to be brought ouer vnto vs out of India, which is prized at 17 deniers the pound. It serueth painters wel for the lines called *Incisura*, that is to say, for to diuide shadows from lights in their workes. To conclude, there is another kinde of *Lomentum* or blew powder of the basest account of all other; some call it *Tritum*, and it is not esteemed worth aboute fife asses the pound.

But to try the right and perfect Azur indeed, the best experiment is to see whether it will flame vpon a burning cole. As for the false and sophisticat Azur, it is thus made: they take the floures of violets dried, and boile them in water: the iuice they presse forth through a linnen cloth, and mix the same with the chaulky earth called *Eretria*, vntill such time as it be well incorporated with it.

To proceed vnto the medicinable vertues of Azur: It is holden to be a great clenfer, & therefore it mundifieth vlcers: in which regard, it entreth into plasters: as also into potentiall cauteries. As touching Ochre or Sil, it is exceeding hard to be reduced into powder: and this also serueth in Physicke; for it hath a mild kind of mordacity: astringent it is besides & incarnatiue; in which respect, soeueraigne to heale vlcers: but before that it will doe any good, it ought to be burnt and calcined vpon an earthen pan.

To conclude with the prices of all those things named heretofore: how soeuer hitherto I haue set them downe, yet I am not ignorant, how they vary according to the place; yea, and alter in manner euery yeare: and well I wot, that as shipping and nauigation speeds well or ill, as the Merchant buyeth cheap or deare, the price may rise and fall. Againe, it falleth out, that sometime one rich munger or other, buying vp a commodity, and bringing it wholly into his owne hands for to haue the Monopoly of it, raiseth the market, and inhaunceth the price: for I remember well, how in the daies of *Nero* late Emperor, all the spicers, druggers, and Apothecaries, preferred a Bill of complaint vnto the Consuls, against one *Demetrius* a regrater. Yet notwithstanding, I thought it necessarie to put downe the prices of things as they are ordinarie

valued at Rome one yeare with another, to shew in some sort (by a generall estimat) the worth of such wares and commodities whereof I haue written.

THE XXXIV. BOOKE OF THE HISTORIE OF NATURE, WRITTEN BY C. PLINIUS SECVNDVS.

The Proem.

CHAP. I.

¶ The Mines of Brasse.

IT is now time to go in hand with Mines of Brasse, a mettall esteemed most of all other next to Gold and Silver, in regard of the uses about which it is employed: nay, if I should say truly, preferred it is (especially that which is called the laton of Corinth) in diuers respects before silver, yea, and gold it selfe: for brasse (I may tell you) is of great authority in the campe, and carrieth no small stroke among souldiers in regard of their pay, which (as I haue said before) was weighed them out in brasse: and hereupon their wages-money is vsually called by the name of *Era militum*. From this mettall likewise, the generall Receiuers and Treasurers take their title of credit and place: for at Rome they be called *Tribuni aerarij*, as a man would say, The Tribunes or Officers to the chamber of brasse coine, that is indeed, of the Treasury: hereof also is the Chamber of the city or Treasury it selfe, called *Aerarium*: finally, those that be deeply indebted to any man, are in Latine named *Obserati*, as it were charged and pressed with the heauy burden of brasse, i. debt. Moreover, I haue shewed already (for the greater credit and authority of this mettall) for how many yeres together the people of Rome vied no other money but brazen coine. And otherwise, as may appeare by antient records and histories, the credit of brasse took root at the beginning, and hath bin in authority euer since Rome was Rome: an euident prooffe whereof we haue from *K. Numa*, who founded and erected a third society or confraternity of brasse-founders. As touching the ore or veine of brasse, digged it is out of the mine in manner aforesaid, but it is tryed, & brought to perfection by fire. Made also it is of the Chalamine stone, named otherwise *Cadmia*. The best mines of brasse that yeeld the excellent mettall, are now in Asia: howsoeuer in old time Campaine in Italy carried the name. And euen at this day, the brasse digged out of the mines within the territory of the Bergomats in the farthest part of Italy, is in great request: and as it is said, there are good mines thereof discovered lately in Germany, a Prouince vnder the Roman Empire.

CHAP. II.

¶ Diuers kinds of Brasse: and namely, the Brasse of Corinth, of the Isles of Delos and Egina.

IN the Island of Cyprus, where first were found mines of brasse, the same is made of another stone also besides *Cadmia*, which they name *Chalcitis*: but this * Cyprian brasse fel soon to beare a low price, by reason of a better kind which other countries did yeeld: and principally the laton called *Orichalcum*, which for a long time was counted the best and held in greatest admiration. Howbeit, this kind of brasse hath not bin gotten for these many yeres, as if the earth were

were not in heart, and had giuen over bearing of it. Next to this *Aurichalcum*, the most reckoning was made of the brasse *Sallustianum*, within the tract or quarter of the Centrones among the Alps: neither held these mines out any long time; but after it, succeeded the *Livian brasse*, discovered in France. These two kinds last mentioned, take name both of the lords and masters of the mines wherein they were digged: the former of one *Sallustius*, a great friend and favorite of *Augustus Caesar* the Emperor: the other of the Emperresse *Livia* his wife: and this mine also quickly failed. And verily of this *Livian brasse* very little or none there is to be had. But now adiaies all the name goes of the *Marian brasse*, which also is called *Cordubense*: and to say a truth setting aside the aboue-named *Livian brasse*, there is not any will take the yellow tincture of the *Cadmia* or *Calamine stone* better, or commeth so neer in goodnesse to the laton *Orichalcum*, as if a man would say that a piece of coin stamped of it, were a sesterces, or at leastwise a double As, to the Cyprian piece, which is but a single As. And thus much concerning the degrees in goodnesse and credit, of those kinds of brasse which be naturall.

There be other sorts of brasse mettall, which stand vpon an artificiall mixture and temperature, whereof I purpose to write in more ample manner in place conuenient, after I haue shewed aboue all other things the excellencie of this mettall in generalitie, thus tempered. In old time there was a mixt mettall made of brasse, gold and silver, melt and confused all together, whereof were made singular pieces of worke: and albeit the mettall was rich and precious, yet euer more the workmanship was the dearer and went beyond it. But now, it is hard to say, whether is worse of the two, the matter or the art that is seen in it. But certes, I cannot but maruell much how it commeth to passe, That these brazen workes, hauing alwaies bin from time to time so dear, and growing so infinitely as they do still in price to be bought & sold, yet the magnificence and credit of this art is so much decayed & utterly gone? But I take this verily to be the cause, that in times past artificers wrought for to win glory and fame; & now, as all things els, for gain and lucre only. Certes, in old time the fear of casting mettall was counted so magnificent, that the Poets ascribed it to some of the principal gods, as a mystery befitting their diuine workmanship; in so much, as the great lords and noble princes of the world fought to win an immortal name by this means: and yet I say for all that, the manner of tempering and casting this precious *Mascellin*, this compound mettall I mean of gold, silver, and brasse, is so far grown out of practise and knowledge, that for these many yeres past Fortune her selfe hath had no power either to retain or to restore the antient art belonging thereto. But setting aside the glorious *Mascellin* of old time, the Corinthian brasse mettall was most highly commended: and the same mixture happened euen by mere chance and fortune, when the city Corinth was woon, sacked and burnt to the ground: and wonderfull it is how the minds of many great men was affected to this compound mettall, and how they stood vpon the hauing thereof, in so much as (by report) there was no other cause in the world why *Kerres*, whom *Cicero* had caused to bee condemned, was together with him proscribed, outlawed, and banished by *Antonie*, but only this, For that he vaunted that he had as goodly vessels and pieces of Corinth mettall as himselfe, and would not part with any of them to *Antonie*: howbeit, in my conceit, most part of those men who delight thus in this Corinth *Mascellin*, in a certain singularity by themselves, because they would seem to know more than their fellows, make semblance rather of a special insight and skill, than they haue therein, than know indeed anything by it of such exquisite stuffe. And this will I shew and declare to you in few words: the city of Corinth was won and destroyed in the 156 Olympias, and the third yere thereof, which fell out to be in the 508 yeres by our computation at Rome: now long before this time, those great masters and imagers, so famous for mettall-founding and casting of Images were dead and gon; and yet all the pieces of their making, these men forsooth at this day will needs haue to be of Corinthian medley, and so they call them. And therefore to disprove this errorious opinion of theirs, I purpose as I proceed in this my discourse, to range all the notable artificers that antiquity hath knowne in this kind, according to the seuerall ages wherein they liued & flourished in the world. For ease it will be to calculate and collect the yeres from the foundation of our city, by the former comparison of them with the Olympiades. All the vessels then which our delicats haue, those I mean that would seem to be more fine in their houses than their neighbors, are only of the Corinth mettall, and no better, which they cast partly into pots and pans, and such like kitchen vessels for to seeth meat in; partly into candlesticks, chafers, chamber pots, and such like homely and base vessels, without any regard of cleanness, and

* As if he would say, this mettall is so much better than the Cyprian brasse & sesterces, as the *Draconidius*, is of more value than As: i. double, or double and halfe.

and neat seruice. But this Corinthian mettall may be reduced well into three principall kinds, G to wit, the white, which commeth nearest in brightnesse to siluer, as standing most indeed vpon the mixture of siluer: the second yellowish, according to the nature and colour of gold, which beareth the chiefe stroke in it: and a third of an equal medley and temperature, wherein a man shall not perceiue any one mettall predominant.ouer and besides, these 3 sorts of Corinthian brasse, there is another kind of Maseellin, as touching the mixture whereof precisely, we are not able to yeeld any reason: for although there be found Images and statues thereof made, wherein we may see the handy worke of man, yet it should seem that Fortune in some sort hath giuen the temperature thereto: and that dainty and precious colour that it hath, is a deep red, much resembling that of the liuer, and therefore they call it commonly Heparizon. Short it commeth far of the Corinthian mettall, but out-goeth a great way the brasse either of Egina or Delos, which two mettalls for a long time were thought to be the chiefe. And in very truth, for ancient glory and name the Deliake brasse may challenge the first place: for thither, as to a mart or fair, there was great resort of chapmen from all parts of the world, & specially of those artificers who were curious in making of table feet, trestles, and bed-steads: and indeed the finest workmanship at first was seen here, and thereby artificers came to be inobled. But in proceesse of time they went farther, euen to cast the images of gods, the personages also of men for statues, yea, & the solid forms and pourtraits of beasts and other such liuing creatures. After this brasse of Delos, the most account was made of that which came from Egina: an Island this is without any mine at al of brasse in it, howbeit, much renowned for the excellent mettall-founders therein, in regard of the singular temperature that they gaue vnto their brasse. The brasse Ox which standeth in the beast market at Rome was brought from thence. And this may serue for a paterne of the Eginetick brasse: but the image of *Iupiter*, erected within the chappel of *Iupiter*, fyrnamed Thundring, in the Capitoll, is the true paterne, testifying what kind of brasse that of Delos was. And, as *Myron* was wont to cast the mettall of Egina in all his works, so *Polyclethus* vied ordinarily that of Delos for this purpose: and these two were rare Imageurs, liuing at one time, and prentises at the Art together: but they indeauoured to surpasse one the other in diuers mettalls which they occupied.

CHAP. III.

¶ Of Candle-sticks and Ornaments belonging to Temples, made of Brasse.

IN old time the Island Egina was in especiall fame for the workmanship only of the branches, sockets, & heads of candle-sticks, like as *Tarentum*, for the shanke, shaft, & body supporting the same: and therefore that candle-sticke was counted rich indeed, when both these places seemed to concur to the making and workmanship thereof: for such a candle-sticke some haue not bin ashamed to giue as much money as the salarie and yearly pension of a Tribune militarie or Colonell, commeth to: and yet you see, an implement or moueable it is, that hath but a vile & base name, for called it is in Latine *Candelabrum* of sticking a candle in it. But wil you know who was so foolish as to bestow so much vpon a candle-stick, and what a tale belongeth therunto, for to mend the hard bargain thus stood the case: it was a jolly dame in Rome, named *Gegania*, who made this wise match. And when she had so done, she must needs forsooth make a feast to shew this candle-stick to her guests, which cost her 50000 sesterces. Now *Cleippus*, the founder or Brasier that sold in her, was misshapen and bunch-backed. And order was taken by the commandement of *Theron* a publick crier of Rome, that he should in the midst of supper be brought into the place stark naked as euer he was borne (and as foule and ill fauoured a fellow he was otherwise as a man should lightly see) under a colour to make sport and to set the company in laughing, but indeed to mocke *Gegania*, the Mistrisse of the house. But what followed therupon? The woman cast a fassie to him by and by, and in that heat of loue, or lust rather, admitted him anon to her bed, and after set him into her will, and made him her heire. This crooke-backed squire seeing himselfe exceedingly enrich by this double bargain, adored the said candlestick no lesse than a god, as the only cause of his rising, and all the wealth he had, and thus by his occasion, one tale more goeth current abroad in the world, of Corinthian vessels. And yet afterwards (as it were to punish his Mistrisse for that slight behauiour of hers) he caused a stately and magnificent sepulchre to be made for her, whereby the infamy and shame of *Gegania* might be eter-

Which was a taler, or 50000 sesterces.

**Cleippus* sutor gibber, &c. not Full. Whoas it should seeme, was one other guests, & knew how to play his part well enough.

A eternized and continue fresh in remembrance with all posterity. But to return again to Corinthian Brasse and the vessels made thereof, although it be well knowne, that there are no Candle-sticks indeed made of that Maseellin, yet there goeth a great name of them, as if they aboue all other things were certainly cast of that mettall: and the reason is, because that *Mummius*, as in the heat of his victorie he sacked and destroyed Corinth, so withall hee dispersed the brasse by parcels and piece-meale, and sent it away into many other townes and cities of Greece.

Moreover, this is to be noted, That in old time it was an ordinary thing to make of brasse, the sides, lintels, sills, and leaues of great doores belonging to temples. I read also in Chronicles, that *Cn. Octavianus*, who defeated *K. Persus* in fight at sea, and rode in triumph for that naual victorie, caused the double gallerie, which standeth neere vnto the Cirque of *Flaminium*, to be erected, which was called the Corinthian gallerie, for that the chapters of the pillars were of brasse. Furthermore, the Annals do testifie, that it was thought good, That the route of the chappel of *Vesta*, should be alwaies couered ouer with Brasse, after the manner of *Saracossian* work. Likewise *M. Agrippa* made all the chapters of the pillars, standing in the temple *Pantheon*, of Syracusan brasse, which remaine at this day to be seene. And not onely publick places and buildings were thus beautified and adorned, but great mens priuat houses also were enriched by this mettall: for it appeareth vpon record, That *Sp. Carvilius*, one of the Treasures of Rome, amongst other criminal imputations that he objected to *Camillus*, challenged him for this, That the doores of his dwelling house were plated and garnished with brasse & copper. Moreover, as *L. Piso* reporteth in his Chronicle, *Cneus Manlius* after his conquest of Asia, was the first that in the triumph wherein he rode in the yeare after the foundation of Rome 568, he made a shew of three-sided tables, cup-bourds, and bourds, supported by one foot all of brasse. And *Valerius Antias* verily doth write, That *L. Crassus*, heire to that great Orator *L. Crassus*, made sale of many such brassen tables, which fell vnto him by right of inheritance. Semblably, I find in the histories, That in old time they were wont to make many large basons, supported with a frame of 3 feet, known by the name of Delphick basons, for that they were commonly dedicated to *Apollo*, the patron or god of Delphos, for to receiue the gifts and oblations offered to him. In those daies also the lamp-branches hanging aloft in churches, spreading out their arms abroad and carrying lights like trees bearing fruit, were vsually made of brasse: and such a one is to be seen in the temple of *Apollo* within the Palatine hill at Rome: which being found by *Alexander* the great in the sac- cage of Thebes, the said prince dedicated to the god *Apollo* at Cyme, a towne in *Æolia*. To conclude, this art of founding and casting brasse proceeded farther and passed on, vntil it was commonly practised in making the idols and images of the gods.

CHAP. IIII.

¶ At what time the first brassen Image was cast at Rome. The first originall and beginning of statues, and the honour that belonged to statues. Also the diuers kinds and fashions of them.

THE first Image of brasse that euer was made at Rome, I finde to be consecrated to *Ceres*, & raised it was out of the goods of *Sp. Cassius*, who aspiring to be a king, was therefore slaine by his owne father. But this honor continued not long proper to the gods, but passed from them vnto the statues of men also and their portraictures, and that after sundry sorts. In ancient time the manner was to vernish their images and statues of brasse, with * Bitumen: more martial it is therefore, that afterwards men should take such pleasure to guild them as they did: this inuention, whether it came from Rome or no, I know not: but if it did, surely it was no ancient deuise, nor of any long continuance there. Certes, the manner was not in old time to expresse the liuely similitude of men in brasse, vnlesse they were such worthy persons as by some notable and famous acts deferred to be immortalized, as namely, for winning the prizes at any of the foure sacred and solemn games holden in Greece, and principally at those of Olympia, where it was an ordinary thing to see the statues of those erected and dedicated, who had atchieued any victory there. But in case any one were so happy as to obtain victory at those solemnities 3 seuerall times, his statue in brasse was so liuely & perfectly cast, that it resembled his person full & whole, according to the proportion of euery member, joint and muskle of the body, yea, euen to the

* or as some say, with kind of Amber.

the haire of the head and beard. And such kind of complete images, the Greeks vse to call Iconicæ, personages. The manner of the Athenians was to honour men of singular vertue and valour, by representing their personages in brasie; but I am not sure whether those Athenians were the first that brought vp that manner or no: true it is, that long ago they caused statues of *Harmodius* and *Aristogiton*, to be made of brasie at the charges of the state, and to be erected in publick place, for that they had the courage and heart to kill *Pisistratus*, who tyrannized ouer them; and this fell out just in that very yeare wherein the kings were also deposed at Rome, and expelled the city for euer. And in proesse of time this manner was taken vp in all parts of the world: so plausible to the nature of man is the ambitious desire to perpetuate their memorie by such monuments, in so much as there is not a good towne within our prouinces, but they haue begun already to beautifie their market places with many such ornaments of brasen statues & images; together with titles, honours, and dignities ingrauen at the bases or pied-stal therof, for the better continuance of mens memoriall, that the posterity might be informed by such inscriptions, as well as by their tombs and sepulchers. And at length the ambition of men proceeded so far, that, as well their priuat houses within, as the base courts and porches without, were so beset with images, that a man would take them for some publicke places within a city: and all this arose from the deuote courtesie of vassalls, in token of homage and honour done to those their patrons and lords, whom they acknowledged to be the protectors and maintainers of their life and liberty.

CHAP. V.

¶ Of brasen statues in long robes, and diuers other sorts of Images. Whose statues were first erected vpon pillars. When they were set vp first in publicke, and at the common charges. Finally, which were the first in Rome.

IN antient time all the images and statues erected to the honour of any men, were in their gowns and robes. Men delighted also to haue them otherwhiles all naked, resting vpon their spears which they held in their hands: this pattern came from the Greeks, resembling the manner of their yong men, which in that sort did exercise naked in their publick wrelling places, thereupon called *Gymasia*: and such images are named *Achilleæ*. And verily, the Greekish fashion it is, To hide no part of the body, but to shew all: whereas the Romanes contrariwise (like souldiers and military men) vsed to make their statues armed with a cuirace or breast plate only, leauing the rest of the body discouered and bare. And *Iulius Caesar* verily the Dictator, was well content that his image should be set vp in the Forum or common place at Rome, armed with an habergeon or coat of male. As for such statues which represented in habit the priests of *Pan*, called *Luperci* (i. all discouered but their priuities) it is an inuention new come vp, and as lately deuised as those which be pourtraied in clokes or mantles. *Mancius* appointed that his image should be erected in that habit and manner, that is to say, bound and vnarmed, as he was deliuered prisoner to the Numantines his enemies. As touching the statue of *L. Afcus*, a famous Poet, I will report vnto you what writers haue recorded, namely, That being himselfe a very little man and low of stature, he caused his image to be made exceeding big and tall, and so to be set vp within the temple of the Muses at Rome. As for the statues represented on horse backe; in great name and request they were among the Romans: but no doubt they had their precedent from the Greeks. At first they honoured such horsemen only in this sort, who had won the price in the race at those solemn & sacred games which were held in Greece, and those horse-runners they called *Celeres*. howbeit, afterwards the like honor obtained they, who had born themselves best at the running of chariots, whether they were drawn with 2 horses or four. And from hence came the manner with vs of our valiant captains and victorious generalls, to haue their statues made riding triumphant in their chariots. Howbeit, long it was first ere this fashion came to be taken vp: and before the daies of *Augustus Caesar*, late Emperour of famous memory, there had not been knowne any such images at Rome riding in chariots either drawne with six steeds, or Elephants, as now there be. The manner also of riding in coches with 2 horses about the cirque or shew place (which vsually they did who had bin lords Pretors of Rome) represented in their pourtraitures, is not antient.

Con-

A Concerning statues erected vpon columns or pillars, they be of greater antiquity, as may appeare by that of *C. Menius*, who vanquished the antient Latines that inuaded the territory of Rome: vnto which nation, the people of Rome was woont by vertue of the league, to allow the third part of the bootie and pillage gotten in the wars: during the Consulship of which *C. Menius*, vpon the victory atchieued of the Anriats, the city of Rome ordained, that the beak heads with their brasen tines, which were taken from them in a confliat at sea, should be fastened vnto the pulpit of publicke pleas and Orations, which thereupon was euer after called *Rostra*: and this fortun'd in the 416 yeare after the foundation of Rome. The like statue vpon a column was set vp for the honour of *C. Duilius*, who first defeated the Carthaginians by sea, and for that naturall victorie entered Rome in triumph: the same remaineth at this day to be seen in the Forum or grand place of the city. Semblably, *P. Minutius* obtained the same honour, who being Puruei- or generall of corne for the city in time of a dearth, behaued himselfe so well in that office, that his statue of brasie was erected vpon a pillar without the gate of Rome called *Trigemina*: and that by an vniuersall contribution of the people, who gaue voluntarily toward the charges thereof, every man to the value of an ounce of brasie coine. And I wot not whether I may boldly say that he was the first man who receiued that honour at the peoples hands: for before time I am well assured that the Senat only granted such rewards for mens good seruice. Certes, these were braue and honourable memorials, had they not begun vpon occasion of some trifling matters to speake of. For such a statue was that of *Afcus Nauis* the Augur or Soothsayer, which stood before the entrie of the Curia or Councell-chamber of Rome: the base or foot of which pillar was burnt, at what time as the said Curia or Senat-houfe caught a light fire, at the funerals of *P. Clodius*. The like image was set vp (by authoritie from the State) in the publicke place of elections at Rome, called *Comitium*, to the honor of *Hermodorus* the Ephesian, who translated out of Greeke into Latine the lawes of the 12 tables, which the ten Decemvirs had gathered and set down for the publicke benefit of the city. As for the statue of *Horatius Cocles*, which remaineth to this day, there was another reason of it, and the same of greater credit and importance: for that he alone sustaining the charge and brunt of *K. Porseus* army, made good the wooden bridge ouer Tybre at Rome, and caused the enemies perforce to abandon the place. As touching the Statues of the Prophetesses *Sibylle*, three of them there be neare vnto the *Rostra*, before said, but of a lesse making, whereat I nothing maruell: the one was repaired by *Sex. Pacuvius Taurus*, one of the *Ediles* of the Commons; the other two by *M. Messala*. And I assure you I would haue taken these Images and that of *Afcus Nauis* to haue bene the most antique of all others, as being set vp in the daies of *K. Tarquinius Priscus*, but that I see the statues of the former kings within the Capitoll.

CHAP. VI.

¶ Statues without gowne or robe at all. Of other Statues. Which was the first statue on horse-backe. When and whereupon all the Images, as well publicke as priuat were demolished and put downe. What women they were at Rome who were honoured with brasen statues: and which were the first statues erected publicquely at Rome by strangers.

AMONG the said Statues of Roman kings, that of *Romulus* is without any coat or cassocke at all, like as that also of *Camillus*, which standeth at the pulpit *Rostra*. As for the Image of *Q. Martius Tremellius*, which was erected before the temple of *Castor* and *Pollux*, the same was in a gowne, and sitting vpon horse-backe: this noble knight had vanquished the Samnites twice: and by the winning of *Anagnia*, a city not far from Rome, procured thereby an easment vnto the people, from paying tribute vnto the state for the maintenance of the wars. In the ranke of the most antique monuments of Rome, I may range the statues of *Tullius Clatius*, *L. Roscius*, *Sp. Nautius*, and *C. Fulcinius*, which stand about the Pulpit *Rostra*: and these were the foure Roman Embassadors, who against all law of Nations, were during their embassage murdered by the Fidenatians. For this was an ordinary custome with the Romanes, to honour those in this manner, who in the seruice of the Commonwealth were vniustly killed: as may appeare likewise by *P. Iunius*, and *T. Coruncannus*, who by *Tenca* the queene of the Illyrians were put to death, notwithstanding

* The twelfth part of the book As.

withstanding they came in embassade to her. And here I cannot ouerpasse one point noted in the Annals, that the measure of the statues erected in the common place at Rome, was set down precisely to be three foot in height: whereby it may appeare, that this proportion and scantling in those daies was thought to be honorable. Neither wil I conceale from you & omit the memorable example of C. * *Othanius*, who for one word speaking lost his life: this man being sent as Embassadour vnto king *Antiochus*, and hauing deliuered his message vnto him according to his charge and Commission, when hee saw that the king made no haste to giue him his dispatch presently, but said hee would make him an answer another day; made no more adoe, but with a wand or rod that he had in his hand, drew a circle about the king, and compelled him by force to giue him his answer before he stirred his foot without that compasse. But this cost him his life: and for that he was killed thus in his Embassage, the Senat of Rome ordained, That his statue should be erected in the most conspicuous place of the city, and that was in the publick pulpit for Pleas and Orations, the Rostra before named. I read in the Chronicles, that the Senat made a decree, that *Taracia Caia*, or, as some say, *Suffetia*, a Votary or Vestall Nun, should haue her image made of brasse, and this speciall prerogative besides, that she might set it vp in what place she would her self: which addition or branch of the decree implieth no lesse honor than the grant it selfe of a Statue to a woman. What her desert might be, in consideration whereof she was thus honoured, I will set downe word for word, as I finde it written in the Chronicles, namely, *For that she had conferred fr ankely vpon the people of Rome, a piece of meadow ground lying vnder the Riuer Tybre, which was her owne Free-land.* I finde moreover vpon record, That the Statues of *Pythagoras* and *Alcibiades* were set vp in the cornered nouke of the Comitium at Rome, & that by direction from the Oracle of *Apollo Pythius*, vnto which the Senate sent of purpose to know the issue of the Samnites warre, which was then in hand: from whence they had this answer, that if they looked to speed well in their affaires, they should take order to erect two statues of brasse in the most frequented place of the city of Rome, the one in the honour of the most valiant man, and the other in the honour of the wisest person of all the Greekish Nation: which Images remained there vntill such time as *Sylla* the Dictatour built his stately hall or pallace in the same place: But I maruell very much, that those sage fathers (the Senators of Rome at that time being) preferred either for wisdom *Pythagoras* before *Socrates* (considering that the said *Socrates* by the very same Oracle of *Apollo*, was judged the wisest man, not of Greeks onely but of all others in the world;) or in regard of valour, *Alcibiades*, before so many hardie Captaines in Greece: but most of all I muse, that in both respects, as well of wisdom as of vertue, they set any one before *Themistocles*. Now if a man be desirous to know the reason of these Columns and Pillars, which supported those Statues afore said, it was to signifie, That such persons were now aduanced and lifted vp above all other mortall men: which also is meant by the triumphant Arches, a new inuention, and deuised but of late daies: yet both it, and all other such honourable testimonies, began first with the Greekes. But amongst many and sundry statues which they granted and allowed vnto such as they affected and liked of, I suppose, there was neuer man had more than *Phalerius Demetrius* at Athens: for the Athenians honoured him with three hundred and threescore: and yet soone after they * brake them all to peeces, even before one full yeare went ouer their heads, that is to say, a few daies more than there were Images. Moreover, all the tribes or wards of Rome set vp a statue in euery street of the city (as I haue said before) in the honor of *Marinus Gratidianus*, and those they ouerthrew euery one, against the comming in of *Sylla*.

* Strabo saith that they defaced & melted them, yea, and hung hem in to draughts and priuities.

As touching statues and Images on foot, I doubt not but they haue beene for a long time greatly esteemed at Rome. Howbeit those on horse-backe were very antient: and that which more is, this honour they did communicat also vnto women as well as men; as may appeare yet at this day by the statue of *Clælia* sitting on horse-backe, as if shee could not haue beene honored sufficiently by making her statue in the habit of a Damofell or Ladie of Rome in a side gowne. And yet neither the Chaste dame *Lucretia*, nor the valiant *Brutus* (who chased the kings and all their race out of Rome, and for whose sake and in whose quarrell the said *Clælia* was deliuered as an Hostage among others) neuer attayned vnto that honour. And I doe verily beleue, that this Statue of hers, and that of *Horatius Coclès*, were the first that publique authoritie ordaind: for before time King *Tarquinius Priscus* caused both his owne Statue and also *Sibyllæ* to be made, like as the other kings before him and after, as may be presumed by all likelihood

And yet *Piso* saith, that the other damofels and young gentlewomen her fellow hostages, after they were set free and sent home safe againe by king *Porfena* (for the honour that he meant vnto *Clælia* in consideration onely of her rare and singular vertue) caused the said statue or image of hers to be cast in brasse, and erected. But *Annus Facialis* (another antiquarie or herald at armes of Rome) reporteth this storie otherwise; for he writeth, That the statue of a woman sitting on horsebacke (which standeth ouer-against the temple of *Iupiter Stator*, and hard at the gate or entry of king *Tarquinius* the Proud his Pallace) was of ladie *Valeria*, daughter vnto *Valerius* the Consul, surnamed *Publicola*: who saith moreover, that shee it was alone who escaped from her fellowes, and swam ouer the riuer *Tiberis*; whereas the rest of the virgins which had been sent as pledges vnto king *Porfena*, were murthered all, by the secret traines and indirect meanes of *Tarquin* the Proud.

L. Piso moreover hath left in writing, that in the yeare when *M. Æmilius* and *C. Popilius* the second time were Consuls, the Censors for the time being (*P. Cornelius Scipio* and *M. Popilius*) caused all the images and statues of those who had been head magistrates, that stood about the Forum of Rome, to be taken downe; permitting those onely to stand which had beene erected and set vp either by grant from the people, or warrant and decree of the Senat. As for that statue which *Sp. Cassius* (him I meane who ambitiously sought to be a king) caused to be erected for his owne selfe before the church of the goddesse *Tellus*, the Censors not onely pulled it down, but also took order that it should be melted. And this (no doubt) did those wise and prouident fathers, to cut off all means euen in such things as these, that might feed the ambitious spirit of men. There be yet extant certaine declamations of *Cato*, who being Censor, cried out against the vain-glorie and pride of certaine Romane Ladies who suffered their own images to be set vp in the prouinces abroad: yet with all his exclamations, he could not repress their ambition, but that their statues must be erected euen in Rome also: as for example, *Cornelia*, the daughter of the former *Scipio Africanus*, and mother to the two *Gracchi*, whose statue was made sitting: and this singularity it had besides from all others, That her shooes were pourtraied open and loose without any strings or latches at all. This image of hers was set vp in the great gallery or publick walking-place of *Metellus*, but now it is to be seen among the stately workes and buildings of *Octavia*.

Moreover, (by allowance and permission of the state) there haue been statues set vp in Rome in publicke place, by strangers: as namely, for *C. Alim* a Tribune or Prouost of the commons, for that he published and enacted a law, That *Stennius Statilius* a Lucan, who twice had invaded and ouer-run in hostile manner, the Territory of Thurium, should be reputed as an enemy vnto the Romanes: In regard of which demerit, the Thurines honoured the said *Alim* with a statue of brasse, and represented to him a coronet of gold. The same Thurines also caused another statue to be made in the honour of *Fabricius*, for raising the siege that inuested and beleaguered their citie. By occasion of which succour and reliefe giuen vnto strangers and aliens, it came to passe in proceffe of time, that forrein states and cities shrouded themselues ordinarily vnder the protection of some great men at Rome; and in deuotion to them, honoured such as their lords and masters, by statues and all other means, euen as their bounden vassels. At length, there grew such disorder and confusion of these statues, that we had them pell mell at Rome without any choise or regard at all: insomuch as it this day, they are no fewer than three statues of *Anniball* to be scene at Rome, in three severall places of that citie, within the walls whereof he was the onely enemy euer knowne to haue launced his iavelin.

CHAP. VII.

¶ Of the Brasse-founders in old time. The inestimable prices of molten Images. Of the most renowned Colosses and gyaunt-like Images in Rome.

That the art of Founderie or casting mettals for Images hath been very antique, practised also and professen in Italie as well as in other countries time out of mind, may be euidently proued by the statue of *Hercules*, which *K. Evander* consecrated to the honour of him, in that very place (by folks saying) which now is the beast market in Rome. This image is called at this day, *Hercules triumphalis*, and at euery triumph is richly clad in triumphant habit. The image likewise of *Ianus* with two faces, dedicated by *K. Numa*, testified no lesse, and honoured

he is no lesse than a god, as by whom the times of war and peace be distinctly knowne. Moreover, the fingers of his hand are in that sort fashioned and formed, as they represent the number of 365, which are the daies of the whole yere; by which notification of the yere, he sheweth sufficiently, that he is the god and patron of time and ages. The images also which are known commonly by the name of Thufcanica, which are so dispersed abroad in all parts of the world, who will euer doubt but that they were commonly made in Tuscan? I would haue thought verily, that these Thufcanica had bene the images of the gods, and no other, but that *Metrodorus Seepius* who for the immortal hatred that he bare against the Romans had his * surname given him, reproches the Romanes among other imputations, That they had forced and sacked the towne Volfinij, for the loue of two thousand pretty images in brasse which were therein. Considering then, that the inuention of making such molten images hath been so antique in Italie, I cannot chuse but much maruaile, that the idols and images of the gods in times past dedicated in churches and chappels, were either of wood or potters earth, rather than of brasse, vntill the conquest of Asia, from whence to say a truth, first arose and proceeded all our excessse and superfluities. As touching the first deuise and originall of casting by moulds and forming the liuely similitudes of any thing expressely to the paterne, I shall haue fitter and better occasion, to write thereof in my treatise of the art of Pottery, which the Greeks call *Plastice*; for of more antiquity I take it to be than this feat of Foundrie: & yet this craft and cunning so flourished in times past, and brought for art such excellent pieces of worke, and for number so infinit, that if I should put down the greater part of them, it would require many volumes; for, to comprehend them all, what man is able? During the time that *M. Scavrus* was *Aedile*, there were three thousand molten images shewed vpon the stage when he exhibited his plaies, notwithstanding this theatre of his was made not to continue any time, but to serue for the present. *Mummius*, after the conquest of Achaia, brought in with him so many of these images, that hee filled the citie therewith, and no corner was free: and yet when he departed this life & died, he left not behind him a competent portion for to bestow his daughter in marriage. And this I write not to accuse and condemne so braue a man, but rather to excuse and commend him: for how can I otherwise doe? The two *Luculli* stored Rome with a number of these images. *Mutianus* (a man who of late daies had been twice *Consull*) reporteth, That there be yet within Rhodes three thousand such images: and verily it is thought, that in Athens, Olympia, and Delphi, there remaine no fewer to be seen. What man living is able to particularize them all? and say a man should come to the perfect knowledge of them, what good can he reape thereby, or what vse may he make thereof? Howbeit, one would take some delight and pleasure lightly to touch the principall pieces of workmanship in this kind, and namely those that be of marke and note for some special singularity about the rest; as also to name therewith the renowned artificers in times past, who wrought euery one of them a number of pieces, the exquisite and curious workmanship wherof, no man is able to unfold and vtter as they deserue, since that *Lysippus* (by report) made in his time six hundred and ten, so full of art, so excellent and perfect all, as there is not one of them but sufficient it were to immortalize his name. And how was it knowne that hee made such a number just? It appeared plaine after his decease by a coffer that he had, wherein he treasured vp his gold, and which was then broken open by his heire: for the manner of *Lysippus* was, when soeuer he tooke mony for the workmanship of any piece that went out of his hands, to lay by in the said coffer one *denier of gold; and so by the number of those deniers it was knowne, how many pieces of worke he made. Incredible it is to what height of perfection this art grew vnto, first by the successe of the art, which was so vendible and high prized; afterwards, by the audaciousnesse of the artificer, who ventured to make so huge and monstrous works.

What good speed this art had, may appeare by an example which I will set downe, of an image, deuised to expresse the likeness neither of god nor man: and a dogg it was in brasse, which many a man hath seene in our time in a chappell of *Inno* within the Capitoll temple, before it was burnt now last by the **Pirellians*: This dogg was made licking his owne wound; but how artificially it was wrought, and how liuely it expressed the proportion & feature of a dogg indeed, to the wonder of all those that beholding it could not discern the same from a liuing creature, is apparant not only by this, That it was thought worthy to stand in that place and to be dedicated to that goddesse, but also by the strange manner of charge laid vpon them that had the keeping and custodie thereof: for no reall caution of mony was thought sufficient to be

* It doth not appeare what it was, but by all likelihood *metastaseus*.

* It should seeme that the Greekes had a piece in gold answerable in weight vnto the Romane *Denarius* in siluer, which was adram Artick: and this cometh not vnto our French crowne.

* These that sided with *Vespasian*.

to be pledged and pawned for the warrantise, or to counteruaile the worth thereof: Order therefore was giuen by the state, and the same obserued from time to time, that the sextons or wardens of the said chappell should performe the safety and forth-comming of it vnder paine of death.

As touching the bold and venturous pieces of worke that haue been performed and finished by this art, we haue an infinite number of such examples: for we see what huge and giant-like images they haue deuised to make in brasse, resembling high towers more like than personages, and such they called *Colossi*. Of this kind is the image of *Apollo* within the Capitoll, transported by *M. Lucullus* out of Apollonia, a city within the kingdome of Pontus, which in height was thirtie cubits, and cost a hundred and fifty talents the making. Such another is that of *Iupiter* within *Mars* field, dedicated by *Claudius Caesar* the Emperour, which because it standeth so neere vnto *Pompeys* theatre, men commonly call *Iupiter Pompeianus*, and full as big he is as *Apollo* abouenamed. Like vnto these, is the colosse or stately image [of *Hercules*] at Tarentum, the handiwork of the said *Lysippus*, but he is forty cubits high: and miraculous is the deuise of this colosse, if it be true which is commonly reported thereof, namely, that a man may moue and stirre it easily with his hand, so truly ballanced it stands and equally counterpoised by Geometry; and yet no wind, no storme or tempest, is able to shake it. Certes, it is said, that the workeman himselfe *Lysippus*, provided well for this danger, in that a pretty way off he reared a colunne or pillar of stone full opposit to the winds mouth, for to breake the force and rage thereof, from that side where it was like to blow and beat most vpon the colosse: and verily so huge it was to weld, and so hard to bee removed, that *Fabius* surnamed *Verrucosus*, durst not meddle withall, but was forced to let it alone & leaue it behind him; notwithstanding he brought with him from thence another *Hercules*, which now standeth within the Capitoll. But the Colosse of the Sun which stood at Rhodes, and was wrought by *Chares* of Lyndus, apprentice to the abouenamed *Lysippus*, was aboue all others most admirable; for it carried seuentie cubits in height: well, as mighty an image as it was, it stood not on end aboue threescore yeares and six; for in an earthquake that then happened, it was ouerthrowne: but lying as it doth along, a wonderfull and prodigious thing it is to view and behold: for first and foremost, the thumbs of the hand and great toes of the foot are so big, as few men are able to fadome one of them about: the fingers and toes are bigger than the most part of other whole statues and images: and lookewhere any of the members or lims were broken with the fall, a man that saw them would say they were broad holes and huge caues in the ground: for within these fractures and breaches, you shall see monstrous big stones, which the workemen at the first rearing and setting of it had couched artificially within, for to strengthen the colosse, that standing firme and vpright so ballaid, it might checke the violence of wind and weather. Twelue yeares (they say) *Chares* was in making of it before he could fully finish it, & the bare workmanship cost three hundred talents: This mony was raised out of *K. Demetrius* his prouision which he had set by for that purpose, & paid from time to time by his officers, for that he would not himselfe endure to stay so long for the workmanship thereof. Other images there are besides of the nature of colosses in the same citie of Rhodes to the number of one hundred, lesser indeed than the foresaid colosse of the Sun; yet there is not one of them, but for the bignesse were sufficient to giue a name to the place and ennoble it, wherefoeuer it should stand.ouer and aboue, there be in the said citie fise other giant-like images or colosses representing some gods, and those of an huge bignesse, which were of *Bryaxes* his making. Thus much of workemen strangers.

And to come somewhat nearer home: we Italians also haue practised to make such colosses, for surely we may see (and go no further than to the librarie belonging to the temple of *Augustus Caesar* here in Rome) a Tuscan colosse made for *Apollo*, and the same is fiftie foot high from the great toe vward: but the bignesse thereof is not so much as the matter and workmanship: for hard it is to say, whether is more admirable, the beautiful feature of the body, or the exquisite temperature of the metall. Moreover, *Sp. Caruilus* long agoe made the great image of *Iupiter* which standeth in the Capitoll hill, after the Samnites were vanquished in that dangerous war, wherein they bound themselves by a sacred lay and oath to fight it out to the last man, vnder paine of death to as many as seemed to turne backe or once recule; to the making whereof, he tooke the brasse cuiraces, grieues, and morions of the enemies that lay dead and slaine vpon the ground: which is so exceeding bigg and large, that hee may very plainly and euidently bee discouered and seene from the other *Iupiter* in Latium, called therefore *Latianus*.

The powder & dust which the filme made in the workmanship & polishing of this colosse, *Caracillus* himselfe cast again, and thereof made his own image and pourtraiture, and the same standeth (as you may see) at the foot of the other. Within the said Capitoll, there be two brasen heads worthy of admiration, which *P. Lentulus* when he was Consul thought good to dedicate to that place. The one was made by *Chares* the foresaid founder; the other wrought by *Decius*: but this of *Decius* his making compared with the other, cometh so farre short, that one would not take it to be the doing of an artificer that was his crafts-master, but rather of some bungler, prentice, or learner. But to speake indeed of a great image, and that which surpasseth in bignes all the rest of that kinde, looke but vpon the huge and prodigious colosse of *Mercurie*, which *Zenodorus* in our age and within our remembrance, made in France at Auvergne: ten yeares he was about it, and the workmanship came to foure hundred thousand sesterces. Now when hee had made sufficient prooffe of his Art there, *Nero* the Emperour sent for him to come to Rome, where he cast indeed and finished a colosse a hundred and ten foot long, to the similitude and likenesse of the said Emperour, according as it was first appointed, and as he began it: but the said prince being dead and his head laid, dedicated is was to the honour and worship of the Sun, in detestation of that most wicked monster, whose vngriuous acts the city conderaned and abhorred. Certes, I my selfe haue been in that workhouse of *Zenodorus*, where I beheld and considered not onely that great master-patterne in cley of the said colosse, but also another consisting of very small pieces, as branches, which serued as it were for moulds, and the first induction to the worke, as the assay and prooffe thereof. Surely the workmanship of this one statue or colosse, shewed plainly, that the true science & skil of founderie or casting brasie into forms, was cleane decayed and gone; considering that *Nero* was ready and willing to giue siluer and gold enough for the doing thereof artificially and with expedition. *Zenodorus* also himselfe was not thought inferiour to any workman in old time, either for counterfeiting a similitude, or grauing the same: for during the time that he made the statue before said in Auvergne, he counterfeited two drinking cups grauen and chased by the hand of *Calamis*, but belonging to *Vibius Avitus* (the president and gouernor at the same time, of that prouince) which he had receiued of *Cassius Syllanus* his vnckle by the mothers side, tutor and schoolemaster somtime to *Cesar Germanicus*; which prince notwithstanding that he loued them wel, yet hee bestowed them freely vpon his said instructor *Cassius*, whom he loued better: and *Zenodorus* did it so well, that hardly there could be discerned any difference in the workmanship. But to conclude, the more consummat and accomplished that *Zenodorus* was for his skill and cunning, the more evidently it appeareth, that the true Art of founderie was in his time cleane lost, and out of knowledge and practise.

CHAP. VIII.

¶ Of 366 excellent pieces of worke in Brasie, and as many cunning artificers in that kind.

The images and wrought pieces of Brasie, commonly called Corinthian works, many men take such pleasure & delight in, that they loue to carry the same with them whither soeuer they goe: as *Hortensius* the famous orator, who would neuer be without the counterfeits of *Sphinx*, which hee had from *Verres* his client, at what time as he was in trouble and called into question, for his extortions and oppressions in Sicilie: in which triall of *Verres*, wherein *Cicero* was his aduerfariie and accuser, vpon occasion that *Hortensius* who pleaded at the barre against him in the behalfe of *Verres*, among other crosse words that passed betweene, happened to say, That he vnderstood no parables and riddles, and therefore willed him to speake more plainly; *Cicero* made answer readily againe, that by good reason he should be well acquainted with riddles, seeing he had a *Sphinx* at home in his house. Likewise, *Nero* the Emperour had a great fancie to a piece or counterfeits of an Amazon, (wherof I meane to write more hereafter) which by his good will he would neuer be without. And *C. Cestius*, somewhat before *Nero*, a man that in his time had bin Consul, was so addicted to a little image that he had, that it went with him into the campe, yea and he would haue it about him in the very conflict and battell with his enemies. Moreover, *K. Alexander* the Great had four statues or images (by report) which ordinarily were wont and none but they, to support his tent when he lay abroad and kept the field: wherof, twain stand now before the temple of *Mars*: called the Reuenger, & other 2 before the *Palatium*.

As

As touching images, statues, and counterfeits of a lesser size, there are an infinite number of artificers who are ennobled & renowned by them: yet to begin with the image of *Iupiter* made at Olympia, *Phidias* the Athenian (about all other) was of great name therefore, and wrought it was of yvorie & gold together: howbeit many other pieces of brasie there were of his making, which greatly commended the workman, he flourished in the 83 Olympias, and about the yere (after our computation at Rome) 300. And at the same time there liued those concurrents of his who endeauoured to match him, to wit, *Alcamenes*, *Critias*, *Nesicles*, and *Hegias*. After these, and namely in the 87 Olympias, there succeeded and had their time, *Agelades*, *Callon*, *Polyclethus*, *Phragmon*, *Gorgias*, *Lacon*, *Myron*, *Pythagoras*, *Scopas*, and *Perelins*: of which, *Polyclethus* brought vp diuers braue and worthy apprentices, and by name, *Argisus*, *Asapodorus*, *Alexis*, *Aristides*, *Phrynon*, *Pyron*, *Athenodorus*, *Dameas* of Clitorea, & *Myron* the Lycian. In the 95 Olympias there flourished *Nausicles*, *Dinomedes*, *Canochus*, and *Patrocles*. In the 102 Olympias there came in place, *Polycles*, *Cephisodorus*, *Leochares*, and *Hypatodorus*. In the 104 liued *Lyfippus*, at what time also *K. Alexander* the Great flourished: likewise *Lyfistratus* and his brother *Sthenis*, *Euphronides*, *Sofratus*, *Iön*, and *Silanius*: of which *Silanius* this is wonderfull, that hauing no master at all to reach and instruct him in the art, yet he became himselfe so excellent, that he brought vp vnder him, *Zeuxis* and *Pamades*. In the 120 Olympias, *Eutychides*, *Euthycrates*, *Labippus*, *Sephisodorus*, *Tymarchus*, and *Pyromachus* were famous artificers for the time. Then lay the art asleepe and as it were dead for a while, vntill such time as about the 155 Olympias it seemed to reuiue and awaken again; & then there arose *Antheus*, *Callistratus*, *Polycles*, *Athenaus*, *Callixenus*, *Pythocles*, *Pythias*, and *Timocles*, indifferent good workemen, but nothing comparable to the other before named. Thus hauing ranged the most famous Artificers distinctly according to their severall Ages, I will runne ouer them againe, as many I meane as excell the rest: and yet howsoeuer I make haste, I will not ouerpasse the multitude of others, but interlard (as it were) and disperse them among, as occasion shal be offered.

In the first place this is to be vnderstood, that the principal and singular of all these founders came in question (notwithstanding they liued in sundry ages) which of them should be esteemed chiefe, by reason of diuers Amasons wrought by their hands: for when these images should be dedicated in the temple of *Diana* in Ephesus, it was thought good to make choise of one that should be deemed & approved best, by the iudgment of those workmen who then liued & were present: for plaine it was, that the image whom they all iudged to be next and second to their own, the same was simply best, and so to be reputed. This principal Amazon hapned to be of *Polyclethus* his making: in a second degree was the Amazon made by *Phidias*: that of *Ctefias* was counted the third; of *Cydon* the fourth, & in a fift place was reckned the workmanship of *Phragmon*. As for *Phidias*, besides the *Iupiter Olympius* of his making, (wherin no man seeketh to come neere vnto him) he made likewise *Minerva* of iuorie at Athens, which standeth there in the temple *Parthenon*. But ouer and aboue the foresaid Amazon, there was of his workmanship *Minerva* in brasie, so faire and beautifull, that of her beauty she tooke the surname [*Kallimorphos*]. Of his doing was the image called * *Cliduchos*, and another of *Minerva*, which *Emilius Paulus* dedicated at Rome in the temple of *Fortuna huiusce dici*, i. Of the daies of Fortune. Also two other statues or images portraied in clokes or mantles, were his handiwork, which *Catulus* set vp in the same temple: likewise another after the maner of a colossus or gyant all naked. In sum, he was deemed and that iustly, to haue bin the first that deuised and taught the skil of chasing & embossing. As for *Polyclethus* the Sicyonian, who learned his cunning vnder *Agelades*, hee it was that made in brasie *Diadumenus* an effeminate yong man looking wantonly, with a diadem or wreath about his head, a piece of work of great account, & much spoke of, for that it cost 100 talents: and of his making was *Doryphorus*, a yong boy with a manly countenance, hauing a speare in his hand. Moreover, he made that which workmen call Canon, that is to say, one absolute piece of worke, from whence artificers do fetch their draughts, simetries, and proportions, as from a perfect patterne or rule which guideth and directeth them in their worke: so as wee may well and truly iudge, That *Polyclethus* alone reduced the skill of Founderie and imagerie into an Art and method, as may appeare both by that Canon, and by other workes which passed through his hands. Of his workmanship was the brasen image, representing one scraping and rubbing himselfe in the bath or hot-house: as also another all naked, and * challenging to the dice. Item, two boyes both naked playing at dice, which thereupon be called *Astragalizontes*. And these remaine

V u 3

* Talo incessanter some read, tulo incessanter

main to be seen in the court or portall belonging to the house of *Titus* the Emperor, which is so exquisite a piece of worke, that many doe iudge there cannot be set another to it more absolute and perfect: also he it was which wrought the image of *Mercury* which is at *Lyfimachia*: of *Hercules* at Rome, and namely how hee heaved and held vp *Anteus* from the ground between heauen and earth: and the counterfeite of *Artemon*, that effeminate and wanton person, who because hee was ordinarily carried in a Litter, men called *Poryphoretos*. This *Polycles* was iudged to haue brought this art of Imagery to a consummat perfection; the feat also of ingrauing & imbossing he was thought to practise and promote, like as *Phidias* before him opened the way to it & gaue instructions. This proper and special gift he had besides about all other, to deuise how Images might stand vpon one leg: and yet *Varro* saith, that all the Images of his making be four square, and all in manner after one pattern.

To come vnto *Myro*, born he was at *Eleutheræ*, and an apprentice likewise to *Agelades*: the piece of worke that brought him into name and made him famous, was an heifer of brasse; by reason that diuers Poets haue in their verses highly praised it, and spread the singularity of it abroad: for so it falls out otherwhiles, that many men are commended by the wit of others, more than by their own. Other pieces of work there were of his besides, to wit, a dog, a coit-caster (or one hurling a stone or weight of lead) *Perseus* [killing *Medusa*] fawyers called *Pristæ*, a Satyre wondring at a pipe or flute, and the goddesse *Minerva*: moreover, the Delphick Pentathli, & the *Pancratiastæ*: furthermore, that image of *Hercules* which standeth in the temple that *Pompey* erected neere the greatest cirque or shew-place, is the handiwork of *Myro*. Besides (as it appeares by the poesie of *Erinna* the Poëtesse) hee it was that made the tombe or monument in brasse of a poore grasshopper and a locust; the image likewise of *Apollo*, which (after that *Antoni* the Triumvir had wrongfully taken from the Ephesians) *Augustus Caesar* restored againe vnto them, being warned so to do by a vision appearing vnto him in his sleep, was of *Myro* his making. This workman seems to haue bin the first that wrought not his images after one sort, but altered his work after many fashions, as being fuller of inuention, and giuen more to deuise in his art, more curious also and precise in his symetries and proportions, than *Polycles*: and yet as exquisite as he was, he went no farther than to the outward linements of the body and members thereof; as for the inward affections of the mind he did not expresse in any of his work: the haire also as well of head, beard, as share, he left after a grosse maner, & wrought them no finer than the rude and vnexpert workmen in old time had either done or taught. No maruel therefore if *Pythagoras* the Imageur of Rhegium in Italy went beyond him in this feat, and namely in that piece of worke of his which resembled a wrestler or *Pancratiastes*, which was dedicated in the temple of *Apollo* at Delphos. He came short also of *Leontius*, who expresse liuely in brasse, *Astylus* the famous runner in a race; which image is shewed for a rare piece of work in Olympia: also the boy *Libys*, which is to be seen in the same place, holding in his hand a little table, and withall carrying apples, stark naked. He made also the pourtraiture of one that seemed lame and to halt, vpon an vicer; but the same is so liuely and naturally done, that as many as behold the same seeme to haue a compassion and fellow-feeling with him of some pain and grievance of his fore; and this piece of work a man may see at *Syracusa*. Furthermore, the said *Leontius* cast in brasse one *Apollo* playing vpon his harpe: as also another *Apollo*, and the serpent killed with his arrowes; which image he surnamed *Dicaeus*, i. Iust: for that when the city of Thebes was won by *Alexander* the Great, the gold which he hid in the bosome thereof when hee fled, was found there safe and not diminished, when the enemy was gon and he returned. Hee was the first that in his images expresse the sinues and veines lying vnder the skinne: hee it was also that couched and layd the haire of the forehead more handsomely, yea and wrought the same farre more finely than any before him.

* or rather *Pavus*, of *Tarot*.

* *Huic* sic dicit.

Now besides *Pythagoras* before mentioned, there was another a * Samian both, who by occupation was at the beginning a painter: of his handiwork are those 7 images halfe naked, which are to be seen in the Temple of * This daies *Fortune* at Rome; and one resembling an old man: all highly commended for singular art. This *Pythagoras* was so like vnto the other about named, especially in face and countenance, that hardly (by report) one of them could be knowne from the other. As touching *Sofratus*, it is said he was apprentice to *Pythagoras* of Rhegium, and his sisters son besides. As for *Lyfippus* of Sicyone, *Durus* saith, That he learned the art by himselfe, and neuer was taught by other. But *Tullius* affirmeth, That hee was an Apprentice vnto it, and

hauing

hauing bin at first by occupation a poore tinker or a plain brasier and coppersmith at the most, he began to take heart vnto him and to proceed further, by a speech or answer that *Eupompus* the painter gaue him: for when he seemed to ask this painters counsel, what pattern and whom he were best to follow of all those workmen that were gon before him? hee shewed vnto him a multitude of people, and said withall, That he should do best to imitate Nature her self, and no one artificer: and that was it (quoth he) which I meant by the former demonstration of so many men. And verily, so excellent a workman he proued in the end, that he left behind him the most pieces of any man (as I haue said before) and those of all sorts, and fullest of art and good workmanship: and among the rest, the image of a man, currying, rubbing, and scraping the sweat and filth off his own body, which *M. Agrippa* caused to be set before his own bairns: and the Emperor *Tiberius Caesar* took so great pleasure in it, that notwithstanding at his first coming to the crown he knew well enough how to command and temper his own affections, yet he could not now rule himselfe, but would needs haue the said image to be removed from thence, into his own bed-chamber, and another to be set in the place of it: wherat the common people (see their contumacie and frowardnesse!) were so much offended and displeased, that they rested not with open mouth to exclaim vpon him in all their theatres, when they met there together, and cried to haue their *Apoxymenos* set again in the own place: inso much as the Emperor was content so to do, notwithstanding he loued it so well. This *Lyfippus* also won great credit and commendation by another image that he made, representing a woman piping or playing vpon the flute; and drunken withall: also by a kennell of hounds, together with the huntman and all belonging to the game. But about all, he got the greatest name for making in brasse a chariot drawne with foure steeds, together with the image of the Sun, so much honored among the Rhodians. The personage of King *Alexander* the Great hee likewise expresse in brasse, and many images he made of him, beginning at the very childhood of the said Prince: and verily the Emperor *Nero* was so greatly enamoured vpon one image of *Alexander*, that hee commanded it to be gilded all ouer; but afterwards, seeing that the more cost was bestowed vpon it by laying on gold, the lesse was the art seen of the first workman, so that it lost all the beauty and grace that it had by that means, he caused the gold to be taken off againe: and verily the said image thus vngilded as it was, seemed far more pretious than it was whilst it stood so enriched with gold; notwithstanding all the hacks, cuts, gashes, and rases all ouer the body wherein the gold did thicke, remained still, which in some sort might disfigure it. Of this mans making was the statue of *Hephestion*, a great fauorite and minion of *Alexander* the Great; and yet some ascribed this piece of worke vnto *Polycles*; whereas in truth he liued almost an hundred yeres before the said *Hephestion*. He counterfeited also *Alexander* the Great how hee rode a hunting, with his hounds and all things belonging to the chace; and this Worke of his resembling hunting, was thought worthy to be consecrated in the temple of *Apollo* at Delphi. At Athens he made a troupe of Satyrs. As for *Alexander* himselfe, with all his principall courtiers and friends about him, he resembled in brasse most liuely. All these pieces of his workmanship before rehearsed were transported to Rome by *Metellus*, after the subduing and conquest of Macedonie. Finally, Coaches drawne with foure horses, he made of many sorts and fashions, all in brasse. And in a word, the art of founderie and imagerie was brought to far greater perfection by this Artificer, as it was thought; for hee expresse the very haire of the head as fine and small as Nature made them. The heads to the images of his making were nothing so big in proportion to the rest of the body as they were in old time: his images shewed not so great and corpulent, but more lank, slender, and lean; as wel to expresse the knitting of joints, the ribs, veines, and sinues the better, as to cause them also to seem the taller. The Symmetrie, which about all things hee obserued most precisely in all his workes, is a terme that cannot properly bee expressed by a Latine word. A new deuice he had that neuer before him any practised, and that was, to make his images of a quarry and square stature, as the Antients before his time did: for an ordinary speech it was of his, That in times past men were made plain, such as they were; but he made them as they would seem to be. Finally, it seemeth, that this singular gift he had about all others in all his workes, to shew finenesse and subtiltie, which hee obserued most curiously in the smallest things that passed vnder his hand. When he died, he left behind him three sonnes, which also were his apprentices: of whom, *Labippus* and *Bedas* were passing good Workemen, and very well regarded; but *Enthyocrates* his third sonne ouerwent his brethren. Although I must needs say, That hee

loued

was the workman, who cast in brasse the full proportion and similitude of *Protesilaus*, and of *Pythodorus* the famous wrestler. *Alexander*, otherwise called *Paris*, was of *Euphranor* his making: The excellent art and workmanship wherof was seen in this, that it represented vnto the eie all at once, a iudge between the goddesses, the louer of *Helena*, and yet the murtherer of *Achilles*. The image of that *Minerva* at Rome, which is called *Catulliana*, came out of this mans shop: and it is the same which was dedicated and set vp beneath the Capitoll by *Quintus Lutatius Catulus*, whereupon it tooke that name. Moreouer, the image that signifieth good lucke or happie success, carying in the right hand a boule or drinking cup, in the left an eare of corne and a Poppy head, was his handie worke. Like as the princeesse or ladie *Latona*, newly deliuered of *Apollo* and *Diana*, holding these her two babes in her armes: and this is that *Latona* which you see in the church of *Concordia* in Rome. He made besides many chariots, drawne as well with foure as two horses: as also a key-bearer or *Cliduchus*, of incomparable beautie. Semblably two other statues, resembling Vertue and Vice, both which were of an extraordinary stature and bignes, gyant-like, in manner of Colosses. He made besides a woman ministring, and yet worshiping withall. Item King *Alexander* the Great, and King *Philip* his father, riding both in chariots drawne with foure horses. *Eutychidis* a renowned imageur, represented the riuer *Eurotas* in brasse: and many men that saw this worke, were wont to say, That the water ran not so cleare in that riuer, as art and cunning did appeare in this workmanship. *Hegyas* the imageur made *Minerva* and King *Pyrrhus*, which be much praised for the art of the maker: likewise boies praefising to ride on horsebacke: the images also of *Castor* and *Pollux*, which stand before the temple of thundring *Jupiter* in Rome. In the colonie or city *Parium*, there is an excellent statue of *Hercules*, the handy worke of *Isidorus*. *Buthyrcus* the Lycian was taught his cunning by *Myron*, who among many other pieces, beseeeming the apprentise of such a master, deuised in brasse to represent a boy blowing at a fire halfe out: and he it was that cast in the same mettall the famous *Argonautes*, in that voyage to *Colchos*.

Leocreas made the *Egle* that rauished *Ganymede*, and flew away with him, but so artificially, as if she knowing what a fine & dainty boy she had in charge, and to whom she caried him, clapped the child so tenderly, that she forbore with her rallions to pierce through the very cloths. The boy *Antolikos* also, winning the prize in all games and feats of actiuitie, was of his making; for whose sake *Xenophon* wrote his booke entituled *Symposion*: likewise that noble image of *Jupiter* in the Capitoll of Rome, surnamed *Thundering*, which is commended aboue all others: as also *Apollo*, with a crowne or diademe.

Lyciscus counterfeited *Lago* a boy, who in maner of a page or lacquey, seemed to be double diligent, & after a flattering and deceitfull sort performed nothing but eie-seruice. *Lycus* also made another boy blowing the coales for to maintain fire. *Menechmus* deuised to cast in brasse a calfe, turning vp the neck & head at the man that setteth his knee vpon his sides, and keepe his body down. This *Menechmus* was a singular imageur, and himself wrote a booke as concerning his own art. *Naucides* was iudged to be an excellent workman, by the making of *Mercury*, & of a discobole or coiteras also for counterfeiting in brasse one that was a sacrificing or killing a ram. *Naucerus* woon credit by making of a wrestler, puffing & blowing for wind. *Nicerates* had the name for the curious workmanship of *Aesculapius* and *Hygia*, which are to be seen at Rome within the temple of *Concord*. *Pyromachus* got great reputation by a coach drawn with four steeds, & sculped by *Alcibiades* the coachman, all of his making. *Policles* was the maker of that noble piece of work that goeth vnder the name of *Hermaphroditus*. *Pyrrhus* counterfeited in brasse another *Hygia* & *Minerva*. And *Phenix* who learned his art of *Lysippus*, liuely counterfeited the famous wrestler *Epitherses*. *Stipax* the Cyprian got himselfe a name by an image resembling one *Splanchnoptes*: This was a pretty boy or page belonging to *Pericles*, surnamed *Olympius*, whom *Stipax* made frying & roasting the inwards of a beast at the fire, puffing and blowing therat with his mouth full of breath and wind for to make it burne. *Silanion* did cast the similitude of *Apollodorus* in brasse, who likewise was himselfe a founder and imageur, but of all other most curious and precise in his art, he neuer thought a thing of his owne making well done, and no man censured his worke so hardly as himselfe: many a time when he had finished an excellent piece of work, he would in a milke vnto it, pass it in pieces, and neuer stood contented and satisfied with any thing when it was all done, how ful of art soeuer it was, and therefore he was surnamed *Mad*: Which furious passion of his, when *Silanion* aforesaid would expresse, he made not the man himselfe alone of brasse, but

* i. Good;
health.

the very image of Anger and Wrath also with him, in habit of a woman.ouer and besides, the noble *Achilles* was of his making, a piece of worke well accepted and much talked of. Of his doing is *Epistates*, teaching men how to wrestle and exercise other feats of actiuitie. As for *Strongylion*, he made one of the Amazons, which for an excellent fine and proper leg that he had, they call *Eucnemus*; and in that regard *Nero* the Emperour set so great store by this image, that it was carried ordinarily wherefoeuer he went. This artificer made likewise another brasse image resembling a faire and sweet boy, which for the singular beautie *Brutus* of *Philippo* so loued, that it was commonly called by his surname *Philippensis*.

Theodorus who made the Maze or Labyrinth at *Samos*, caused his own image to bee cast in brasse, which besides the wonderfull neere resemblance and likenesse to himselfe, was contriued so artificially besides, and so set out with other fine deuises, that he was much renowned for the workmanship, and in the sight of all men it was admirable: he carrieth yet in his right hand a file, and in his left hand he bare sometime (with three fingers) a little pretty coach, and the same with four horses at it, which was afterwards taken from the rest, and had away to *Præneste*: but both the coach, the teeme of horses, and the coachman were couched in so small a roome, that a little flie (which also he deuised to be made to the rest) covered all with her pretie wings.

Xenocrates was apprentise to *Tiferates*, or as some say, to *Euthyrcrates*; but whether of the twaine foerer was his master, he outwent them both in the number of statues and images that he wrought, and besides compiled bookes of his owne art and workmanship.

Many artificers there were, that by imagerie delighted to counterfeit in brasse the battailes that king *Attalus* and *Eumenes* both, fought against the *Galatians* or *Gallogreekes*; and namely, *Ligonus*, *Pyromachus*, *Stratonicus*, and *Antigonus*, and this artificer last named, composed bookes also of his own art. *Boethius*, although he was a better workman in siluer, yet one piece of worke he made in brasse, which had an excellent grace, and that was a child throttling a Goose by the necke.

Of all these pieces of antique worke which I haue reckoned vp, the most choise and singular aboue the rest, *Nero* before time had by his violent edicts and commandements caused to bee brought from all parts to Rome, and he disposed them in diuerse roomes of his golden house for to adorne and beautifie the same; but now they be consecrated by *Vespasian* the Emperour, in the temple of Peace, and in other stately buildings and edifices of his.

Many other excellent artificers there are besides these aboue rehearsed: but they may be all ranged in one ranke, and counted for their skill and cunning equal, for a man shall not find one piece of worke of their making, that carrieth any singularity aboue the rest, and namely *Ariston*, who also was wont to graue and chafe in siluer, *Callias*, *Clephas*, *Cantharus* of *Sicyone*, *Dionysius*, who was an apprentise trained vp vnder *Critias*, *Deliaides*, *Euphorion*, *Eumicus*, and *Hecateus*. As touching famous engrauers in siluer, I read of *Lesboles*, *Prodorus*, *Pithodius*, and *Polygnatus*, who also were most excellent and renowned painters. Likewise, of siluer smiths or grauers in siluer, we haue *Stratonicus*, and *Scymnus*, who had for his master *Critias*.

Now will I reckon vp those worthy and famous Imageurs, who employed themselves in one and the same kind of workes. In the first place, *Apollodorus*, *Androbulus*, *Astelepiodorus*, and *Alcetas*. He tooke pleasure to expresse the similitudes of learned men & Philosophers. As for *Apelles*, he delighted besides to represent women at their deuotions, adoring the gods, and offering sacrifices. *Antigonus* had a grace likewise to represent one currying and scraping his skin al ouer the body to haue in their shops the statues of great ladies and noblewomen. *Aristodemos* tooke much pleasure to busie himselfe about the portraying of wrestlers, coaches with two horses for thereto, and a coachman, Philosophers and great clearkes, old matrons, and king *Selenus*: There is also of his making a *Doryphorus*, resembling one of *Darius* his guard, which is a proper piece of worke & a louely. As touching the *Cephistodori* (for two of them there were) the elder had a great dexterity in making *Mercurie* fostering prince *Bacchus* in his infancie: He made also one, preaching to the people, and casting forth his armes; but what person of quality he should be, it is not certainly knowne: the younger was wont to represent the Philosophers. *Colothas*, who joined with *Phidias* in the making of *Jupiter Olympius*: He delighted also to be doing with the images of Philosophers. So did *Cleon* and *Cenchramis*, *Callicles*, and *Cephis*. As for *Calcothentus*, he busied and amused himselfe in the counterfeits of *Comedians*, players of enterludes, and champions. *Dahipus*

*. erizomenos
the same that
Apollonemeron.

hippus had a very good hand, in making one scraping and rubbing his body in an hot-house. *G Daiphron*, *Democritus*, and *Damon*, were as cunning and perfect in the personages of Philosophers and Sages. *Epigonus* would haue his hand in all those works in manner which I haue rehearsed, and laboured to imitate those artificers: but he surpassed them all in a Trumpetter of his owne devising, and a little infant, who seeing the mother slaine, made toward the dead corps, and hung about it as if it would play and be plaied withall, full pittiously to behold. *Eubolides* made one, as if he were counting vpon his fingers. *Mycon* his cunning was most seen in the counterfeiting of wrestlers and such as practise feats of actiuitie: and *Menogenes*, in making chariots with foure horses. *Niceratus* likewise enterprised all maner of works wherein others were best seen: and besides represented the personage of *Alcibiades*, together with his mother *Demarete*, as shee sacrificed with lampe light burning by her. *Pisicrates* shewed much skill with a chariot of two horses, wherein he bestowed * *Pitho* sitting in the habit of a woman: The images *Mars* and *Mercurie* also, which stand at Rome in the temple of *Concordia*, be of this mans making. As for *Perillus*, there is no man commendeth him for his workmanship, but holdeth him more cruell than *Phalaris* the Tyrant, who set him a work, for that he deuised a brasen Bull, to roast & frie condemned persons in, assuring the Tyrant, that after the fire was made vnder it, they would when they cried seeme to bellow like a Bull, & so rather make sport than moue compassion: but this *Perillus* was the first himselfe that gaue the handsell to the engine of his own inuention, & although this was cruelty in the Tyrant, yet surely such a workman deserued no better a reward, & justly he felt the smart of it: For why? The art and cunning foundery, which of all others is most ciuile & agreeable to our nature, and which had bene employed ordinarily in representing the personages of men and gods, this monster of men abused, and debased to this vile and vnnatural ministry of tormenting man. Would one haue euer thought, that after so many witty & worthy men who had trauelled in this science to bring it to some perfection, all their labours should turne in the end to this prooue, for to make instruments thereby of torture? And certes, there being many pieces of his workmanship, they be kept and faued for this cause onely, that as many as see the same, may detest and abhor the wicked hand that made them. But to proceed forward to other workmen in this kinde. Of *Sthenis* making are the images of *Ceres*, *Iupiter* and *Minerva*, which at Rome are within the temple of *Concord*. The same man took pleasure in counterfeiting ancient dames and matrons, weeping, praying, and offering sacrifice. *Simon* [of *Aegina*] was very good at the making of a dog and an archer. *Stratonicus* that famous cutter and engrauer, was neuer well but when he portraied some Philosopher or other: no more than *Scopas*, both the one and the other. As for wrestlers and champions, armed men, hunters, and sacrificers, they were the onely workes that these artificers following delighted most in, to wit, *Batten*, *Eucher*, *Glaucides*, *Heliodorus*, *Hicanius*, *Leophon*, *Lyson*, *Leon*, *Menodorus*, *Myagrinus*, *Polycrates*, *Polydorus*, *Pythocritus*, and *Protogenes* (who also was a most excellent & renowned painter, as I will hereafter shew more at large) also *Patrocles*, *Polis*, *Posidonius* born at Ephesus, who likewise chased and engraued in siluer most finely, *Periclimenus*, *Philon*, *Simenus*, *Timotheus*, *Theomnestus*, *Timarchides*, *Timon*, *Tisias*, and *Tibrason*. But aboue all other, *Callimachus* is the workman of greatest note, in regard of a by-name giuen vnto him, and that was *Cacizotechnos*: and well he might be so called, for hee would alwaies be finding fault with his own workmanship, & neuer could see when to make an end, thinking still that he had not bestowed art ynough vpon that he had vnder his hand. And so he brought forth little or nothing perfect in the end: A notable and memorable example to teach all men not to be ouer curious and exquisite in any thing, but to hold a measure in all. And there is a dauce of Lacedemonian women of his making: a piece of work which he went about also to amend, and when he thought to make it better, he marred it clean, so that it lost all the grace it had before. Some say, that this *Callimachus* had bin in former time a painter. And since I haue entred so far into this Treatise of statues & images, I may not passe ouer in silence, but note (as it were) by the way one thing of *Cato*, although haply it may be thought but a meere vanity: In that expedition or voiage wherein Cyprus was conquered and reduced vnder the dominion of Rome, hee made port-faile of al the pillage taken there, saue only one statue of *Zeno*, not for the excellencie of the matter, for it was but brasse, nor yet for the art and curious workmanship thereof, but for that it was the image of a Philosopher. In this discourse of statues and images, I must not passe by one, although it is not certainly known who was the maker of it, and this is *Hercules* in his shirt and other habit that he wore vpon the mount *Oete*: standing now at Rome neere vnto the publicke pulpit

* *Snada*, i. Per-
suasio, or *Diana*
as some think.
Some read *Pi-
tho*, the god-
desse of Cre-
dulitie.

pulpit called *Rostrum*: Made he is (whosoever did it) with a grim, sterne, and fower countenance, and such indeed as doth bewray and feel those intollerable torments which the body sustained by that poisoned shirt [sent to him from *Deianira*.] Vpon this statue there stand 3 titles or inscriptions: the first is this; *L. Luculli Imperatoris de Manubius*, i. *L. Lucullus* Lord Generall, erected this statue out of the spoile of the enemies: the second, *Pupillus Luculli filius ex S. C. dedicauit*, i. The son of *L. Lucullus*, being orphan or ward, dedicated this, by an order or act from the Senat: the third, *T. Septimius Sabinus Aedile Curulis, ex priuato in publicum restituit*, i. *T. Septimius Sabinus*, Aedile Curule for the time being, hath from a priuat house caused it to stand againe in publick place. This is the image of that worthy *Hercules* that fought so many battels, indured such hard conflicts and labors, and was so highly honored.

Now is it time to return to the different kinds and sundry temperatures of brasse, from which I haue digressed: first and foremost therefore this is to be noted, That in Cyprian brasse or copper there is to be considered, one sort which is named *Coronarium*, and the other that they call *Regulare*; and both the one and the other will abide the hammer & be brought into thin plates. As for the *Coronarium* or *Laton*, when it is reduced into thin leaues or plates, and then coloured or rubbed ouer with the gal of an oxe, it looketh like gold, and maketh a faire shew in those coronets that plaiers weare; whereupon it tooke the name *Coronarium*: the same, after that to euery ounce of it there be put six scruples of gold, and be reduced into a very thin foile, resembling the color of fire, like a rubie or carbuncle stone. As touching this brasse, it is found also in other mines of mettall, like as the pot-brasse *Caldarium*: this only is the difference, that this *Caldarium* will melt only, for vnder the hammer it will break; whereas the other sort of copper named *Regulare*, yeeldeth to the hammer and will be drawne out, whereupon some there be who call it *Ductile*, battable; and such is all the kind of copper or Cyprian brasse. That also which is found in the mines of other mettalls, by art refined, differeth from the foresaid pot-mettall, for out of what mine soeuer it commeth, after that the drosse & imperfections thereof be thoroughly purged by the fire, being thus (I say) clenfed, it becommeth *Regulare* and wil abide the hammer. As for all other sorts besides the Cyprian brasse aboue named, the *Campane* brasse is counted best: like to which, there is much in other parts also of Italy, and in the prouinces: but to e-uery [hundred pound of brasse] they put 8 pound of lead: then they boile it as it were and melt it again with a soft fire, for want and scarcitie of wood and fuell. And what difference there may be in that regard, it is most of all seen in the heart of France, where it is commonly melted (for lack of other fuel) among stones made red hot: for by reason that this is a swift & scorching fire, it becommeth black and brittle withall: besides, they melt it but once: but surely to doe so oftner, maketh very much for the goodnesse thereof.

CHAP. IX.

¶ The difference in Brasse: the diuers mixtures thereof: and how Brasse should be kept.

Moreouer, it were not amisse to note thus much also, that all kind of brasse melteth best in coldest weather. Now there is another temperature of brasse which serueth for founders, imageurs, and brasen tables, called thereupon in Latine, *Statuaria* and *Tabularis*, which is made in this manner following: first, the masse, ore, or stone as it commeth out of the mine, is melted in the bloome-smithie, and so soone as it is melted, they put thereto a third part of the brasse *Colletaneum*, that is to say, broken pieces of old vessels that haue bin vsed, and bought vp here and there. In the choice whereof, this care would be had, that for to giue vnto this temperature the kind seasoning as it were, which peculiarly it requireth, there would be gotten such pottain or old mettall which is ouerworne, and by ordinary occupying and vsing to the hand, bright-shining, and as one would say tamed, made gentle, and pliable. It would not be forgot-ten also, to euery 100 pound weight of the said melted ore, to mix 12 pound and a halfe of Tin. But to haue a kinde of Brasse mettall that is most tender and soft, there must bee giuen vnto it that mixture or temperature which is called *Formall*, namely, by putting thereto of ordinarie lead a tenth part, and of Tin a twentieth part; and by that means especially it taketh that colour which they call *Grecanicke*. The last temperature is that, which in Latine they call *Ollaria*, as one would say, the pot-brasse, for it taketh the name of that vessell whereto it is most employed; and

and this is by tempering with euery hundred pound weight of brasse, 3 or four pound weight of argentine lead or tin. To Cyprian brasse or copper, if you put lead, you shall haue that deep red or purple colour which giueth the tincture to the robes that statues are pourtraied with. Moreover, this is to be noted, that the more you do scour any vessels of brasse, the more are they subiect to rust, and sooner will they gather it, than if they were neglected and not meddled withall; vnlesse they be well annointed with oile. It is said, that a vernish made of tarre, is singular for to preserue and saue any brasse from rust. To conclude, brasse hath serued many a yeare ago, for the perpetuity of memorials and registers, as we may see by those brassen tables here in Rome, wherein be cut and ingrauen all our publick laws and constitutions.

CHAP. X.

¶ Of Cadmia or Brasse ore, and the medicines wherein it is usually employed.

THe mines and veins of brasse ore do many waies furnish vs with medicines: a good proofe whereof this may be, that any vlcers be soonest healed there: but the most medicinable of all minerals that belong to brasse mettall, is Cadmia [artificial.] And verily there is a kind of Cadmia made in the furnaces where siluer is fined, of a whiter colour and lesse ponderous, but nothing comparable to that which commeth from the brasse furnaces. And sundry sorts there be of Cadmia: for the very stone of which they make brasse, is called Cadmia, and as it is necessary for founders, so it is of no vse at all in Physick. Now is there a Cadmia besides which is made in the furnaces, and so called, but the reason thereof is far different: and this kinde of Cadmia commeth of the finest and thinnest part of the ore or matter in the furnace, cast vp aloft by the flame & blast, sticking to the roofo or sides of the furnace, higher or lower according to the proportion of the lightnesse that it carrieth, more or lesse. The finest and the floure as it were of Cadmia, is found in the very mouth of the furnace, whereas the flames * do strue to get forth; the Greeks call it Capnitis, for that it is smokie and burnt, and for the exceeding leuity thereof resemble flying cinders. That which is more inward and hangeth downe from the coping and vaulted roofo of the furnace, is the best: and in that respect, because it hangeth so as it were by clusters, they giue it the name Botrytis: heauier this than the former, but lighter than those that follow after. As for the colour thereof, it is in two sorts: that which you see of a dead hew like ashes is the worse, whereas the red is the better; the same also is brittle and will soone crumble small: for eie-salues and collyries reputed soueraign. A third kind of Cadmia sticketh by the way, to the sides and wals of the furnace; for by reason of the heauinesse and ponderosity, it was not able to mount vp to the bending roofo of the furnace: this the Greeks call Placitis: and well it may be so named; for a crust rather it is than a scaly substance: break it, you shal find many colours in it: and this Cadmia for to heale scabs and scurfe; as also to cicatrice or skin a fore, is better than the former. Out of this kinde, there proceed other twaine; to wit, Onychitis, which in the outside is after a sort blewish, but within, it resembleth the flecks or spots of the onyx stone; and Ostracitis, blacke throughout, of all the rest most foule and grosse, howbeit, fittest for wounds.

Generally, that Cadmia, of what kinde soeuer, is best, which is found within the furnaces of Cyprus: this the Physitians doe burne a second time with pure coles; and when it is calcined and turned to ashes, they quench it with Ammian wine, if they meane to prepare it for plasters; but with vinegar, for scabs and scurfe. Some there be, who after it is stamped grosse, burne or calcine it in an earthen pot, then wash it well in a mortar, and afterwards dry it. *Nymphedorus* taketh the very stone or the ore as it lieth in the mine, the heauiest and most compact that may be found, which he burneth among coles; and after it is sufficiently burnt, quencheth it in wine of Chios: he beareth and punneth it then again, anon he driueth or bouldeth it through a linnen cloth, and grindeth it finer in a mortar: this done, soon after he steepeth and soketh it wel in rain water, and that which setleth in the bottom he stampeth: and this he doth, vntill such time as it be like ceruse or white lead, and wil not crash between the teeth. The same maner of preparing vseth *Tollas*, but he chuseth the purest and brightest stone that he can get.

The medicinable operations of Cadmia, bee, to drie, to heale thoroughly, to stay fluxes, to cleanse the filthinesse in the eyes, and to scour the pin and web, to extenuate any roughnesse; and

And in one word, to worke all those effects which I shall attribute hereafter to Lead.

Furthermore, brasse it selfe may be burnt, and being so prepared, it serueth for all those purposes before named: ouer and above, it cureth the pearls, films, and skars in the eies: if it be incorporat with milk, it healeth the vlcers in the eies: the same likewise they vse to grinde vpon hard stones, after the manner of the Egyptian collyrie; taken as a lobeck inwardly with hony, it causeth vomit. Now as touching copper, the manner is to burn it in vnbacked earthen pans, with the like weight of brimstone; but all the breathing holes of the furnace ought to be well closed and luted vp where they must stand, vntill such time as the said pans be thoroughly baked hard: some put salt thereto: others in stead of brimstone take alumne; and there be againe, who vse neither the one nor the other, but sprinkle it well with vineger onely: when it is thus calcined, they pun it in a mortar of Thebaick marble, and then wash it in rain water. Howbeit, this first lotion of it maketh it but weak and of small effect: and therefore it had need of a second washing, in a greater quantity of water, and to be braied againe therein, and left so standing vntill it be settled: this would be reiterated often, vntill such time as it be brought to looke like vnto Minium: after that, it ought to be dried in the Sun, and saued in a brassen box.

CHAP. XI.

¶ Of the drosse or refuse of Brasse: of the skales of Brasse: of Verdegreece or Spanish greene: of Stomoma: of Verdegreece which is the rust of Brasse, and of Hieracium.

THe drosse of Brasse is washed after the same manner, but of lesse effect it is than Brasse it selfe: howbeit the floure of Brasse or verdegreece, is much vsed in Physick: and engendred it is, when Brasse is melted by much blowing, and then transferred out of the furnace into other receptacles, and there, are shaken out certain skales of miller, and this they call Flos æris: Verdegreece. Now these skales vse to fall off, when as the masses of brasse be cooled with water and be red. Likewise of the same masses, there is made that which they call Lepis; and thus the verdegreece may be sophisticated, so as the said Lepis or skales be sold for it: Now these skales come, by being driuen & smitten off from those nails which they vse to forge of the said masses and lumps of brasse, and all these most commonly are found in the Cyprian forges: herein only is the difference, that the foresaid skales are driuen forcibly & smitten from the said pains or masses of brasse, whereas the floure of verdegreece falls off by it selfe. And yet there is a second kind of these skales more fine and subtil than the other, to wit, driuen and smitten from the very outside and vppermost part of the brasse, and this they call * Stomoma.

Howbeit, Physitians in these daies (with reuerence to their profession and with their good leaue be it spoken) are ignorant wholly of all these things; yea, and the greater part of them bee not so much as acquainted with the terms and bare names (so far be they from the true composition of medicines:) and yet in times past, it belonged properly vnto Physitians, for to be acquainted with the terms of all simples, and to be perfect in the knowledg of them. But our physitians in this age, when they are to make any composition of simples, they haue recourse straightwaies to their books to be directed by them, that is to say, they try experiments by the hazard of their poore patients; and there finding the names of this and that, they set downe a receit, & for the making thereof trust the Apothecaries, as also for the ingredients, which commonly they do sophisticate and corrupt by all deceitfull meanes that possibly they can devise; selling their emplasters and collyries that are old made, and such drugs as are past all goodnesse, seruing the bills of the Physitians with the very refuse of their shop. And thus the deceitfull wares that they haue, they rid their hands of, to the discredit of the Physitian, and danger of the sicke.

But to come againe vnto our skales, and floure of brasse or verdegreece; the manner is, first to calcine both the one and the other, either vpon earthen vessels or brasse pans; then, to wash the same, as is before said, and for the same vses. But ouer and above, these being prepared thus accordingly, are singular for the carnosities and excrescences within the nostrils, or the fundament: for hardnesse also of hearing, if they be blowne into those parts by meanes of a pipe: and the sores or cankers of the mouth they doe heale, by application of their powder: this powder also taketh away the inflammations and accidents of the tonsils or almonds about the throat, if it be tempered and incorporat with honey, and vsed in a collution or gargarisme. There is be-

* Effluantur, or rather, Effluantur, are breathed and sent forth.

* Stomoma is nothing else but Steele, and therefore, Pliny here doth erre like as in most of this chap.

side, a scale that commeth of laton or white brasse, farre better than that which the red brasse or copper doth yeeld.

Moreover, there is a denier that some vse, namely, to let first the nails and parties of brasse to lie wet in the vrine of a boy; others, so soone as the scales be driuen off, bray them, and afterwards wash them in rain water, which they vse to giue for the dropie, to the weight of two drams in one hemine of honied water; and besides they make a liniment with it and flour, for to vse outwardly to the belly.

* Which some take to be verdegreece.
* *Erugo vrasilia*.

As touching the rust of brasse, great vse there is of it in Physick: but it commeth after many sorts, for first and foremost, it is found sticking (in manner of the flour aforesaid) vnto the stone or ore out of which brasse is tried, in such sort, as it must be scraped from it before a man can haue it. Also it is made after an artificiall manner, by hanging certain plates of laton driuen full of holes, and hung in a pipe or barrill ouer vineger; but the same ought to be close couered and stopped with a lid of brasse, so as the said plates do not touch the vineger: and verily, verdegreece thus made, is far better than of skales in the same wise vsed. Some there be that take vessels of white brasse or laton, and put them in earthen pans, where they suffer them to lie in vineger for ten daies together, and then scrape off the verdegreece or rust that is gathered vpon the said laton. Others there are who couer the said vessels of laton in the refuse of grapes after they be pressed (skins I meane and stones), and after ten daies, as is aforesaid, scrape off the Verdegreece which they find vpon the brasse. There be againe, who take the fine dust which the file fetcheth from brasse, and strew the same in a vessell of vineger, stirring it with spatules or ladles oftentimes in a day, vntill it be resolued into the vineger and consumed: and yet many think it better to work and stamp the said file-dust with strong vineger in a brassen mortar, for to gather verdegreece. But the speediest way, of ingendring the said rust of brasse or verdegreece, is to take the cuttings, parings, or small pieces of laton plates, such as be employed about coronets, and to put them in vineger, and you shall haue diuers, who will not sticke to sophisticate verdegrees (such especially as is brought out of Rhodes) by mixing it and the powder of marble together; others with the pumish stone puluerized, or els with gum. But the cunningest deuice that they haue to falsifie it and deceiue chapmen by, is to mingle vitrioll amongst: for all the other deceitfull tricks be soone found out by the teeth, because a man shall fee the verdegreece to crash and grate between them, like grit, which hee shall not perceiue if it be sophisticate with vitrioll: howbeit, this sophistication also and fraudulent cast, may be soon detected and found out by an experiment made with a slice or fire-pan of yron-made red hot in the fire: for cast vpon it the right and true verdegreece indeed, it will hold and keep the owne colour still; but if it be corrupted with vitrioll, you shall see it turne red. You may discouer likewise the fraud aboue said with paper, tempered beforehand and foked in gall-nuts; for besmeare therewith the verdegreece that is falsified, it will quickly become black. The eie also wil soon bewray the falsehood that is vsed therein, for if it be naught, a man shall perceiue it to looke with a weak green color, nothing full nor fresh. But be the verdegreece true or false, the best way is, before it be employed in Physick, after it be dried, to calcine it vpon a new earthen pan that neuer was occupied, and in the burning to turne it often with a slice or spatule, vntill such time as it be reduced into light cinders, and then after it is finely puluerized, to lay it vp for vse. Others prepare it after another sort; they put it in an earthen pot vn timer, and set the same into an oven, where they let it stand to be calcined so long vntill the said pot of clay be well and thoroughly baked. Finally, there be, that before they vse Verdegreece, put thereto the male Frankincense, the best that can possibly be had.

* Of the red Papyrus.

* *Olibanum*.

* *Græce Sinda-urum*, which Pliny translates *delachry-mationibus mor- dædoprosfici-entibus*: which also may be turned thus, It helpeth watering eyes proceed- ing of some fretting humors.

The manner also is to wash verdegreece before it be occupied, after the same order as Cadmia is vsed. Being thus made & prepared as is aboue said, it is excellent to be put into eie-salues or collyries, for by a mordicative quality it helpeth weeping and watering eyes: in which regard, necessarie it is that it be washed first with pencils well bathed in hot water, so long vntill it haue lost that corrosiue quality.

As touching Hieracium, a composition it is or collyrie so called, and made in this manner: Take foure ounces of Sal Ammoniacke, of Cyprian Verdegreece two ounces, of shoemakers blacke, or that coppereffe which the Greekes name Chalcantum as much, that is to say, two ounces; of Myfy or yellow vitrioll one ounce, and of saffron six: let all these bee stamped together and tempered in the vineger of Thasos vntill they be concorporat, and then reduce them into

into trochiques. A singular collyrie or eyefalue this is to withstand the beginning of pearls, catarrachs, and such accidents of the eyes, to discusse also the webs that come ouer their sight, to leuigate the roughnesse of the tunicles, to dispatch the white skars, and in one word to cure all the infirmities of the eielids. As for verdegreece, that is not calcined at all, it is excellent good to be put into vulnerarie or healing plasters: the same also is of a wonderful operation to cure the exulcerations of the mouth or the gumbs; the lips also exulcerat it heales, being reduced into a liniment with oyle: but if you put wax thereto, it doth mundifie, and withall skin and heale perfectly. Verdegreece is proper to eat away and consume the callositie growing in a fistula, and in those infirmities which are incident to the feat or fundament, whether it be brought into a liniment with gum Hammoniacke and so applied, or else in forme of a collyrie, that is to say, a tent thrust into the hollow fistula. The same verdegreece incorporat with a third part of the true rosin called Terpentine, is soueraigne for foule leprogies and wild-fires.

CHAP. XII.

¶ Of *Scolecia*, and *Chalcitis*, of *Myfy*, *Sory*, and *Chalcantum*.

ANother sort there is of Brasse-rust or Verdegreece, which commonly is called *Scolecia*: this is made of alume, salt or salnitre, of each a like weight, stamped well together with the strongest white wine vinegre that can be gotten, in a mortar of Cyprian brasse or copper: and this must not be done but in the hottest daies of the yere, to wit, about the rising of the Dog-starre. Now must all the ingredients aforesaid be punned and incorporat together, vntill such time as the masse become green, and that it gather and draw together in manner of crawling wormes, whereupon it taketh the name *Scolecia*. But if so be, that this manner of working and making it, chance to faile and doe not well, for to amend the same, the two parts of vinegre which entred into the mixture, ought to be tempered with as much vrine of a boy vnder fourteen yeares of age. Now if you would know the medicinable effects and vertues of this kind of verdegreece, both it and the artificiall Borax aforesaid (which I named *Sañterna*) be of the verdegreece, there is the ordinary rust of brasse or verdegreece, called in Latin *Ærugo*. There is a kind of *Scolecia* naturall or mineriall of it selfe, without addition of any thing els whatsoeuer, whereof I purpose to speake in this place, and the same is scraped from the stone or ore of which commeth brasse. There is a stone lying in the mine which they name *Chalcitis*, out of which also (with burning) they excoit brasse: differ it doth from *Cadmia*; for *Chalcitis* is hewed out of the mines that lye aboue, very ebb and exposed to the ayre, whereas the other is digged from vnder the ground in those mines that lie hidden. Item, *Chalcitis* (as being of a tender and soft nature) presently will crumble into pieces, so as it seemeth to be a certaine fine mosse concreat and gathered together. Also, there is another difference betweene these two *Marcaffins*; for that, *Chalcitis* containeth in it three seuerall kinds of matter, to wit, Brasse, Myfy, and Sory; of which I purpose to speak seuerally by themselves in their due place. Now this *Chalcitis* lies within the brasse mine in long veins: that which is of a yellowish colour like hony, full of small veins running here and there, brittle and apt to crumble, and not of a stony hardnesse, is counted the best: the fresher also and more newly gathered that it is, the more effectually and wholely some men take it to be; for that being long kept, it will grow into the nature of Sory. Being thus in the right nature, it hath a facultie (if it be puluerized) to repress also the accidents befalling to the proud or dead flesh in vlcers, to staunch blood, to repress also the accidents befalling to the gumbs, vula, and tonsils: the same put vp into the naturall parts of a woman within a locke of wooll in manner of pessarie, helpeth the infirmities of those places: but if it be tempered and incorporat with the juice of porret, it serueth to put into those plasters which are appropriate to the vlcers and sores of the priuities or members of generation. Now if you steepe it in vinegre, and let it lie so infused within an earthen pot well luted with beasts dung, for the space of forty daies, it will come to the colour of saffron: put then vnto it of *Cadmia* stone the like quantitie in weight, you shall haue that medicine which is called *Pforicum*. Also, if in this composition you put two parts of *Chalcitis* to one third part of *Cadmia*, & so temper them together, this aforesaid medicine will be more quick & agre: but in case you would haue it yet more mordicant and stronger in operation, let the said ingredients be tempered rather with vinegre than wine. Calcine the same or torrifie it, you shall find it more effectually in all operations aforesaid.

* A kind of verdegreece or rust of brasse in manner of a worme, as Pliny taketh it. * The flour of copper, whereof is made vitrioll, as some think. * *Brassæculus* holdeth it to be vitrioll. Romanes: others take it for yellow copper. * Duskish or ash-colour copper. * Vitrioll. * It seemeth that Pliny doth here err; by reading in *Diog. oenobolus* for *chalcitis*; & for *chalcitis* is *chalcitis*: for the said mixture is to be reduced into certain trochiques or thin cakes called *chalcitis*, and not into the form of worms.

* The veine
of minerall,
whereof com-
meth the dus-
kish Vitrioll.

As for * Sory, that which is brought out of Ægypt is counted best, and farre better than the Cyprian, Spanish, or African: neuerthelesse, some hold that which commeth from Cypresse, to be more appropriat to the cure of the eies. But of what country soeuer it be, the principall is that which to smell vnto is of the rankest and most stinking sauour: the same also in the bruising will grow black and be vntoeous or fatty, and such lightly is hollow in manner of a sponge. A minerall this is altogether hurtfull to the stomack, and so contrary vnto the nature of it, that to some the very smell thereof is enough to ouertune it and to cause vomit: and especially the Ægyptian Sory is of this operation. That which commeth from other nations, when it is broken or braied, shineth againe.

Touching Myfy, it is of a more hard and stony nature than Sory, but good it is for the tooth ache, if either it be held in the mouth, or a collution be made therewith to wash the teeth and gums: also it healeth the grieuous and irkesome sores of the mouth, yea though they grow to be cancerous and corrosiue. The manner is to burne and calcine it vpon coles of fire as Chalcitis. Some neuerthelesse haue written, that Myfy is engendred by the means of a fire made with pine wood, in the hollow veins or mines of brasse ore: and they hold, that the cinders or ashes of this pine fewell, being mingled with the yellow greines or floure of the said mettall, is that which begetteth Myfy. But the truth is, of the foresaid stone or ore it is ingendred naturally: howbeit, a thing it is by it selfe gathered, distinct and separat from it apart: and the best is that which is found in the mines and forges of Cypresse. You shall know it by these signes: break it (for crumble it will) there appeare within it certain sparks shining like gold: and in the braying or stamping, it runneth into the nature of a sand or earth, like vnto Chalcitis. This Myfy is the Minerall that they put to gold ore, when it is to be tried and purified.

To come vnto the medicinable vertues thereof: being infused or powred into the eares with oile of roses, it cureth the running with matter: the same being applied in a frontal within wool to the head, easeth the ach thereof: it doth extenuate also and subtiliat the asperities of the eies, such especially as be inueterat and haue continued long: but soueraigne it is found to bee for the inflammation or swelling of the tonsils, for the squinancy, and all impostumat sores growne to suppuration. For which purpose, prepared it would be in this wise, and after this proportion: Take of it 16 drams, seeth the same in one hemin of vineger with some addition of hony, vntil it begin to yeeld and relent, and in this manner ordred, it serueth in cases aforesaid: but whensoever need requireth to mollifie the violence thereof, and make it more mild, it were good to wet it with some sprinkling of hony. If there be a lotion or fomentation made with it in vineger, it doth consume and eat away the hard callositie in fistuloes, and fortifieth greatly the collyries or tents to be made thereof, and put it into the concauity of the fore: it serueth also for the collyries that be eie-salues: it stancheth bloud, represseth the malice of fretting humors in corrosiue vlcers and such as do putrifie: the excrecence of proud or ranke flesh it taketh downe and consumeth: a peculiar property it hath to cure the accidents of the members of generation in men and withall stoppeth the immoderat flux of the moneths in women.

As concerning Vitrioll, which wee call in Latine Atramentum Sutorum, y. Shoos-makers blacke, the Greeks haue fitted it with a name respectiue vnto brasse, and by a neere affinity therunto call it Chalcantum: and verily there is not a mineral throughout all the mines, of so admirable a nature as it is. There haue been found in Spaine certaine pits or standing pooles, containing a water of the nature of Vitrioll: they vsed to seeth the same, putting thereto of other fresh water a like quantitie, and poure it into certaine troughs or broad keelers of wood: ouer these vessels, there be certaine barres [of yron] or transoms ouerthwart, lying fast that they cannot stirre, at which there hang downe cords or ropes with stones at the end stretching them out-right, that they reach to the bottome of the sayd decoction within those keelers, to the end that the viscous substance of the water may gather about those cords, which you shall see sticking fast thereto in drops, congealed in manner of a glasse, and it doth represent as it were the forme of grapes; and that is Vitrioll. Being taken forth and separated from the cords aforesaid, they let it dry for the space of thirtie dayes. In colour it is blew, and carrieth with it a most pleasant and liuely lustre, so cleare, as a man would take it to bee transparent glasse. Of this being infused in water, is made that blacke tincture which Curriers and Coruiners occupie in colouring of their leather. This Vitrioll is ingendred many waies of the coppereffe vein within the mine, being hollowed into certaine trenches: out of the sides whereof you shall see in the midst of

Vitriol

A Winter when it is a frost, certaine yfickles depending, as the drops destilled and grew one to another: whereupon this kind of Vitrioll they call Stalagmias, and a purer or clearer thing there is not. But look what part thereof is whitish of colour, but not transparent, and the same inclining to the wall floure or * white violet, the same they call Leucoion. There is a Vitrioll likewise made artificially in receipts and concauities (dugged of purpose in the stonie mines of Cypresse) by occasion of raine water there congealed, which had been conueighed into them, and gathered a viscous slime or mud in the passage. Also there is a cast to make it in manner of salt by letting fresh water into such hollow receptacles, and permitting the same to ferment in the sun when he is at the height and full strength of his heat in the summer, vntil it be gathered and hardened as salt. And therefore some there be who make two sorts of Vitrioll, to wit, the Naturall, or Minerall, and the Artificiall: this that is made by the industry and art of man is paler than the other, and looke how much the colour is abated, so much inferior it is in goodnesse. The Cyprian Vitrioll is thought best to be imploied in Physicke. For, to expell the wormes out of the belly, it is giuen vnto the patient to the weight of one dram in honey, after the manner of an electuary. If the same be dissolved and conueyed vp into the nostrills, it purgeth the head. In like manner it purgeth the stomack, in case it be taken in hony or honied water. The asperities of the eies, their paine, and the dimnesse or mists ouergrowing the sight, it dispatcheth: and healeth the sores in the mouth. It staieth bleeding at nose, and the immoderat running of the Hæmorrhoids. It draweth forth spels of broken bones: and tempered with the seed of Henbane, it stoppeth the course of a rheum running to the eies, if it be laid in a cloth to the forehead in manner of a frontale. Of great effect it is in plasters, both for to mundifie wounds and to consume the excrecence of flesh in vlcers. If the Vvula be fallen, it putteth it vp againe, by touching it only with the decoction thereof. Moreouer, being incorporat with line-seed, it is singular good to be applied aloft vpon plasters, for to mitigat pain. Of this kind, that which is white is preferred before any that are of a yellowish colour like * wall-floures aforesaid. Moreouer, if it be blown into the eares by the means of a pipe, it doth remedy the hardnesse of hearing. A liniment made of Vitrioll alone, healeth vp wounds, but it draweth the skar too neare together: in regard of which astringencie of Vitrioll, there hath bin an inuention deuised of late, to cast the powder of Vitrioll into the mouths of Bears and Lions when they are to be baited: for so great a knitter and binder it is, that it will draw their chaws together in manner of a muzzle, that they shal not be able to bite.

* Violet also,

* Volaris: hee meaneth those that resemble Leucoion, and which he called before by that name.

CHAP. XIII.

¶ Of Pompholyx: Of Spodos, Antispodos, and of Diphryges. Of the Trient of Seruilius.

There be found ouer & besides in brasse smithies or furnaces, those matters which they call Pompholyx and Spodos: and the difference of the one from another, consisteth in this, that Pompholyx requireth washing for to be prepared, Spodos neuer commeth into water or liquor. And yet some distinguish them otherwise, calling the whitest and lightest part, Pompholyx: holding opinion, that it is nothing els but the very cinders of brasse, or the Calamine stone Cadmia, whereof brasse commeth: whereas Spodos (say they) is blacker and more weightie than Pompholyx, as being scraped from the wals and sides of the furnaces, among which you shall see many times grosse sparks, yea, and otherwhiles coles intermingled. Well, this Pompholyx being tempered or soaked in vineger, smells of brasse: and if a man touch it at the tongues end, hath a horrible tast that goeth against ones stomacke. Proper it is to enter into those compositions which be ordained for the eies, for it helpeth all the infirmities incident thereto: and in one word, serueth for the same purposes that Spodos doth: herein onely lieth the difference, that Spodos is thought to be more mundificatiue, by reason that the strength of Pompholyx is delayed by the washing aforesaid. It is one of the ingredients also to those implasters which are deuised for gentle refrigeratiues and exiccatiues. And for whatsoeuer it shall be imploied, better it is found to be, in case it were washed first with wine.

As touching Spodos, the Cyprian is most esteemed: and ingendred it is, whiles Cadmia and the brasse ore or stone be melted together in the furnace. Exceeding light it is, and apt to mount aloft with the smoake of the bloome smithie, very speedily, yea, & ready to flie out of the fur-

image of *Hercules* all of hard yron or steele, which *Alcon* the famous workman made of purpose, to signifie the vndaunted heart of that deified *Hercules*, who vnderwent and indured all labours and perils whatsoeuer. Here also in Rome we may see certain drinking cups of steele dedicated in the temple of *Mars* the Reuenger.

But to come vnto the nature of yron, herein appeareth still the same goodnesse of Nature, that this mettall working such mischiefe as it doth, should be reuenged of it selfe, and receiue condigne punishment by the own rust. See also the wonderful prouidence of Nature, who maketh nothing in the world more subiect to death and corruption, than that which is most hurtfull and deadly to mankind.

As touching mines of yron ore, they are to be found almost in euery country, for there is not so much as the Island *Iliua* here within Italy, but it breedeth yron. And lightly wherefoeuer any such be, they are easily found, for the very leere of the earth, resembling the colour of ore, bewraileth where they lie. And when it is found out, they burn, try, and fine it, as other veins of mettall. Onely in Cappadocia there is some question and doubt made, whether in the making of yron they be more beholden to the earth that yeeldeth the ore, or to the water for the preparing and ordering of it: for this is certain, that vnlesse the vein of ore bee well drenched and foked with the water of one riuer there, it will neuer yeeld yron out of the furnace. As for the kinds of yron many they are, and all distinct. The first difference ariseth from the diuersity of the soile and climats where the mines be found: for in some places, the ground & the position of the heauens do yeeld onely a soft ore, and comming nearer to the substance of lead than yron: in another, the mettall is brittle and short, standing much vpon a veine of brasse, such as will not serue one whit for stroke and naile to bind cart-wheels withall, which tire indeed would be made of the other that is gentle and pliable. Moreouer, some kind of yron there is that serueth onely, if it be wrought in short and smal works, as namely, for nailes, studs and tackes imploied about greeces and leg-harneis: another againe, that is more apt to take rust and canker than the rest. Howbeit, all the sorts of yron ore are termed in Latine *Strictura*, a word appropriat to this mettall & to no other, * *Stringenda acies*, of dazling the eyes, or drawing a naked sword. But the furnace it self, where the ore or yron stone is tried, maketh the greatest difference that is: for therein you shall haue to arise by much burning and fining, the purest part thereof, which in Latine is called *Nucleus ferri*, the kernell or heart of the yron [and it is that which we call steele] and the same also of diuers sorts: for the best is it that hardeneth the edge of any weapon or toole: there is of it which serueth better for sithy or anuill heads, the faces of hammers, bits of mattocks, and yron crowes. But the most variety of yron commeth by the means of the water, wherein the yron red hot is eftsfoons dipped and quenched for to be hardened. And verily, water onely which in some place is better, in other worse, is that which hath innobled many places for the excellent yron that commeth from them, as namely, *Bilbilis* in Spaine, and *Tarassio*, *Comus* also in Italy; for none of these places haue any yron mines of their owne, and yet there is no talk but of the yron and steele that commeth from thence. Howbeit, as many kinds of yron as there bee, none shall match in goodnesse the steele that commeth from the *Ceres*: for this commoditie also, as hard were as it is, they send and sell with their soft silks and fine furs: in a second degree of goodnesse, may be placed the Parthian yron. And setting aside these two countries, I know not where there be any bars or gads tempered of fine and pure steel indeed, for all the rest haue a mixtue of yron, more or lesse. And generally in this West part of the world wherein wee liue, all our steel is of a more soft and gentle temperature than that of the Leuant. This goodnesse of steele in some countries ariseth from the nature of the mine, as in *Austrich*: in others from the handling and temperature thereof, like as by quenching, as I said before, and namely at *Sulmo*, where the water serueth especially for that purpose: and no maruell, for we see a great difference in whetting and sharpening the edge of any instrument, between oyle whetstones that barbars vse, and the common water grind-stones: for surely the oile giueth a more fine and delicat edge. Furthermore, this is strange, that when the ore or vein is in the furnace, it yeeldeth yron liquid & cleare as water, and afterwards, being reduced into bars and gads when it is red hot, it is spongeous and brittle, apt to break or resoue into flakes. And considering the difference that is between the nature of oile and water (as I haue said) this is to be obserued, that the finer any edge tooles bee, the manner is to quench them in oile for to harden the edge: for feare lest the water should harden them ouer much, and make the edge more ready to breake out into nickes, than to bend

A and turne again. But wonderfull it is about all, that mans blood should haue such a vertue in it, as to be reuenged of the yron blade that shed it; for being once embrued therein, it is giuen euet after eftsfoones to rust and canker.

Concerning the load-stone, and the great concord or amity betweene yron and it, I meane to write more amply in the due place. Howbeit, for the present thus much I must needs say, that yron is the only mettall which receiueh strength from that stone, yea, and keepeth the same a long time, in so much, as by vertue thereof, if it be once well touched & rubbed withal, it is able to take hold of other pieces of yron: and thus otherwhiles we may see a number of rings hanging together in manner of a chaine, notwithstanding they be not linked and inclosed one within another. The ignorant people seeing these rings thus rubbed with the load-stone, and cleauing one to another, call it quick-yron. Certes, any wound made by such a toole, are more eager and angry than by another. This stone is to be found in *Biskay*, scattered here and there in smal pieces by way of bubblation (for that is the term they vse,) but it is not that true Magnet or load-stone indeed, which growes in one continued rock. And I wot not whether these be so good for glasse makers, and serueth their turn so well in melting their glasse, as the other: for no man yet hath made experiment thereof. But sure I am, that if one do rub the edge, back, or blade of a knife therewith, it doth impart an attractive vertue of yron thereunto, as well as the right Magnet. An here I cannot chuse but acquaint you with the singular inuention of that great architect and master deuifer, of *Alexandria* in *Egypt*, *Dinocrates*, who began to make the arched rooffe of the temple of *Arifnoe* all of Magnet or this load-stone, to the end, that within that temple the statue of the said princeffe made of yron, might seeme to hang in the aire by nothing. But pre- uented he was by death before he could finish his worke, like as *K. Ptolomee* also, who ordained that temple to be built in the honour of the said *Arifnoe* his sister.

But to returne again to our yron: of all mines that be, the vein of this mettall is largest, and spreadeth it self into most lengths every way: as we may see in that part of *Biscay* that coasteth along the sea, and vpon which the Ocean beateth: where there is a craggy mountaine very steepe and high, which standeth all vpon a mine or veine of yron. A wonderfull thing, and in maner incredible, howbeit, most true, according as I haue shewed already in my *Cosmography*, as touching the circuit of the Ocean.

CHAP. XV.

The temper of yron. The medicinable vertues thereof, as also of the rust of Brasse and yron. Of the scales that shed and flie from yron: and of the liquid emplaster called by the Greekes *Hygriplastrum*.

Iron made once hot in the fire, vnlesse it be hardened with the Hammer, doth soone waste and corrupt. So long as it looketh but red, it is not ready for the hammer, neither would it be beaten before it begin to look white in the fire. Besmeare it with vinegar and Allum, it wil looke like copper or brasse. If you be desirous to keep any yron worke from rust, giue it a vernish with cerusse, plaster, and tar, incorporat all together. And this is that composition, which is called by the Greeks * *Antipathia*. And some fay also, that there is a kind of hallowing yron that will preferue it from rust: as also that there is at this day to be seen the chaine of yron within the city called *Zeugma*, seated vpon *Euphrates*, wherewith king *Alexander* the Great sometime bound and strengthened the bridge ouer the riuer there: the linkes whereof, as many as haue been repaired and made new since, doe gather rust, whereas the rest of the first making, be all free therefrom.

As touching the vse of yron and steele, in Physicke it serueth otherwise than for to launce cut and dismember withall: for take a knife or dagger and make an imaginarie circle two or three times with the point thereof, vpon a yong child, or an elder body, and then goe round withall about the party as often, it is a singular preseruatiue against all poisons, forceries, or enchantments. Also to take any yron naile out of the coffin or sepulchre wherein man or woman lieth buried, and to sticke the same fast to the lindle or side-post of a dore, leading either into the house or bed-chamber where any doth lie who is haunted with spirits in the night, hee or shee shall be deliuered and secured from such phantasticall illusions. Moreouer, it is said, That if one be lightly pricked with the point of sword or dagger which hath bene the death of a man, it

* *Vulgus est in timore.*

is an excellent remedy against the paines of sides or brest, which come with sudden pricks and G stitches. An actuall cauterie of yron red hot, cureth many diseases, and especially the biting of a mad dog; in which case it is so effectuall, that if the poison inflicted by that wound, haue preuailed so far, that the patient be fallen into an Hydrophobie thereby, and cannot abide drinke or water, let the fore be feared therewith, the party shall find help presently. Gads of Steele or other yron red hot quenched in water, so long vntil the same water be hot, causeth it to be a whole-some drinke in many diseases, but principally in the bloody flux.

The very rust of yron also is counted medicinable: for so *Achilles* is said to haue healed *Telephus*: but whether the head of his speare were yron or bras, of which he vsed the rust, I doe not certainly know. Certes, he is paynted thus: with his sword scraping and shaking off the rust into the wound. But if you would fetch off the rust from any old nails, scrape it with a kniue wet before in water. As touching the vertues thereof, it is clensing, exiccatieue, and astringent; it recouereth the haire in places despoiled thereof, if they be annointed therewith in the forme of a liniment: being reduced into a salue with wax and oile of Myrtles incorporate together, many vse it for roughnesse about the eie-lids: the pimples also breaking forth all ouer the body. For shingles and *S. Antonies* fire, it is singular good to apply it in an vnguent with vineger: likewise it killeth scabs, and healeth whitlawes of the fingers, and the excrescence or turning vp of the flesh about the roots of the nails, if linnen rags wet therein be applied conueniently. The same conueyed vp in wooll after the manner of a pessary into the naturall parts of women, staieth the immoderat flux both of whites and reds. The rust of yron tempered in wine, and wrought together with Myrrhe, is good for a Greene wound: put thereto vineger, and then it helpeth the piles I and swelling bigges of the fundament. A liniment made with it, mitigateth the paine of the gout.

As touching the skales of yron that flie from the edge or point of any weapon wrought in the smiths forge: they serue in the same cases, that the rust doth, and haue the like effects, saue only this, that they haue greater acrimonie, and work more eagerly: in which regard they are employed about the repressing of the flux that falleth into watering eies. But marke this one thing: Yron being that which woundeth most and sheddeth blood, yet the skales that come from it, stanch the same: a property they haue besides to stop the flux in women: and being applied to the region of the spleene, they do open the obstructions thereof, and ease other infirmities incident thereto: the running hemorrhoids they repress, and such vlcers as are giuen to spread farther and corrode as they go. Reduced into a fine powder, and gently strewed vpon the eye-lids, they are good for the accidents thereto belonging. But the principal vse of them, and for which they are most commended, is in a certain liquid plaster called *Hygreplastum*; which serueth to mundifie wounds, vlcers, and fistulaes: to eat away all callosities, and to incarnate and engender new flesh about bones that are perished. And this is the receipt of that composition: Take of the scouring Tuckers earth the weight of two oboli, of bras six drams, of the skales of yron as much, and no lesse of wax, incorporate all these according to art in one sextar of oile. But in case there be need to mundifie any sores, or to incarnate, there would be put thereto some plain cerot besides.

CHAP. XVI.

¶ Of the Mines of Lead ore: of *white lead and blacke.

* Which seme
hold to be
Tin glasse.
* Our ordinary
lead,

NOW insueth the discourse of lead, and the nature of it; of which there be two principall kindes, the blacke, and the white. The richest of all, and that which carrieth the greatest price, is that which we in Latine name *Plumbum candidum*, i. the white bright lead, and the Greeks *Cassiteron*. But I hold it a meere fable and vaine tale, that all of it is fetched as farre as from the Islands of the Atlantick sea, and that the inhabitants of those parts doe conueigh it in little twiggen boats, couered all ouer with feathers. For the truth is, that there is found of it in these daies within Portugall and Gallæcia, growing ebbe vpon the vpmoost face of the earth, being among the sands, of a black colour, and by the weight only is knowne from the rest of the foile: and here and there among, a man shall meet with small stones of the same stuffe, most of all within the brookes that be dry sometimes of the yere. This sandie and grauelly substance, the mine masters and mettall finers vse to wash, and that which setleth downward, they burne and

& melt in the furnace. There is found likewise in the gold mines a kind of lead ore which they cal *Eluria*; for that the water that they let into those mines (as I said before) washeth and carrieth down withall certain little blacke stones streaked and marked a little with a kind of white, and as heauy they be in hand as the very ore of gold; and therefore gathered they be with the same ore, and laid in the paniers together therewith: and afterward in the furnace when the fire hath made a separation between them and gold, so soone as they are melted do resolue into the substance of the white lead or tinglasse aforesaid.

Moreover, this is strange, that throughout all Gallæcia you shal not find a mine of common black lead, & yet in Biskay (which confineth hard vpon it) there is abundance of it & no other; neither out of the vein of this white lead shal you try any siluer, whereas out of the black it is an ordinarie thing to extract siluer. Again, this is certain, that two pieces of black lead cannot possibly be sodered together without this tinglasse; neither can this be vnited to the other but by means of oile: nay it is vnpossible to conioyne a piece of tin-soder or white lead with another, but with a soder of the black. This white lead or tinglasse hath bin of long time in estimation, euen since the war of Troy, as witnesseth the poet *Homer*, who calls it *Cassiteron*. As for blacke lead, ingendred it is two maner of waies, for either it groweth in a vein of the owne without any other mettall with it, or els it doth participat with siluer in the same mine, and being intermixt in one piece or lump of ore, it is separated from it at the melting and fining only; for the first liquor that runs from it in the furnace is tin, and the second siluer. As for the third part of the vein which remaineth behind in the furnace, it is *Galæna*, that is to say, the very mettall it selfe of lead; which beeing once againe melted and tried in the fire, after two parts thereof be deducted, yeeldeth that black lead whereof we now do treat.

CHAP. XVII.

¶ Of Tin, of Argentine Lead, and other points pertinent to these matters.

IN hath a proper vse to enhuile vessels of bras, partly to take away the euil tast they haue, and to make them sweeter, and partly to preserue them from rust, or to qualifie the malitious nature of bras: and yet wonderfull it is, that such vessels thus tinned are neuer a jot the heauier by that means. Also in times past there were (as I haue already said) excellent Mirrors made of tin, and the same were tempered & wrought at Brundise: but those of siluer haue put them down since, that euery chamber-maid and such like seruing creature would be at their looking-glasses of siluer. But tin is found much counterfeited in these daies, by putting to White lead aboute said a third part of white bras; yea and there is another deuise to sophisticate tin, to wit, by mixing white and blacke lead one with another by euen weight and portion: and this maslen some call at this day, * siluer lead or argentine. As for that mixed matter wherein be two parts of black lead, and one of the white, they cal it *Tertiarium*: this kind of tinne is sold after * 30 the pound, and it is that wherewith they vse to soder conduit pipes: but the lewder disposed pewterers haue a cast to put vnto this tin called *Tertiarium*, an equal quantity of white lead and then they call it *Argentarium*: which mettall they employ in vessels for the kitchen, to seeth meat or what they list in them: and this kind of pewter wanteth no price, for they set it at 130 the pound, whereas a pound of white lead or tinglasse pure and fine of it selfe, is sold for thirty, and the blacke for sixteen. As touching the temperature and nature of the white lead, it standeth more vpon a dry substance, contrariwise, that of blacke is wholly moist and liquid: which is the reason that the said white lead or tinglasse will serue to no vse or purpose vnlesse it be mixed with some other mettall; neither is it good to lead or soder siluer with, for sooner will siluer melt in the fire than it. There is a deuise to tin pots, pans, and other pieces of bras so artificially with white lead or tinglasse (an inuention which came out of France) that hardly a man shall discerne them from vessel of siluer; and such leaded vessels are commonly called *Incothilia*. After the same maner they haue taken vp of late another custome, to siluer the trappings especially and caparisons of their horses of seruice, yea and the harness of coach-horses and draught jades, and namely in the town *Alexia*. As for the former inuention, those of Bourges haue the honour of it. Neither rested they so, but haue proceeded to adorn and garnish in

* i. Pewter, as
some take it.

* This place
seemeth to be
corrupt.

that maner their chariots, wagons, and coaches. But our vain and wastfull wantons not herewith contented, are come now to their wagon seats, not of siluer only, but also of gold: and that which in times past was condemned as monstrous prodigality, to be put into drinking vessels; the same to tread vpon now with the feet, and to waste and consume about waggon and chariots, is commended for finenesse, neatnesse, and elegancie. But to return againe vnto our white lead, if you would know whether it be right and good or no, the proof is to be made in paper: for put it melted into a sheet of paper, if it be not falsified, it will seem to break and rend the paper with the weight, and not with the scalding heat thereof.

Moreouer, it is worth the obseruation, that the Indians haue no mines among them either of brasie or lead, but are content to part with their pearles and pretious stones vnto merchants, by way of counterchange for these mettals.

Black lead or common lead is much vsed with vs for sheets to make conduit pipes; also it is driuen with the hammer into thin plates and leaues. This mettall requireth much labor & toile in Spain and France, before it be gotten out of the mine, so deepe it lieth; whereas in Brittain it runneth ebb in the vppermost coat of the ground, and that in such abundance, that by an extresse act among the Islanders themselves, it is not lawfull to dig and gather ore about such a proportion, set down by stint. Furthermore, all the black lead which now men haue in request, is known by these names, to wit, *Iovetanum*, *Capriense*, and *Oleastre*. As for the drosse and refuse that is purged from it, there is no difference at all, so that it haue the due cleansing by the fire as it ought. These mines alone of lead haue one wonderfull and admirable gift about all others, That if they be forelet a time and suffered to rest, they will grow againe and be more fertile of ore thereby. And in truth this seems to be the reason thereof, for that the aire hath good means and libertie to infuse it selfe, and to enter in at the pores and passages which it findes enlarged and open: much like as we obserue in certain women, who vpon their slips of abortiue fruit, proue thereby more fruitfull and apt to conceiue. And that this is true that I say of lead mines, it was found of late by good experience in the mines of Santaria in the prouince of Boetia in Spain: for whereas in times past for two hundred yeares together, it was wont to be set for a rent of ten pound weight, after it had taken repose and was opened againe, it yielded for euerie ten, 55. Likewise the lead mine named *Antimonianum* within the said prouince, which paid in old time but a chiefe of ten pound weight, is come now to a yearly reuenue of four hundred pound. To conclude, one marvellous quality lead hath besides, That no vessel made thereof will melt ouer the fire, if there be water in it: and yet cast into the said water a little stone, or a small piece of brasie coin, although it be no more than a Quadrant, you shall see it melt, and a hole burnt through it by and by.

CHAP. XVIII.

¶ The medicines that we haue from Lead, and the refuse and drosse of Lead: of the veine of Lead called *Molybdana* or *Galena*: of Ceruse, white Lead, or Spanish White, called *Psimithyum*: and of *Sandaracha*.

Great vse there is in physicke of lead applied by it selfe alone, and namely to repress and keepe downe the skars and cicatrices that rise about the other skin: also by the refrigerative quality that it hath to coole the heat of fleshly lust, if there be bound vnto the loins and region of the reins a thin plate or leafe thereof. And verily *Calvus* the Orator, who by occasion of much dreaming in his sleepe of venereous sports, fell into mighty pollutions, and so farther into the grieuous maladie of *Gonorrhæa* or running of the reines, with wearing ordinarily these leaden plates, stayed (by report) all such vaine and wanton fantasies and imaginations: by which means he preferred also his strength, and had a body able to endure the labor of much study and sitting at his booke. And *Nero* the Emperor (since the gods would haue it so) vsed ordinarily to weare a plate of Lead to his breast, vnder which he would chaunt out lustily with a wide throat and strong voice, his filthy Sonnets and beastly Ballads: but hee shewed thereby that Lead was a singular meanes to maintaine a good voice. But to serue otherwise in Physicke,

Physick, lead ought to be prepared and baked after this manner: take an earthen pan of potters worke, and lay one bed therein of brimstone finely poudered; vpon which, bestow another couch of thin leaues or plates of lead, and a third course ouer them of brimstone and yron file dust together, for to couer all: this being done, set the vessel into a furnace; but while these things are calcining, meet it is and necessary that the vessel or pan aforesaid be well luted and stopped close, that there be no venting or breathing hole at all; for otherwise the lead within the said pan would send forth a noisome vapour and pestilent, most dangerous to all that be within the sent thereof, but to dogges especially, whom it killeth out of hand: and verily, as this exhalation of lead is deadly vnto them, so the aire of all mettals in generall, is aduerse and contrary vnto flies and gnats: which is the reason, that a man shall neuer see any of these insects in mines, forges, and bloome-smithies, where mettals be vsually tried. Now in the calcining of lead, some there be who chuse rather to take the dust of lead gotten off with a file, & to mix the same with brimstone: others think it better to vse ceruse rather than brimstone. Furthermore, lead doth yeeld from it selfe a certaine substance by way of loture, which is of right great and manifold vse in physicke: the making whereof is in this manner, They take a leaden mortar, they pun and stamp the same with a leaden pestill, casting in raine water oftsoones; and thus they labour at it continually vntill such time as the water grow to some consistence and be thicke againe; this they permit to rest and settle: the pure and cleare portion that is aloft, they suck and foke away with sponges: the grossest part that is settled in the bottome, after it is dried, they reduce into trochisks. There be some who stamp in the same order, the file-dust which commeth of lead: others put thereto some lead ore among: and as there be many that vse vinegar or wine in this operation, so there are some againe who take greace or roses in lieu thereof. You shall haue those that for this purpose make choice of a stone mortar, especially of Thebaicke marble, but they take a leaden pestill rather than any other, to bray and pun withall: and by this means the medicinable lead will be the whiter.

Now as touching the lead calcined in manner aforesaid, it may be washed also after the order of *Antimonie* and *Cadmia*: and in this manner prepared, it is of power astringent, good to stop any flux or rheume; proper also to skin and make a smal skar. Much vse there is of lead thus burnt and washed, in collyries or eie-salues, and principally if the eies either stand out too far, or be sunke in too deepe: also it is singular to repress the excrecence of flesh in vlcers, to heale the chaps in the seat or fundament, to cure the running hæmorrhoids, and to discusse or keepe downe the blind and swolne piles: and for all these accidents in generall, the loture of lead aforesaid is most excellent. But the ashes of lead burnt and calcined, is more proper for the cure of corroding vlcers and filthy sores. And in one word, the same effects and operations it hath, that the ashes of paper. Also the manner of burning and calcining lead, is to put into a pan certaine little plates thereof, together with brimstone, turning the same euery and anon either with some yron rod or stiffe stalke and stem of *Ferula* plants, vntill such time as both the one and the other being liquefied, be conuerted & turned into ashes: the same, after that they be once cooled, ought to be punned and beaten againe, and reduced into a most pure and exquisite fine pouder. Some there be who take file-dust of lead, put the same in an earthen pot or greene potters clay, set the same into an oven, and so let it calcine therein vntill such time as the pot be well and thoroughly baked: others againe there are, who mix with lead the like quantity of ceruse, or els of barly, and pun the same like crude lead vncalcined in manner aforesaid, for a loture; and when it is reduced thus into pouder, they make more reckoning of it than of the *Cyprian Spodium*.

Ouer and besides, the drosse or refuse of lead is medicinable: and the best is that accounted, which commeth nearest to a yellow colour, without any reliques at all of the lead among; or else inclining to the hew of brimstone, and cleansed from all earthly substance: this also being braied and broken into small parcels, may be washed in manner aforesaid, and stamped with water in a mortar, vntill such time as the water looke yellow; then must it be poured forth into a pure cleane vessel; and this transuasion ought so long to be continued out of one vessel into another, vntill such time as it haue done casting any residue downward; for the sediment that resteth in the bottome is the best, working the self-same effect as lead doth, but with more acrimony. When I consider all this, mee thinkes I cannot sufficiently admire the diligence of men, who haue made such experiments of all things in the world, sparing not so much as the very

ordure, offall, and filthy excrements, but haue tried conclusions therein so many waies, and left nothing vnattempted.

There is a kind of Spodium also made of lead in the furnace, after the same manner as I shewed before, of copper or Cyprian brasse: the order of washing wherof, is this; to put it in a course linnen cloth, and to lay the same in rain water, that the terrene substance may be separated from the rest that is transfused or passeth through the cloth with the water: and yet the same must be cribled or forced afterwards, and beaten to powder. Some thinke it better to wipe and scoure off the dust from the Calamine with wings, and then to beat it in a mortar with the most odoriferous wine they can get.

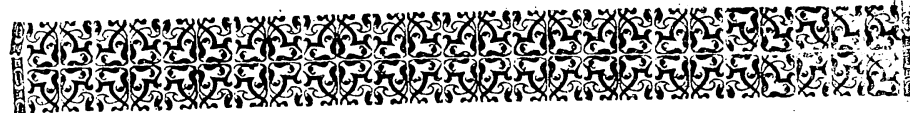

There is besides, a minerall named Molybdæna, which elsewhere I haue called Galæna; by which I meane in this place, the ore or veine that containeth within it, both siluer and lead: the better this is thought to be, the more that it inclineth to the colour of gold, and the lesse that it standeth vpon lead: the same also is brittle, apt to crumble, and in proportion of the quantity not very weighty in hand: the same, if it be boiled with oile, will in colour resemble liuer. There is a kind of Galæna likewise that sticketh to the furnaces of gold and siluer: but this (wherof I now speake) they call Metallica, that is to say, the Minerall: and verily the best of this kinde, is that which is found in Zephyrium: the marks wherof are these; if it haue little or no earth in it, nor be any waies stony: the same is burnt, calcined, and washed, neither more nor lesse than the drosse Scoria. Much vsed this minerall is in those vnctuous liniments or salues called Liparæ, deuised as lenitiue & refrigerant, for vlcers: also it entrencheth into plasters which are * not mordicant: but being applied to any fore in tender and delicat bodies, and in the softest parts, it doth heale faire, and skin throughly. The composition of which plasters, is after this manner; Take three pound weight of this minerall lead Molybdæna, put thereto of wax one pound, and of oile three hemines, which done, incorporat all together (according to art) into the forme of an emplatre. Now if it so fall out that the patient be an elderly body, there would be an addition put thereto of the lees or mother of oile oliue. This minerall may be tempered also to right good purpose, with litharge of siluer, and the drosse of lead, and then it is a most excellent medicine (to be injected by a clystere) for the dysenteric or bloody flux; for the tinesm also, which is an inordinat desire to the stoole without doing any thing; prouided alwaies, that the belly be fomented besides with hot water.

There is another mineral besides, called Psimithyum, which is al one with Ceruse: and this, the furnace and mine of lead ore doth yeeld: but the best of this kind is brought from the Island Rhodes. The manner of making it is this: Take the finest pieces that are scraped from lead, let the same be hung ouer a vessell of the strongest and sharpest vineger that possibly can be had, that they may distill thereinto: and looke what of it is fallen into the said vineger, must be dried afterwards, ground into powder, and searced; & then a second time it ought to be tempered with vineger, and so reduced into seuerall trochiskes, to be dried in the Sun during Summer. There is another way of making Ceruse besides this; namely, to put lead into certaine pots or pitchers of vineger well and throughly stopped, that no aire go out, and therein to let it rest for ten daies space together: after which time, to take it forth, and scrape from it the mouldinesse or vineger, continuing so, vntill such time as the lead be consumed to nothing. Now that which hath been thus scraped from it, they take and beat into powder, they searce it also very fine, calcin it ouer the fire in a pan, stirring and mixing it together with little slices or pot-sticks, vntill such time as it wax red, and be like vnto Sandarach. After all this, they wash it in fresh water so long vntill that all the grossenesse be scoured off: which when it is dry, in like manner as before, they digest into trochiskes. This Ceruse serueth to the same purposes that the rest abouenamed (onely of al the other it is lightest in operation) and besides serueth to make an excellent blanch for women, that desire a white complexion: but deadly it is, being taken inwardly in drink; like as letharge also. This ceruse thus made, as white as it is, in case it be afterwards burnt againe, turneth to be reddish.

As touching Sandarache, I haue already shewed in manner all that concerneth the nature of it; howbeit, this would be noted ouer and aboue, that it is found in the mines as well of siluer as of gold; the redder it is, and of a more strong and violent smell, the better men take it to be; such also is pure, clear, and brittle withal, or easie to crumble: mundificatiue it is and astringent, heating

heating also and exceeding corrosiue: and the principal vertue that it hath, is to fret and putrifie whatsoeuer it worketh vpon: in a liniment with vineger, it causeth the haire to come vp thicke againe in places despoiled thereof by any disease. It entrencheth into collyries or eie-salues: reduced into a lohoch with hony, it clenseth the throat, and maketh a cleare shrill, and loud voice: eaten by way of a bole with turpentine, it is a gentle and pleasant medicine for those that be short-winded and troubled with the cough: a perfume also made with it and Cedar together, is good in the same cases, so that the smoke be receiued vp at the mouth. As for * Arsenicke, it is of the same stuffe: that which is best of this kind, resembleth burnished gold in colour: the paler kind inclining to the colour of Sandarach, is thought to be the worse. A third sort there is, of a middle and medled color, compounded as it were of gold and Sandarach. These two later kinds be skaly aloft: as for the first, which is dry and pure, it is ful of small veins running here and there, whereby it is apt to cleaue as the veine goeth. Of the same operation is Arsenicke as the rest, but that it is more hot and biting; in which regard, it is vsed in potentiall cauteries, and depilatories: it taketh away the carnosities and apostemations about the nailes of the fingers: the superfluous flesh also within the nostrills: the bigs that hang forth of the fundament: and in one word, it eateth away any excrecence whatsoeuer. To conclude, much better it is and more powerful in operation, in case it be calcined in a new earthen pan, where it must torrifie so long vntill it change the colour.

* Yellow orpiment.

THE XXXV. BOOKE OF THE HISTORIE OF NATURE, WRITTEN BY C. PLINIUS SECVNDVS.

The Proem.

THE discourse of Mines and Metalls, wherein principally consisteth the wealth of the world: of other Minerals also growing to them, with the Natures, Operations, and effects of them all, is an argument so knit and annexed to Physicke, that the handling thereof, (which I haue already well-neare performed) not onely discovereth a world of wholesome medicines profitable for the life and health of man, but also inferreth a number of hidden secrets, couched within the Apothecaries shops; yea, and openeth the way vnto the curious Art and subtill deuises of Grauers, Painters, and Diers, inducing me withall to take them also before me, and to treat thereof accordingly: which when I haue done, there remaineth yet for mee a new worke to take in hand; namely, to write of sundry kinds of Earth and Stone, and those linked together & carying with them a longer traine by far, than the former minerals. Concerning which, other authors, and the Greeke writers especially, haue so particularized, that of each one of them they haue written many volumes. For mine owne part, I mean not to follow their steps, but by way of compendious breuitie, to proceed as I haue begun, and yet to omit nothing that is necessary, profitable, and pertinent to Nature.

CHAP.

CHAP. I.

¶ The honour of flat picture in old time.

O begin then with that which remaineth as touching Picture and Painting, this would be knowne, That in times past it was reputed a noble and excellent art: in those daies I meane, when Kings and whole Sates made account thereof; and when those onely were thought innobled and immortalized, whom Painters vouchsafed to commend by their workmanship to posterity. But now, the marble and porphyrit stones haue put painting clean down: the gold also laid vpon them hath woon all credit from painters colours: gold I say, wherewith not only plain and entire walls are richly guilded all ouer, but also the polished works of marble engrauen vpon them after the manner of inlaid work and marquetage of diuers pieces, resembling men, beasts, and floures, and all things else: for in these daies contented we are not with plaine squares and tables of marble, nor with the riches of mighty mountains, couchr vnder couert, & laid within our bed-chambers in that sort as they grew, but come we are now to Emperor, the inuention was taken first in the daies of *Claudius Caesar*: but when *Nero* came to be Emperor, the inuention was taken vp, to giue those colours to stones in their superficiall outside, which they had not of their own; to make them spotted, which naturally were of one simple colour: that by the helpe of mans hand, the * Numidian red porphyrit should be set out with white spots in * eg. fashion: the * Siniadian grey marble distinguished with marks and strakes of purple: as if our delicate wantons shewed thereby how they could haue wished the stones to grow. Thus would they seem to correct the works of Nature, to supply the wants of mountains and quarries, and to make amends for the hills clouen in funder for gold, and hewed in pieces for marble. And what is the end of all this prodigious prodigality and wastfull superfluity? but that the fire when it commeth, may consume in one houre a world of wealth.

* Numidicus.
* Oatius.
* Siniadicus.

CHAP. II.

¶ The estimation and account that was made of Images in times past, represented by liuely pictures.

The manner was in ancient time, to continue and perpetuat the memorial of men, by drawing their pourtraitures in liuely colours, as like to their proportion and shape as possibly could be; but this custome is growne now altogether out of vse: in stead whereof wee haue shields and scutcheons set vp of brasle: we haue faces of siluer in them, without any liuely distinction of one from another: and as for our testerees, the heads vpon them otherwhiles be changed one for another: which hath giuen occasion long since of many a jest and libel spread abroad in rime and sung in euery street. In so much as all men now adaies are more desirous to haue the rich matter scene that goeth to the making of images, than to be knowne by their own personage and visage as it is: and yet euery man delighteth to haue his cabinet and closet well furnished with antique painted tables: the statues & images of other men they think it enough to honor and adore, whiles they themselves, measuring worship by wealth, & thinking nothing honorable that is not sumptuous and costly, see not how by this meanes they giue occasion to their heires for to break open their counters and make spoile of all, or els before that day come, entice a thiefe to be hooking or twitching them away with gins and snares. Considering then, that no man careth for a liuely picture, all the monuments that they leaue vnto their heires, are images rather of their monies, than resemblances of themselves. Howbeit, these great men take pleasure to haue their owne wrestling places and halls of exercise, yea and the roomes where they are annointed, beautified and adorned with the pourtraitures of noble champions: they delight also to haue the face of *Epicurus* in euery chamber of the house, yea and to carry the same about them vpon their rings wheresoeuer they go: in the remembrance and honour of his natiuitie, they doe offer sacrifice euery 20 day of the Moone, and these moneth-minde they keep as holy-daies duly, which thereupon they call *Icades*: and none so much as they who will not abide to be knowne another day by any liuely image drawne whiles they be alieue. Thus it is come to passe, that whiles artificers play them and sit still for want of worke, noble arts by the means

* for they were
so made that
they might be
taken off and
set on againe.

A means are decayed and perished. But I maruel nothing hereat: for thus it is verily and no otherwise, when we haue no respect or care in the world to leaue good deeds behind vs, as the Images of our minds, we do neglect the liuely portraitures and similitudes also of our bodies. In our forefathers daies ywis it was otherwise: their halls and stately courts were not set out with images and pourtraitures after this sort, there were not in them to be scene any statues or images wrought by artisan strangers, none of brasle they had, none of marble, their Oratories & Chapels were furnished with their own and their ancestors * pourtraitures in wax, and those liuely and expressely representing their visages; these were set out and disposed in order, these were the images that attended the funerals of any that was to be interred out of that stock & lineage. Thus alwaies as any gentleman died, a man should see a goodly traine of all those which were liuing of that house, accompanying the corps, causing also the images of their predecessors to march ranke by ranke in order, according to their feuerall descents: in which solemne shew, the whole generation that euer was of that family, represented by these images, is there present, ready to performe that last duty and honour to their kinsman. Moreouer, wheresoeuer these images stood within the oratory and chappell before said, there were lines drawne from them vpon the wall, directing to the feuerall titles and inscriptions which contained their stile, their dignities and honors, &c. As for their studies and counting houses, full they were of books, records, and rols, testifying all acts done & executed by them both at home & abroad, during the time they were in place to beare office of state.ouer and besides those images within house, resembling the bodily shape & countenance, there were others also without dores, to wit, about the portals and gates of the house, which were the testimonies of braue minds & valiant hearts: there hung fixed the spoiles conquered and taken from the enemies, which notwithstanding any sale or alienation, it was not lawfull for the purchaser to pluck down; in such sort, as the house it self triumphed still and retained the former dignity, notwithstanding it had a new lord and master: and verily, this was to the master and owner a great spur to valour and vertue: considering, that if he were not in heart & courage answerable to his predecessor, he could neuer come in at the gates, but the house was ready to reproch and vpbraide him daily for entering into the triumph of another. Extant there is vpon record, an Oration or a & of *Messala* (a great Orator in his time) wherein vpon a great indignation he expressely forbad that there should be intermingled one image that came from another house of the *Leuini*, among those of his owne name and lineage, for feare of confounding the race of his family and ancestors. The like occasion moued and inforced old *Messala* to put forth and publish those bookes which he had made of the descents and pedigrees of the Roman houses: for that vpon a time as he passed through the gallerie belonging to *Scipio Africanus* his house, he beheld therein his stile, augmented by the addition of *Salutio* (for that was one of his synames) which fel vnto him by the last wil and testament of a certain rich man so called, who adopted him for his owne son: as being greatly discontented in his minde, that so base a name as that (to the shame and dishonor of the *Africanus*) should creepe into the noble family of the *Scipio's*. But if I may speak without offence of these two *Messala's*, it should in my conceit be some token of a noble spirit and good mind that loueth and imbraceth vertue, to entitle his owne name, although vntruly, to the armes and images of others, so long as they be noble and renowned: and I hold it a greater credit so to doe, than to demeane our selues so vnworthily, as that no man should desire any of our armes or images. And seeing that I am so far entered into this theam, I must not passe ouer one new deuise and inuention come vp of late, namely, to dedicate and set vp in libraries the statues in gold or siluer, or at leastwise in brasle, of those diuine and heauenly men, whose immortal spirits do speak still and euer shall, in those places where their bookes are. And although it bee vnpossible to recouer the true and liuely pourtraits of many of them, yet we forbear not for all that to deuise one Image or other to represent their face and personage, though we are sure it be nothing like them: and the want thereof doth breed and kindle in vs a great desire and longing, to know what visage that might bee indeed which was neuer deliuered vnto vs: as it appeareth by the statue of *Homer*. Certes, in my opinion there can be no greater argument of the felicity & happinesse of any man, than to haue all the world euermore desirous to know, What kinde of person hee was whiles he liued? This inuention of erecting libraries, especially here at Rome, came from *Asinius Pollio*, who by dedicating his Bibliothetheque, containing all the bookes that euer were written, was the first that made the wits and workes of learned men, a publique matter and a benefit to a Commonweale.

But

* Ptolomæus.
* Philadelphus.
* Attalus.

But whether the kings of * Alexandria in Egypt, or of * Pergamus, began this enterprife before G (who vpon a certain emulation and strife one with another, went in hand to make their stately and sumptuous libraries) I am not able to auouch for certain. But to returne againe to our flat images and pictures; that men in old time delighted much therein, yea, and were carried away with an ardent and extraordinary affection to them, may appeare by the testimony, not only of *Atticus* that great friend of *Cicero's* (who set forth a book intituled, A Treatise of painted images) but also of *M. Varro*, who in all his volumes, whereof hee wrote a great number, vpon a most thankfull and bountifull mind that he carried, deuised to insert not onely the names of 700 famous and notable persons, but also in some sort to set down their physiognomy & resemblance of their visage: not willing as it might seem that their remembrance should perish, but desirous to preserve the shapes and portraits of so worthy personages against the injury of time, which H weareth and consumeth all things, indeuoring by this means, & as it were in a kind of emulation struing to do as much for them in this behalf, as the gods could do, not only in giuing them immortality, but also by dispersing those pourtrails into all parts of the world, to shew them personally in euery place to the eyes of men, as if they were present.

CHAP. III.

¶ At what time scutchions and shields, with images ingrauen in them, were first erected in publique place. Where they began to be set up in priuat houses. The originall of pictures. The first pourtrait that was of one single colour. Of the first Painters. How antient the Art of Painting was in Italy.

AND this verily which *Varro* did, namely, to insert the names & counterfeits of famous men in his books, was to gratifie strangers only. But of those who were desirous in this kinde, to honour Romans, I find in the Chronicles, that *Appius Claudius* was the first (him I meane, who in the 259 yeare after the foundation of the city of Rome, bare the Consulship with *Seruius*, and namely, by dedicating in temples and publicke places of the city, the shelds of his predeceffours by themselves alone. For within the chappell of *Bellona*, hee caused to bee set vp the scutchions and shields of his ancesors, taking great contentment to haue the armes of his predeceffors seen on high, and the same accompanied with the titles of their honorable dignities to be read. A goodly shew, no doubt, and a magnificent, in case there should be shewed withall a long descent of petty images representing a number of children, as it were the nest of a faire brood and off-spring: for who would not take great joy and pleasure to see such a sight, who would not fauorably behold the arms of such a race and linage? After that *Appius Claudius* had giuen this precedent at Rome, there followed *M. Æmilius*, companion in the same Consulship with *Q. Lutatius*, who not contented to haue the Armoires and coats of his Progenitors, to be aduanced aloft in the stately hall and pallace *Æmilia* only, tooke order, that they should stand also at home in his owne house: and this also was a matter of right great consequence, beeing done according to the pattern and example of the martiall worthies in *Homer*: for within these shields & scutchions, resembling those which were vsed in old time in the battels before Troy, were represented the images of such as serued with them, ingrauen therein: for thereupon such shields took the name * *Clypeus*, chafed and ingrauen, not of the old word in Latine *Cluere*, which signifyeth to fight, or to be well reputed, as our thwarting Grammarians would with their subtle sophistrie seeme to etymologize and deriue it. Certes, this originall of shields and coats of armours, implied a braue mind and noble spirit full of vertue and valour, when euery mans shield shewed the liuely portrait of him that bare it in the warres. The Carthaginians were wont to make their targuets of beaten gold, and those likewise they caused to bee ingrauen with their own portraits, & carried the same with them to the wars. And verily, *Q. Martius* that worthy warrior, and reuenger of the 2 *Scipio's* in Spain, hauing defeated the Carthaginians & taken many of them prisoners, found among other spoils and pillage, the shield of *Asdrubal*, made in manner asore said: Which shield was erected & hung vp ouer the porch of *Iupiters* temple vpon Capitoll hill, and remained there vnto the first fire that consumed the temple. And seeing I am fallen vpon this poynt, namely, of erecting the armours woon from enemies, in publicke place; I may not passe over in silence the securitie and carelesse regard that our forefathers had in this behalfe:

* Quasi glypei,
id est quasi
i. d. Calens.

A behalfe: which was so great, that *M. Aufidius*, who farmed and vndertook the custody or keeping of the Capitoll, the temple, and all therein, the same yeare wherein *L. Manlius*, and *Q. Fulvius* were Consuls, and which was from the foundation of the city of Rome 575 yeares, aduertised the Senat, That those shields there, which for so long together were appointed & assigned thither by the Censors, were not of brasse, as they had been taken for, but of siluer.

Concerning pictures, and the first originall of painters art, I am not able to resolute and set downe any thing for certain: neither is it a question pertinent to my designe and purpose. I am not ignorant that the Egyptians do vaunt thereof, auouching that it was deuised among them and practised 6000 yeres, before there was any talk or knowledge thereof in Greece: a vain brag and ostentation of theirs, as all the world may see. As for the Greeke writers, some ascribe the B inuention of painting to the Sicyonians, others to the Corinthians. But they do all jointly agree in this, That the first pourtrait was nothing els but the bare pouring and drawing onely the shadow of a person to his iust proportion and liniments. This first draught or ground, they began afterwards to lay with one simple colour, and no more: which kind of picture, after that they fell once to more curious workmanship, they called Monochromaton, i. a pourtrait of one colour, for distinction sake from other pictures of sundry colours: which notwithstanding, yet this plaine manner of painting continueth at this day, and is much vsed. As for the linearie portrauing or drawing shapes and proportions by lines alone, it is said, that either *Phidias* the Egyptian, or els *Cleantes* the Corinthian was the inuenter thereof. But whosoever deuised it, certes *Arctides* the Corinthian, and *Telephanes* the Sicyonian, were the first that practised it: howbeit colours they vsed none, yet they proceeded thus far as to disperse their lines within, as well as to draw the pourtrall, and all with a coale and nothing els. And therefore their manner and order was to write also the names of such as they thus painted, and alwaies to set them close to the pictures. But the first that tooke vpon him to paint with colour, was *Cleophantus* the Corinthian, who (as they say) took no more but a peece of a red potsherd, which he ground into powder and this was all the colour that he vsed. This *Cleophantus*, or some other of that name, was he who by the testimony of *Cornelius Nepos*, as I will anon shew more at large, accompanied *Demetrius* the father of *Tarquinius Priscus* king of Rome, when he fled from Corinth to auoid the wrongs of *Cypsellus* the tyrant, who persecuted and oppressed him. But it cannot be so: for surely before this *Tarquines* time, the art of painting was grown to some perfection, euen in Italy: for D prooue wherof, extant there be at this day to be seen at Ardea within the temples there, antique pictures, and indeed more antient than the city of Rome: and I assure you, no pictures came euer to my sight, which I wonder so much at, namely, that they should continue so long, fresh, and as if they were but newly made, considering the places where they be, so ruinar and vncouered ouer head. Semblably, at Lanuvium there remaine yet two pictures of lady *Atalanta*, and queen *Helena*, close one to the other, painted naked, by one and the same hand: both of them are for beauty incomparable, and yet a man may discern the * one of them to be a maiden, for her modest and chaste countenance; which pictures, notwithstanding the ruins of the temple where they stand, are not a whit disfigured or defaced. Of late daies, *Pontius* lieutenant vnder *C. Caligula* the Emperor, did what he could to haue remoued them out of the place, and carried them away whole and entire, vpon a wanton affection and lustfull fancy that he cast vnto them: but the plaste or porget of the wall whereupon they were painted, was of that temper that would not abide to be stirred. At Cære there continue certaine pictures of greater antiquity than those which I haue named. And verily, whosoever shall well view and peruse the rare workmanship therein, will confesse, that no art in the world grew sooner to the height of absolute perfection than it, considering that during the state of Troy no man knew what painting was.

* Atalanta.

CHAP. IIII.

¶ Of Romanes that were excellent Painters. When the art of painting came first into credit and estimation at Rome. What Romanes they were that exhibited the pourtrails of their owne victories in pictures. And about what time painted tables made by strangers in forreine parts, were accepted and in great request at Rome.

AMONGST the Romanes also this Art grew betimes into reputation; as may appeare by the *Fabij*, a most noble and honourable house in Rome, who of this science were surnamed *Pictores*,

Pictores, i. Painters: & the first who was intituled with that addition, painted with his own hand G the temple of *Salus*; and this was in the 450 yeare after the foundation of our city: which painting continued in our age, even vnto the time of *Claudius Caesar* the Emperor, in whose daies the temple it selfe with the painting, was consumed with fire. Next after this, the workmanship of *Pacuvius* the Poet (who likewise painted the chappell of *Hercules* in the beast-market at Rome) was highly esteemed and gaue much credit to the art. This *Pacuvius* was *Ennius* the Poets sitters sonne: and being as he was a famous Tragædian besides, and of great name vpon the stage, the excellency of his spirit that way, much commended at Rome his handy-work and painting afore said. After him, I doe not finde that any person of worth and quality tooke penfull in hand and practised painting, vnlesse haply a man would nominate *Turpilus* a gentleman of Rome in our time, and a Venetian born, of whose workmanship there be many faire parcels of paynting H extant at this day in Verona: and yet this *Turpilus* was altogether left-hanued, and painted therewith; a thing that I doe not heare any man did before him. As for *Aterius Labeo*, a noble man of Rome, late Lord Pretour, and who otherwise had been vice-consull in Gallia, Narbonensis or Languedoc, who liued to a very great age and died not long since, he practised painting; and all his delight and glory that he tooke, was in fine and smal works of a little compasse: howbeit he was but laughed at, and scorned for that quality, and in his time the handicraft grew to be base and contemptible. Yet I thinke it not amisse to put downe for the better credit of painters, a notable consultation held by certaine right honourable personages as touching the Art, and their resolution in the end. And this was the case: *Q. Papius*, the little nephew of *Q. Papius*, who had bin Consull in his time and entred Rome in triumph, him I mean whom *C. Caesar* Dictator, made co-heire with *Augustus*, hapned to be born dumb; and *Messala* the great Oratour, made out of whose house the grandmother of this child was descended, being carefull how the boy should be brought vp; after mature aduise and deliberation, thought good that hee should by signes and imitation be trained vp in the art of painting, which counsell of his was approoued also by *Augustus Caesar*. And in truth, this yong gentleman being apt thereto, profited marvellous much therein, and died in his youth. But the principall credit that painters attained vnto at Rome, was, as I take it, by the means of *M. Valerius Maximus*, first surnamed *Messala*, who being one of the grand-seigneurs of Rome, was the first that proposed to the view of all the world, and set vp at a side of the stately hall or court *Hortilia*, one picture in a table, wherein hee caused to be painted that battell in Sicily wherein himselfe had defeated the Carthaginians and *K. Hiero*, which happened in the yeare from the foundation of Rome 490. The like also, I must needs say, did *L. Scipio*, and hung vp a painted table in the Capitol temple, containing his victory and conquest of Asia, whereupon he was surnamed *Asiaticus*. But (as it is said) *Africanus* although hee were his owne brother, was highly displeased therewith: and good cause he had to be angry and offended, because in that battell his own son was taken prisoner by the enemy. The like offence was taken also by *Scipio Emilianus*, against *Lucius Hostilius Mancinus*, who was the first that entered perforce the city of Carthage; for that hee had caused to be set vp in the market place of Rome a faire painted table, wherein was liuely drawne the strong scituation of Carthage, and the warlike means vsed in the assaulting and winning of it, together with all the particulars and circumstances thereof: which *Mancinus* himselfe in person sitting by the said picture, desciphered from point to point vnto the people that came to behold it; by which courtesie of his hee wooon the hearts of the people, in so much, as at the next election of Magistrates, his popularitie gained him a Consulship. In the publicke plaies which *Claudius Pulcher* exhibited at Rome, the painted clothes about the stage and Theatre (which represented building) brought this art into great admiration: for the workmanship was so artificiall and liuely, that the very rauens in the aire, deceived with the likenesse of houses, flew thither apace for to settle thereupon, supposing verily there had been tiles and crests indeed. And thus much concerning Painters craft, exercised in Rome.

To come now to forraign pictures, *Lu. Mummius*, surnamed *Achaicus* (for his conquest of Asia) was the first man at Rome, who made open shew of painted tables wrought by strangers, and caused them to be of price and estimation: for when as in the port-sale of all the bootie and pillage gotten in that victorie, king *Attalus* had brought one of them, wrought by the hand of *Arifides*, containing the picture only of god *Bacchus*, which was to cost him * six thousand sesterces, *Mummius* wondering at the price, & supposing that this table had some speciall and secret

cret propertie in it more than himselfe knew of, brake the bargain, called for the picture again, & would not suffer it to be caried away, notwithstanding *Attalus* complained much at the hard measure offered vnto him; and so he brought it with him to Rome, and dedicated it in the chappell of *Ceres*. And verily this I take to be the first painted table of a forreiners making, that euer was set vp in publick place at Rome. But after he had once begun, I see it was an ordinary thing to adorn and beautifie euen the common place also with such like: for vpon this occasion arose that pretty scoffe which was giuen by *Craffus* the Oratour, as hee pleaded vpon a time vnder the * old *Rostra*: for when there was a Witnesse produced to depose against him, whom hee would seeme to challenge and reprove, whereupon the party replied again and vrged him instantly in these termes, Speake out *Craffus*, and in the face of all this Court say, what kinde of person you would make me to be? Mary (quoth he again) I take thee to be such an one (pointing directly to a table hanging there by, wherein was painted a certain Frenchman yawning and lolling out his tongue full sauoredly.) In the same Forum or Grand place at Rome there stood sometime the picture of an old shepheard leaning vpon his crooke, as touching which (for that as it should seeme it was very workmanlike made) when a certain Dutch Embassador who beheld it, was demanded, at what price hee esteemed it; answered short & quick, What a question is that: I would not haue such an one (were he aliuie, as I see he is but painted) though he were giuen me for nothing. But if I should speake at once, who it was that gaue the greatest countenance vnto such tables in open view, I must needs say it was *Caesar* dictatour, who shined the pictures of *Ajax* and *Medea* in no meaner place than before the temple of *Venus Genetrix*. Next after him came *M. Agrippa*, a man by nature inclined rather to rusticitie than to delights, and more like a rude peasant than a ciuill gentleman. But surely there is extant a worthy Oration of his, and becomming the principal person of a whole city, as touching the open sale of all painted tables, statues, and images, that were in the hands of priuat men, and the setting of them vp in publicke places for to adorn the city: which no doubt had bin far better than to haue them banished (as it were) and sent as they be into the country, to beautifie manors and retyring houses of pleasure: howbeit as sterne and grim a fir as he was, he could find in his heart to bestow vpon two tables with the pictures of *Venus* and *Ajax*, 12000 sesterces, which he paid vnto the *Cyzicenes* for them. Also hee had caused to be set in marble stone in chafed, within the hottest part of his baths, many rich pictures of a small making, and couched in small tables, the which were taken away but a little before the said baths were repaired. But aboue all that euer were, *Caesar Augustus* the Emperour of famous memory, did set vp in the most frequented or perspicuous place of his Forum or stately hal, two excellent painted tables, one containing the liuely portrait of *VV*, the other of Triumph. He also dedicated the pictures of *Castor* and *Pollux*, besides others, whereof I will write in my catalogue of Painters: which he hung vp all within the temple of *Iulius Caesar* his father. The same *Augustus Caesar* inclosed within the wall of that Curia, which hee erected and consecrated in the common place called Comitium, two Tables painted; the one resembling the Forrest Nemea, in habit of a woman sitting vpon a lion, she carrieth in her hand a date tree; and there standeth by her an old man resting vpon his staffe, ouer whose head there was a pretty tablet hanging down as a label, from a chariot drawn by two horses, with this inscription, *Nicias me inuicit*; i. *Nicias* inamelled or wrought me with fire: for that verb [*inuicit*] it pleased him to vse. As for the other table, the admirable workmanship therein was this, An old grey-beard accompanied with his son, a youth exceeding like his father, saue onely for the difference in age, which appeared in the yong down that sprung vpon his cheeks and chin. A deuise there was besides of an *Egle* flying ouer their heads, clasping a dragon within her talons: and as it appeared by the superscription, *Philochares* was the workman. By which one table (if there were no more but it in the whole world) a man may make an estimate of the infinite power that is in this art, which could cause the Senat & people of Rome to take such pleasure so many yeares together to look vpon *Glaucion* and his son *Aristippus*, persons otherwise most base and contemptible, onely in respect of *Philochares* who painted them. As for *Tiberius Caesar* the Emperour, albeit hee was a prince of all other least curteous and affable, yet he delighted to hang vp those painted tables within the temple of *Augustus Caesar*, whereof I mean to write hereafter.

* *Subveneribus*, which some interpret *Tavernis*.

Quintilianus reporteth this otherwise.

or rankling matter that lieth secret within: for if a place be anointed therewith, when it is reduced into a liniment with water, in case it wax not dry, be sure there is some suppuration vnderneath.

As touching Sandaracha and Ochra, K. Iuba writeth, that they are to be found in Tapazus, an Island within the red sea; but that which we haue, was neuer brought from thence. How Sandaracha is ingendred, I haue said already in the discourse of mines. There is an artificiall and sophisticated Sandaracha, made of cerusse burnt in a furnace. The colour of Sandaracha ought to be fiery like a flame: a pound thereof is bought for 5 Asses, i. halfe a denier. Calcine this and Ruddle together, and of both, being concorporat in equall quantity, you shall haue the color called Sandyx. Howbeit, I do obserue in *Virgil*, that he took Sandyx for an herb, as may appear by this verse:

Sponte sua Sandyx pascentes vestiet agnos.
A ruddie fleece shall Sandyx yeeld,
To lambs, as they do graze in field.

This Sandyx to be bought and sold, carrieth but halfe the price of Sandaracha: neither bee there any colours more weighty than these in the ballance.

Among the artificiall and made colors, I reckon Scyricum, which as I haue already said, serueth for a good ground to take vermillion. The maner of making it, is to mix the best ruddle Si-nopis and this Sandyx together.

Painters black [called in Latine Atramentum] I count an artificiall colour, although I know there is a vitrioll or coperoze going vnder that name, which is minerall, and is ingendred two manner of waies: for either it issueth and ooseth out of the mine in maner of a salt humor or li- quor; or els there groweth an earth it self of a brimstone colour, which serueth for it, that it may be drawn out thereof. Some painters haue bin knowne, who for to get black, haue searched into sepulchres for the coles there, among the reliques and ashes of the dead. But in mine opinion, all these be but new deuises, and foolish irregular roies without any reason; for a man need seek no farther but to foot, and that made many waies, by burning either of rosin or pitch: in which regard, many haue built places and forges of purpose to burn them in; without any emissaries, tunnels, or holes, that the said foot or smoke may not get forth: but the best black in that maner made, comes of the smoke of torchwood. This fine foot is sophisticated with grosse foot that doth gather and ingender in forges, furnaces, & stoups: and this is that inke wherewith wee vse to write our books. Some there be who take the lees or dregs of wine, and when it is dried, boile it throughly; and they affirme, that if the wine were good whereof those lees came, the said inke or black will make a colour like Indico. And in truth, *Polygnotus* and *Mycen* (two as renowned painters as euer were) vsed no other black at all, but that which they made of the mare or refuse of grapes after they be pressed, & this they cal Tryginon. *Apelles* deuised a way by himself, to make it of yuorie or the elephants tooth burnt, and this they named therupon Elephantinum: as touching the black called Indicum, it is brought from India: but as yet I know not the maner either of the making or the ingendring of it. A kind thereof I see the diers do make, of that black florie which sticketh to their coppers. Also, there is a black made of torchwood burnt, & the coles that come of it punned to powder in a mortar. And here commeth to my mind the wonderfull nature of Curtle fishes, which do yeeld a black humor from them like to inke: howbeit, I do not find that painters or writers make any vse thereof. But all blacks whatsoever take their perfection by sunning: if it be writing inke, with gum (Arabick;) if to colour pargetting or walls, with glew among; and lookewhat blacke is dissolued and liquified in vineger, the same will hold well and hardly be washed off. And thus much of the ordinary colours low prized.

Of all the colours besides, which (as I said once before) for their high price the poore painters be serued with from their masters hands who set them on worke, the rich roset or purple red that is made of Tripolie or goldsmiths earth, is simply the best: for this Tripolie is commonly died together with purples; and no silk, wooll, or cloth, wil so soon take that tincture as it. The principal is that, which hauing had the floure of a farr, hath drunk the fil as it were, whiles the liquor is yet boiling, and the drugs within the caudron be in their verdure and haue not lost the heart. When this first Tripoly thus deeply died, is cast vp and taken forth, that which is put in next into the said liquor, is counted the second in goodnes; & so consequently by degrees; for the former euer taketh the higher die, & the oftner you dip therein, the weaker will the tincture be: which is the reason that the roset or purple red of Puteoli, is more commended, than either the

the Tyrian, Getulian, or Lacedemonian, notwithstanding from thence come the most rich and pretious pearls. The reason is, because the Tripoli in Puteoli is died most with the juice of the Magaleb berries among, which yeelds the gallant red, & besides, is forced to drink the tincture of Mader. That roset which is made at Canusium is the worst of all other, and carrieth the lowest price: a pound of roset costeth vsually * 30 deniers Roman. Painters or complexioners, when they would counterfeit a lustre or glosse of vermillion, lay a ground first with Sandyx, and then charge roset vpon it with the white of an egg: but if they be desirous to make a purple colour, the first course or ground is azur, and straitwaies they come vpon it with * roset and the white of an egg aboue said. After this rich and liuely roset or purple red, Indico is a colour most esteemed: out of India it comes, wherupon it took the name; and it is nothing els * but a slimy mud cleauing to the some that gathereth about canes and reeds: while it is punned or ground it looketh black, but being dissolued, it yeelds a wonderfull lovely mixture of purple and azur. There is a second sort of it found swimming vpon the coppers or vats in purple Diers worke-houses: and in truth, nothing els but the very some or scum that the purple casts vp as it boileth, in maner of a florey. Some there be that do counterfeit and sophisticat Indico, selling in stead thereof pigeons dung, Selinusian earth, and Tripoli, died and deeply coloured with the true Indico: but the prooffe thereof is by fire, for cast the right Indico vpon liue coles, it yeeldeth a flame of most excellent purple, and while it smoketh, the fume senteth of the sea; which is the reason that some do imagine it is gathered out of the rockes standing in the sea. Indico is valued at 20 denarij the pound. In physicke there is vse of this Indico, for it doth assuage swellings that doe stretch the skin: it represseth violent rheums and inflammations, and drieth vlcers.

The land of Armenia doth furnish vs with the colour verd d' azur, and of that country it is named Armenicus: a stone it is that is likewise died before it can die, in manner of Borrax or verd d' terre: the best is the greenest, & yet withall it doth participat the colour of azur, in which regard it may properly be called Verd d' azur. In times past a pound of it was held at 300 Sesterces: but since there was found in Spain a kind of sand that would take the like tincture and do as well, the price hath bin well abated, and is come downe to six deniers. All the difference between this colour and azur is this, for that it stands more vpon the white, which causeth this colour to be lighter and weaker. The only vse that it hath in physick, is to nourish hairs, & especially those of the eie lids.ouer and besides all these colours aboue named, there be two more newly come vp, and those beare but a very low price; to wit, the green called Appianum, & oft times it is taken for Borrax or Verd d' terre, as if there were not other things enough that did counterfeit and resemble it. Made it is of a certain Greene chalky earth, & is worth but one Sesterce a pound. The second new colour is a white, called Anulare, being that which in womens pictures giues a lightfom carnation white: this also is made of a kind of chalk, & certain glassy gems or bugles, which the common sort vse to weare in rings, & thereupon is called Anulare.

CHAP. VII.

What Colours refuse to be layd vpon some grounds: with what colours they painted in old time: and when the fight of sword-fencers was first proposed to be seen at Rome.

OF all colours, Rofer, Indico, Azur, Tripoli or Melinum, Orpiment, white lead or Cerusse, loue not to be laid vpon plaister-work or any ground, while it is moist; & yet wax will take any of these colours aboue said, to be imploied in those kind of works which are wrought by fire (so it be not vpon plaister, parget, & wals, for that is impossible) whether they be inamel or damaskd; yea and in their painting of ships at sea, as well hulks & hoies of burden, as gallies and ships of war: for now wee are come (forsooth) to inamel and paint those things that are in danger to perish & be cast away euery houre: so as we need not maruel any longer, that the coifin going with a dead corps to a funeral fire, is richly painted: and we take a delight when wee mind to fight at sea, to sail with our fleet gallantly dight & intriched with colours, which must cary vs into dangers, either to our own death, or to the carnage of others. And when I consider so many colours, & those so variable, as be now adaies in vse, I must needs admire those artificers of old time; and namely of *Apelles*, *Echion*, *Meclanthius*, and *Ticomachus*, most excellent painters, and whose tables were sold for as much apiece, as a good town was worth; and yet none of these vsed aboue foure colours in all those rich and durable workes. And what might those be?

Of all whites they had the white Tripoli of Melos, for yellow ochres they took that of Athens: for reds, they sought no farther than to the red ochre or Sinopie ruddle in Pontus: & their black was no other than ordinarie vitriol or shoemakers black. And now adaies, when we haue such plenty of purple, that the very walls of our houses be painted all ouer therewith, when there cometh from India store enough not only of Indico, which the mud of their riuers do yeeld, but also of Cinnambre, which is the mixed blood of their fel dragons and mighty elephants, yet among all our modern pictures we cannot shew one faire piece of worke: insomuch as wee may conclude, All things were done better then, notwithstanding the scarcitie that was of stufte and matter. But to say a truth, the reason is: Given wee are now (as I haue oftentimes said) to esteem of things that be rich and costly, neuer regarding the art that is imployed about them. And here I thinke it not amisse to set down the outrageous excesse of this age, as touching pictures. Nero the emperor commanded, that the portrait of himselfe should be painted in linnen cloth, after the maner of a gyant-like colosse 120 foot high, a thing that neuer had been heard or seen before. But see what became of it! when this monstrous picture (which was drawne and made in the garden of Marius) was don and finished, the lightning and fire from heauen caught it, and not only consumed it, but also burnt withall the best part of the building about the garden. A slaue of his infranchising (as it is wel known) when he was to exhibit at Antrium certain solemnities, and namely a spectacle of sword-fencers fighting at sharp, caused all the scaffolds, publique galleries, and walking places of that city to be hung & tapissed with painted cloths, wherein were represented the liuely pictures of the sword-players themselves, with all the wiffers and seruitors to them belonging. But to conclude, the best and most magnanimous men, that for many a hundred yeares our country hath bred, haue taken delight (I must needs say) in this art, and set their minds vpon good pictures. But to portray in imagery tables and painted cloth the publick shews of fencers & sword-plaiers, and to set them vp to be seen in open place to the view of the world, began by C. Terentius a Lucan: for this man to honour his grandfather, who had made him his own son by adoption, exhibited a shew for three days together of thirty paire of such fencers fighting with vnrebat swords; and a faire painted table which carried the liuely resemblance of this spectacle, hee set vp and dedicated within the sacred groue of Diana.

CHAP. VIII.

This argument
or title reacheth to many
chapters following.

¶ The antiquitie of Painting, and the severall ages wherein the famous Painters liued. A survey of excellent Pictures, and the Artificers that made them, together with the prices that their workmanship was valued at: and no table pictures to the number of 305.

Now will I after a cursorie sort run through all the famous professors and Artizans in this kind, and that with as great breuity as possibly I can; for the scope I haue proposed to my selfe tends another way: and therefore let not the Reader think much if I do but touch the names of some, as it were passing by, and by occasion of others whose catalogue I meane to deliuer. Howbeit, in making this hast, my purpose is not to omit any excellent piece of worke which is worth the remembrance and relation, whether the same be extant at this day, or lost and perished. Where I must aduertise the readers, that in this argument my meaning is not to stand much vpon the authoritie of Greeke writers, who indeed deliuer no certitude, nor agree in their records as touching this point (notwithstanding that they would seeme diligent in that behalfe) and namely, in that they haue written, That the excellent painters flourished so many Olympiads after the famous Imageurs; and haue nominated for the first and chiefe to haue liued in name, about the time of the 90 Olympiad: whereas this is for certain reported, that Phidias himself was a painter in the beginning, and that the noble shield of Minerva in Athens was by him painted: besides, this is confessed and resolved vpon for a truth, that Panaus his brother liued in the 83 Olympias, and painted the inside of the said shield; who also in another scutcheon of Minerva, which Colores the apprentice of Phidias had made, as also in making the statue of Iupiter Olympius, wrought with the said Colores and helped him. But what should I dwell long in this matter? Is there any doubt made, that Candaules King of Lydia, the last of the race and family

A family of the Heracleide, who also was commonly called Myrsilus, bought the painted table which contained the battell of the Magnetes, and paid for it to Bularchus (the painter or workman thereof) as much gold as it came to in weight. See of what price and estimation pictures were euen in those daies! And needs it must be that this hapned about that age wherein K. Romulus liued: for the said K. Candaules died in the 18 Olympias, or as some write, in that very yeare that Romulus departed this life: at what time this skill of painting (if I be not much deceived) was in great request euery where, and growne already to an absolute perfection. Which being granted, as of necessitie it cannot be denied, euident and apparent it is, that the originall and beginning of this art, was much more antient: and that those painters who vied one colour and no more in their plain draughts called Monocromata (to wit, Hygieanon, Dinias, and Charmas) liued a good while before, although it be not recorded in any writer in what age precisely they flourished: as also that Eumarus the Athenian painter, who deuised first to distinguish male and female in painting, and besides, vndertook to draw with his pensill the proportion & shape of any thing that he saw, together with Cimon the Cleonæan, who followed his steps, and practised his inuentions, could not chuse but by a congruity & consequence be of more antiquity than Bularchus aforesaid, or the reign of Romulus & Candaules: this Cimon deuised the works called Catagrapha, i. pourtraits and images standing byas and side-long: the sundry habits also of the visage and cast of the cie, making them to look, some backward ouer their shoulders, others aloft, and some againe downward: his cunning it was to shew in a picture, the knitting of the members in euery ioint: to make the veins appeare how they branched and spread: and besides, the first hee was that counterfeited in flat pictures, the plaits, folds, wrinkles, and hollow lappets of a garment. As touching Phamaus the brother of Phidias, hee painted also the battell betwene the Athenians and the Persians, vpon the plains of Marathon; for now by this time were painters furnished in some sort with colours to their purpose, and the art was growne to such perfection, that in the picture resembling the said battell, the full personages were pourtraied most liuely, of the captains on both sides, to wit, Miliades, Callimachus, and Cynegyrus, for the Athenians, Datis also and Artaphanes, for the Barbarians or Persians.

CHAP. IX.

¶ The Painters that first entred into contention for to win the prize by their Art: and who deuised to paint with the pensill.

Moreouer, during the time that the aboue-named Panaus flourished, there were prizes proposed at Corinth and Delphos, for those painters that could win them: and the first that strived for the best game, was the said Panaus, who challenged Timagoras the Chalcidian vpon this occasion. That the same Timagoras had giuen him the foile before at the Pythian games, which also doth appeare by certain verses composed by Timagoras himselfe as touching that argument, which fauor of great antiquity. Whereby the error of Chronicles before said is manifestly conuincied, who haue failed much in the calculation of the times. Furthermore, besides these painters aboue rehearsed, others therewere of great name, and yet all of them before that 90 Olympiad whereof they write; as namely, Polygnotus the Thasian, who was the first that painted women in gay and light apparell, with their hoods and other head attire of sundry colours, and in one word, passed all others before him in deuises, for the bettering of this art. His inuention it was to paint images with their mouths open, to make them shew their teeth; and in one word, represented much variety of countenance, far different from the rigorous and heauy looke of the visage beforetime. Of this Polygnotus workmanship, is that picture in a table which now standeth in the stately gallerie of Pompeius, and hung sometime before the Curia or Hall that beareth his name, in which table he painted one vpon a scaling ladder, with a targuet in his hand, but so artificially it is done, and with such dexterity, that whoeuer looketh vpon him, cannot tell whether he is climbing vp or coming downe. All the painting of Apollo his temple at Delphos, was of this mans doing, who also beautified with pictures, the great gallery or walking place at Athens, which thereupon was called Poecile; and this he did gratis, and would not take one penny for it; whereas Mycon afore him, painted one part thereof, & was well paid for his workmanship, which liberrall mind of his, wan him the greater credit and honor besides: for by a decree from the Amphyctions (who are the lords of the publick counsel of state

in Greece) it was granted, that in all cities and towns of Greece wherefoever he came, he should be lodged and entertained of free cost. Besides that *Mycon* before mentioned, there was another of the name, distinguished only by this, that the former was called *Mycon* the elder, and this *Mycon* the younger, who had a daughter named *Timareta*, & she could paint likewise excellently. But to come now to that ninetieth Olympia, there flourished in that time *Aglaophon*, *Cephisodorus*, *Phrylus*, and *Euenor*, who was both father and master to *Parafius* that most renowned painter, of whom I purpose to speak in his rank when the time comes; all these were reputed very good artizans in their time, howbeit not so excellent that I should need stand long upon them or their workmanship, making haste as I do unto those glorious and glittering painters indeed, who shine as bright stars above all their fellows; among whom, *Apolloderus* the Athenian was the first that gave light, and he lived in the 93 Olympias: this man led the way to others, & taught them to expresse the favor and beauty of any thing, which he observed especially: of whom I may well and truly say, that he and none before him brought the penfill into a glorious name & especial credit. Of his making there is one picture, of a priest at his devotions, praying & worshipping; as also another representing *Ajax*, all on a flaming fire with a flash of lightning, which at this day is to be seen at Pergamus, as an excellent piece of worke. And verily before his daies there cannot be shewed a table of any ones painting worth the sight, and which a man would take pleasure to behold and looke upon any long time.

* For *Olympias* was counted the space of five years,

When this man had opened the dore once, and shewed the way to this art, *Zeuxis* of Heraclea entered in, and that was in the fourth yere of the 95 * Olympias: and now that the penill was taken in hand (for now I speak thereof) he seeing that it made good worke, followed on therewith, and by continuall practise brought the same to great perfection, whereby he wan much credit to the art, and reputation to himselfe. Some writers there bee, who range him wrong in the 89 Olympias, at which time it must needs be, that *Demophilus* the Himeræan and *Nefæus* the Thracian liued; for to one of them apprentice he was: but whether of the two was his master, there is some doubt made; and verily he excellent he proued in his art, that the abouenamed *Appollodorus* made verses of him; in which he signifieth, that *Zeuxis* had stollen the cunning from them al, and he alone went away with the art. He grew in proesse of time to such wealth by the means only of his excellent hand, that for to make shew how rich he was, when he went to the solemnity of the games at Olympia, he caused his owne name to be imbrodered in golden letters, within the lozenge worke of his clokes, whereof he had change, and which he brought thither to be seene. In the end, he resolu'd with himselfe to work no longer for mony, but to giue away al his pictures, saying, That he valued them aboute any price. Thus he bestowed vpon the Agrigentines, one picture of queen *Alcmena*; and to king *Archelaus* he gaue another of the rustical god *Pan*: there was also the pourtraict of lady *Penelope*, which he drew in colours; wherein he seemeth not only to haue depainted the outward personage and feature of the body, but also to haue expressed most liuely the inward affections and qualities of her mind: and much speech there is of a wrestler or champion of his painting, in which picture he pleased himselfe so well, that hee subscribed this verse vnder it, * *Invisurus aliquis facilius quam imitaturus, j.* Sooner will a man enuy me, than set such another by me. Which thereupon grew to be a by-word in euery mans mouth. One fitately picture there is of his workmanship, *Iupiter* sitting vpon a throne in his Majestie, with all the other gods standing by and making court vnto him. Hee pourtraied *Hercules* also as a babe lying in a cradle, and strangling two fell serpents with his hand, together with his mother *Alcmena*, and her husband *K. Amphytion* in place, affrighted both at the sight thereof. Howbeit, this *Zeuxis* as excellent a painter as he was, is noted for one fault and imperfection; namely, that the head and joints of his pourtraicts, were in some proportion to the rest somewhat with the biggest; for otherwise so curious and exquisite hee was, that when he should make a table with a picture for the Agrigentines, to be set vp in the temple of *Iuno Lacinia*, at the charges of the city, according to a vow that they had made, he would needs see all the maydens of the city naked; and from all that company he chose 5 of the fairest to take out as from feuerall patterns, whatsoeuer he liked best in any of them; and of all the louely parts of those five, to make one body of incomparable beaurty. Many draughts he made of one color, in white. There liued in his time *Timanthes*, *Androcycles*, *Eupompus*, and *Parasius*, who were his concurrents, and thought as well of themselves as he did.

СНАР. X.

¶ *Of birds deceived by pictures. What is the hardest point in the art of painting?*

Of those foure before named, *Parasus* by report was so bold as to challenge *Zeuxis* openly and to enter the lists with him for the victory, in which contention and triall, *Zeuxis* for prooffe of his cunning, brought vpon the scaffold a table, wherein were clusters of grapes so liuely painted, that the very birds of the aire flew flocking thither for to bee pecking at the grapes. *Parasus* againe for his part to shew his workmanship, came with another picture, wherein he had painted a linnen sheet, so like to a sheet indeed, that *Zeuxis* in a glorious brauery and pride of his heart, because the birds had approoued of his handy worke, came to *Parasus* with these words by way of a scorn and frumpe, Come on sir, away with your sheet once, that we may see your goodly picture. But taking himselfe with the manner, and perceiving his own error, he was mightily abashed, & like an honest minded man yeelded the victory to his aduersary, saying withall, *Zeuxis* hath beguiled poore birds, but *Parrhasius* hath deceiued *Zeuxis*, a professed artifice. This *Zeuxis*, as it is reported, painted afterwards another table, wherein he had made a boy carrying certaine bunches of grapes in a flasket, and seeing again that the birds flew to the grapes, he shook the head, and comming to his picture, with the like ingenious mind as before, brake out into these words, and said, Ah, I see well enough where I haue failed, I haue painted the grapes better than the boy, for if I had don him as naturally, the birds would haue bin afraid and neuer approached the grapes. He pourtraied also diuers pieces of earthen vessels in potterie, which onely were left behind in *Ambracia*, at what time as *Fuluius* surnamed *Nobilior*, removed the Muses from thence of his pourtraying, and brought them to Rome. Moreouer, there remaineth yet at Rome within the galleries of *Philippus*, the picture of *Helena*, wrought by the hand of *Zeuxis*: and in the temple of *Concord* another, resembling *Marsias* the Musitian bound to a tree.

As for *Parasus* before named, borne hee was at Ephesus, and inuented also diuers things of himselfe to the aduancement of this art: for the first he was that gaue the true symmetrie to a portraiture, and obserued the iust proportions: he first exa^tly kept the sundry habits and gestures of the countenance: he it was, that first stood vpon the curious workmanship of couching and laying the haire of the head in order: the lovely grace and beauty about the mouth and lips, he first exa^tly expressed: and by the confession of all painters that saw his worke, he wooon the praise and praise from them all in making vp the pourfils and extenuities of his linaments, which is the principall point and hardest matter belonging to the whole art: for to draw forth the bodily proportion of things, to haue also, yea, and to fill within, requireth (I confesse) much labour and good workmanship; but many haue bin excellent in that behalfe, many to pourfil wel, to make the extremities of any part, to mark duly the diuisions of parcels, & to giue enery one their iust compasse and measure is exceeding difficult; and few when they come to the doing of it, haue been found to attaine vnto that felicity. For the vtmost edge of a worke must fall round vpon it selfe, and so knit vp in the end, as if it shadowed somewhat behind, and yet shewed that which it seemeth to hide. In this so curious and inexplicable a point, *Antigonus* and *Xenocrates* both, who wrote as touching this art, haue giuen him the honour of the best; not onely confessing his singular gift herein, but also commending him for it. Many other plots and projects there doe remaine of his drawing, pourtraied as well in tables as vpon parchment, which serue as patters (they say) for painters to learn much cunning by. And yet for inward works, and to expresse the middle parts of a portraiture, he seemeth not so perfect, nor inuenerable to himselfe otherwise. There is a notable picture of his making, which he called * *Demon Atheniensium*, that is to say, * the Athenians, the common people of the Athenians; the deuise whereof was passing full of wit, and verie inuentiue: for his intention was in one and the same pourtrait, and vnder one object of the eye to expresse the nature of the people, variable, wrathfull, vnjust, and vnconstant; the same also he would haue to appeare exorable, milde, and pittifull; haughtie, glorious and proud, and humble, lowly, and submis; fierce and furious, and the same coward-like, and ready to run away: all these properties, I say, he represented vnder one cast of the eie. This workeman painted also *Theſeus*, which stood sometimes in the capitoll of Rome; a certaine Admirall likewise of a nauie.

naue armed with a corselet. In one table also which is at Rhodes, he depainted *Meleager*, *Hercules*, and *Perseus*. This table was thrice blasted with lightning; howbeit, the pictures were not defaced, but remained whole and entire as at the first: a miraculous thing, and that which maketh much for the credit of the picture. *Archigallus* was of his painting; a picture that *Tiberius* the Emperor tooke great pleasure in; and as *Enileo* mine author doth testifie, he esteemed it worth 60000 sesterces, and inclosed it within his bed-chamber. Moreouer, he counterfeited one *Gresia* a nourse, with her infant in her arms: he pourtraied *Philiscus*, and god *Bacchus*, with the goddesse *Vertue* standing by him: also two boies, on whom a man might see most liuely resembled, the carelesse and simplicity of that age: likewise a priest, attended vpon with a pretty boy, holding a censar in his hand, and a coronet.ouer and besides, two pictures there be of his handiwork, going vnder the name of *Hoplites*, i. armed: the one running in his armour in battel-wise, so as he seemeth all in a sweate: the other disarming himself, all wearied, so as a man would think his wind were gone, or that he drew it very short. Great praise there is of one table of his, wherein are depainted, *Aeneas*, *Castor*, and *Pollux*; also of another, which contained *Telephus*, *Achilles*, *Agamemnon* & *Vlysses*. An artisan full of work, & who would euer be doing one thing or other; but so arrogant withall, as no man euer shewed more insolency than he, in regard that hee was cunning and well thought of: which he knew well enough, and no man needed to tell him. In this proud spirit of his, he would take vpon him diuers titles and additions to his name: among others, he would call himselfe * *Abrodiatus*: and other words he vsed, whereby hee would make himselfe known that he was prince of painters, and the art by him made perfect and accomplished. But it exceedeth how vaine-glorious he shewed himselfe, in that hee gaue out, hee was in I right line descended from *Apollo*: also that the pourtrait of *Hercules*, which is in a table at *Lindos*, he drew from the very person of *Hercules* himselfe, answerable in all points to the proportion and lineaments of his body; who (by his saying) had appeared to him oftentimes in his sleep of purpose, that he might paint him liuely as he was. In this veine of vanity, being vpon a time put down by *Timanthes* the Painter at *Samos*, where, by the iudgement of all that were present, his picture representing *Ajax*, and the awarding of the armor of *Achilles* from him to *Vlysses*, was not thought comparable to another of *Timanthes* his making: I am ill apaid (quoth he) and sorry at the heart, for this noble knight and braue warrior *Ajax*, whose euill hap it is thus to be foiled once againe by so vnworthy a weight, and a far meener person than himselfe. He delighted also to paint small pictures in prety tables, and those representing wantonnesse and lecherie: and this he did (as he was wont to say) for his recreation, and as it were to breath himselfe when he had laboured hard at greater workes.

As for *Timanthes*, an excellent fine wit he had of his owne, & full he was of rare inuentions: he it was that made the famous picture of *Iphigenia*, so highly commended by eloquent orators: and to say a truth, his conceit therein was admirable: for when he had deuised that the poor innocent lady should stand hard at the altar, ready to be slain for sacrifice, and had painted those that were present about her, with heauy and sad countenance, weeping & wailing all for the instant deatch of this young princeesse, and her vnckle *Menelaus* about the rest, full of sorrow and lamentation, and shewing the same as much as possibly might be: hauing by this time spent in them all the signes that might testifie the hearts griefe, and that he was come to pourtray her own father *Agamemnon*, he represented his visage couered with a veil, for that he was not able to expresse sufficiently the extraordinary sorrow about the rest which he had to see his own daughter sacrificed, and her guiltlesse blood spilt. Other pieces of worke there be, patternes all of singular wit: among the rest, he deuised within a very small table, a Cyclops lying a sleep: and yet because he would seeme euen in that little compasse to shew his giant-like bignesse, hee deuised withall to paint little euilish Satyres hard by, and those taking measure of one of his thumbes with long perches. In sum, so inuentiue he was, that in the works which passed through his hand, a man shall euer conceiue & vnderstand some hidden thing within more than is painted without: for albeit a man shall see in his pictures as much art as may bee, yet his wit went alwaies beyond his art. Moreouer, his picture of a prince was thought to be most absolute, the majesty whereof is such, that all the art of painting a man, seemeth to be comprised in that one pourtrait. This piece of worke remaineth at this day within the temple of *Peace*, in *Rome*.

In this age flourished *Euxenides*, and taught *Aristides* his cunning, who prooued afterwards a singular workeman. *Eupompus* also trained vp *Pamphilus* the painter vnder him, whose apprentife

A was *Apelles*. There is a fine picture of *Eupompus* his making, to wit, one who had obtained the victorie at the publique Gymnick exercises of a stuitie, painted naked as hee performed his deuoir, holding in his hand the branch of a date tree. This *Eupompus* was of such authoritie; that whereas before his time there were but two kinds of pictures, to wit, *Helladicum*, i. the Greekish; and *Asiaticum*, i. Asiatick, he brought in a new diuision, and made 3 distinct members thereof: for in loue of him, because he was a Sicyonian born, the foresaid *Helladicum* being parted in twain, there arose three seuerall sorts, the *Ionian*, *Sicyonian*, and *Attick*.

As for *Pamphilus*, renowned he was for painting a confraternity or kindred, the battel fought before *Phlius*, and the victorie of the Athenians: semblably, of his making is the picture of *Vlysses* in a punt or small bottom. Himselfe was a Macedonian borne, but of all painters, the first that gaue his mind to other good literature, and especially to Arithmetick & Geometry, without the insight of which two sciences, hee was of opinion, that vnpossible it was to be a perfect painter. He taught none his cunning vnder * a talent of siluer for 10 yeares together: and thus much paid *Apelles* and *Melanctus* vnto him for to learn his art. His authoritie brought to passe, that ordained it was at *Sicyone*, and so consequently throughout all Greece, that gentlemen sons or free-born should go to painting schoole, and there be taught first about all other things: the art *Diagraphice*, that is to say, the skil to draw and paint in box tables: and for the credit of Painters he brought to passe, that the art should be ranged in the first degree of liberall Sciences. And vnto this craft of painting hath bin alwaies of that good respect and so honored, that none but gentlemen and free-born at the first beginning medled therewith, yea, and afterwards honorable personages gaue themselves to the practise thereof, with this charge from time to time, to teach no slau the mysterie of painting, who by a strict and perpetuall edict were excluded from the benefit thereof. Neither shall you euer heare of any piece either of picture or grauerie and embossing, that came out of a seruile hand.

Furthermore, about the 170 Olympias there flourished *Echion* and *Therimachus*, two renowned painters: as for *Echion*, ennobled he is for these pictures, god *Bacchus*, a Tragedie and a Comedie, represented by painting: also *Semiramis*, who of a bond-maiden came to be a queen; an ancient woman carrying a torch or lamp, going before a yong wife newly wedded, and leading her to the bride-bed, who followeth with a modest, shamefast, and bashfull countenance most apparant to the eie.

D But what should I speake of these painters, when as *Apelles* surmounted all that either were before, or came after. This *Apelles* flourished about the 112 Olympias, by which time hee became so consummate and accomplished in the art, that hee alone did illustrate and enrich it as much, if not more, than all his predecessors besides: who compiled also diuers bookes, wherein the rules and principles, yea and the very secrets of the art are comprised. The speciall gift that he had was this, that he was able to giue his pictures a certain louely grace inimitable: and yet there were in his time most famous and worthy painters, whom he admired, whose works when hee beheld hee would praise them all, howbeit not without a but: for his ordinarie phrase was this, Here is an excellent picture, but that it wants one thing, & that is the *Venus* it should haue; which *Venus* the Greeks call *Charis*, as one would say, the grace: and in truth he would confesse, that other mens pictures had all things els that they should haue, this onely excepted; wherein hee was perswaded that he had not his peere or second. Moreouer, he attributed vnto himselfe another propertie, wherein hee gloried not a little, and that was, that hee could see to make an end when a thing was well done. For beholding wistly vpon a time a piece of worke of *Protagoras* his doing, wherein he saw there was infinite pains taken, admiring also the exceeding curiositie of the man in each point beyond all measure, he confessed & said, That *Protagoras* in euery thing else had done as well as himselfe could haue done, yea and better too. But in one thing he surpassed *Protagoras*, for that he could not skill of laying work vnto of his hand when it was finished well enough. A memorable admonition, teaching vs all, That double diligence and ouermuch curiositie doth hurt otherwhiles. This painter was not more renowned for his skill and excellencie in art, than he was commended for his simplicitie and singleness of heart: for as he gaue place to *Amphion* in disposition, so hee yielded to *Asclepiodorus* in measures and proportion, that is to say, in the iust knowledge how far distant one thing ought to be from another. And to this purpose impertinent it is not, to report a pretty occurrent, that fell between *Protagoras* and him: for being very desirous to be acquainted with *Protagoras*, a man whom hee had

* i. fine, delicate and sumptuous: for he would be in his purple, or his golden chaplets, his staffe tipped with gold, and his shoon buckles of the same.

* *Minoris est tanto annis decem: yet Budaeus readeth annis talentis decem, cents by the yearre.*

had neuer seen, and of his works, whereof there went so great a name, he imbarqued and sailed to Rhodes, where *Protagenes* dwelt: and no sooner was hee landed, but he enquired where his shop was, and forthwith went directly thither. *Protagenes* himselfe was not at home, only there was an old woman in the house who had the keeping of a mighty large table set in a frame, and fitted ready for a picture: and when he enquired for *Protagenes*, she made answer, that he was not within; and seeing him thereupon ready to depart, demanded what his name was, & who she should tell her master asked for him. *Apelles* then, seeing the foresaid table standing before him, tooke a pensil in hand and drew in colour a passing fine and smal line through the said table, saying to the woman, Tell thy master, that he who made this line enquired for him; and so he went his wayes. Now when *Protagenes* was returned home, the old woman made relation vnto him of this thar hapned in his absence; and as it is reported, the artificer had no sooner scene and beheld the draught of this small line, but he knew who had been there, and said withall, Surely *Apelles* is come to town; for vnpossible it is, that any but hee should make in colour so fine workmanship. With that hee takes me the pensil, and with another colour drew within the same line a smaller than it: willing the woman when hee went forth of dores, that if the party came againe, she should shew him what he had done, and say withall, that there was the man whom he inquired after. And so it fell out indeed, for *Apelles* made an errand againe to the shop, and seeing the second line, was dismaied at first and blushed withal to see himselfe thus ouercome; but taking his pensil, cut the foresaid colours throughout the length, with a third colour distinct from the rest, and left no room at all for a fourth to be drawn within it. Which when *Protagenes* saw, hee confessed that he had met with his match and his master both; and made all the haste he could to the haven to seek for *Apelles* to bid him welcome & giue him friendly entertainment. In memoriall whereof it was thought good both by the one and the other, to leaue vnto posterity this table thus naked without any more work in it, to the wonder of all men that euer saw it, but of cunning artificers and painters especially: for this table was kept a long time, and as it is well known, consumed to ashes in that first fire that caught *Cæsars* house within the Palatine hill: and verily we took great pleasure before that, to see it many times, containing in that large & extraordinary capacite that it had, nothing els but certaine lines, which were so fine and small, that vnnett or hardly they could be discerned by the eie. And in truth, when it stood among the excellent painted tables of many other workemen, it seemed a very blanke hauing nothing in it: howbeit as void and naked as it was, it drew many to it euen in that respect, being more looked vpon and esteemed better than any other rich and curious work whatsoeuer. But to come againe vnto *Apelles*, this was his manner and custom besides, which he perpetually obserued, that no day went ouer his head, but what businesse soeuer he had otherwise to call him away, he would make one draught or other (and neuer misse) for to exercise his hand and keepe it in vre, inso much as from him grew the prouerbe, *Nulla dies sine Linea*, i. Be alwaies doing somewhat, though you doe but draw a line. His order was when he had finished a piece of work or painted table, and layd it out of his hand, to set it forth in some open gallerie or thorow-fare, to be seen of folke that passed by, and himselfe would lie close behind it to hearken what faults were found there-with; preferring the iudgement of the common people before his owne; and imagining they would spy more narrowly, and censure his doings sooner than himselfe: and as the tale is told, it fell out vpon a time, that a shoemaker as he went by seemed to controlle his workmanship about the shoe or pantoffle that he had made to a picture, & namely, that there was one larcher fewer than there should be: *Apelles* acknowledging that the man said true indeed, mended that fault by the next morning, and set forth his table as his manner was. The same shoemaker coming againe the morrow after, and finding the want supplied which he noted the day before, took some pride vnto himselfe, that his former admonition had sped so well, and was so bold as to cauil at somewhat about the leg. *Apelles* could not endure that, but putting forth his head from behind the painted table, and scorning thus to be checked and reproued, Sirrha (quoth hee) remember you are but a shoemaker, & therefore meddle no higher I aduise you, than with shoes. Which words also of his came afterwards to be a common prouerbe, *Ne sutor ultra crepidam*. Ouer and besides, very courteous he was and faire spoken, in which regard King *Alexander* the Great accepted the better of him, and much frequented his shop in his owne person: for, as I haue said before, he gaue streight commandement, That no painter should bee so hardie as to make his picture but only *Apelles*. Now when the King being in his shop, would seeme to talke much

A much and reason about his art, and many times let fall some words to little purpose, bewraying his ignorance, *Apelles* after his mild manner, would desire his grace to hold his peace, & said, sir, no more words, for feare the prentise boies there that are grinding of colours, do laugh you to scorn: So reuerently thought the king of him, that being otherwife a cholericke prince, yet hee would take any word at his hands in that familiar sort spoken in the best part, and be neuer offended. And verily, what good reckoning *Alexander* made of him, he shewed by one notable argument, for hauing among his courtiers one named *Campaspe*, whom he fancied especially about the rest, in regard as wel of that affection of his as her incomparable beauty, he gaue commandement to *Apelles* for to draw her picture all naked: but perceiving *Apelles* at the same time to be wounded with the like dart of loue as well as himselfe, he bestowed her on him most frankly. By which example, hee shewed moreouer, that how great a Commander, and high minded a prince he was otherwise, yet in this mastering and commanding of his affections, his magnanimity was, more seen: and in this act of his he wan as much honor and glory, as by any victory ouer his enemies; for now he had conquered himselfe, and not onely made *Apelles* partner with him of his loue, but also gaue his affection clean away from her vnto him, nothing moued with the respect of her whom before he so dearly loued, that being the concubine of a king, she should now become the bedfellow of a painter. Some are of opinion, That by the patterne of this *Campaspe*, *Apelles* made the picture of *Venus* * *Anadyomene*. Moreouer, *Apelles* was of a kind bountifull disposition euen to other painters of his time, who commonly as concurrents, do enuie one another. And the first he was that brought *Protagenes* into credit and estimation at Rhodes; for at the first, his owne countrymen made no account at all of him (a thing ordinarily seen, that in our own country we are least regarded) but *Apelles*, for to countenance and credit the man, demanded of him what price he would set of all the pictures that he had ready made; *Protagenes* asked some small matter and trifle to speake of: howbeit, *Apelles* esteemed them at fifty talents, and promised to giue so much for them: raising a bruit by this means abroad in the world, that he bought them for to sel againe as his owne. The Rhodians hereat were moued and stirred vp to take better knowledge of *Protagenes*, what an excellent workeman they had of him: neither would *Protagenes* part with any of his pictures vnto them, vnlesse they would come off roundly and rise to a better price than before time. As for *Apelles*, he had such a dexterity in drawing pourtraits so liuely, and so neer resembling those for whom they were made, that hardly one could be known from the other; inso much, as *Appian* the Grammarian hath left in writing (a thing incredible to be spoken) that a certain Physiognomist or teller of Fortune, by looking onely vpon the face of men and women, such as the Greekes call *Metoposcopos*, judged truly by the portraits that *Apelles* had drawne, how many yeres they either had liued or were to liue; for whom those pictures were made. But as gracious as he was otherwise with *Alexander* and his train, yet he could neuer win the loue and fauor of prince *Ptolomeus*, who at that time followed the court of K. *Alexander*, and was afterwards king of Egypt. It fortuneth, that after the decease of *Alexander*, and during thereigne of K. *Ptolomeus* aforesaid, this *Apelles* was by a tempest at sea cast vpon the coast of Egypt, and forced to land at Alexandria; where, other painters that were no well willers of his, practised with a jugler or jester of the kings, and suborned him in the kings name to train *Apelles* to take his supper with the king. To the court came *Apelles* accordingly, and shewed himselfe in the presence. *Ptolomeus* hauing espied him, with a stern and angry countenance demanded of him what he made there, and who had sent for him; and with that shewed vnto him all his seruitors who ordinarily had the inuiting of ghefts to the kings table, commanding him to say which of all them had bidden him: whereat *Apelles*, not knowing the name of the party who had brought him thither, and beeing thus put to his shifts, caught vp a dead cole of fire from the hearth thereby, and began therewith to delineate and draw vpon the wall the proportion of that couliner before said. He had no sooner poufled a little about the visage, but the king presently tooke knowledge thereby of the party that had played this pranke by him and wrought him this displeasure. This *Apelles* drew the face of K. *Antiochus* also, who had but one eie to see withall: for to hide which deformity and imperfection, he deuised to paint him, turning his visage a little away, and so he shewed but the one side of his face, to the end, that whatsoeuer was wanting in the picture, might be imputed rather to the painter, than to the person whom he portrayed. And in truth, from him came this inuention first to concele the defects & blemishes of the visage, and to make one halfe face onely, when it might be represented full and whole, if it pleased

* *Ortomanus* rising out of the sea.

pleased the painter. Among other principall pieces of worke, some pictures there be of his making, resembling men and women lying at the point of death, and euen ready to gasp and yeeld vp the ghost. But of all the pictures & portraitures that he made, to say precisely which be the most excellent, it were a very hard matter: as for the painted table of *Venus*, arising out of the sea (which is commonly knowne by the name of *Anadyomene*) *Augustus Caesar*, late Emperour of famous memory, dedicated it in the temple of *Iulius Caesar*, his father; which hee enriched with an Epigram of certaine Greeke verses, in commendation as well of the picture, as the painter. And albeit the artificiall contriuing of the said verses went beyond the worke, which they seemed to praise, yet they beautified and set out the table not a little. The nether part of this picture had caught some hurt by a mischance; but there neuer could be found that painter yet, who would take in hand to repaire the same and make it vp again as it was at first: so as, this wrong & harm done vnto the work, and continuing still vpon the same, turned to the glory of the workman. This table remained a long time to be seen, vntill in the end for age it was worm-eaten and rotten: in such sort, as *Nero* being Emperour was faine to set another in the place, wrought by the hand of *Doratheus*. But to come againe vnto *Apelles*, he had begun another picture of *Venus Anadyomene*, for the inhabitants of the Island Cosor Lango, which hee minded should haue surpassed the former: howbeit, before he could finish it, surprised he was with death, which seemed to enuie so perfect workmanship: and neuer was that painter knowne to this day, who would turne his hand to that piece of worke, and seeme to go forwarde where *Apelles* left, or to follow on in those traicts and liniments, which he had pourfild and begun. One picture he drew of * *K. Alexander* the Great, holding a * thunderbolt and lightening in his hand, which cost twentie talents of gold, and was hung in the temple of *Diana* at Ephesus. And verily, this deuise was so finely contriued, that as *Alexanders* fingers seemed to bear out higher than the rest of the work, so the lightening appeared to be clean without the ground of the table, and not once to touch it. [But before I proceed any farther, let the readers take this with them, and alwaies remember, that these rich and costly pictures were wrought with foure colours and no more.] And for the workmanship of this picture, the price thereof was paid him in good gold coine by weight and measure, and neuer told and counted by tale. Of his handyworke was the picture of a *Megabyzus* or guelded priest of *Diana* in Ephesus, sacrificing in his pontificall habits & vestiments accordingly. Also the counterfeit of prince *Clytus*, armed at all pieces (saue his head, mounted on horse-back and hasting to a battell, calling vnto his squire or henxman for his helmet, who was portraied also reaching it vnto him. To reckon how many pictures *Apelles* made of *K. Alexander* and his father *Philip*, were but losse of time, and a needlesse discourse. But I cannot omit the painted table, containing the pourtrait of *Abrons* that wanton and effeminate person; which piece of work the Samians so highly extoll and magnifie: ne yet another picture of *Menander* the K. of Caria, that he made for the Rhodians, and which they so much admire. Neither must I forget the counterfeit of *Ancus*: of *Gorgosthenes* the Tragædian, which he made at Alexandria: or while he was at Rome, one table containing *Castor* and *Pollux*, with the image of *Victorie*, and *Alexander* the Great: Likewise another representing the counterfeit of *Warre* in person, bound with his hands behind at the backe, and *Alexander* the king mounted in a charriot triumphant: both which tables *Augustus* late Emperour of immortall memory, had dedicated modestly, and in simplicity of heart caused them to be hung vp in the most conspicuous places of his Forum or hall that he built: but when *Claudius Caesar* came to weare the diadem, he thought it more for the honour of *Augustus*, to scrape out the face of *Alexander*, as well in the one as in the other, and to set in the place the liuely image of the said *Augustus* to be seen. It is thought likewise, that the full pourtrait of *Hercules*, painted in a table, standing now in the temple of *Antonia*, was of his doing: an exquisite piece of worke no doubt, for notwithstanding that the backe part stand toward them that looke vpon it, yet it sheweth the entire visage, which is an exceeding hard matter: a man that beholdeth this *Hercules*, would think that the picture it selfe turned the face to be seen, which the painter seemed by the rest of the work to hide from the eie. Of his painting there is a * prince or worthy knight all naked, in which picture he seemed to challenge Nature: and to haue pourtraied every part so well, as shee her selfe could not haue framed the same better. There is or was at leastwise, a horse of his painting: which he pourtraied, to set against other horses painted by diuerse workemen, with whom he was entred into contention for the victory: in which triall, he appealed from the sentence of men to the judgement of foure-footed beasts.

* Of this picture *Apelles* was wont to say, That there were two *Alexanders*: the one begotten by *Philip*, who was a name: & the other painted by *Apelles*, and he was inimitable. * The manner was to expresse lightening, by three shafts bound together in the midst.

* Some thinke he meant the Hero & *Leander*: and they read, *Hero Leander* pinxit. He painted *Hero* and *Leander*.

even liuing horses indeed: for perceiuing that his concurrents were in fauor too mighty for him and that they were like to carry away the prize by corrupting the judges and vmpires, he caused liuing horses to be brought vp into the place; and hauing presented before them the pictures of his concurrents horses one by one, they seemed not to joy nor make toward them: but no sooner had he shewed * that of his owne pourtraying, but they fell all to neigh, as taking it for one of their fellows; which experiment serued euer after for a rule, to know indeed a good piece of workmanship in that kind. Moreover, he made a picture representing *Neoptolemus* the sonne of *Achilles*, in habit of a man of armes, sitting on horsebacke and riding against the Persians: likewise another, resembling *Archelams* with his wife and little daughter: also *K. Antigonus* armed before with a cuirace, & marching on foot with his horse of seruice led by him. Howbeit those Painters that are counted more skilfull and cunning than others, preferre before all other pieces of his work manship, one picture of the same king sitting vpon his horse; and another which doth represent the goddess *Diana*, among a consort or company of other virgins at sacrifice; whom he depainted so artificially in this table, that he seemeth to haue surmounted *Homer* the Poet, who oftsoons in his poems describeth the same maiden *Diana* with her traine of yong damosels. What would you haue more? he would seeme to pourtray those things which indeed cannot be pourtraied, crackes of thunder, leames or flashes of lightening, and thunderbolts; all which pictures go vnder the name of *Brontes*, *Astrape*, and *Ceraunobolus*; his inuentions serued as precedents and patterns for others in that art to follow. One secret he had himselfe, which no man was euer able to attaine and reach vnto, and that was a certain blacke vernish which he vnto lay vpon his painted tables when he had finished them; which was so finely tempered, and withall driuen vpon the worke so thin, that by the repercussion thereof it gaue an excellent glosse and pleasant lustre to the colors; the same also preserued the picture from dust and filthinesse: and yet a man could not perceiue any such thing at all, vnlesse he held the table close at hand, and looked very neere. And great reason hee had besides to vse this vernish, namely, lest the brightnesse of the colours without it, might offend and dazzle the eyes, which now beheld them as it were a farre off through a glasse stone; and withall, the same gaue a secret deeping and sadnesse to those colours which were too gay and gallant. And thus much may suffice for *Apelles*.

In his time liued *Aristides* the Thebane, a famous painter. This *Aristides* was the first that would seeme to paint the conceptions of the mind, and to expresse all the inward dispositions and actions thereof, which the Greeks call *Ethe*: yea, the very perturbations and passions of the soule he represented in picture: howbeit, his colours were vnpleasant and somewhat too harsh: He represented in a table the winning of a towne by force, wherein was pourtraied most liuely a little infant winding it selfe and making pretty means to creep vnto the mothers pap, who lay a dying vpon a mortall wound receiued in her brest; but it passed, how naturally the poor womans affection was expressed in this picture; for a man might perceiue in her, very sensibly, a certaine sympathie and tender affection yet, vnto her babe, albeit shee were now in her deadly pangs and going out of the world, tearing euen then, least the childe should meet with no milke when shee was dead, but in stead of sucking it, fall to lick her blood, and doe it selfe hurt and iniurie: this painted table *K. Alexander* the Great translated from Thebes to Pella, the city where himselfe was borne. The same *Aristides* painted the counterfeit of a battell betwene the Greeks and the Persians: in which table, he comprised an hundred fighting men: his bargain was to haue of *Mnason* the tyrant or K. of Elate, for euery personage that hee made * ten pounds of siluer. Hee pourtraied the running in a race of charriots drawn with four steeds, so liuely, that a man would haue thought he saw the wheels running about. And as for an humble suter or suppliant, he depainted him so naturally, making his petition and following it with such earnestnesse, that hee seemed in maner to cry with an audible voice from the very picture. He counterfeited in a painted table, hunters with their venison that they had taken, *Leontion* also the painter; and a woman vnder the name of *Anapaomene*, dying for kind heart and the loue of her brother: likewise prince *Bacchus*, and lady *Ariadne* his wife, which be pictures much looked vpon at Rome in these dayes within the temple of *Ceres*; a plaier besides in a tragædy, accompanied with a boy (& these are to be seen in the chappell of *Apollo*) howbeit, this table hath lost the beauty which it first had, through the folly of an vnskillfull painter, vnto whom it was put forth to be scoured and refreshed by *M. Innins* the Pretor, against the solemnitie of the Apollinar games. Moreover, there was

to be seen in the chappell of *Faith* within the Capitoll, the picture of an old man with an harp, teaching a boy to play; which was of *Aristides* his making; but there is a man lying sicke in his bed, of his painting, that cannot be praised sufficiently. And verily to conclude with his owne word, so accomplished he was in this art, that *K. Attalus* (by report) gaue vnto him for one table with the picture, one hundred talents of siluer.

About the same time, there flourished (as I haue said before) *Protogenes*; born he was at *Cynos* a city in Cilicia, and subiect to the Rhodians: he was so exceeding poore at the beginning, and withall, so studious, intentiue, and curious in his worke without all end, that fawer pictures by that means came out of his hands, and himselfe neuer rife to any great wealth. Who it was that taught him his art, it is not knowne for certaine: but some say that he painted ships vntill he was 50 yeres of age: which they collect by this argument, That when at Athens in the most conspicuous and frequented place of the city, he was to adorne with pictures the porch before the temple of *Minerva*, wherein he depainted that famous ** Paralus* and ** Hemionis*, which some call *Nausicaa*, he deuised certaine borders without: wherein he painted among those by-works (which painters call *Parerga*) certaine small gallies and little long barks, to shew thereby the small beginnings of his art, and to what height of perfection hee was come to in the end, when his workmanship was thought worthy to be seen in the most eminent place of that citie. But of all the painted tables that euer he wrought, that of ** Ialysus* is accounted the principall, which is now dedicated at Rome within the temple of *Peace*: whiles he was in painting this *Ialysus*, it is said, that he liued only vpon steeped Lupines, which might serue him in stead of meate and drinke both, to satisfie his hunger and quench his thirst: and this hee did, for feare least too much sweetnesse of other viands should cause him to feed ouer liberally, and so dul his spirit and senses. And to the end that this picture should be lesse subiect to other injuries, and last the longer, he charged it with foure grounds of colours, which he laid one vpon another: that euer as the vpper coat went, that vnderneath might succede in the place and shew fresh againe. In this table, the pourtraiture of a dog is admirable and miraculous; for not only art, but fortune also met together in the painting thereof; for when he had done the dog in all parts to the contentment of his owne minde (and that ywis was a very hard and rare matter with him) & could not satisfie and please himselfe in expressing the froth which fell from his mouth as he panted and blowed almost windlesse with running, displeased he was with the very art it selfe: and albeit he thought that he had bin long enough already about the said froth, and spent therein but too much art and curiositie, yet somewhat (he wist not what) was to be diminished or altered therein: the more workmanship and skill that went thereto, the farther off it was from the truth indeed and the nature of froth (the onely marke that he shot at:) for when he had done all that he could, it seemed still but painted froth, and not that which came out of the dogs mouth, whereas it should haue been the very same and no other, which had been there before. Hereat he was troubled and vexed in his mind, as one who would not haue any thing seene in a picture of his, that might be said like, but the very same indeed. Many a time he had changed his pensill and colours, as often, he had wiped out that which was done, and al to see if he could hit vpon it, but it would not be, for yet it was not to his fantasie. At the last, falling clean out with his own workmanship, because the art might be perceived in it, in a pelting chafe he flings me the sponge-full of colors that he had wiped out, full against that unhappy place of the table which had put him to all this trouble: but see what came of it! the sponge left the colours behind, in better order than hee could haue laied them, and in truth, as well as his heart could wish. Thus was the froth made to his full mind, and naturally indeed by meere chance, which all the wit and cunning in his head could not reach vnto. [After whose example, *Nealees* another painter did the like, and sped as well, in making the froth falling naturally from a horses mouth; namely, by throwing his sponge against the table before him, at what time as he painted a horse-rider cheering and cherking vp his horse, yet reining him hard as he champed vpon his bit.] Thus (I say) Fortune taught *Protogenes* to finish his dog. This picture of *Ialysus* and his dog, was of such name and so highly esteemed, that *K. Demetrius* when hee might haue forced the city of Rhodes, on that side onely where *Protogenes* dwelt, forbore to set it on fire, because he would not burne it among other painted tables: and thus for to spare a picture, he lost the opportunitie of winning a towne. During this strait siege and hot assault of Rhodes, it chanced that *Protogenes* himselfe was at worke in a little garden that he had by the townes side, euen as a man would say within the compasse of

* Names of gallies;

* A worthy knight, sonne of Achimus.

Demetrius

Demetrius his camp. And for all the fury of warre and the daily skirmishes within his sight and hearing, yet he went on still with his workes that he had in hand, and neuer discontinued one hour. But being sent for by the king, and demanded, How he durst so confidently abide without the walls of the city in that dangerous time? he answered, That he knew full well that *Demetrius* warred against the Rhodians, and had no quarrell to good Arts and Sciences. The king then (glad in his heart that it lay now in his hand to saue those things, which he had spared before, and whereof he had so good respect) bestowed a very strong guard about *Protogenes* for his better safety & security: and as great an enemy as he was to the Rhodians, yet he vsed otherwhiles to visit *Protogenes* of his owne accord in proper person, because he would not esteemes call him out of his shop from worke: and setting aside the maine point and occasion of lying before Rhodes, which was the winning thereof, the thing that hee so much desired; euen amid the assaults, skirmishes, and battels, hee would finde time to come to *Protogenes*, and took great pleasure to see his worke. By occasion of this siege and hostilitie, arose this tale moreover of one table of his making, That all the whiles he painted it, the dagger (forsooth) was set to his heart, and a sword ready to cut his throat: and it was the picture of a Satyre playing vpon a paire of bag-pipes, which he called ** Anapauiomenos*: by which name, as well as by the thing it selfe, hee would seem to signifie, that he tooke but little thought and care during those dangerous troubles. Moreover, he made the picture of lady *Cydicpe*, and of ** Tlepolemus*: he painted also *Philiscus* a writer of Tragedies, sitting close at his study meditating and musing. Also, there be of his making, a wrestler or champion, *Antigonus* the king, and the * mother of *Aristotle* the Philosopher, who also was in hand with *Protogenes*, persuading him to busie himselfe in painting all the noble acts, victories, and whole life of king *Alexander* the Great, for euerlasting memoriall and perpetuities: but the vehement affection and inclination of his minde stood another way, and a certaine itching desire to search into the secrets of the art, tickled him, and rather drew him to these kinds of curious workes whereof I haue already spoken. Yet in the later end of his daies, he painted *K. Alexander* himselfe, and god *Pan*. Ouer and besides this flat painting, he gaue himselfe greatly to the practise of founderie, and to cast certaine images of brasse, according as I haue already said.

At the very same time liued *Aesclepiodorus*, whom for his singular skill in obseruing symetries and iust proportions, *Apelles* himselfe was wont to admire. This Painter pourtraied for *Mnason* the foresaid king of the Elateans, the 12 principall gods, and receiued for euery one of them 300 pound of siluer. The said *Mnason* gaue vnto *Theomastus* for painting certaine Princes or Worthies, one hundred pounds apiece.

In this rank is to be ranged *Nicomachus*, son and apprentice both to *Aristodemus*. This *Nicomachus* pourtraied the rauishing of *Proserpine* by *Dis* or *Pluto*: which picture standeth in a table within the Chappell of *Minerva* in the Capitoll, about the little cell or shrine of *Inuentus*. In the same Capitoll, another table there is likewise of his making, which *Plancus* (Lord Generall of an army for the time being) had there dedicated and set vp: the same doth represent *Victorie* catching vp a triumphant chariot drawn with four horses aloft into heauen. He was the first that pourtraied prince *Plinies* in a picture, with a * cap vpon his head. He painted also *Apollo* and *Diana*: *Cybele* likewise the mother of the gods, sitting vpon a Lyon: of his workmanship is the table, representing the religious priestesses of *Bacchus* in their habite, together with the wanton Satyres creeping and making toward them. Semblably, the monstrous meermaid *Scylla*, which at this day is to be seen at Rome within the temple of *Peace*. A ready workman he was, & you shall not heare of a painter that had a quicker hand than he, at his worke: for prooffe whereof, this voice goeth of him, That hauing vnderaken for a certain sum of money to *Aristrates* the tyrant of Sicyone, to paint a monument or tombe which he caused to be made for *Telestes* the Poet, and to finish it by such a day appointed and set downe in the covenants of the bargain, he made no great hast to go about it, but came some few daies before the expiation of the prescript term for to beg in the same worke: whereat the tyrant was wroth, and menaced to punish him for example: howbeit, he quit himselfe so well, and followed his worke with such wonderfull celeritie, that in few daies space he brought it to an end: and yet the art and workmanship thereof was admirable. Vnder him were brought vp as apprentices, his brother *Aristides*, his owne son *Aristocles*, and *Philoxenus* the Eretrian.

This *Philoxenus* made one painted table for *Cassander* the king, containing the battel between

* One at rest, or reposing himselfe. Some reade, *Triptolemus*.

* *Phaëcia*.

* In token of nobility, as *Pierius* noteth in his Hieroglyphicks.

Alexander the Great and *K. Darius*, which for exquisite art commeth not behind any other what soeuer. One picture there is of his doing, wherein he would seeme to depaint lascious wantonnesse, which he pourtraied by 3 drunken Sylenes making merry and banquetting together. He gaue himselfe also to the speedy workmanship of his master before him, and for that purpose inuented other compendious means of greater breuitie to make riddance and quicke dispatch with his pencill.

With these may be sorted *Nicophanes* also, a proper, feat, and fine workman, whose manner was to take out all pictures and paint them new againe, thereby as it were to immortalize the memory of things: a running hand hee had of his owne, and besides, was by nature hasty and furious: howbeit, for skill and cunning there were but few comparable vnto him. In all his workes hee aimed at loftinesse and grauity: so that a man may attribute the stately port that is in this Art, vnto him and no other.

As touching *Persus* apprentice to *Apelles*, & who wrote a book to him of the very art) he came far short both of his master & also of *Zeuxis*. As for *Aristides* the Theban, who also liued in this age, he brought vp vnder him his two sons, *Niceros* and *Aristippus*. This *Aristippus* pourtraied a Satyre crowned with a chaplet, and carrying a goblet or drinking cup: he taught *Antonides* and *Euphranor* his cunning; of whom I will write anon: for meet it is to annex vnto the rest, such as haue bin famous with the pencill in smaller works and lesse pictures; among whom I may reckon *Pyreicus*, who for art and skill had not many that went before him; and verily of this man, I wot not well, whether he debased himselfe and bare a low sale, of purpose, or no? for surely his mind was wholly set vpon painting of simple and base things: howbeit, in that humble & lowly carriage of himselfe, hee attained to a name of glory in the highest degree; his delight was to paint shops, of barbers, shoemakers, cobblers, taylers; and semsters: hee had a good hand in pourtraying of poore asses, with the victuals that they bring to market, & such homely stuffe: where by he got himselfe a by-name, and was called *Rhyparographus*. Howbeit, such rude and simple toyes as these were so artificially wrought, that they pleased & contented the beholders, no thing so much. Many chapmen he had for these trifling pieces, and a greater price they yeelded vnto him, than the fairest and largest tables of many others. Whereas contrariwise, *Serapion* vied to make such great and goodly pictures, that (as *M. Varro* writeth) they were able to take vp & fill all the stals, bulks, and shops, jutting forth into the street vnder the old market place *Rostre*; this *Serapion* had an excellent grace in pourtraying tents, booths, stages, and theaters; but to paint a man or woman, he knew not which way to begin. On the other side, *Dionysius* was good at nothing els, and therefore he was commonly called *Anthropographus*. Moreover, *Callicles* also occupied himselfe in smal works; and *Calaces* set his mind especially vpon little tables and pictures which were to set out comedies and interludes; but *Antiphilus* practised both the one and the other; for he pictured the noble ladie *Hesione*, *K. Alexander the Great*, and *Philip* the king his father, with the goddesse *Minerva*: which tables hang in the Philosophers schoole or walking place within the stately galleries of *Ostia*, where the learned clerks and gentlemen fauorers of learning, were wont to meet and conuerse. Within the galleries also of *Philippus*, there are to be seen, the picture of prince *Bacchus*, the pourtrait of *Alexander* in his childhood, and of *Hyppolitus* the yong gentleman, affrighted and astonied at the sight of a monstrous bull let loose and ready to encounter him. Likewise in the gallerie of *Pompey*, the counterfeits of *Cadmus* and *Europa*; all pictures of *Antiphilus* his making. Of his handy worke, there is a fool with his bel, cockscorn, bable, and in other ridiculous habit, going vnder the name of *Gryllus*, deuised for the nones to make sport and pastime, wherupon all such foolish pictures be called *Grylly*. Himself was born in *Egypt*, howbeit he learned all his cunning of *Ctesidemus*. In this bed-roll of painters, I should not do well to passe ouer in silence, the workman that painted the temple of *Inno*, at *Ardea*, especially seeing that he was enfranchised free burgeois of that city, and honored besides with an Epigram or Tetraistichon, remaining yet to be read in the mids of his pictures in these fower Hexameter verses following;

*Dignis digna loca picturis condecorauit,
Regina Iunonis supremi conjugis templum
Marcus Ludius Elosas Abolia oriundus;
Quem nunc, & post semper ab artem hanc Ardea laudat*

This stately Church of *Inno* Queen, with pictures richly dight,
Whom wife to mighty *Iupiter*, and sister, men do call;
Commends the hand of *Murke Ludie*, *Elosas* also hight,
Etolian born: whom *Ardea* doth praise, and euer shall.

These verses are written in antique Latine letters. By occasion of whose name, I must not de-
frand another *Ludius* of his due praise and commendation, who liued in the time of *Augustus*
Cesar Emperor of happy memory: for this *Ludius* was he who first deuised to beautifie the wals
of an house with the pleasantest painting that is in all varietie, to wit, with the resemblance of
manors, farms, & houses of pleasure in the country, hauens, vineys, floure-work in knors, groues,
woods, forests, hills, fish-pooles, conduits, and drains, riuers, riuercets, with their banks, and what-
soeuer a man would wish for to see: wherein also he would represent sundry other shews of peo-
ple, some walking and going to and fro on foot; others sailing & rowing vp and down the stream
vpon the riuier, or els riding by land to their farms, either mounted vpon their mules and asses,
or els in wagons and coaches: there a man should see folk in this place fishing and angling, in
that place hauking and fouling: some hunting here, the hare, the fox, or deere both red and fal-
low; others busie there in haruest or vintage. In this maner of painting a man should behold
of his workmanship faire houses standing vpon marshes, vnto which all the ways that lead be tie-
lish and full of bogs; where you should see the paths so slipperie, that women as they goe are
afraid to set one foot afore another; some at euery step ready to slide, others bending forwards
with their heads as though they caried some burdens vpon their neck and shoulders, and all for
fearc leitt, their feet failing vnder them, they should catch a fall and a thousand more deuises and
pretty conceits as these full of pleasure and delight. The same *Ludius* deuised wals without
dores, and abroad in the open aire to paint Cities standing by the sea side. All which kinde of
painting pleaseth the eie very well, and is besides of little or no cost. Howbeit, neither hee nor
any other in this kinde (how soeuer otherwise respected) grew euer to be famous and of great
name, that felicitie they only attained vnto, who vsed to paint in tables: and therefore in this re-
gard, venerable antiquitie we haue in greater admiration; for painters in old time loued not to
garnish wals for to please the master only of the house, ne yet to bedeck houses in that maner
which cannot stir out of the place, nor shift and saue themselves when fire commeth, as painted
tables may, that are to be removed with ease. *Protogenes*, as excellent a painter as he was, contented
himselfe to liue within a little garden in a small cottage, and I warrant you no part ther-
of was painted. *Apelles* himselfe might well haue the wals of his house rough cast or finely plai-
stered, but neuer a patch thereof had any painting: they took no pleasure, nay they had no lust
at all to paint vpon the whole wals, and to work vpon them from one end to another, al their skill
and cunning attended vpon the publique seruice of states and cities: and a painter was not for
this or that place only, but imploied for the benefit indifferently of all countries and nations.

But to return again to our particular painters: there flourished at Rome a little before *Augu-
stinus* *Cesars* days, one *Arellius* a renowned painter, but that he had one notable foul fault that mar-
red all and discredited his art; giuen he was exceedingly to wenching, and sure hee would be to
haue one woman or other all times in chafe: which was the reason hee loued a life to be painting
of goddeses, which were euer drawn by the pattern of his sweet-hearts whom hee courted. A
man might know by his pictures, how many queans he kept, and which were the mistresses or ra-
ther goddeses whom he serued. Of late daies wee had among vs here at Rome one *Amulius* a
Painter; he caried with him in his countenance and habit grauitie and seuerity; howbeit he lo-
ued to make gay and gallant pictures, neither scorned he to paint the most trifling toyes & mea-
nest things that were. The picture of *Minerva* was of his making, which seemes to haue her eie
ful directly vpon you, look e which way soeuer you will vpon her. Hee wrought but some few
houres of the day, and then would he seem very graue and antient, for you should neuer find him
out of his gown and long robe, but very formall, though he were close set at work & euen lockt
as it were to his frame. The golden house or palace of *Nero* caught vp all the workes hee made,
where they remained as it were in prison, and neuer came abroad; which is the reason that none
of his pictures els be extant. After him succeeded *Cornelius Pinus*, and *Aelius Priscus*, two Pain-
ters of good reputation, who painted the temples of *Honour* and *Verne* for *Vespasianus Augustus*
the Emperor, when he caused them to be re-edified: but of the twaine, *Priscus* in his workman-
ship came neerer to the painters of antient time.

¶ The manner how to make Birds silent, and to leane their chattering and singing. Who first deuised with fire and pencill to enamel and paint the arched rouses and embowed feelings of houses. The admirable price of pictures inserted here and there among other matters.

Since I haue proceeded so far in the discourse of Painters and their art, I must not forget to set down a pretty jest, which hath bin reported by many as touching *Lepidus*: It hapned during the time of his Triumvirat, that in a certain place where he was, the magistrates attended him to his lodging enuironed as it were with woods on euerie side: the next morrow *Lepidus* took them vp for it, and in bitter tearmes and minatorie words chid them, for that they had laid him where he could not sleep a wink all night long, for the noise and singing that the birds made about him. They being thus checked and rebuked, deuised against the next night to paint in a piece of parchment of great length a long Dragon or serpent, wherewith they compassed the place where *Lepidus* should take his repose; the sight of which serpent thus painted so terrified the birds, that they had no mind to sing, but were altogether silent. By which experiment at that time, it was known afterwards, that birds by this means might be stilled.

Encaustice.

As touching the feat of setting colours with wax, and *enamelling with fire, who first began & deuised the same, it is not known. Some are of opinion, that the inuention thereof came from *Aristides*; and that *Praxiteles* practised the same, & brought to an absolute perfection. But surely there were pictures wrought by fire a good while before *Aristides* daies; and namely by *Polygnotus*, *Nicanor*, and *Arcefilas* of Paros. *Lysippus* also in his painted tables that he made at *Aegina* vsed to entitle them with this inscription, *Αὐτῶντος ἰσχυρῶς, ἰ. Lysippus painted this with fire*: which verily he would neuer haue done, if the art of painting with fire (called Encaustice) had not bin before deuised. Moreover, *Pamphilus*, master to *Apelles*, is reported not onely to haue himselfe practised this painting with vernish, and to inamel by the means of fire, but also to haue taught it vnto *Pausias* the Sicyonian, who was the first that excelled in this kinde, and caried away the name from all others in his time. This *Pausias* was the son of *Brietes*, and apprentice also to his father in the beginning: he vsed also the plaine pensil, wherewith he wrought vpon the walls at *Thestia*; which hauing been in times past painted by *Polygnotus*, were now to be refreshed and painted new again by his hand: howbeit in comparison of the former worke he was thought to come a great way short of *Polygnotus*; and the reason was, because he dealt in that kind of work which was not indeed his proper profession. He it was that brought vp first the deuice of painting vaulted rouses; for neuer was it the manner to adorne and garnish embowed feeling ouer head with colours, before his time. His delight naturally was to be painting little tables, and therein he loued to portray little boies. Other painters his concurrents, and no well-willers of his, gaue it out, that he made choice of this kind of work, because such painting went but slowly away, and required no quicke and nimble hand. Whereupon *Pausias*, to disproue his aduersaries, and withall to get himselfe a name, as well for celeritie and expedition, as for his art and skill otherwise in these small pieces, began and finished in a table the picture of a boy, within one day, and thereupon it was called *Hemereusios*. In his youthfull daies he fell in fancie with a woman in the same towne where he dwelt, named *Glycera*: a fine wit she had of her owne, and especially in making chaplets and guirlands of floures, she was full of inuention. *Pausias* by his acquaintance with her, and struing to imitate with his pensil her handiworke, and to expresse that varietie of floures which she gathered and couched together full artificially in her Coronets, enriched his owne pictures also with a number of colours, and brought the art to wonderfull perfection in that point. In the end he painted *Glycera* also his loue, sitting, with a Chaplet of floures her hand: and certes this is the most excellent peece of worke that euer went out of his shop: this table with the picture was thereupon called by some, *Stephanoplocos*, *i. [A woman] plaiting and twisting a guarland*: by others, *Stephanopolis*, *i. Selling guirlands*: for that this *Glycera* got a poor liuing by making chaplets, and had no other good means to maintain her selfe. The counterfeit taken from this table and made by it (which kind of pattern the Greekes call *Apographon*) *L. Lucullus* bought of *Diouysius* a painter of Athens, and it cost him

* 781 l. 15 ff. * two talents of siluer. Furthermore, this *Pausias* made faire and great pictures also; and namely,

A namely, one of his making which doth represent a solemne sacrifice of oxen, is to be seen at this day within the stately galleries of *Pompeii*: and verily, this maner of painting the solemnity of a sacrifice he first inuented: but no man euer after could attaine to his dexteritie in that kinde: and notwithstanding many gaue the attempt, and seemed to imitate him, yet they came al short of him: about al, he had a singular gift to work by perspective, for when he was minded to paint a boe for oxen, to shew the full length, he would not portray him sidelong or askant, but afront: by which means the beast is best represented, not only how long, but also how large and big he is euery way. Again, whereas all other painters, whensoever they would raise their work, & make any thing seeme eminent and high, vse to colour the same white and bright, and the better to make their perspective, do shadow or deep the same with black: this man in lieu thereof, would paint the oxen all of a black colour, and cause the body as it were of the shadow to arise out of it selfe. And verily so excellent he was in this perspective, that a man would say, his euen, plaine, and flat picture were embossed and raised work, yea and imagin where fractures were, that al was found and entire. This man liued also at *Sicyone*, and verily for a long time this city was reputed the native countrey that bred painters, and the onely place stored with excellent pictures. But during that time wherein *Scourus* was *Aedile* at *Rome*, all the rich tables which were in the publick places of that city, whether in the market steads, temples, or common halls, were seised vpon and brought to *Rome*, for to satisfie great sums of money wherein the *Sicyonians* stood indebted.

After *Pausias*, there arose one *Euphranor* the *Isthmian*, whom flourished about the 104 *Olympias*, far surpassing all other painters of his time. This *Euphranor* is hee whom I haue named among the famous imageurs and founders. Of his workmanship there be Colosses of brasse, statues of marble stone, yea and faire drinking cups chased and engrauen. Of an excellent capacity he was, and apt to learn any thing, studious withall, and painfull about all others, and whatsoeuer he gaue his mind vnto, therein he excelled: and in one word, a general man he was like himselfe still, that is to say, his craftsman in all, and as good in one thing as another. This is hee who seems to haue expresse first the port and maiestie that is in princes and great states, and to haue obserued symmetry and proportion: & yet he was not without his imperfection, for commonly as he made the bulk of the body too slender, so the joints and heads were somewhat with the biggest; howbeit he wrote books touching symmetry and proportion, as also of colours. Among other works of his, there are reckoned these, to wit, the portraiture of a battel or skirmish of horsemen, the twelve chiefe gods and goddeses, also the liuely picture of *Theseus*, of whom he was wont to say, That the *Theseus* of *Parasus* painting was fed with roses, but this *Theseus* of his with good flesh. There be excellent tables of his making at *Ephesus*, to wit, *Phyxes* feigning himselfe mad, and in that fit coupling an oxen and a horse in one and the same yoke: also diuers personages in their clokes and mantles after the Greekish fashion, musing and in a deep study; likewise a captain putting vp his sword into his scabbard.

At the same time liued *Cydias*, he who in a table represented the * *Argonauts*, for which *Hortensius* the Orator was content to pay 144000 Sesterces. This picture he shined in an Oratorie or chappell built of purpose for it, in a house of pleasure that he had at *Thusculum*.

E As for *Antidatus*, apprentice he was to *Euphranor*: of his handiwork there is a picture at *Athens* resembling one with a shield ready to enter into combat or fight; also a wrestler and a plaier vpon the fife or hautbois, which is a piece of work highly commended, and few comparable vnto it: more curious and precise he was in the secrets of the art, than obseruant of symmetry & proportion; being otherwise given to vse sad and dusky colours. The greatest name that he had, was for bringing vp *Nicias* the *Athenian*, who of all others painted women most excellently. For lights and shadowes in perspective he was excellent: also a passing great care and regard he had so to raise his worke, as that it seemed to be embossed and higher than the boord of his table: the pictures of *Nemea*, which out of *Asia* were transported to *Rome* by *Syllanus*, and hung vp in the Senat house, as I haue shewed heretofore; of prince *Bacchus*, within the temple of *Concord*; of *Hyacinthus*, which *Augustus Caesar* vpon a speciall liking to it brought with him to *Rome*, after hee had forced and sacked *Alexandria*; (in which regard *Tiberius Caesar* his successeur, seeing what affection *Augustus Caesar* had vnto it in his life time, dedicated it in the Temple of the said *Augustus*) and lastly of the goddesse *Diana*, were all proofes of his skill and workmanship. Moreover, at *Ephesus* the Sepulchre of *Megabyzus* one of the Priests of the Or-

* i. Diuers valiant knights, who accompanied prince *Idem* in his voyage to *Colchos* for the golden fleece.

der of *Diana* of Ephesus was of his painting: like as at Athens, the necromancie of the Poet *Homer*. This picture *Nicias* held at so high a price, that he would not let it go vnto *K. Attalus* for 60 talents, but chose rather to bestow it freely vpon his own native country, being otherwise a man for his own priuat state very wealthy. Besides these before rehearsed, he made others of a larger size, among which are reckoned *Calypso*, *Io*, and the lady *Andromeda*. The excellent picture also of *K. Alexander*, which is in the gallery of *Pompeius*, together with *Calypso* painted sitting, came out of his shop. The perfect pourtraying of fourfooted beasts is ascribed vnto him; and in truth, a singular grace he had and felicitie in painting dogs. This is that *Nicias* of whom *Praxiteles* gaue so good testimonie: for being asked vpon a time, what pieces he esteemed best of all those that himselfe had cut in marble: he answered, Euen those wherein *Nicias* hath had a hand: so much did he attribute vnto his * vernish and polishing. Another *Nicias* there was, who liued in the 112 Olympias; but whether this man were he or no, it is not certainly knowne; howbeit some there be that would haue him to be the same. Certes, *Athenian* of Marona was taken for as good a workman euery way as *Nicias*, and in some respects better: he learned the art of *Glaucon* the Corinthian. In choice of his colours he stood not so much vpon gallantnesse, but vied those that were with the saddest; howbeit those dark and shadowed works of his shewed more pleasant and delectable than his masters: wherby appeared his profound knowledge and deep skil, in the very laying and couching of his colours. The picture of *Philarchus* he drew, which is in the Temple of *Ceres Eleusine*. The frequent assem- ly also of the dames of Athens, which they call *Polygynacon*, was of his pourtraying: likewise he represented *Achilles* in his youth, hidden vnder the habit of a yong damosell, and how the crafty foxe *Pylissus* discouered and found him out, notwithstanding he was so disguised. But one table about the rest woon him the greatest credit, and that was, wherein he painted an horsekeeper training and nurturing his palfrey. Certes, but that he died in his youth, there had not been a painter in all the world comparable vnto him.

As touching *Heraclides* the Macedonian, he also may run in the range of famous Painters: at the beginning he employed himselfe in painting ships: after that King *Perseus* was taken prisoner, he left his native country and went to Athens, where liued at that time *Metrodorus*, a Painter and Philosopher both, a man of great name and authoritie as well in the one profession as the other: and therefore when *L. Paulus* after the defeature of the said *Perseus* sent vnto the Athenians, and requested them to send vnto him an excellent Philosopher to teach and instruct his children, together with a singular painter to set out his triumph with curious pictures, the Athenians made choice of *Metrodorus* onely, and commended him alone vnto *Lucius Paulus*, for the best approoued and most consummate to serue his turne and satisfie both his desires: which by good prooffe and experience *Paulus* found true, and gaue iudgement of him accordingly.

Timomachus the Byzantine flourished in the dayes of *Cesar* Dictatour, for whom hee painted *Ajax* and *Medea*: which pictures when he bought of him for 80 talents, hee caused to be hung vp in the temple of *Venus * Genetrix*. Now when I speake of a talent, you must vnderstand the Attick talent, which *M. Varro* doth value at 6000 deniers Roman. There goeth as great praise likewise and commendation of other pieces that passed from vnder the hands of *Timomachus*, to wit, the pictures of *Orestes*, of *Iphigenia* in Tauris, and of *Lecythion*, who taught youths dancing, vaulting, and other feats of actiuitie: he pourtraied also in a table, a goodly race, descent, and kindred of gentlemen; two persons besides in their clokes or mantles, after the Greekish fashion, ready to make a speech vnto the people, the one set, the other standing vpon his feet: but it seemed that art fauored and graced him most in painting *Minerva's* shield, where he portraied *Gorgon* or *Medusa's* head most liuely.

Aristelans was the son of *Pausias*, and vnder his father he learned the myserie of painting, who is counted one of the greatest painters that euer was. Of his workmanship are the tables containing the pictures of *Epaminondas*, *Pericles*, *Medea*, *Virtue*, and *Thebus*. Hee also drew with his pensill in colours, the common people of Athens, and a solemne sacrifice of Oxen.

There was also one *Mechopanes*, apprentise likewise vnto the same *Pausias*, who is highly commended by some for his curious and exquisite workmanship: but such it is, as none but cunning artists can conceiue, for otherwise I assure you his colours are vnpleasant, and hee loued to lay on too much of one thing, and that was Sil.

honored much
for that hee
would seeme
to be defended
from Iulus or
Ascanius, son
of *Enneas*, and
nephew to *Ve-
nus* by *Anchi-
se*.

A As for *Socrates* the painter, his pictures were liked very well of all that saw them, and in truth, they deserued no lesse: for of his doing are these and such like, to wit, *Esculapius*, with his daugh-
ters, *Hygia*, *Egle*, *Panacea*, and (1) *Iaso*: and an idle lazy lubber, knowne by a deuised name *Ocnos*, whom he pourtraied twisting a cord of Spart, and euer as he did it, an asse behind him gnawed it asunder. Thus much may serue concerning the principall painters that haue been knowne to excell in both kinds, to wit, with the pensill, and with fire: it remaineth now that I should discourse of those who were next vnto the principall, and so reputed.

In this second course of painters I must range *Aristocles*, who beautified with his pictures the temple of *Apollo* in Delphos: as for *Antiphilus*, he is as much praised for painting a boy blowing hard at the coles; in which table, it is a pretty sight to see how all the house (which was faire enough besides) shineth by the fire that he makes, as also what a mouth the boy makes: likewise for the picture of a company of Spinners, so liuely, that one would imagin he saw euery woman making hast to spin off her distaffe, struiuing aview who shal haue don her task first. He deuised also to portray *Ptolome* hunting, & this they call (2) *Aposcopon*; for which he is much commended: but principally for a braue Satyr of his workmanship, clad in a Panthers skin. *Aristophan* woone much credit by painting *Ancas* wounded to death by a wild bore, & his wife *Astypate* standing hard by, who seemeth to lament for his sake, and (as it were) to feele part of his paine: he made also one faire table, enriched with a number of personages, to wit, *K. Priamus*, faire *Helena*, dame *Credulitie*, *Vlixes*, *Deiphobus*, and *Dolori*. *Androbius* got himself a great name by a picture, representing one (3) *Scyllus* (a cunning diuer) cutting in two the anker cables of the Persian fleet, riding

C at sea. *Artemon* likewise was renowned for the counterfeite of lady *Danae*, found floating in the sea by (4) rowers or men of war, who seemed to wonder at her beauty, and to behold her with much contentment: also for picturing queene *Statonice*: *Hercules* and *Deianira* his wife: but the most excellent pieces of his workmanship, be those which are to be seene in the galleries of *Ostania*, among other of her stately buildings; to wit, *Hercules* ascending vp into heauen from the mountaine *Oeta* within the region of *Doris*, where he changed this mortall life, and by the generall consent of all the gods, was receiued into their society: the whole history also of *Laomedon*, as touching his falshood to *Hercules* and *Neptune*. *Alcimachus* the painter was renowned for the picture of hardy *Dioxippus*, who (5) carried away the prize in all feats of actiuitie, at the solemne games of Olympia, and neuer sweat nor touched (6) dust for it, which easie victory the Greekes call *Aconiti*. As for *Canus*, he was excellent at painting Coronets & Garlands: also at drawing coats of arms in scutcheions, of gentlemen and noble persons, with the stile of their titles & dignities. *Ctesilochus*, an apprentice to *Apelles*, became very famous for one picture about the rest, although it were but a wanton one and offenseue to chaste eies; wherein forsooth hee depainted *Iupiter*, attired in a caule or coife about his head like a woman, groning and crying out also (as women do in trauell of childe birth) among the goddesses for their helping hand, who plaied the midwives about him, vntil he was deliuered of god *Bacchus*, and brought to bed. *Cleon* was much spoken of, for the picture which hee made of *K. Admetus*: *Ctesidamus* for pourtraying the winning of *Oechalia* by *Hercules*. And for drawing the picture of lady *Laodamia*, the wife of *Protesilaus*. *Cleides* was notorious for one picture which he made in despite of queene *Stratonice*, wife to *K. Antiochus*, and to be reuenged of her for a disgrace that he had receiued at her hands: for being in the court, and perceiuing that the queen did him no honour at all, nor gaue him any countenance, he made no more ado, but painted her in her colours, tumbling and wallowing along full vnseemly with an odde bafe fisherman, whom as the voice went, she was inamored vpon; and when he had done, set it vp in the very haue of Ephesus, recovered a barke presently, and away he went vnder sale as fast as wind and tide would carry him. When the queene heard of it, she made but a iest and mocke of it; neither would shee suffer the picture to be taken away, in regard of the wonderfull workmanship, which expressed her and him so like and liuely. *Craterus* was a Comedian and plaier in Enterludes, howbeit, a fine Painter, as may appeare by his handyworke at Athens, within the publicke place *Pompeium*. *Eutychides* pourtraied a charriot drawne with two horses, and *Victorie* to guid and driue the same. *Eudoxus* had the name for his pictures which are seen at stage-places, to beautifie the place: who also was a good imageur and cast many faire pieces in brasse. *Iphis* was well thought of for *Neptune* and *Victorie* of his painting: and *Abros* was no lesse esteemed for the pictures resembling *Amity* and *Concord*, as also for the pourtraitures of the gods. *Leontiscus* pictured *Aratus* the Generall of the Achæans, re-

turning with victory, and triumphing with his trophy. He painted also a minstrel wench playing vpon a Psaltry, and seeming to sing to it; which was thought to be a daintie piece of worke. As for *Leon*, he painted *Sappho* the Poetresse. And *Nicaarchus* was much bruid abroad, for a picture, shewing *Venus* accompanied with the Graces and the pretty *Cupids*. And of his workmanship is *Hercules*, sad and peniue: penitent also and repentant, for that which he had done in his furious madnesse. *Nealces* made one picture of *Venus* most curiously: for passing witty hee was, full of inuention, and exquisit in his art. When he painted the nauall battell betwene the Egyptians and the Persians, which was fought vpon the riuer Nilus, the water whereof is rough and like the sea; because he would haue it knowne, that the fight was vpon the said riuer, he deuised another by worke to expresse the same, which all the Art of painting otherwise could not performe: for he painted an Asse vpon the banke, drinking at the riuer, and a Crocodile lying in wait to catch him: whereby any man might soone know it was the riuer Nilus, and no other water. *Oenias* the painter made one picture about the rest, which he called *Syngenicus*. *Philiscus* became renowned by a painters shop of his painting, where he deuised a prentice boy blowing the coles to kindle a fire. *Phalerion* pourtraied *Scylla*, transformed into a monstrous Meeremaid. *Simonides* got credit by the picture of *Agatharrhus*, who woon the best game at running: and of the goddesse of Memory, named *Mnemosyne*. *Simus* took pleasure in painting a yong boy lying asleep in a waulke-mill or Fullers worke-house: another sacrificing vnto *Minerva* at the feast *Quinquatrus*: and of the same mans doing, there is an excellent picture of *Nemesis*, representing Iustice and Reuenge. *Theodorus* drew one smetting his nose: and the same painter represented in a table, how *Orestes* murdered his owne mother *Clytemnestra*, and *Aegisthus* the Adulterer that kept her. The warre of Troy hee deapainted in many seuerall tables: and these hang in the galleries of *Philip* at Rome. Of his handy-worke is lady *Cassandra* the Prophetesse, which is to be seen in the Chappell of *Concord*. Also, *Leontium* the courtisane belonging to *Epicurus* and his followers, was of his painting; like as king *Demetrius* musing and standing in a deepe studie. As for *Theon* the painter, hee described with his pensill the madnesse of *Orestes*, and pourtrayed *Tamyras* the Harper or Musitian. *Tauriscus* made one table, representing a man flinging a coit; and another resembling queene *Clytemnestra*. He pictured also a little *Pan*, whom he called *Panniscus*, in manner of an Anticke: *Polynices* also making claime to his kingdome, and marching in warlike manner to recover the possession thereof againe: and last of all, signieur *Capaneus*, who lost his life in skaling the walls of Thebes. And here commeth to my minde one notable example as touching *Erigonus*, which I cannot passe with silence: This *Erigonus*, seruant sometime to *Nealces* the Painter, and employed onely in grinding colours, profited so much by seeing his master worke, that he became a Painter himselfe, and left behinde him an excellent workman of his owne teaching, *Paustias* brother to *Aginetia* the Imageur. But one thing more there is, of rare admiration and worthie to be remembered, That the last peeces of excellent Painters, and namely such tables as bee left vnperfect, are commonly better esteemed than those that bee fully finished: as wee may see by the Raine-bow or Iris which *Aristides* was entered into, the two brethren *Castor* and *Pollux*, begunne by *Nicomachus*; the Picture of *Medea*, killing the children that shee had by *Iason*, which *Timomachus* was in hand with; and the *Venus*, that as I sayd before, *Apelles* liued not to make an end of: for in these and such like imperfect tables, a man may (as it were) see what traicts and lineaments remayne to bee done, as also the very desseignes and cogitations of the Artificers: and as these beginnings are attractive allurements to moue vs for to commend those hands that began such Draughts: so the conceit that they be now dead and missing, is no small grieue vnto vs, when wee behold them foraw and fore-let. But to come againe vnto our Painters: there be more yet behinde, and those of verie good regard in their time, howbeit, I will runne them ouer sleightly, and as it were passing and glauncing by them, namely, *Aristonides*, *Anaxander*, *Aristobulus* the Syrian, *Arcefilas* the sonne of *Tisicrates*, *Corybas* Apprentice to *Nicomachus*, *Carmanides* to *Euphranor*, *Dionysodorus* the Colophonian, *Diogenes* who followed the Court of King *Demetrius*, *Euthymedes*, *Heraclides* the Macedonian, *Mydon* of Solæ brought vp vnder *Pyromachus* the Imageur, *Mnasitheus* of Sicyone, *Mnasitheus* the sonne of *Aristonides*, who was Apprentice likewise vnto him, and *Nessus* the sonne of *Abron*, *Polemon* of Alexandria, *Theodorus* of Samos, and *Siodus*, (all three trayned vp vnder *Nicostratus*) and *Xenon* of Sicyone, who learned his Craft of *Nealces*.

Moreo-

Moreouer, women there were also, excellent * Paintresses, to wit, *Timarete*, the daughter of *Nicon*, who made that excellent pourtraiture of *Diana* at Ephesus, a most antique picture: *Irene* the daughter of *Cratinus* the painter, who learned vnder her father, & drew the picture of a yong damosell, which is at Eleusine: *Calypso*, of whose workmanship there is the picture of an old man, and of *Theodorus* the juglar: *Alosthenes* painted a dauncer: and *Aristarete*, both daughter and apprentise to *Nearchus*, made prooffe how well she had profited, by the picture of *Asculapius*. And *M. Varro* saith, That when he was a yong man, there was at Rome one *Lala*, a Cyzecene borne, who passed her whole life in virginity, and she was skilful both in painting with the pensill, and also in enamelling with hot Steele in yuorie: her delight was principally in drawing women; and yet there is a Neapolitane of her pourtraying in a faire long table: last of all, shee took out her owne counterfeite at a mirroir or looking glasse. This one thing is reported of her, that no painter had a quicker hand or went faster away with his worke than she: and look what pictures soeuer came out of her hands, they were so artificially done, that they did out-sell a great deal the works of *Sapphus* and *Dionysius* (the most famous painters in that age) notwithstanding their pictures and tables were so faire, as that they take vp whole cabinets; and wel was he (before that her pictures came abroad) who could be furnished out of their two shops. There was yet one paintresse more, to wit, *Olympias*: howbeit I heare no great matter of her, but this onely, that she taught *Autobulus* the art of painting.

To come now to painting by the means of fire: I find this agreed vpon by all, that practised it was in old time but two waies only, that is to say, with wax, and in yuorie with a little Steele or punching yron; vntill such time as they fell to painting ships also with wax and fire: and in this third sort the manner is to vse great pensils or brushes dipt in wax molten ouer the fire: and this kind of painting ships is so fast and sure, that neither sun will resolute, nor salt water eat and fret, ne yet wind and weather pierce and chinke it.

Moreouer, in Egypt they haue a deuise to staine cloths after a strange and wonderful maner: They take white clothes, as sailes or curtaines when they haue bin worne, which they besmeare not with colours but with drugs that are apt to drinke and take colour: when they haue so don, there is no apparence in them at all of any dye or tincture. These clothes they cast into a lead or cauldron of some colour that is seething and scalding hot: where, after they haue remained a pretty while, they take them forth againe, all stained and painted in sundry colours. An admirable thing, that there being in the said cauldron but only one kind of tincture, yet out of it the cloth should be stained with this and that colour, and the foresaid boiling liquor change so as it doth, according to the quality & nature of the drugs which were laied vpon the white at first. And verily, these stains or colours are set so sure, as they can neuer be washed off afterwards: thus the scalding liquor, which no doubt if it had diuers tinctures and colours in it, would haue confounded them all into one; now out of one doth dispense and digest them accordingly, and in boiling the drugs of the clothes, setteth the colour and staineth surely. And verily, this good moreouer haue the clothes by this scalding, that they be alwaies more firme and durable, than if they had not come into the boiling cauldron.

CHAP. XII.

¶ The first deuisers of the art of Potterie, and in working in cley. Of Images made of earth. Of earthen vessels, and their value in old time.

Now that I haue discoursed of painting enough, if not too much, it were good to annex and ioine thereto the craft of Potterie, and working out of cley. And to begin with the original and inuention of making the image or likenesse of any thing in cley, it is said, that *Dibutades*, a Sicyonian borne, and a Potter, was the first that deuised at Corinth to form an image in the same clay whereof he made his pots, by the occasion and means of a daughter which hee had: who being in loue with a certain yong man, whensoever he was to take a long iourney far from home, used ordinarily to mark vpon the wal the shadow of her lours face by candle light and to pourfill the same afterwards deeper, that so she might inioy his visage yet in his absence. This her father perceiuing, followed those traicts, and by clapping cley therupon, perceiued that it took a print, and made a sensible forme of a face: which when hee saw, hee put it into the furnace to bake among other vessels, & when it was hardned, shewed it abroad. And it is said, that this

ned at Corinth

* Moulds or
patterns

* Hee meant
those whereby
images of
brasse were
cast.

this very piece remained in the bairns of Corinth safe, untill *Mummus* destroyed the city. Howbeit, writers there be who affirme, That *Rhaecus* and *Theodorus*, both of the Isle Samos, were the first inventors of this feat of forming shapes in cley, long before the expulsion of the * *Bacchidae* out of Corinth. And by their saying, when *Demaratus* was faine to flie out of that city, and to retire himselfe into Tuscan (where he begat *Tarquinius*, afterwards surnamed *Priscus*, & king of Rome) there accompanied him from Corinth *Eucheir* and *Engrammus*, two Imageurs in cley, and they taught in Italy the art of Potterie and Imagerie in that kind. As for *Dibutades* before-said, the inuenter he was not of his craft, but indeed he deuised to vse with other cley and earth, a ruddle, or els to colour the white cley with madder. His inuention it was to set vp Gargils or Antiques at the top of a Gauill end, as a finiall to the crest tiles, which in the beginning he called * *Protypa*. The same man afterwards deuised other counterfeits, and those be termed *Ectypa*: and hence come the louers and lanterns reared ouer the roofs of temples, which are so curiously wrought in earth. In sum, this man gaue the original name *Plastica* to the craft, and *Plasta*, to the craftsmen in this kind. But *Lysistratus* of Sicyone, and brother to *Lysippus*, of whom I haue written before, was the first that in plaster or Alabaister represented the shape of a mans visage in a mould from the liuely face indeed; and when hee had taken the image in waxe, which the foresaid mould of plastre had giuen, ysed to form and fashion the same more exactly. This man staid not there, but began to make images to the likenesse and resemblance of the person: for before him euery man studied only to make the fairest faces, and neuer regarded whether they were like or no. *Lysistratus* also inuented to make counterfeits in cley, according to the images and statues in brasse, already made. And in the end, this feat of working in cley grew to such height, that no images or statues were made without moulds of cley: wherby it may appear, that the skill and knowledge of Potterie is more ancient than founderie or casting brasse. To come now to Imageurs in cley, *Damophilus* & *Gorgasus* were counted most excellent & principal of all others, and they were good painters besides; as may appear by the temple of *Ceres* in Rome, that standeth at the greatest shew-place, called *Circus Maximus*, which these two workmen enriched both with pictures, and also with earthen images: for in the said temple there be certaine Greek verses set vp, which testifie, That all the work on the right hand was wrought by *Damophilus* & on the left hand by *Gorgasus*. Before this temple was built, *M. Varro* saith, that all Rome was furnished with images, of Tuscan work, and no other: but of this church, when it was re-edified, the pictures vpon the wals were esteemed so rich, that people thought them worthy to be cut out in great crusts and flakes out of the said wals; and for to saue them, they bestowed cost to set them in frames fair crested about the edges: also (by his report) the images wherewith the festeries & louers of the said church stood adorned, were dispersed into diuers parts of the city, as singular pieces of work, and well was he that could haue one of them. Moreover, I reade, that *Chalcosthenes* made diuers pieces of work in raw cley at Athens, and the place called *Ceramicos* tooke the name of his work-house. And *M. Varro* writeth, that himselfe knew at Rome a certaine man named *Possis*, who was wont to make of cley, clusters of grapes, and fishes, soluely, that whosoever looked vpon them, could hardly haue discerned them by the eie from grapes and fishes indeed. The same author doth highly extoll and magnifie one *Arcefilaus*, a very familiar friend of *Lu. Lucullus*, and whom he loued very well, whose * moulds were commonly sold dearer euen to workmen themselves, than the workes of others after they were finished. And hee saith, That the image of *Venus Genetrix*, which standeth in the Forum of *Caesar*, was of his making: but before hee had fully finished the same, for haste of dedication, it was set vp vnperfect. After which time (as he affirmeth) *Lu. Lucullus* bargained with him to make the image of *Felicitie*, for which he was to haue threescore thousand Sesterces, howbeit, the death both of the one and the other, was the cause that the worke was neuer finished. As for *Octavius*, a knight of Rome, being minded to make a fair standing cup, hee paid to him for the mould in plastre one whole talent. The same *Varro* praiseth also *Praxiteles*, who was wont to say, that the craft of Potterie and working in cley, was the mother of Founderie, and of all workes that are cut, engrauen, chased and embossed: who, albeit hee were an excellent founder and imageur in brasse, and knew how to carue, graue, and chase passing well, yet would he neuer goe in-hand to make any piece of worke, but he would forme it first in cley, in a mould of his own making. Moreover, this art (by his saying) was much practised in times past, in Italy and Tuscan especially: from whence, and namely out of the city *Fregellæ*, king *Tarquinius Priscus* sent for one *Turianus*, to no other purpose in

the world, but to agree with him for to make the image of *Iupiter* in earth to set it vp in the capitoll: for surely, no better he was than made of clay, and that by the hand of a porter, which was the reason, that they vsed to colour him ouer with vermillion: yea and the charriots with foure horses which stood vpon the lanterns of the said temple, were of no other stuffe; concerning which, I haue spoken in many places. The same *Turianus* also made the image of *Hercules*, which at this day retaineth still in the city that name, which testifieth what matter he is made of. Lo, what kind of images there were in those daies made in the honour of the gods by our ancestors, for the most excellent! neither haue we cause to be ashamed of those our noble progenitors, who worshipped such and no other. As for siluer and gold, they made no reckoning thereof, either about themselves or the very gods whom they worshipped: and verily, euen at this day, there continue still in most places, such images of earth. As for the festeries and lanterns of temples, there be many of them both within the city of Rome, and also in diuers burrough townes vnder the Empire, which for curious workmanship (as it were chased and ingrauen) are admirable; and for continuance of time more lasting and durable, than our louers of gold, and for any harme they do, lesse subiect I am sure to iniurie. Certes in these daies, notwithstanding the infinit wealth and riches that we are growne vnto, yet in all our diuine seruice and solempne sacrifices, there is no assay giuen or tast made to the gods out of Cassidoine or cristall bols, but only in earthen cups. If a man consider those things aright, & weigh them duly in particular, he shall find the bounty and goodnesse of the earth to be inenarrable, though he should not reckon her benefits that she hath bestowed vpon mankind, in yeelding vs so many sorts of corne, wine, apples, and such like fruits, herbs, shrubs, bushes, trees, medicinable drugs, mettals, and mineralls; which I haue already treated of: for euen in these works of earth and pottery, which we are glutted with (they be so vsuall and ordinary) how beneficiall is the earth vnto vs, in yeelding vs conduit pipes for to conuey water into our bairns, tyles flat yet hooked and made with crochets at one end to hang vpon the sides of the roofo, chamfered for to lie in gutters to shoot off water, curbed for crests to clasp the ridge on both sides; bricke to lie in wals affront for building, and those otherwhiles to serue as binders in parrine worke with a face on both sides; to say nothing of the vessels that be turned with the wheele and wrought round; yea and great tuns and pipes of earth deuised to contain wine and water also: In regard of which stone and earthen vessels, *K. Numa* ordained at Rome a seuenth confraternitie of potters. Ouer and besides, many men there haue bin of good worth and reputation, who would not be burnt to ashes in a funerall fire after they were dead, but chose rather to haue their bodies bestowed entire within coffins of earth, lying among leaues of myrtle, oliue, and blacke poplar, after the Pythagorean fashion: in which manner, *M. Varro* tooke order for to be interred. And if we looke abroad into the world, most Nations vnder heauen do vse these earthen vessels: and euen still, those that be made of Samian earth and come from that Isle, are much commended for to eat our meats out of, and to be serued to the board: and Eretum here in Italy, retaineth yet the name for such vessel: but for drinking-cups, onely Surrentum, Asia, and Pollentia, within Italy; Saguntum in Spaine, and Pergamus in Asia, be in credit: at Tralleis also a city in Sclauonia, and Modenna (to goe no farther than Lombardie in Italy) there is made much faire vessel of earth, appropriat vnto those places: for euen in this respect, some nations are innobled and growne into name. This earthen ware is of that price besides, that it is thought a commodity worth the transporting too and fro ouer land & sea, by way of merchandise. But if we speak of that kind that is wrought by turners craft with the wheele, the daintiest vessels come from Erythrae. And in very truth, such may the earth be, that much art and fine workmanship is shewed therein: in testimony whereof, there be two stone vessels or earthen (call them whether you wil) within the principal temple of that city to be seen at this day, thought worthy to be consecrated there, in regard of their clean worke and their thinnesse besides, which a master and his prentise wrought in a strife and contention, whether of them could driue his earth thinnest: howeuer it be, they of the Island *Cos* are most commended for the fairest vessels of earth; and yet those of Hadria beare the name to be more durable, and of a more fast and firme constitution. And since I am entred thus far, I will obserue vnto you some examples of feueritie not impertinent to this discourse: I find vpon record, That *Q. Ceponius* was condemned and fined for an ambitious man, onely for this, because hee had sent an earthen * amphor [of wine] as a present vnto one who was to giue him his voice when he stood for an office. And that you may certainly know that vessels of earth haue in some sort

Bbb

* *Vini amphora*: I suppose that he means the vessel in which wine is sent, and not full of wine.

been of wine.

* Decies festerium, according to Budens; but if you read according to Hotomanius, ducenties, it is twenty times as much more. This platter he called, the rarguet or Minerva, and hee got himselfe thereby a name to be called Patinarum. See Sueton.

been in request among riotous gluttons and wastfull spendthrifts, listen what *Fenestella* saith as touching this point, the greatest exceeding (quoth he) and gaudiest fare at a feast, was serued vp in three platters, and was called *Tripatinum*: the one was of Lampreys, the second of Pikes, the third of the fish *Myxon*: whereby it may appeare, that euen in those daies men began at Rome to grow out of order, and to giue themselves to riot and superfluity: yet were not they so bad, but we may prefer them euen before the Philosophers of Greece: for it is written, that in the sale of *Aristotles* goods, which his heirs made after his decease, there were sold 60 platters, which were wont ordinarily to go about the house. As for that one platter of *Aesop* the plaier in tragedies, which cost fix hundred thousand sesterces, I doubt not but their stomackes rise thereat when they reade thereof in my treatise as touching birds. But this is nothing (I assure you) to that charger of *Vitellius*, who whiles he was Emperor caused one to be made and finished that cost a * million of sesterces, for the * making wherof there was a furnace built of purpose in the field; the which I rather note, because they should see the monstrous excesse in these daies, that vessels of earth should be more costly than of Cassidonie. Alluding to this monstrous platter, *Musianus* in his second Consulship (when he ripped vp in a publicke speech, the whole life of *Vitellius*, now dead) vpbraided the very memoriall of him in these very terms, calling his excesse that way, *Patinarum paludes*, i. platters as broad as pools. And verily (saith he) that platter of *Vitellius*, came nothing behind another, which *Cassius Senerus* reproched *Asprenas* withall, whom he accused bitterly, and said, that the poison of that one platter had killed an 130 persons who had tasted thereof.

Furthermore, there are certaine townes that are in good account by reason onely of this vessel made therein, and namely *Rhegium* and *Cumæ*.

The priests of *Cybele* the mother of the gods, who are called *Galli*, vse to gueld themselves with a sheard of Samian earth; and they be of opinion, that if it be done with any thing els, they shall die thereof, if we may beleue *M. Calvus*, who whetted that tongue of his (which shortly after was in that sort to be cut out) against *Vitellius*; which turned to his great reproch and infamie, for that himselfe euen then railed vpon *Vitellius* in so bad termes, and lost his tongue for his labour.

But to conclude, what is it, that Art and the wit of man hath not deuised? for there is a means found to make a strong kind of mortar or cement by the broken sheards of potters vessell, if the same be ground into powder and tempered with lime; and the ordering of it in this manner, causeth it to be more firme and last the longer, and such they call *Signina*. And hereby also men haue found out certain durable pauements of that kind.

CHAP. XIII.

¶ The varietie of sundry kinds of earth: of the dust or sand of *Puteoli*: and of other sorts of earth which will harden as a stone.

Over & besides the cement aboue named, there be other percells that the earth it self doth afford, fit to be laid in pauing worke: for who can sufficiently wonder at this, namely, That the worst part of it (which thereupon is called dust and sand, as it were the very excrement thereof) should be of that nature vpon the side of the hills of *Puteoli*, as being opposed against the waues of the sea, and continually drenched & drowned therewith, should become a stone so compact and vnited together as it were into a rock, that it scorneth all the violence of the surging billows, which are not able to vndermine and pierce the same, but hardeneth euery day more than other; euen as if it were tempered with the strong cement of *Cumes*. Of the same property is the earth within the country about *Cyzicum*: onely this is the difference, that not the dust or sand there, but the earth it selfe cut out into what parcels you will, in case it be drenched in the sea water a certaine time, is taken forth againe a very hard stone. The same (by report) happeneth about the citie *Cassandria*: as also about *Gnidos* in a fountaine of fre sh water, wherein if earth do lye, within the space of eight moneths it will turne to be a stone. Certes, all the way as a man goeth from *Oropus* as farre as to *Aulis*, what ground soeuer is beaten vpon by the water, changeth into rockes and stones. There is found also in *Nilus* a certaine sand, whereof the finest part differeth not much from that of *Puteoli* before said: not in regard that

that it is so strong as to breake the force of the sea-water, & to beat back the waues, but to subdue and crush the bodies of our yong gentlemen, and therefore serueth well in the publicke place of wrestling for those that be giuen to such exercises: and for this purpose verily was it brought from thence by sea to *Pairobis*, a slave lately enfranchised by *Nero* the Emperor. I reade also, that *Leonatus*, *Cratius*, and *Meleager*, who were great captains vnder *Alexander* the Great, and followed his court, were wont to haue this sand carried with them, with other baggage belonging to the camp. But I mean not to write any more of this argument, no more verily than of the vse of earth in those places where our youth annoint their bodies against they should wrestle; wherein our youths addict themselves so much to the exercise of the body, that they haue spoiled themselves otherwise, and lost the vigor of the mind.

CHAP. XIIII.

¶ Of mud walls: of Bricke walls, and the order and manner of making them.

What shall we say? See we not in *Africke* and *Spaine* both, certain walls of earth, which they cal * *Formacei*, of the forme and frame that is made of planks and boords of each side, between which a man may say they are rather infarced & stuffed vp, than otherwise laid and reared orderly; but I assure you, the earth thus infarced, continueth a world of yeres and perisheth not, checking the violence of raine, winde and fire, no mortar and cement so stiffe and strong. There are yet to be seene in diuers parts of *Spaine*, the watch-towers of *Anniball*, the high turrets and sconces also reared vpon the tops of hills, made all of earth: and hereof we haue our turres, which naturally are so proper not only for the rampiers and fortifications of a camp, but also for wharfs, banks, and buttresses, to breake the violence and inundation of riuers. As for the manner of making walls, by dawbing windings and hurdles with mud and clay, also of rearing them otherwhiles with vnbacked bricke, who is so ignorant that he knoweth it not? howbeit, for to make good bricke, they ought not to be made of any soile that is full of sand and grauell, much lesse then of that which standeth much vpon grit & stones, but of a greyish marle or whitish chalkie clay, or at leastwise a reddish earth: but in case wee bee forced to vse that which is giuen to be sandy, yet we must chuse that kind of sand which is tough and strong. The best season to make these bricke or tyles, is in the spring time; for in the mids of Summer they will cleaue and be full of chinkes; but if you would haue good bricke for building, they ought to be two yeres old at the least. Now the batter or lome that goeth to the making of them, ought to be well steeped and foked in water, before it be fashioned into bricke or tyle. Bricks are made of three sizes: the ordinarie bricke that we vse, is called *Didoron*, which carrieth in length one foot and a halfe, and in breadth a foot: a second sort is named *Tetradoron*, i. three foot long: and the third, *Pentadoron*, of three foot and nine inches in length: for the Greeks in old time, called the span or space of the hand from the thumbe to the little fingers end stretched out, *Doron*; which is the reason that gifts and rewards be called in their language, *Dora*, for that they were presented by the hand. You see therefore, how according to the length that they carrie, either of foure or fūe spans, they haue their denomination of *Tetradora*, or *Pentadora*; for the breadth is one and the same in them all, to wit, one foot ouer. Now there beeing this difference in the size, in Greece the manner is to imploy the smaller sort in their priuat buildings, but the bigger serueth for greater publicke workes. At *Pitana* in *Asia*, and in *Massia* and *Calentum*, cities of low *Spaine*, the bricks that be made, after they are once dried, will not sinke in the water, but float aloft; for of a spongeous and hollow earth they be made, resembling the nature of the pumish stone, which is very good for this purpose, when it may be wrought. The Greeks haue alwaies preferred the walls of bricke, before any others, ynlasse it be in those places where they had flint at hand to build withall: for surely such brick wals, if they be made plump vpright & wrought by line and leuell, so as they neither hang nor batter, be cuerlasting; & therefore such bricks serue for wals of cities and publick workes; their roiall pallaces likewise be built therewith. After this sort was that part of the wall at *Athens* laid and reared, which regards the mount *Hymettus*: so they built also at *Patrae*, the temples of *Iupiter* & *Hercules*, although all the columns, pillars, and architraues round about them, were of ashler stone: thus was the pallace of *K. Attalus* built at *Tralleis*; likewise that of *K. Crasus* at *Sardis*, which afterward was conuerted

* Some reade formacei, arched walls.

to their Senat-house, named *Gerusia*: likewise the sumptuous and stately house of king *Mausolus* at *Halicarnassus*: which goodly edifices continue at this day. Wee read in the Chronicles, that *Murena* and *Varro* when they were the high *Ædiles* at Rome, caused the outmost coat which was ouercast of the brick-walls of *Lacedæmon*, to be cut out whole and entire, and to bee set and enclosed within certaine frames or cases of wood, and so to be translated from thence to Rome, for to adorne and beautifie the publicke hall for elections of Magistrates, called *Comitium*; and all for the excellent painting vpon that parget. The workmanship therein although it were excellent and wonderfull in it selfe, yet being thus remoued and brought so far safe, it was esteemed more admirable. Moreouer, here within Italy the walls of *Aretine* and *Meuania* be made all of bricke: many at Rome they dare not build their houses with this kind of bricke, because a wall bearing in thicknesse but one foot and an halfe, wil not sustain aboue one* single story, for the order of the city permitted not the common wals and those which were outmost, to be thicker than a foot and an halfe: neither wil the partition wals within abide that thicknes, but are made after another sort.

CHAP. XV.

¶ Of Brimstone and Alum, with their severall kinds: also their medicinable properties.

HAVING spoken sufficiently of Bricks, it remaineth that I should proceed to other kinds of earth: wherein the nature of sulphur or brimstone is most wonderfull, being able as it is to tame and consume the most things that be in the world: it is ingendred within the Islands *Æolia*, which lie between Italy and Sicily; those I meane which (as I haue said before) doe alwaies burne by reason thereof. Howbeit, the best sulphur is that which commeth from the Isle *Melos*. There is found thereof likewise in Italy, within the territory about *Naples* and *Capua*, and namely in the hills called *Leucogæi*: that which is digged out of the mines, is fined and brought to perfection by fire. Of brimstone there be foure kinds; to wit, *Sulphurvis* or *Quickebrimstone*, which the Greeks call *Pyrron*, because it neuer came into the fire: the same is found for all the other kindes consist of a certaine liquid substance, and being boiled in oile are made vp and conected to their consistence: whereas the sulphurvis is digged out of the mine such as we see, that is to say, transparent, cleere, and greenish. The second kind is named *Gleba*, good onely for *Tuckers* and *Fullers*. The third sort also yeeldeth but one vse and no more, and that is, for tincture of wooll, by reason that the smoke and perfume thereof wil bring it to be white and soft; and this brimstone they call *Egula*. As for the fourth kinde, it serueth most of all for matches and wicks.

As touching the nature of Brimstone, so forcible it is, that if it be cast into the fire, the verie smell and steeme thereof will driue those in the place into a fit of the falling sicknesse, if they be subject thereunto. As for *Anaxilans*, he would commonly make sport withall at a feast, and set all the guests into a merriment: for his manner was to set it a burning within a cup of new earth ouer a chafing dish of coales, and to carry it about the table where they were at supper: and in very truth the reuerberation of the flame would make all that were neere it to looke pale and wan after a most fearefull manner, like as if there were as many grisly ghosts or dead mens faces. And to come more neere to the properties that it hath respectiue vnto Physicke, it healeth mightily, and is a maturatiue: it doth resolue withall and discusse any gathering of impostumes; in which regard it entereth ordinarily into such plaisters, that bee discussive and emollientiue. A cataplasme made with it, incorporate with grease or sewer, and so applied vnto the loynes and regions of the Kidnies, doth wonderfully assuage the paine and grieve in those places: being tempered with turpentine, it riddeth away the foule terrors called *Lichenes* that arise in the face, yea and cleanse the leprosie. The Greekes haue a pretty name for it and call it *Harpacticon*, for the speedy remouing and snatching it from the place where it is applied; for eftsoones it ought to be taken away. The same reduced into a lioch or liquid Electuarie, is good to be licked and let downe softly towards the lungs, in case of shortnesse and difficultie of winde: in which sort it serueth for them that spit and reach out of the breast by coughing, filthie matter: and soueraigne it is for those that be stung with scorpions. Take sulphurvis

A mix it with sal-nitre, grind the same together with vinegre, it maketh a singular good liniment for to scoure the foule morphew: let the same be tempered and prepared with vineger of *Sandaracha*, it killeth the nits that breed in the eie-lids. Moreouer, brimstone is employed ceremoniously in hallowing of houses; for many are of opinion, that the perfume and burning thereof, will keep out all enchantments, yea, and driue away foule fiends and euill spirits that doe haunt a place. The strength of Sulphur is evidently perceiued & felt in the springs of hot waters, that boile from a vein of it: neither is there in all the world, a thing that sooner catcheth fire; whereby it is apparant, that it doth participat much of that element. Thunderbolts & lightnings in like manner do sent strongly of brimstone: the very flashes and leames thereof stand much vpon the nature of sulphur, and yeeld the like light. Thus much shall suffice as touching the nature of sulphur.

The nature of Bitumen approacheth neere vnto brimstone: where it is to be noted in the first place, that the Bitumen whereof I speake, is in some places in manner of a muddy slime; in others, very earth or minerall. The slimy bitumen ariseth (as I haue said before) out of a lake in *Iurie*; as for the minerall bitumen, it is found in *Syria*, about a maritime town vpon the seacoast called *Sidon*: but both the one and the other are of a compact and massie substance, growing together fast and vnite. And yet there is a kind of Bitumen liquid, and namely that of *Zacynthus*, and the Bitumen which is brought from *Babylon*, where verily it is white naturally as it groweth. The Bitumen also which commeth from *Apollonia* is liquid: and all these the Greeks doe comprehend vnder one name *Pissasphaltion*, a word deriued of *Pitch* and *Bitumen*. There is a fatty kind of Bitumen likewise resembling an vnctuous or oleous liquor, within the territorie of *Agrigentum* in *Sicilie*, arising out of a fountaine, and it floteth aloft: The inhabitants of the countrey vse to scum and fleer it off by the meanes of certaine chats or catkins, which grow vpon many reeds and canes, for quickly will it hang and cleaue to the downe of such. Great vse they haue of this Bitumen, for it serueth their turnes to maintain lamp-light, in steed of oile: & therewith also they kill the farcins, scabs, and mange in their jades and laboring garrons. Some writers there be who reckon *Naphtha* (whereof I haue written in my second booke) to be a kinde of Bitumen; but so ardent it is, and holdeth so much of the fire, that wee know not which way to make any vse thereof. Concerning the marks of good Bitumen, the best is knowne by the glosse that it carrieth, if it shine exceeding much: the same also is ponderous and weighty: whereas the lighter sort is but indifferent heauy, and argueth some sophistication with pitch. In operation it hath the qualities of brimstone; asfringent it is, and yet resolutiue: it draweth together, and foldereth withall. A perfume thereof while it burneth, chafeth away serpents. The Babylonian Bitumen is thought to be very effectuell for the cataraacts, pearles, and slimes that ouerspred the eies: soueraigne likewise for the leprosie, and filthy terrors of the face called *Lichenes*, and the itch in any part of the body: it serueth in a liniment for the gout: and there is no kind thereof, but it causeth the haies of the eie-lids, which grow vntowardly and fall into the eies, for to turn vp againe. If the teeth be well rubbed with bitumen and sal-nitre together, it doth ease and assuage their paine: and being giuen in wine, it helpeth an old cough, and the shortnesse of wind. In case also of the dysenterie, it is taken in that manner, for it staieth a bloudy flux: but if it be drunke with vinegre, it doth discusse and dissolue * cluttered bloud which is within the body, and expelleth the same downward by seage: it doth likewise assuage the paine of the loynes or small of the backe, and generally mitigateth any grieue of the joints, if it bee layed too in manner of a cataplasme with *Barley meale*. There is a speciall plaister or cataplasme made of Bitumen, which carrieth the name thereof; it stancheth bloud, it bindeth and draweth together the edges of a wound, also it knitteth and vniteth again sinews which be cut in twain. There is an ordinary medicine also for the quartane ague, made in this wise: Take of Bitumen one dramme, of Mints the like weight, of Myrrhe the quantitie of one Obolus, mix and incorporate all these together: a perfume or smoke thereof will bewray the falling sicknesse. The very smell of Bitumen also discusse the fits of the mother when it riseth and stoppeth the womans breath: A suffumigation thereof, doth likewise reduce the matrice and twill into the right place, if they bee slipped and fallen downe too low, and ready to hang forth of the bodie: being drunke with Wine and Castoreum, it bringeth the ordinary course of the monthely termes in women. It serueth also for diuerse and sundrie other vses than in Physicke: For if any brassen Pots, Chaufers, pannes or kettles, or such like vessels, bee enhuiled

*For by reason that Rome was so populous, they made many lofts ouer head, so that the building was raised to 60 and 70 foot in vp-right wals: & these serued as tenements, & were called *Cenacula*, and one paire of staires leading into the street, serued them all: whereas the lord and master of the house kept beneath with his household, and was not troubled with these tenants or in-mates.

*Hereupon it is an ordinary medicine, to giue *Mumia* (which is *Asphaltum*) vnto those that are faine from on high and bee inwardly brouiled.

clots or pieces, & otherwise is glutinous. The same effects it hath that Cimolia, howbeit, some- what weaker in operation.

There is an earth called Ampelitis, which resembleth Bitumen as neer as may be. The triall of that which is good indeed, is, if in oile it be gentle to be wrought as wax, and if when it is tor- rified, it continue still of a blacke colour. It entred into medicines and compositions, which are made to mollifie and discusse; but principally it serueth to be autifie the eie-browes, and to colour the haire of the head blacke.

CHAP. XVII.

¶ Sundry sorts of chaulkes for to scoure clothes, and namely the Tuckers earth Cimolia, Sarda, and Vmbria. Of the common chaulke: and of Tripolium.

OF Chaulkes there be many kinds: of which, Cimolia doth affoord two sorts, and both per- tinent to Physick; the one is white, the other inclineth to the colour of Rofer. Both the one and the other is of power to discusse tumors, and to stay distillations, if they be vsed with vineger. They do keep downe biles and emunctories and swellings behind the eares: the foule tettars also, and other offenseue pimples and pusshes they repress, applied in the forme of a liniment: incorporat therewith salt-petre, salnitre, and put vineger thereto, it is an excellent medicine to allay the swellings of the feet, with this charge, that this cure be done in the Sun, and that after six houres, the medicine be washed off with salt water. Put thereto the cerot Cy- prinum, it is singular good for the swelling of the genetours. This Fullers earth Cimolia is of a cooling nature, and being vsed in the forme of a liniment, it staieth immoderat sweats: the same taken inwardly with wine in the baine or hot-houise, restraineth the breaking forth of pimples. The best of this kind, is that which commeth out of Thessalie. It is to be found also in Lycia a- bout Bubon. There is ouer and besides, another vse of this Cimolia or Tuckers cley, to wit, in scouring clothes. As for the chaulke Sarda, so called because it is brought out of Sardinia, it is employed only about white clothes, for if they be moteley or pied coloured, it is of no vse. Of al kinds of Cimolia it is the cheapest, and of basest account: yet that of Vmbria is of more price, and that which they call Saxum in Latine, and is our ordinary white chaulke: this property it hath, that with lying in water, it groweth; this is commonly bought therefore by weight, where- as the other is sold by measure. As for the foresaid earth of Vmbria, it serueth only for to polish and giue a glosse to clothes: for why should I scorne or thinke much to handle this matter al- so? seeing there is the expresse law or act Metella, prouided for Fullers, the which C. Flaminius and Lu. Amylius, when they were Censors, proposed vnto the people for to be enacted; so care- full were our predeceffors, to take order for all things. To come then to the myserie of Fullers craft: First they wash and scour a piece of cloth with the earth of Sardinia, then they perfume it with the smoke of brimstone, which done, they fall anone to burling of it with Cimolia; pro- uided alwaies that it be the right and haue the natieue colour, for if it be sophisticat, it is soone knowne by this, that it waxeth blacke, and wil chaune and cleaue, if it come after sulphur: and if it be the true Cimolia, it doth refresh and giue a cheerefull hew to precious and rich colors, yea it setteth a certain glosse and lustre vpon them, if they were made duskyish & sad by the smoake of sulphur. But in case the clothes be white, then the common chaulke is better to be vsed: pre- sently after the brimstone: for hurtfull it is to other colors. In Greece, they vse in stead of Ci- molia, a certaine plastre which they haue from Tympe. Yet is there another kind of chalke or white cley, named Argentaria, for that it giueth a glistering siluer color to clothes. Howbeit, one sort more there is of chalk, which of all others is most base and least esteemed; this is that chalke, wherewith our auncestours in old time ordained to whiten the cirque, in token of victo- ry: wherewith also they vse to marke the feet of those slaues which were brought ouer from be- yond sea, to be bought and sold in the markets: such an one somtime was that Publius, the deu- lfer of riming and wanton jestures vpon a stage: such another was his cousin germaine, Manilius M. Antiochus, the Astrologer; yea, and Taberius Erotes the excellent Grammarian: whom all three, our great grandfathers saw in that manner brought ouer in one and the same ship.

CHAP

CHAP. XVIII.

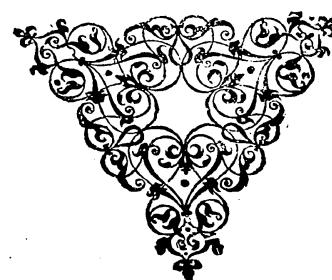

¶ Who they were in Rome, and of whom enfranchised, that of slaues rise to be mightie, and of exceeding wealth.

BVt what meane I to stand vpon those who had learning to commend and bring them into some state of credit and honour? Haue not the same forefathers of ours seene in the like plight standing within a cage, with a marke of chaulke vpon their feet, and a locke about their heeles, Chrysogonus the slaue to Sylla, Amphion to Qu. Catulus, Here to Lu. Lucullus, Demetrius to Pompey, Ange the bondmaid to Demetrius (though she was thought to be the base daughter of Pompey,) Hipparchus the slaue of Antonius, Menas and Menecrates of Sex. Pompeius, and an infinite sort of others, whom I cannot reckon vp; and yet they all being by their masters enfranchised, became wonderfull rich by the bloudshed and goods of Romane citizens, in that licentious time of proscriptions. Well, this was the marke of slaues set out by companies in the market to be sold: and this is the opprobrious and reprochful note, to twit those by, that in their fortunes are growne insolent. And yet we in our daies haue knowne the same persons to climbe vnto the place of highest honour and authority, in so much, as we haue seene with our owne eies the Sen- nat (by commandement from Agrippina the Empreffe, wife to Claudius Caesar) to decree vnto en- franchised slaues, the robes of Pretours, with the badges and ornaments to that dignity belong- ing, yea, and such to bee sent againe as it were with the axes and knitches of rods decked with Lawrell, into those countries to gouerne, from whence they came at first poore slaues with their feet chalked and marked for the market.

CHAP. XIX.

¶ Of the earth of Galata, and Clupea: of the Balearie earth, and Ebusitana.

OVER and aboue those before rehearsed, there be other sorts of earth, hauing a property by themselves, which I haue named heretofore, but in this place I am to set downe their na- ture and vertues also. There is a kind of earth comming out of the Isle Galata, and about D Clupea in Affricke, which killeth scorpions: like as the Balearike and Ebusitane earth, as the death of other serpents.

CHAP. I.

¶ The natures and properties of Stones: The excessive expence in columnes and build-
ings of Marble.

It remains now to write of the nature of stones, that is to say, the principal point of all enormous abuses, and the very height of wastful superfluities, yea though we should keep silence, and say nothing either of precious stones and Amber, or of Chrystall and Cassidonie. For all things els which we haue handled heretofore euen to this Booke, may seem in some sort to haue been made for man; but as for mountaines, Nature had framed them for her owne selfe; partly to strengthen (as it were) certaine ioints within the veines and bowels of the earth; partly to tame the violence of great riuers, & to break the force of surging waues and inundations of the sea; and in one word, by that substance and matter whereof they stand, which of all others is most hard, to restraine and keep within bounds that vnruely element of the water. And yet notwithstanding, for our wanton pleasures and nothing els, we cut and hew, we load and carry away those huge hills and inaccessible rockes, which otherwise to passe only ouer, was thought a wonder. Our Ancestors in times past reputed it a miracle, and in manner prodigious, that first *Annibal*, and afterwards the *Cimbrians*, surmounted the Alps: but now, euen the same mountaines wee pierce through with picke-axe and mattocke, for to get out thereof a thousand sorts of marble; wee cleaue the capes and promontories: we lay them open for the sea, to let it in; downe we goe with their heads, as if wee would lay the whole world euen, and make all leuell. The mightie mountaines set as limits to bound the frontiers of diuers countries, and to separate one Nation from another, those wee transport and carrie from their native seat: ships wee build of purpose for to fraught with marble: the cliffes and tops of high hills they carrie too and fro, amid the waues and billowes of the sea, and neuer feare the danger of that most fell and cruell element: wherein verily wee surpasse the madnesse and vanitie of those, who search as high as the clouds for a cup to drink our water cold; and hollow the rocks that in manner touch the heauen, and all to drink out of * yce. Now let euery man thinke, with himselfe what excessive prices of these stones hee shall heare anone, and what monstrous pieces and masses he seeth drawne and carried both by land and sea; let him consider withall, how much more faire and happy a life many a man should haue without all this, and how many cannot chuse but die for it, whensoever they go about to doe, or if I should speake more truely, to suffer this enterprise: also, for what vse else, or pleasure rather, but onely that they might lie in beds and chambers of stones that forsooth are spotted, as if they neuer regarded how the darknesse of the night bereaueth the one halfe of each mans life of these delights and ioies. When I ponder and weigh these things in my mind, I must needs think great shame, & impute a great fault to our forefathers that liued long since, & blush in their behalfe. Lawes were enacted, and prohibitions published by the Censors, and those remaining vpon record,

* yce, bibatur
glacie, for hey
held Crystall
to be a kinde
of yce.

A cord, forbidding expressly, That neither the kernelly part of a Bores neck, nor dormice, & other smaller matters than these to be spoken of, should be serued vp to the boord at great feasts: but as touching the restraint of bringing in marble, or of sailing into forraine parts for the same, there was no act or statute ordained.

CHAP. II.

¶ Who was the first that shewed Marble stones in Columnes, or any publicke workes at Rome.

But some man haply might reply againe vpon me, and say: what need was there of any such Bordinance, considering there was no marble in those daies brought in from strange countries? Vnto whom I answer, That it is a meere vntruth, for euen our progenitors, of whom I speake, saw well enough how in that yere when *M. Scaurus* was *Ædile*, there were not fewer than 360 pillars of marble transported to Rome, for the front and stage of a Theater, which was to continue a small while, and scarcely to be vsed one moneth to an end: and yet no law there was to checke and controule him for it. But it may be inferred againe, the Magistrats winked heretofore, because he did all this for a publicke pleasure to the whole citie, during the plaies exhibited by him in his *Ædileship*: marrie that is it that I would haue, What reason I pray you had they so to doe? By what means more doe abuses and inormities creepe into a citie or state, than by a publicke president giuen? for I assure you it was nothing else but such examples at the first C that brought those other things, I meane, yvorie, gold, jewels, and precious stones, to be vsed by priuat persons, so commonly as they be, in their houses, plate, and ornaments. And what haue we left and reserved at all for the very gods to haue, since that we lay so much vpon our selues? but say that in those daies they did tolerat this excesse in *Scaurus*, because of the pastimes he did exhibite to the whole city; What, were they silent also and made no words, when the said *Scaurus* caused the biggest of all these columnes (yea those that were fortie foot high within twain, and the same of Lucullean black marble) to be erected and placed in the court before his owne house in mount *Palatine*? And least any man should say, that this is done in secret and hucker mucker, know he, That when these pillars were to be carried vp into the mount *Palatine* where D his house stood, the Baillife that had the charge of the publick sinkes vaulted vnder the ground, dealt with *Scaurus* for good securitie, yea, and demanded cautions and sureties for satisfying of all harmes and dammages that might be occasioned by their carriage, so huge and heauie they were. Considering then this bad example, so prejudiciall to all good manners, and so hurtful to posterity, had it not bin better for the city to haue cut off these superfluities by wholsome laws and edicts, than thus to permit such huge and proud pillars to be carried vnto a priuat house vp into the *Palatine* mount, euen vnder the nose of the gods, whose images were but of earth, and hard by their temples that had for their couers and louers no better than such as were made of potters cley?

CHAP. III.

¶ The first man who had at Rome for his owne vse, pillars of Marble brought from forraine Lands.

Neither can it be alledged for excuse of this tolleration in *Scaurus*, that hee tooke the vantage and spied his time when the city of Rome was not ware of any such matter toward, as hauing not been acquainted beforetime with the like, and therefore he stale vpon them with these superfluous pompes, as doubting nothing lesse than such new deuises, and therefore hauing no time to prevent and stay them: for long before this, *L. Crassus* that great Orator, who was the first that enriched his house (within the same *Palatium*) with pillars of outlandish marble, although they were but of the Quarry in *Hymettus* hill, and neither more in number than six, nor carying in length aboue 12 foot apiece, was reprobued and reproched for this pride and vanity by *M. Brutus*, who among other hot words and biting terms that passed interchangeably between them, taunted him by the name of *Venus Palatina*. Certes, considering how all good orders and customs otherwise were trodden vnder foot, weare to presume thus of our predeceffors, That when they saw other injunctions and prohibitions as touching diuers abuses crept in, take

* Surnamed
Lemnia; be-
cause the
Lemnians de-
dicated it.

he made, that he well deserued the name which went of him. I wil lay abroad some smal pieces G as arguments of his handiwork, and those only that may testifie his fine head & rare inuention: neither wil I alledge for prooffe hereof, either the beautiful image of *Iupiter Olympius*, which hee made at Olympia; nor the stately statue of * *Minerua* that he wrought at Athens, which carried in height 26 cubits, and was all made of Iuory and gold: but I will take the shield or targuet that the said goddesse is portraied with; in the embossed and swelling compasse whereof he ingraued the battell wherin the Amasons were defeated by [*Teseus*], within the hollow part and concauitie he inchaufed the conflict between the gods and the gyants: vpon the shoos or panto- fles that he weareth, he portraied the fight betwixt the *Lapithae* and the *Centauris*; so full com- pact of art was euery thing about her, and so curiously and artificially contriued. Now in the base or piedstall vnder the statue, the work that was cut he called the Genealogie of *Pandora*: A H man might there see the natuirty of the gods, to the number of 30; among them the goddesse *Victory*, of admirable workmanship. Moreover, artificers that are seen & skilful in these matters do greatly admire the fel serpent, as also the monster *Sphinx* made in brasse, vnder the very spear that *Minerua* holdeth in her hand. This may serue by the way in a word or two, touching that famous & most renowned Artift *Phidias*, whom no man is able to commend sufficiently, that it may be known likewise that the sufficiency of his workmanship was the same stil, euen in small matters as well as great.

To come now to *Praxiteles*: what time hee liued I haue declared already in my catalogue of Founders and Imageurs in brasse: who albeit he was singular in that kind, yet in marble he went beyond himselfe: his workes are to be teen at Athens, in that conspicuous street called *Cerau- nium*: but of all the images that euer were made (I say not by *Praxiteles* onely, but by all the workmen that were in the world) his *Venus* passeth that hee made for them of *Gnidos*: and in truth so exquisit and singular it was, that many a man hath embarked, taken sea, and sailed to *Gnidos* for no other busines, but onely to see and behold it. Hee made two of them, and sould them both together; the one with a vaile and arrayed decently in apparell, which in that regard the men of *Cos* bought: for being put to their choice, they like honest men preferred it before the other which was naked (notwithstanding *Praxiteles* tendred them both at one and the same price) in the good mind that they carried, and hauing respect and regard vnto their grauity and modest carriage of themselves: that which they refused and reiected, the *Gnidians* bargained for: and indeed, to speak of wo. kman ship, it was infinitely better, and there was no comparison K betweene them, by the generall fame and opinion of all men: and verily King *Nicomedes* would afterwards gladly haue bought it againe of the *Gnidians*, and offered them enough; for he promised in consideration thereof to discharge al debts that their city was engaged in, which were very great summes; but they would not giue eare or hearken vnto him: content they were rather to liue in debt and danger still, yea and to abide and endure any forfeitures, exigents, ex- cutions, and extents whatsoeuer, than to part with their *Venus*. And to say a truth, good reason they had so to do, for, that one image of *Praxiteles* his making was their chiefe credit, innobled their city, and drew resort from all parts thither. This *Venus* was shrined in a little chappell by her selfe within a tabernacle; but of purpose so deuised, that it might be set open on all sides, L for to be seen and viewed all and whole on euery part: wherewith the goddesse her selfe (as men were verily perswaded) was well enough pleased, and shewed her contentment therein to al com- mers; for looke vpon her as one would, amiable shee was, and admirable euery way. It is repor- ted, that a wretched fellow was inamoured of this *Venus*, and hauing lurked one night secretly within the chappell, behaued himselfe so and came so neere vnto the image, that he left behind him a marke of his leaud loue and beastly lust; the spot of which pollution appeared afterward vpon the body. In the same *Gnidos* there be diuers other pieces more of Marble, wrought by excellent workmen; to wit, one god *Bacchus* made by *Brixiaides*, and another by *Scopas*, of whose handiwork there is *Minerua* also: yet there goeth no speech nor voice of any but onely of *Venus* as abovesaid; than which, there cannot be a greater argument to prooue the excellencie of M *Praxiteles* his work; they all seem but foils, to giue a lustre to his *Venus*. Of his making there is the picture of *Cupid* also, that *Cicero* reproched *Verres* with; the same for whose sake there is such resort and pilgrimage to *Thespia*; & which standeth now shrined within the * Schooles of

A of *Ostania*. He made also another *Cupid* all naked, for them of *Parium*, a city within *Propontis*, howbeit in the nature of a colony gouerned by the Roman lawes, and owing seruice to their high court: comparable it was vnto *Venus* at *Tenedos*, as well for beauty and excellency of work- manship, as for the like abuse and villanie done vnto it; for one *Alchidas* a *Rhodian* loued this *Cupid*, and (a shamefull thing to speake) defiled both himselfe and it, like a most filthy and pro- faine villaine. Moreover, at *Rome* there be diuers pieces of *Praxiteles* his making, to wit, *Flora*, *Triptolemus*, and *Ceres*, within the gardens of *Seruilus*; the images of *Good-adventure*, and *Good- fortune* both, which are in the *Capitoll*; also the religious women of the order of *Bacchus*, to wit, the furious *Menades* which also they name *Thyades*: also the holy nuns or votaries called *Cary- atides*; and *Silenus*, standing amongst the Monuments and Bookes within the Librarie of A- B *Asinius Pollio*, together with *Apollo* and *Neptune*. Thus much may suffice to haue beene spoken of *Praxiteles*.

Praxiteles left behind him a son named *Cephisodorus*, who was his fathers heire euery way, as well of his excellent and singular cunning as his worldly goods: of his handy worke there is to be seene at *Pergamus*, a couple of little boies clipping, embracing, and kissing one another: a most dainty and exquisit piece of worke, and much spoken of and highly praised: a man that saw them would verily beleeue and say, they dented with their fingers into a bodie of flesh, rather than a statue of marble. At *Rome* there be images that came out of his hand, to wit, *Latona* within the temple vpon mount *Palatine*, *Venus* within the librarie or monuments of *Asinius Pol- lio*, *Aesculapins* and *Diana* in the temple of *Iuno*, standing within the pourpris or quadrant of Ofa- C *uias* galleries.

Scopas followeth these in order of narration, but striueth to match them in praise of worthy workemanship: hee engraue and wrought the images of *Venus*, *Pothos*, and *Phaeton*, which three be honored among the *Samothracians* in all ceremonious deuotion, as right holy saints: like- wife of *Apollo*, which standeth within mount *Palatine*: of the fierie goddesse *Vesta*, sitting in a chaire, accompanied with two * hand-maidens set vpon the ground of each hand of her, which are to be seene within the gardens of *Seruilus*: like vnto which, there be other such *Damofels*, and Lady *Vesta*, remaining within the monuments or Librarie of *Asinius* before said: where also there is one *Canephoros*, to wit, a virgine bearing vpon her head a flasket of holy reliques: all of *Scopas* his making. But of all that euer he wrought, there is most account made of those images D which are in the chappell of *Cneus Domitius*, within the cirque of *Flaminius*, to wit, *Neptune* himselfe, and dame *Thetis*, and her sonne *Achilles*; the Sea-nymphs or Meere-maides also called *Nereides*, mounted vpon Dolphins, Whales, and mightie Sea-horses called *Hippocampi*, and sitting vpon them: moreover, the sea trumpeters *Tritones*, with all the quire and traine attending vpon sir *Pborcus* a Sea-god, and the mighty fishes called *Pristes*, besides many other monsters of the sea: all wrought by one & the same hand so curiously, that if he had sitten about the making of them al his life time and done nothing at all els, a man would haue thought it worke enough, and a great deed. But moreover and besides these aboue rehearsed, and many more which wee are not come to the knowledge of, we haue here with vs at *Rome* the image of *Mars* made gyant like after the manner of a colosse, yet sitting within the temple of *Brutus Callaicus*, which stands E close vnto the said cirque, in the way as men goe from thence to the gate *Laticana*. In the same place there is moreover another *Venus* naked, and wrought by the hands of *Scopas*, which seemeth to goe beyond that other *Venus* of *Gnidos* that *Praxiteles* made; which image alone were able (no doubt) to giue name to any other citie where it should stand, and to innoble the place: But at *Rome* verily there bee so many pieces besides, and those so stately and sumpt- uous withall, that they obscure and darken it (as it were) in some sort. Moreover, the excee- tuous withall, that they obscure and darken it (as it were) in some sort. Moreover, the excee- ding great affaires and the busie negotiations (whereof there is such a multitude and a world as it were in that Citie) withdraw all men from the contemplation and beholding of such things, bee they neuer so singular: for to say a truth, it belongeth rather to idle persons to look F quiet and silent: which was the cause that no man knoweth who was the workeman that made the images of *Venus*, which *Vespasian* the Emperour dedicated in the rampars and building of his temple of *Peace*: and yet if it stood any where else than at *Rome*, it might seeme to be nothing inferiour in name to the antient workes of old time. As little certaintie there is likewise of that image wrought in marble, which represents dame *Niobe* ready to die, together with

ing at handy-
gripes.

* Chamaeteras.

with all her sweet children, and standeth in the temple of *Apollo* surnamed *Sofianus*, whether *G Scopas* or *Praxiteles* made it: no more than father *Ianus*, which *Augustus Caesar* brought out of Egypt and dedicated in his owne temple, is known out of whose shop it came; notwithstanding now it be gilded all ouer: semblably, there standeth in the courtly pallee of *Ostania*, the image of *Cupid* holding a thunderbolt or lightning in his hand, ready to shoot; but it is a question who was the maker of him? And yet this is affirmed, That the same *Cupid* was made by the liuely partner of *Alcibiades*, who at that age was held to be the fairest youth that the earth did beare. In the same place, and namely in the schoole or gallerie of learned men, there be many more images highly commended, and yet no man knoweth who wrought them: As for example, four that resemble *Satyres*; of which, one seemeth to carry on his shoulders prince *Bacchus* arraigned like a girtle in a side coat or gown; another likewise beareth yong *Bacchus* in the same order, clad in the robe of his mother *Semelle*; the third maketh as though he would still the one *Bacchus* crying like a childe: the fourth offereth the other a cup of drink to allay his thirst: furthermore, there be two images in habit and form feminine, representing gales of wind, & these seem to make sail with their owne clothes. As doubtfull also it is, who made the images within the railed inclosure in *Mars* field named *Septa*, which do represent *Olympus*, *Pan*, *Chiron*, and *Achilles*; and yet so excellent pieces they be, that men esteeme them worthy to be kept safe, & satisfaction to be made with no lesse than their death, vnder whose hands and custody they should miscarrie. But to retorne againe vnto *Scopas*; he had concurrents in his time, and those that thought themselves as good workmen as himselfe, to wit, *Bryaxis*, *Timotheus*, and *Leochares*, of whom I must write jointly together, because they joined all foure in the grauing and cutting of the stately monument *Mausoleum*.

1 The temple of Diana in Ephesus.
2 The sepulchre of Mausoleus.
3 The colosse of the Sun at Rhodes.
4 The statue of Iupiter Olympias.
5 The walls of Babylon.
6 The Egyptian Pyramids.
7 The obeliske of Semiramis.
Sec. Cei. Rhed. antiquas. test. 1.23 c. 6.
* Dalerbarnius suspecteth this place: but me thinks a man may conceiue, euer by the very words of Pliny, that vpon the first pyramid of 2 cubits ther was raised another spire which ledded by 24 degrees, like as wee may see in many steeples with vs) and that might carry so many foot, as being added to the rest, will make vp the whole 140 from the ground.

This *Mausoleum* was the renowned tombe or sepulchre of *Mausolus*, a petty king of *Caria*, which the worthy lady *Artemisia* (sometime his queene, and now his widow) caused to be erected for the said prince her husband, who died in the second year of the hundredth *Olympias*: and verily so sumptuous a thing it was & so curiously wrought, by these artificers especially, that it is reckoned one of those matchlesse monuments which are called the * seuen Wonders of the world: from North to South it carrieth in length, 63 foot; the two fronts East and West, make the breadth, which is not all out so large; so as the whole circuit about, may containe foure hundred and eleuen foot: it is raised in height fise and twenty cubits, and inuironed with fixe and thirty columnes: on the East side, *Scopas* did cut; *Bryaxis* chose the North end; that front which regardeth the South, fell to *Timotheus*; and *Leochares* engraued at the west side: but Queene *Artemisia* (who caused this rich sepulchre to be made for the honour and in the memoriall of her husband late deceased) hapned her selfe to depart this life before it was fully finished: howbeit these noble artificers whom she had set a worke, would not giue ouer when she was dead and it gone, but followed on still and brought it to a finall end, as making this account, that it would be a glorious monument to all posterity, both of themselves and also of their cunning: and in truth at this day, it is hard to judge by their handy worke, who did best. There was a fifth workman also came in to them; for about the sidewall or wing of the tombe, there was a *Pyramis* founded, which from the very battlements of the said wal was carried to the height of the building vnderneath it: the same grew smaller still as the worke arose higher, and from that height at euery degree (which in the whole were 24) was narrowed and taken in, vntill at last it ended in a pointed brooch in the top whereof, there is pitched a coach with foure horses wrought curiously in marble; and this was the worke of *Pythis* for his part. * So that reckoning this chariot with the sharp spire, the *Pyramis* vnder it vnto the battlements, and the body of the sepulchre founded vpon the bare ground, the whole worke arose to an 140 foot in height. But to come to some particular works of *Timotheus* before said: his hand wrought that statue of *Diana* in marble which standeth at Rome in the chappell of *Apollo*, scituate in mount *Palatine*: and yet the head belonging thereto, which now this image carrieth, *Antianus Evander* set vnto it in place of the former.

As touching *Menesstratus*, men haue in high admiration *Hercules* of his making; as also *Hecate*, which standeth in a chappell at *Ephesus* behinde the great temple of *Diana*: the sextons or wardens of which chappell, giue warning vnto those that come to see it, that they looke not too long vpon it for dazling and hurting their eyes, the lustre of the Marble is so radiant and splendid.

I can

A I cannot range in a lower degree vnto these, the three *Charites* or *Graces*, which are to be seen in the Bassie court before the Citadell of *Athens*, the which * *Socrates* made; I meane not that *Socrates* whom I reckoned among painters, although some thinke he was the same man. As for *Myro* (whom I commended for a singular imageur in brasse) there is in marble of his portraying and ingrauing, an old woman drunken, which he made for them of *Smyrna*; a piece of worke as much esteemed and spoken of, as any other. And here I cannot but thinke of *Pollio Asinius*, who (as he was a man of a stirring spirit and quick conceit) delighted to haue his librarie and monuments to be enriched with such antiquities as these: for among them, a man shall see the *Centaur* carry behind them vpon their croup, the *Nymphs*, which *Archeus* wrought; the *Muses* named *Thespiades*, of *Cleomenes* his cutting; *Oceanus* and *Iupiter*, done by the hand of *Eutychus*; the statues on horse back resembling women called *Hippiades*, which *Stephanus* wrought; joint Images of *Mercurie* and *Cupid*, called *Hermocrates*, the workmanship of *Tauriscus* (I meane not the grauer, of whom I spake before, but another *Tauriscus* of *Tralleis*;) *Iupiter* surnamed *Xenius* or *Hospitalis*, which came out of the hands of *Pamphilus* an apprentice to *Praxiteles*: as for the braue piece of worke, to wit, *Zetus*, *Amphion*, *Dirce*, the Bull, and the bond wherewith *Dirce* was tied, all in one entier stone, which was brought from *Rhodes* to Rome; it was done by *Apollonius* and *Tauriscus*; these men made question of themselves, who should be their fathers? professing in plaine termes, that *Memocrates* was taken and suppoled their father, but indeed *Artemidorus* begat them, and was their father by nature; & in the same place among other monuments, the statue of father *Bacchus* made by *Eutychides*, is much commended. Moreover, neare vnto the C gallerie of *Ostania*, there is the Image of *Apollo*, wrought by *Phyliscus* the *Rhodian*; and hee standeth in a chappell of his owne. Item, *Latona*, *Diana*, the nine *Muses*, and another *Apollo* naked. As for that *Apollo*, who in the same temple holdeth in his hand a harp, *Timarchides* was the workman of it; but in the precinct or cloister of the said galleries, and in the chappell of *Iuno*, there is the goddesse herselfe curiously made in marble, the handy worke of *Dionysius* and *Polycles*; but the image of *Venus* in the same place, *Phyliscus* wrought: al other statues there, came out of *Praxiteles* his hands. Moreover, *Polycles* and *Dionysius*, the sons of *Timarchides*, made that *Iupiter* which is in the next chappell; the images of *Pan* and *Olympus*, wrestling together in the same place, were the workmanship of *Heliodorus*; and this is one of the fairest images coupled together as wrestlers, that are knowne in the world; as for *Venus*, bathing her selfe, he also made her; but *Dadalus* standing by, *Polycharmus*. As touching one piece of worke that *Lyfias* made, it may appear how highly it was esteemed, by the honourable place wherein it stood: for *Augustus Caesar* late Emperor of happy memorie, to the honour of *Ostianus* his father, dedicated it in mount *Palatin* ouer the triumphant arch there, and placed it within a shrine or tabernacle adorned with columnes: but what might this worke be? surely nothing else but a chariot with foure horses set vnto it, *Apollo* and *Diana*, all of one entire piece. Within the gardens of *Servilius*, I finde there is great praise of *Apollo* made by *Calamis*, that singular grauer in mettall: the religious priests and prophetesses also of *Phæbus*, called *Pythææ*, done by *Dactylis*; and *Callisthenes* the *Historiographer* statue, wrought by *Amphistratus*.

Moreover, many cunning workmen there were, whose same notwithstanding is obscured, by E reason that albeit many singular pieces & those vnmarchable, haue passed through their hands, yet for that many haue ioined in the workmanship together, the number hath bin a checke and barre to the excellency of some that went beyond their fellows, for neither is there one among them that goeth away cleare with the honor from the rest, nor many together can well be named for one thing: and this may be scene in the image of *Laocoon*, which remaineth within the pallee of Emperor *Titus*, a piece of worke to be preferred (no doubt) before all pictures or cast images whatsoever; and yet we know not what one artificer to praise for it. *Agelander*, *Polydorus*, and *Athenodorus*, *Rhodians*, most excellent workmen all, agreed by one generall consent to expresse liuely in one entire stone, *Laocoon* himselfe, his children, and the wonderful intricate winding of the serpents, claspings and knitting them about: semblably, the houses *Palatine* of the F *Cæsars*, a man shall see fully furnished with right excellent statues, which *Craterus* and *Pythidorus*, *Polydectes* and *Hermolaus*, another *Pythodorus* also joynd with his fellow *Arthemion*, wrought together, as also those that *Aphrodisius Trallianus* alone himselfe, did cut. As for the temple called *Pantheon*, which *Agrippa* built, *Diogenes* of *Athens* enriched it with marble images. The *Virgins* also going vnder the name of *Caryatides*, erected vpon the chapters of the columnes in that temple,

Ccc 3

CHAP. VI.

¶ When first began Marble Stones to be used in building of privat houses. Who began at Rome to parget and cover walls with thin leanes of Marble. In what ages each kinde of Marble came into use and request. Who inuented cutting of Marble into thin plates: the deuise and manner thereof. Of sand proper for building.

*So named, by occasion of the statues of 14 nations there erected, as appeareth a little after.

*For in Greek Batrachos is a frog, and Saurus a lizard.

temple are commended, as few like vnto them for workmanship: like as the other images which G be aduanced vp to the very top of the lantern of the foresaid temple, are thought to be excellent pieces: howbeit, for that they stand so high and cannot well be discerned, lesse speech there is of them. As touching that *Hercules*, in the honour of whom the Carthaginians were won euery yere to sacrifice the flesh of mankind, it is an image not regarded; for he hath no place in any temple or chappell, neither is he erected vpon pillar, no nor so much as vpon a base, but standeth vpon the bare ground, just ouer-against the entrie to those galleries in Rome, called *Ad Nati- ones: howbeit, the workmanship of this *Hercules* is not to be despised. There stood also beneath the nine Muses called *Thepiades* vnder the temple of *Felicity*, and as *Varro* saith, one *Iunius Pisticulus* (by place a gentleman of Rome) was enamored vpon one of them, so beautifull they were made: and yet to this day, *Pasticules* cannot look enough thereupon, but hath the same in great admiration: who also wrote fife books, comprising all the famous and principall pieces of worke that are to be found in the world. This *Pasticules* was borne in the marches and coasts of Italy called *Græcia*, and together with the townes of that tract, was made a Romane free denizen; being himselfe also a good cutter in stone, hee made that image of *Iupiter* in Yvory which standeth in the chappell of *Metellus*, in the way which leadeth into [Mars] field. It happened vpon a time, that being about the Arsenall, where certaine wild beasts were, newly brought out of Affricke, hee looked in at a grate to behold a lyon and to take out the counterfeite of him; but as hee was ingrauing in stone according to the patterne, behold, out of another cage a panther brake loose, to no small danger of that most curious and painfull workman: it is said, that hee made many works; but in particular which were of his doing, it is not precisely set down. Moreover, *M. Varro* doth highly magnifie *Arcefilaus*, of whose handy worke hee saith that hee had a lionesse in marble, and certaine winged *Cupids* playing with her: of which, some seemed to hold her fast bound, others forced her to drinke out of a horne, others againe would seeme to shooe her with their fockes; and all this prettie anticke worke was of one entire stone. The same *Varro* writeth, that *Coponius* made the images of the foureteene Nations, which are about the galleries or theatre of *Pompeius*. I finde also by my reading, that *Canachus* (whom I commended for a good founder or imageur in brasse, in my catalogue of such artisans) wrought in marble likewise and cut many faire statues: neither is it meet, that *Sauos* and *Batrachus* should be forgotten, who wrought the chappells that are within the clofe or cloister belonging to the galleries of *Ostia-ua*, notwithstanding they were themselves Lacedæmonians borne. Some also are of opinion, that they were exceeding rich men, and that of their owne purses they defraied the charges of building those chappells, hoping to haue had the honour to be immortalized with the inscriptions in the forefront thereof: which being denied them, yet in another place and after another sort, they made meanes to eternize their name; for they deuised in the foot or base of euery pillar (as it appeareth yet at this day) to cut the forme of a * frog and a lizard, to represent thereby their owne names. Moreover, I cannot conceale from you one pretty thing to be obserued, and which we all know to be true, That in one chappell of *Iupiter*, all the pictures therein, as also all the ceremoniall seruice, thereto belonging, are respectrue altogether to the foeminine sex: the which happening at first by meere chance, continued afterwards: for when the temple of *Inno* was finished, the porters who had the carriage of the images ordained there to stand, mistooke their marks and carried thither those which were appointed for the chappell of *Iupiter*; and contrariwise those for *Inno*, into the chappell of *Iupiter*; which beeing once done, was not altered againe, but taken for a presage, and religiously euer after kept, as if the very gods themselves had so ordered and appointed it, and made a counterchange: which is the reason also, that in the foresaid chappell of *Inno*, there is that kinde of seruice which was meant for *Iupiter*.

To conclude, there haue been certaine workemen that haue growne to great name, by cutting and grauing in small pieces of marble; and namely, *Myrmecides* deuised to inchafe in marble, a charriot and foure horses, and a man to driue the same, in so smal a roome, that a poor flie might couer all with her little wings. As for *Callicrates*, he cut in stone the similitude and proportion of pismires in so narrow a compasse, that a man cannot easily discern the feet and other parts of the body.

CHAP.

Thus far forth haue I discoursed of the cutters and ingrauers of marble, and of those excellent artificers, who haue bin most renowned. In which treatise I remember wel, that the dis- apred and spotted marble all this while was of no regard: for all the antique pieces which I haue rehearsed, were made of the marble of *Thafos*, of the Islands *Cyclades*, as also of *Lesbos*; and yet this inclineth to a blackish or blewish colour somewhat more than the rest. As for marble spotted in sundry colours, as also of the ordering, workmanship and vse of any kinds of marble in building, *Menander*, who in his time was most curious of all others in discussing all such superfluitie, dealt first therein, but seldome medled he withall. Howbeit, true it is, that at length pillars of marble were taken vp to be vsed in temples, not vpon any pride, brauerie, or magnificence (for as yet they knew not what such things meant) but for that it was thought, that they could not be erected nor beare vpon any thing stronger; and in that manner was begun the temple at *Athens* of *Iupiter Olympias*, out of which, *Sylla* brought those columnes which serued for his house and pallace in the Capitoll. Howbeit, euen in *Homers* time a difference there was made betweene ordinary stone and marble: for this Poet saith plainly, that *Paris* caught a rap vpon the mouth with a marble stone: and yet whensoever he extollet and setteth out in the highest degree the most stately pallaces of kings and princes, he neuer makes mention of any other matter to adorne them withall, but of *Brasse*, *Gold*, *Electrum*, *Siluer*, and *Yvory*, and not one word of *Marble*. But, as I take it, the first time that these marbles of sundry spots and colors were discovered, was in the quarries of the Islanders of *Chios*, by occasion that they digged for stone to fortifie their city with walls; whereupon *M. Cicero* plaies merily vpon them with a pleasant conceit, for when they made shew to all that came, and among the rest to him, what walls they had built of marble, and seemed to take great pride in their sumptuous and magnificent building; What ado is here (quoth *Cicero*) I would haue maruelled much more at your wall, and thought you had done a greater deed, if you had built it out of the quarry of *Tyburnum*. Certes, if marble had bin of any name and credit in old time, painters had not bin so highly honored as they were, nay, had there bin (thinke ye) any reckoning made of them at all?

As touching the manner of sitting marble into thin plates, therewith to couer and feel as it were the outsidcs of walls, I wot not well whether the inuention came from *Caria*, or no. The palace of *Manfolus K.* of *Caria*, built at *Halicarnassus*, is the antientest building that I can find in any record, garnished, set out and enriched with marble of *Proconnesus*, notwithstanding all the wals were reared of brick. This prince changed his life in the second yere of the 100 Olympias which fel out to be the 302 yere after the foundation of the city of Rome. As for our Romans, *Cornelius Nepos* writeth, That *Mamurra*, borne at *Formia*, a gentleman of Rome, and sometime a Prouost ouer the Pioners, Masons, Smiths, and Carpenters vnder *Cesar* in France, was the first who couered all the walls throughout his house which he had vpon mount *Cælius*, with leaues of marble. Now when I speak of *Mamurra*, you must not be offended, and think that I ascribe the inuention hereof to a mean person; for I tell you, this is that *Mamurra*, whom the Poet *Catullus* my countryman of *Verona*, so tanted and reuiled in his verses; this is the man, whose house before said, testifieth better by prooffe and effect, than *Catullus* could by his Poeticke expresse, That he had laid vpon it and gathered into it all the riches of *Gallia Comata*: which was as much to say as all France, saue only *Prouance*, *Languedoc*, *Sauoy*, and *Dauphine*. And well it might be so, for *Cornelius Nepos* before named addeth moreover and saith, that he was the first man, who caused the pillars of his house to be of marble, & had not one of other matter, neither were those sleight and slender, but solid & massie, euen hewn out of the quarries either of *Carystus* or *Luna*. But after him, in proccesse of time, *M. Lepidus* who was ioined companion in the Consulship to *Catullus*, was the first man known to lay the sils, lintels, & cheeks of his dores thorowout his house with *Numidian marble*; being Consul in the 666 yere, reckoning from the foundation of Rome: but

but well shent and rebuked he was for his labor. And verily, this was the first Numidian marble G as far as I can find by any mention or token at all, brought ouer to Rome; not to serue in pillars only and pannels in the feeling of walls, as *Mamurra* imploied his Carystian marble, but in * middlewoikes, and in the basest of all, namely, in dore sils, lentils, and jambes. After this, *Lepidus* some foure yeares, succeeded Confull *L. Lucullus*, who, as it should seeme by that which fell out, gaue the name to Lucullean marble, for that he was so much delighted therien: he brought it first to Rome, and had a speciall fancy thereto, notwithstanding it were black otherwise: whereas all other men esteemed better of other coloured marble, or els spotted. This marble growes in an Island lying within the riuer Nilus, and no marbles (as many kinds as there be) took name of him that loued them, but it alone. But among these men that were giuen to build with marble, *M. Scaurus* was the first man, as I take it, that for the stage and forefront of his Theatre, made H the wals of marble: but whether the same were of slit and sawne marble, or laid with good found square ashler or no (as the temple of *Iupiter Tonans* in the Capitoll hill, is at this day built) I am not able to say for certaine: for as yet I do not reade or find by any sign, that Italy knew how to slit marble into leaues. But surely, whosoever deuised that inuention, to saw marble stone, and to slit it into leaues for to serue the turne of riotous and wastful persons, had a perillous head of his own, and a shrewd. But would you know the cast of slitting marble? It is done with a kind of sand, and yet a man would think that it were the saw alone that doth the deed; for when there is an entry once made by a very smal line or trace, they strew the said sand aloft al the length thereof: then they set the saw to it, and by drawing it to and fro, the sand vnder the teeth thereof, maketh way downwards still, & so the stone, as hard as it is, they cut through in a trice: now for this purpose the Æthiopian sand hath no fellow: and to this passe forsooth we are come, that we cannot haue marble to serue our turns, vnlesse we send as far as into Ethiopia: nay, we must bee provided of sand to slit our marble with, out of India; from whence in times past, during the anient discipline of Rome, it was thought too much and a shamefull thing, to fetch rich pearles. And yet this Indian sand is commended in a second degree; but the Æthiopian is the softer and better simply; for that sand cutteth smooth and cleane as it goeth, and leaues no race at all in the work; the Indian maketh not so euen and neat plates, howbeit, they that polish marble, fit themselves with this sand when it is burnt and calcined; for if they rub their leaues and plates therewith, it will make them slick & fair; for otherwise, if it be not calcined to a fine powder, of it self it is churlish and rugged, which is the fault likewise of the sand that commeth from *Naxos* and *Coptis*, which commonly is called the Egyptian sand; for these sands verily were vsed in old time to the cutting of marbles. Afterwards they met with a sand as good as the best, and went no farther than to a certain bay or creek in the Adriatick sea or Venice gulf, which being left bare when the tide is gone, they may at a low water easily discerne to haue bin cast vp by the flood. And now adaeas our sawyers of marble, make no more ado, but take the first sand they come by, (it makes no matter out of what riuer it be) this serues their turne well enough; and thus they abuse and deceiue the world, although few chapmen there bee that know what losse there is by their marble leaues sawne in that sort: howbeit, such grosse sand as that, first makes a wider slit in the main stone, and by consequence spendeth and consumeth more of the marble; again, there is more work and labour about the polishing thereof, the saw and sand before said leaue the L faces of the stone so rugged and vneuen: and by this meanes the plates become sleight and thin before they can be imploied. To conclude, the sand from Thebais in high Egypt, is very good to polish withall: like as the grit that commeth of grauelly stones or pumish ground, serueth very well for the said purpose.

CHAP. VII.

¶ Of Whetstones and Grindstones, comming out of *Naxos* and *Armenia*. Of diuers kinds of Marble.

For polishing of statues and images made of Marble; for cutting, filing, and trimming of precious stones, *Naxium* serued a long time, and was commended before any other stone: for by this word *Naxium* I vnderstand the whet-stones and grinde-stones that come out of the Island *Cyprus*; but afterwards, those which were brought from *Armenia*, woon the name from them, and were esteemed better.

As

A As for the sundry sorts of Marble and their colours, to discourse of them in generall, were needlesse, they are so well and easily knowne: and to reckon them all in particular, were endlesse, they be in number so many and infinit: for what corner of the world is there, where you shal not find one marble or other different from the rest? And yet in my Cosmography, I haue already written of the best and most excellent kinds of marble, as I had occasion to speak of the nations and countries where they be found. Howbeit, this would be noted, that all sorts of marble bee not found in quarries and rocks, that stand vpon veines thereof: for much you shall meet with, lying ebbe in the ground, and the same scattering by pieces here and there. But the green marble that commeth from *Lacedæmon*, is esteemed most precious, and to be more gay and pleasant than all other. As touching the marbles called *Augustum* and *Tiberium*, they were found in B Egypt first after that sort lying loose and scattered, during the time that *Augustus* and *Tiberius* were Emperors of Rome, of whom they took their name. And albeit these marbles bee flecked and spotted, yet they differ from the Serpentine marble called *Ophites*; for that the speckles in *Ophites*, do resemble those in a serpents skin, whereupon it took that name: whereas the other two be distinguished with spots after a diuers sort: for *Augustum* hath veines curled, after the manner of waues, running round as it were like whirle pooles; and *Tiberium* spreadeth rather abroad in strakes, winding yet and turning after the order of whitish haire. Neither be there any pillars found of the foresaid Serpentine marble, vnlesse they be very small. And of this marble there be two kinds: the white, which is gentle and soft: the blacke, which is churlish and hard. Both of them are said to ease the head-ache, and to cure the sting of serpents, if they be but carried about one in pieces, either hanging at the neck, or otherwise tied to any part. Some there be who prescribe the whiter kind to be applied accordingly for the phrensie and lethargy: howbeit against serpents, there be who commend especially about the rest, that which of the colour of ashes they commonly call * *Tephria*. As touching the marble of *Memphis* or great *Caire* in Egypt, named thereupon *Memphites*, it is of the nature of these * precious stones, rather than of quarries. The vse herof is to be ground into powder, & with vineger to be reduced into a liniment, for to be applied to those parts that are to be cauterized or cut: for it so astonieth and benummeth the member, that it feeleth no pain, either by the searing iron or the Chyrurgians lancet. The *Porphyre* marble, which also comes out of Egypt, is of a red colour: of which kinde, look which hath white spots or streaks running among, is called thereupon *Leucostictos*: And D quarries there be in Egypt, standing wholly vpon this marble, which yeeld so sufficient, cut and hew therout as big and as huge pieces as you will. *Triarius Pollio*, Procurator general vnder *Claudius Caesar*, in the prouince of Egypt, brought for the Emperour certain statues of this *Porphyre*, out of Egypt: which new deuise of his was not very well liked and accepted, for no man tooke example by him afterwards to do the semblable. The Egyptians also found in *Æthiopia* another kind of Marble, which they call *Basaltis*, resembling yron as well in colour as hardness: and thereupon it took the name. The greatest piece of this marble that euer was found, *Vespasian Augustus* the Emperour dedicated in his temple of *Peace*, and it was a statue resembling the riuer *Nilus*, with 16 little children playing about it, whereby is signified the number of cubits, to which height the said riuer riseth when it is at the highest. It is said also, that within the temple of *Serapis* in *Thebes*, a city of high Egypt, there is another statue not vnlike to this marble *Bazaltis*, and many think it was made for *Memnon*, & by report, euery day at the Sun-rising, so soon as the raies or beames do beat thereupon, it seemeth to cracke or cleaue. As for * *Onyx*, our antient writers were of opinion, That it was found in those daies vpon the mountains of Arabia, and no where els: yet *Sudines* saith, that it is gotten in Germany. *Cornelius Nepos* affirmeth, That there was at first great wonder made at the drinking cups of this stone: and afterwards, at the feet of tables and beds, of chaires and stoolles likewise thereof: howbeit, afterwards (quoth he) *L. Lentulus Spinter* shewed at Rome wine vessels, as big as good barrels, such as came out of the Isle *Chios* with wine: but within sue yere after by his saying, hee saw pillars also, and those 32 foot long, all of *Onyx* or *Chalcedonie*. But in proceffe of time this stone altered and varied much: F for *Cornelius Balbus* brought foure small pillars thereof, and shewed them in his Theatre for a strange and miraculous sight. And in my time I haue seen of them about thirty, much fairer and bigger, which went to the making of a Summer parlour for pleasure, that *Callistus*, one of the franchised slaues of *Claudius Caesar* (a man wel known for his exceeding riches and power) built for his owne selfe.

CHAP

* Here Pliny remembreth himselfe, and makes a third kind of *Ophites* as *Diocor.* did before him. * *Dioc.* saith it is no bigger than a little pebble or grauel stone

* or rather *Onyx* as *Chios* *Callistonic*

¶ Of the stone called *Alabastrites*: likewise, of *Lygdinus* and *Alabandicus*.

THis Onyx stone, or Onychitis aforesaid, some name Alabastrites; whereof they vse for to make hollow boxes & pots to receiue sweet perfumes and ointments, because it is thought that they will keepe and preserue them excellently well, without corruption. The same being burnt and calcined, is very good for diuers plasters. This Cassidony or Alabastrer is found about Thebes in Ægypt, and Damascus in Syria: and this Alabastrer is whiter than the rest: Howbeit, the best and principall simply is that which commeth out of Carmania: next to it in goodness is that of India: and then the Alabastrer of Syria and Asia. The least esteemed of all other, is brought out of Cappadocia, and no beauty or lustre it hath at all. In sum, come it from what country it will, those pieces which stand most of a yellowish colour, like hony, spotted also in the head and nothing transparent, goe for the best. And generally throughout, look where you meet with any in colour white, or resembling horne, is rejected for naught, like as whatsoeuer of it is like glasse.

As touching the stones Lygdinus, found in the mountain Taurus, many are of opinion, that they be well neare as good as the former, for to keep odoriferous ointments: and those for big- nesse and capacity, exceed not bowls and good broad platters: passing faire and white they be: and in times past were wont to be brought only out of Arabia. Moreover, there be two kinds I besides of Marble, well esteemed both, and in great price, notwithstanding in nature they be ve- ry contrary: the one is called Coraliticus, found in Asia; you shal not light vpon any about two cubites long: in whitenesse they come passing neare vnto yvorie, and otherwise also they haue a certaine resemblance vnto it. The other called Alabandicus, after the name of the countrey that yeeldeth it, is contrariwise blacke: howbeit, there is of it to be found growing in Miletus, but not altogether so blacke, for it inclineth or declineth rather to a purple colour. This stone of Miletus will resolute in the fire, and commonly they vse to melt it for drinking cups, in man- ner of glasses. To come now to the Thebaicke marble, marked it is with certain drops here and there of a golden colour: and naturally it is found growing in that part of Africke, which con- fineth vpon the Ægyptians, and lyeth vnder their iurisdiction. A peculiar propertie it hath by K a secret in Nature, respectiue vnto the eies, to serue for to grinde collyries with, that is to say, those powders which are appropriat to the diseases of that part. But about Syene, in the pro- vince of Thebaies, there is a marble (thereupon called Syenites) which sometime they named Pyrrhopæcilos: the kings of Ægypt in times past (as it were vpon a strife and contention, one to exceed another) made of this stone certaine long beames, which they called Obeliskes, and consecrated them vnto the Sun, whom they honoured as a god: And indeed, some resemblance they carry of Sun-beames, when they are made to the forme of Obeliskes, and the very Ægypti- an name implieth so much. The first that euer began to erect these Obeliskes, was *Menes*, king of Ægypt, who held his royall seat and court in Heliopolis, the citie of the Sunne; where hee was admonished in a dreame by a vision, so to doe: and thus much may appeare by the inscrip- L tion of certaine letters engrauen vpon the said Obeliske: for those Characters, figures, and formes that wee doe see incathed in them, be the verie * letters that the Ægyptians vse them- selues. After him, foure other princes also set vp more of these Obeliskes in the aboue named citie: and namely king *Sachis* for his part, foure in number, those carrying in length eight and fortie cubits apiece. And *Ramises* (in whose reigne Troy was woon by the Greekes) created an Obeliske fortie cubits long, in the said citie: but being departed from thence (for that he took plea- sure in another city, where sometimes stood the royal pallace of king *Menevis*) he pitched on end another Obeliske, which carried in length * a hundred foot wanting one, and on euery side foure cubits square.

* *Undecentk*, by another Obeliske, which carried in length a hundred foot wide, and
the Gr. mma- cubits square.

¶ Of three Obelisks. The first of Thebes in high Egypt: the second of great Alexandria in Egypt: and the third which standeth at Rome in the large Cirque or Shew-place.

It is said, that *Ramifies* abouenamed kept 20000 men at work about this Obeliske. The King himselfe in person, when it should be reared on end, fearing lest the engins deuised to raise it, and hold the head thereof betwixt heauen and earth, in the rearing should faile and not be able to beare that monstrous weight; because hee would lay the heauier charge vpon the artificers that were about this enterprife, vpon their vtmost perill, caused his own son to be bound to the top thereof; imagining withall, that the care of the engineers who vndertooke the weighing vp this Obeliske, ouer the young prince, for feare of hurrying him, would induce them also to be the more heedfull to preferue the stone. Certes, this Obelisk was a piece of work so admirable, that when *Cambyses* had woon the city where it stood, by assault, and put all within to fire and sword, and burnt all before him, as far as to the very foundation & vnderpinning of the obelisk, commanded expressely to quench the fire: and so in a kind of reuerence yet vnto a masse and pile of stone, spared it, who had no regard at all of the city besides. Other Obeliskes there be twaine, the one erected by *K. Smarres*, the other by *Erapius*, both without characters, and the same are 48 cubits in height apiece. At Alexandria, *K. Ptolomeus* surnamed *Philadelphus*, let vp another obelisk 80 cubits high, the which king *Nectabis* had caused to be hewed out of the quarry, plaine without any work: but much more difficultie there was in carving it from the quarry, & setting it vpright, than there had bin labor in the hewing: some write, that *Satyrus* a great architect & engineer, conueied it to Alexandria by means of flat bottoms or sleds. But *Calixenus* saith, that one *Phenix* did the deed, who caused a trench to be cut from the riuer Nilus, and to be carried with water as far as to the place where the obelisk lay along: then he deuised two broad barges, prepared & well fraught with smal squares of the same stone, a foot euery way, to the double poise or weight of the Obelisk it selfe in proportion, by reason whereof the vessels hauing their full load, might come vnder the Obelisk iust, as it lay hollow ouerthwart the head of the fosse, with either end resting vpon the banks: which done, he began to discharge the vessels vnderneath, & to throw out the stones wewith they were laden, by meanes whereof, as they were lightened, they rose vp higher and higher to the very Obelisk, and receiued the charge ordained for them. He writes moreover, that there were six other like to it hewed out of the same mountain, & the workmen who cut and squared them had fifty talents for a reward. But the foresaid Obelisk was afterwards by the abouenamed king erected in the hauen of Arsinoë, in testimonie of loue to *Arsinoë* his wife and sister both. But for that it did hurt to the ship-docke there, one *Maximus* a gouernor of Egypt vnder the Romans, remoued it from thence into the market place of the said city, cutting off the top of it, intending to put a filiall thereupon gilded, which afterwards was forelet and forgotten. Two Obeliskes more there were in the hauen of Alexandria neere to the temple of *Caesar*, which were hewed out of the rocke by *Mesphees* king of Egypt, being 42 cubits high. But about all other difficulties, it passeth, what a do there was to transport them by sea to Rome: and verily, the ships prepared of purpose therefore were passing faire and wonderfull to see to. As for one of the said ships which brought the former Obelisk, *Augustus Caesar* the Emperour of famous memorie, had dedicated it vnto the harbor or hauen of Puteoli, there to remain for euer as a miracle to behold, but it fortune to be consumed with fire: the other, wherein *C. Caesar* had transported the second Obeliske into the riuer, after it had bin kept safe for certaine yeares together, to be seen (for that it was the most admirable Carrick that euer had bin known to float vpon the sea) *Claudius Caesar* late Emperour of Rome caused it to be brought to Ostia, where for the safetie and securitie of the hauen he sunk it, and thereupon, as a sure foundation, he raised certaine piles or bastions like turrets or sconces, with the sand of Puteoli: which being done, a new care and trouble there was to bring the Obeliske vp the riuer Tiberis to Rome. Which being effected, it appeared well by that experiment, that vpon the riuer Tiberis a vessel draweth as much water full as Nilus. As touching the said Obelisk which *Augustus Caesar* late Emperour erected in the great shew-place or cirque at Rome, it was first cut out of the rock by

* Whom some
take to be *A-*
masis.

* *Sennefertus* King of Egypt, in the time of whose reign *Pythagoras* sojourned in Egypt; & the same contains 125 foot nine inches, besides the foot or base of the said stone. As for the other, standing in *Mars* field, being 9 foot lower than it, hewed and squared it was by commandement from *Sesoftris* K. of Egypt. In the characters ingrauen in both of them a man may see all the philosophy and religion of the Egyptians, for they contain the interpretation of nature.

CHAP. X.

¶ Of that Obelisk at Rome which standeth in *Mars* field, and serueth for a *Gnomon*.

And as for that Obelisk which standeth in *Mars* field, *Augustus Caesar* deuised a wonderful means that it should serue to mark out the noontide, with the length of day and night, according to the shadowes that the Sun doth yeeld by it: for hee placed vnderneath at the foot of the said Obelisk, according to the bignes and length thereof, a pavement of broad stone, wherein a man might know the sixth houre or mid-day at Rome, when the shadow was equall to the Obelisk; and how by little and little, according to certain rules (which are lines of brasse inlaid within the said stone) the daies do increase or decrease. A thing no doubt worth the knowledge, and an inuention proceeding from a pregnant wit. *Manlius* a renowned Mathematician & Astronomer, put vnto the top of the said Obelisk a gilded ball, in such sort, that all the shadow which it gaue fell vpon the Obeliske, and this cast other shadowes more or lesse, different from the head or top of the Obeliske aforesaid. The reason whereof (they say) was vnderstood from the sundry shadowes that a mans head yeelds. But surely for these thirty yeares past, or thereabout, the vse of this quadrant aforesaid hath not been found true: and what the reason of it should be I know not; whether the course of the Sun in it self be not the same that hertofore, or be altered by some disposition of the heauens, or whether the whole earth be somewhat removed from the true centre in the midst of the world (which I heare say is found to be so in other places) or that it proceed by occasion of the earthquakes which haue shaken the city of Rome, and so haply wrested the *Gnomon* from the old place: or lastly, whether by reason of many inundations of *Tyber*, this huge and weighty Obelisk hath settled and sunk down lower (and yet it is said, the foundation was laid as deep vnder ground as the obelisk it selfe is aboue ground.)

CHAP. XI.

¶ Of the third Obelisk in the *Vaticane*.

There is a third Obelisk at Rome, standing within the cirque or shew-place of the two Emperors *C. Caligula* and *Nero*: and this is the only Obeliske known to haue bin broken in the rearing. This was hewn and erected in Egypt by *Nuncoreus* the son of *Sesoftris*: which *Nuncoreus* caused another to be set vp of 100 cubits high, and consecrated it vnto the Sun, after hee had recovered his sight vpon blindness, being so aduertised by the Oracle, which remains at this day.

CHAP. XII.

¶ Of the Egyptian Pyramides, and of *Sphinx*.

Having thus discoursed of the Obelisks, it were good to say somewhat of the Pyramids also in Egypt; a thing I assure you that bewraileth the foolish vain-glory of the Kings in that country, who abounding with wealth, knew not what to doe with their money, but spent it in such idle and needlesse vanities. And verily most writers doe report, That the principall motives which induced them to build these Pyramides, was partly to keepe the Common people from idleness, partly also because they would not haue much treasure lying by them, lest either their heirs apparant, or other ambitious persons who aspired to be highest, should take occasion thereby to play false and practise treasons. Certes a man may obserue the great follies of those princes herein, That they began many of these Pyramides, and left them vnfinished, as

A may appeare by the tokens remaining thereof. One of them there is within the territory vnder the jurisdiction of *Arsinoe*; two within the prouince that lieth to the gouernment of *Memphis*; not far from the Labyrinth, whereof also I purpose to speake: there are other twaine likewise in the place where sometimes was the lake *Moeris*, which was nothing else but a mighty huge fort intrenched by mans hand in manner of a mote or poodle: but the Egyptians (among many other memorable and wonderfull works wrought by their princes) speake much of these two * *Pyramides*; the mighty spires and steeples whereof (by their saying) do arise out of the very water. As for the other three which are so famous throughout the world (as indeed they are notable marks to be kenned a far off by sailers, and directions for their course) these are scituated in the marches of *Affricke* vpon a craggy and barren mountaine, betwene the city *Memphis* and a certaine Island or diuision of *Nilus* (which as I haue said before) was called *Delta*, within foure miles of *Nilus* and six from *Memphis*, where there standeth a village hard vnto it named *Bufiris*, wherein there be certaine fellows that ordinarily vse to clime vp to the top of them. Ouer against the sayd *Pyramides* there is a monstrous rocke called *Sphinx*, much more admirable than the *Pyramides*, and forsooth the peisants that inhabit the countrey esteemed it no lesse than some diuine power and god of the fields and forrests: within it, the opinion goeth, that the body of *K. Amasis* was intombed; & they would bear vs in hand, that the rock was brought thither, all and whole as it is: but surely it is a medre crag growing naturally out of the ground; howbeit wrought also with mans hand, polished and very smooth and slippery. The compasse of this rocks head (resembling thus a monster) taken about the front, or as it were the forehead, containeth one hundred and two foot, the length or height 143 foot; the height from the belly to the top of the crowne in the head, ariseth to 62 foot. But of all these *Pyramides*, the biggest doth consist of the stone hewed out of the Arabicke quarries: it is said, that in the building of it therewere 366000 men kept at worke twentie yeares together: and all three were inmaking threescore and eightene yeares and foure moneths. The writers who haue made mention of these *Pyramides*, were *Herodotus*, *Euhemerus*, *Darius* the Samian, *Aristagoras*, *Dionysius*, *Artemidorus*, *Alexander Polyhistor*, *Butorides*, *Amisthenes*, *Demetrius*, *Demoteles*, and *Apion*: but (as many as haue written hereof) yet a man cannot know certainly and say, This *Pyramid* was built by this king: a most iust punishment, that the name and authors of so monstrous vanity, should be buried in perpetuall obliuion: but some of these Historiographers haue reported, that there were a thousand and eight hundred talents laid out only for raddish, garlick, and onions, during the building of these *Pyramides*. The largest of them taketh vp eight acres of ground at the foot; foure square it is made, and every face or side thereof equall, containing from angle to angle, eight hundred fourescore and three foot, and at the top five and twenty: the second made likewise foure cornered, is on euery side euen, and comprehendeth from corner to corner seuen hundred thirty and seuen foot: the third is lesse than the former two, but far more beautifull to behold, built of *Ethiopian* stones; it carrieth at the foot in each face betwene foure angles, three hundred threescore and three foot. And yet of all these huge monuments, there remaine no tokens of any houses built, no apparence of frames and engins requisite for such monstrous buildings; a man shall find all about them far and neare, faire sand and small red grauell, much like vnto *Lentill* seed, such as is to be found in the most part of *Affricke*. A man seeing all so cleane and euen, would wonder at them how they came thither; but the greatest difficultie mouing question and maruell is this, What meanes were vsed to carry so high as well such mightie masses of hewen squared stone, as the filling, rubbith, and mortar that went thereto? for some are of opinion, that there were deuised mounts of salt and nitre heaped vp together higher and higher as the worke arose and was brought vp; which being finished, were demolished, and so washed away by the inundation of the riuer *Nilus*: others thinke, that there were bridges reared with bricks made of clay, which after the worke was brought to an end, were distributed abroad and imploied in building of priuat houses; for they hold, that *Nilus* could neuer reach thither, lying as it doth so low vnder them when it is at the highest, for to wash away the heaps and mounts aboue-said. Within the greatest *Pyramid* there is a pit 86 cubits deep, and thither (some thinke) the riuer was let in. As touching the height of these *Pyramides* & such like, how the measure should be taken, *Thales Milesius* deuised the meanes; namely, by taking just length of a shadow when it is meet and euen with the bodie that casteth it. These were the wonderfull *Pyramides* of Egypt, whereof the world speaketh so much. But, to conclude this argument,

D d d

That

* *Herodotus* saith, they were 250 foot high aboue the water, and as many deepe vnder.

That no man should need to maruell any more of these huge workes that kings haue built, let G him know thus much, that one of them, the least (I must needs say) but the fairest and most commended for workmanship, was built at the cost and charges of one *Rhodope*, a very strumpet: this *Rhodope* was a bondslawe together with *Asopos*, a Philosopher in his kind, and writer of morall fables, with whom she serued vnder one master in the same house: the greater wonder it is therefore and more miraculous than all I haue said before, that euer she should bee able to get such wealth by playing the harlot. Ouer and aboue the Pyramides abovesaid, a great name there is of a tower built by one of the kings of Egypt within the Island Pharos, and it keepeth & commands the hauen of Alexandria, which tower (they say) cost 800 talents the building. And here because I would omit nothing worth the writing, I cannot but note the singular magnanimity of *K. Ptolome*, who permitted *Softratus* of Gnidos (the master workman and architect) to graue H his owne name in this building. The vse of this watch-tower, is to shew light as a lanthorne, and giue direction in the night season to ships, for to enter the hauen, & where they shall auoid bars and shelues, like to which there be many beacons burning to the same purpose, and namely, at Puteoli and Rauenna. This is the danger onely, lest when many lights in this lanterne meet together, they should be taken for a star in the skie, for that a far off such lights appeare to sailers in manner of a star. This engineer or master workman before said, was the first man that is reported to haue made the pendant gallery and walking place at Gnidos.

CHAP. XIII.

Of the Labyrinths in Egypt, Lemnos, and Italy.

Since wee haue finished our Obelisks and Pyramides, let vs enter also into the Labyrinths; which we may truly say, are the most monstrous workes that euer were deuised by the head of man: neither are they incredible & fabulous, as peradventure it may be supposed; for one of them remaineth to be seen at this day within the jurisdiction of Heracleopolis, the first that euer was made, to wit, three thousand and six hundred yeares ago, by a king named *Petesuccas*, or as some thinke *Tithoes*: and yet *Herodotus* saith, it was the whole worke of many KK. one after another, and that *Psammethichus* was the last that put his hand to it and made an end thereof: the reason that moued these princes to make this Labyrinth, is not resolued by writers, but diuerse causes are by them alledged: *Demoteles* saith, that this Labyrinth was the roiall pallace and seat K of king *Motherudes*: *Lyctas* affirmeth it to be the sepulchre of *K. Meris*: the greater part are of opinion, that it was an ædifice dedicated expressly and consecrated vnto the Sun, which in my conceit commeth nearest to the truth. Certes, there is no doubt made that *Dædalus* tooke from hence the pattern and platforme of his Labyrinth which he made in Crete; but surely he expressed not aboue the hundreth part thereof, chusing onely that corner of the Labyrinth which containeth a number of waies and passages, meeting and incountring one another, winding and turning in and out euery way, after so intricat manner and so inexplicable, that when a man is once in, he cannot possibly get out againe: neither must wee thinke that these turnings and returnings were after the manner of mazes which are drawne vpon the pauement and plain floore of a field, such as we commonly see serue to make sport and pastime among boies, that is to say, L which within a little compasse and round border comprehend many miles; but here were many dores contriued, which might trouble and confound the memorie, for seeing such variety of entrie, allies, and waies, some crossed & encountred, others flanked on either hand, a man wandred still and knew not whether he went forward or backward, nor in truth where he was. And this Labyrinth in Crete is counted the second to that of Egypt: the third is in the Isle Lemnos: the fourth in Italy: made they were all of polished stone, and besides vaulted ouer head with arches. As for the Labyrinth in Egypt, the entrie thereof (whereat I much maruell) was made with columns of stone, and all the rest stuffed so substantially and after such a wonderfull manner couched and laid by art of Masonrie, that impossible it was they should in many hundred yeres be disjointed and dissolued, notwithstanding that the inhabitants of Heracleopolis did what M they could to the contrary; who for a spight that they bare vnto the whole worke, annoied and impeached it wonderfully. To describe the site and plot thereof, to vnfold the architecture of the whole, and to rehearse euery particular therof, it is not possible; for diuided the building is into sixteene regions or quarters, according to the sixteene seuerall governments in Egypt (which they

A they call *Nomos*) and within the same are contained certain vast & stately pallaces which bear the names of the said jurisdictions, and be answerable to them: besides, within the same precinct are the temples of all the Egyptian gods: ouer and aboue, fifteen litle chappels or shrines, euerie one enclosing a *Nemesis*, to which goddesse they be all dedicated: to say nothing of many Pyramides forty eils in height apiece, and euery of them hauing six walls at the foot, in such sort, that before a man can come to the Labyrinth indeed which is so intricat & inexplicable, & wherein (as I said before) he shall be sure to lose himselfe, he may make account to be weary & tyred out: for yet he is to passe ouer certain losses, galleries, & garrets, all of them so high that he must clime staires of ninety steps apiece ere he can land at them; within the which, a number of columns and statues there be, all of porphyrit or red marble, a world of images and statues B representing as well gods as men, besides an infinit sort of other pieces pourtraied in monstrous and ougly shapes, and there erected. What should I speake of other rooms and lodgings which are framed and situat in such manner, that no sooner are the dores and gates opened which lead vnto them, but a man shall heare fearful cracks of terrible thunder: furthermore, the passages from place to place are for the most part so conueighed, that they be as dark as pitch, so as there is no going through them without fire light: and still be we short of the Labyrinth, for without the main wall therof, there be two other mighty vpright wals or wings, such as in building they call *Pteris*; & when you are passed them, you meet with more shrouds vnder the ground, in manner of caues and countermines vaulted ouer head, and as dark as dungeons. Moreover, it is said, that about 600 yeares before the time of *K. Alexander* the Great, one *Circamnos* (an eunuch or C groomer of *K. Nestabis* chamber) made some small reparations here about this Labyrinth, & neuer any but hee would go about such a piece of work. It is reported also, that while the main arches and vaults were in rearing (and those were made all of foure square ashler stone) the place shone all about and gaue light with the beams and placher made of the Egyptian *Acacia* sodden in oile. And thus much may serue sufficiently for the Labyrinths of Egypt and Candy.

The Labyrinth in Lemnos was much like to them, only in this respect more admirable, for that it had a hundred and forty columns of marble more than the other, all wrought round by turners craft, but with such dexterity, that a very child was able to weld the wheele that turned them, the pins and poles wherby they hung were so artificially poysed. The master deuisers and architects of this Labyrinth, were *Zmilus*, *Rholus*, and a third vnto them, one *Theodorus* who was borne in the same Island. Of this, there remaine some reliques to be seene at this day, whereas a man shall not find one smal remnant either of the Italian or Candian Labyrinths: for meet it is that I should write somewhat also of our Labyrinth here in Italy, which *Porfena* K. of Tuscane caused to be made for his own sepulchre, and the rather, because you may know that forein KK. were not so vain in expences, but our princes in Italy surpassed them in vanity: but for that there go so many tales and fables of it which are incredible, I thinke it good in the description therof to vse the very words of my author *M. Varro*: King *Porfena* (quoth he) was interred vnder the citie Clusinum in Tuscane, in which very place he left a sumptuous monument or tombe built all of square stone, thirty foot it carried in bredth on euery side, and fifty in height; within the base or foot whereof (which likewise was foure square) he made a Labyrinth, so intricat, that if a man were entred into it without a bottom or clue of thread in his hand, and leaving the one end therof fastned to the entry or dore, it was impossible that euer he should find the way out again. E Vpon this quadrant there stood fise Pyramides or steeples, foure at the foure corners, and one in the mids, which at the foot or foundation caried 75 foot euery way in bredth, & were brought vp to the height of 150: these grew sharpe spired toward the top, but in the very head so contriued, that they met all in one great roundle of brasle which wrought from one to the other, & couered them all in manner of a cap, and the same rising vp in the mids with a cress most stately; from this couer there hung round about at little chains, a number of bells or cimbals, which being shaken with the wind, made a jangling noise that mought be heard a great way off, much like to that ring of bells which was deuised in times past ouer the temple of *Iupiter* at Dodona: F & yet are we not come to an end of this building mounted aloft in the aire, for this couer ouer head serued but for a foundation of 4 other Pyramides, and euery one of them arose a hundred foot high aboue the other worke, vpon the tops whereof there was yet one terrace more to sustaine fise Pyramides, and those shot vp to such a monstrous height, that *Varro* was ashamed to report it: but if we may giue credit to the tales that go currant in Tuscane, it was equal to the

* Which was
250 foot: so
that the whole
was 500 foot.

whole * building vnderneath. O the outrageous madnesse of a foolish prince, seeking thus in a vaineglorious mind to be immortalized by a superfluous expence which could bring no good at all to any creature, but contrariwise weakened the state of the kingdome! And when all was done, the artificer that enterprised and finished the worke, went away with the greater part of the praise and glory.

CHAP. XIII.

¶ Of a garden made vpon Terraces. Of a citie standing all vpon vaults and arches from the ground. And of the temple of Diana in Ephesus.

WE reade moreover of gardens made in the aire; nay it is recorded, that a whole city (and namely Thebes in Egypt) was built so hollow, that the Egyptian KK. were wont to lead whole armies of men vnder the houses of the said city, and in such sort as none of the inhabitants could beware thereof, yea and sodainly appeare from vnder the ground: a marvellous matter I assure you, but much more wonderful in case the river Nilus also ran thorough the mids of the said towne. But surely of this opinion I am, that if this be true, *Homer* no doubt would haue written of it, considering he hath spoken so much in the praise and commendation of this city, and especially of the * hundred gates that it had. But to speake of a stately and magnificent work indeed, the temple of *Diana* in Ephesus is admirable, which at the common charges of all the princes in Asia was * two hundred and twenty yeres a building. First and foremost, they chose a marish ground to set it vpon, because it might not be subiect to the danger of earthquakes, or feare the chinkes and opening of the ground: againe, to the end that so mighty and huge building of stone worke should stand vpon a sure and firme foundation (notwithstanding the nature of the soile giuen to be slipperie and vnsteadfast) they laid the first couch and course of the ground worke with charcole well rammed in manner of a pavement, & vpon it a bed of wool-packs: this temple carried in length throughout, four hundred twenty and five foot, in breadth two hundred and twenty: in it were a hundred and seuen and twenty pillars, made by so many KK. and every one of them threescore foot high, of which, six and thirtie were curiously wrought and engrauen, whereof one was the handiworke of *Scopas*: *Cherisiphron* the famous architect was the chiefe deuiser or master of the workes, and who undertooke the * rearing thereof: the greatest wonder belonging thereto was this, How those huge chapters of pillars, together with their frizes and architraues, being brought vp and raised so high, should be fitted to the sockets of their shafts: but as it is said, he compassed this enterprize and brought it to effect, by the meanes of certaine bags or sacks filled with sand; for of these he made a soft bed as it were raised above the heads of the pillars, vpon which bed rested the chapters, and euer as he emptied the nethermost, the foresaid chapters settled downward by little and little, and so at his pleasure he might place them where they should stand: but the greatest difficultie in this kind of worke, was about the very frontispiece and maine litle-tree which lay ouer the jambes or cheekes of the great dore of the said temple; for so huge and mighty it was, that hee could not weld it to lay & bestow the same as it ought, for when he had done what he could, it was not to his mind, nor couched and settled in the right place: whereupon the workman *Cherisiphron* was much perplexed in his mind, and so wearie of his life, that he purposed to make himself away: but as he lay in bed in the night season, and fell asleep all wearie vpon these dumptish and desperat cogitations, the goddesse *Diana* (in whose honor this temple was framed, and now at the point to be reared) appeared sensibly vnto him in person, willing him to be of good cheare and resolute to liue still, assuring him that she herself had laid the said stone of the frontispice, and couched it accordingly: which appeared true indeed the morrow morning, for it seemed that the very weight thereof had caused it to settle iust into the place, and made a joint as *Cherisiphron* would haue wished it. As touching all the other singularities belonging to this temple, and namely the gorgeous ornament that set it out, they would require many volumes to discipher and particularize vpon them; and when all is done, little or nothing pertinent they are to the illustration of Natures worke, which is the principall marke I aime at.

CHAP.

CHAP. XV.

¶ Of the proud temple in Cyzicum. The fugitive stone. The eccho which resoundeth seuen times to one cry. Of a great building without pin or naile of yron. The sumptuous and admirable adifices in Rome.

HERE is at this day a temple standing at Cyzicum, wherein the mason had bestowed threds of gold in all the joints vnder euery stone throughout, and those were all faire polished: within this temple, prince *Cyzicus* (who caused it to be built) minded to dedicat the image of *Iupiter* in yvorie, and of *Apollo* in marble, setting a crowne vpon his head. Certes, these joints thus entelaced with most fine and dainty threads, gaue a wonderfull grace and beautie to the whole Church, by sending and breathing (as it were) from them certaine raies, which by reuerberation cause all the images therein to haue a glittering lustre: in such sort, that ouer and above the deuise and wittie inuention of the workman, the very matter also (although it be close couched and hidden betwene each stone) commendeth the price and riches of the worke.

Within the said town there is a stone called the Fugitive and Runaway: The braue knights of Greece called Argonauts, who accompanied prince *Iason* in his voyage for the golden fleece, after they had vsed it for an anchor, left it there: but for that this stonewas ready many times to run away and be gone out of their Prytaneum (for so they call their publick hall) they soudred it fast with lead. In the same city neer vnto that gate which is called Thracia, there stand seuen turrets, which doe multiply a voice, and send backe many againe for one: this miraculous rebounding of the voice, the Greekes haue a pretty name for, and call it Echo. True it is, that this reuerberation and redoubling of the voice, proceedeth otherwhiles from the nature of the place, and most of all in vallies lying betwene hills; but at Cyzicum it commeth by fortune, and no such reason can be giuen thereof. At Olympia the like is wrought by art, for there is a gallerie there made of purpose, which after a wonderfull manner deliuereth the same voice which it receiuet, seuen times backe, whereupon they call it Heptaphonon. Moreover, in Cyzicum there is a faire and large building, which (because they keep courts and sit in counsell there) is named Buleuterion: the same is built in such sort, as there goeth not one pin or naile to all the carpentrie thereof: and the stories are so laid, that a man may take away the beams and rifters without any prop or shoure to support them, yea and bestow them againe fast enough without laces to bind them. After which manner, the wooden bridge at Rome was so framed ouer the river Tyberis; and a matter of religion and conscience was made thereof, to maintaine it so, in remembrance of the difficultie in taking it a pieces and breaking it downe, at what time as *Horatius Codes* made the place good against the power of *K. Porfena*.

And now since the coherence of matters hath brought me to Rome, me thinks I should not doe amisse to proceed vnto the miraculous buildings of this our city, to shew the docilitie of our people, and what prooffe there is of their progresse in all things, during the space of nine hundred yeres; that it may appeare how not only in magnanimitie and prowess they haue conquered the world, but in magnificence also of stately and sumptuous buildings surmounted all Nations of the earth: and as a man shall find this singularity and excellencie of theirs in the particular suruey of euery one of their stately and wonderfull adifices as they haue bin reared from time to time, so if he put them all together and take a generall view of them at once, he shall conceiue no otherwise of their greatnesse, than of another world assembled (as it were) to make shew in one place: for if I should reckon among great workes (as needs I must) the grand cirque or shew-place built by *Cesar* Dictator, which took vp of ground three stadia or furlongs in length, and one in breadth, containing also in adifices and rooms foure acres of iugera, wherein were bestowed to sit at ease and behold the sight with pleasure, two hundred and threescore thousand persons: what tearme shall I giue, but of Stately and magnificent buildings, either vnto the royall pallace of *Paulus Amilius*, enriched with goodly pillars of Sinadian marble out of Phrygia, most admirable to behold; or to the sumptuous Forum of *Augustus Caesar* late Emperour, or yet the temple of Peace built by the Emperour *Vespasianus Augustus*, now liuing, the goodliest and fairest buildings that euer were: what should I speake of the temple * *Pantheon*, made by *Agrippa* to the honor of *Iupiter Reuenger*? as also how before this time, *Valerius* of Ostia the architector enginer, made a rouse ouer the great Theatre at Rome against the time that

time) was deuised for to contain no greater number than fortie thousand seats at large. As touching the other furniture of this Theatre of *Scaurus* in rich hangings, which were cloth of gold; painted tables, the most exquisite that could be found; plaies apparrell and other stufie meet for to adorne the stage, there was such abundance thereof, that there being caried back to his house of pleasure at Tusculum the surplussage therof, ouer and aboue the daintiest part, wherof he had daily vse at Rome, his seruants and slaues there, vpon indignation for this wast and monstrous superfluitie of their master, set the said country house on fire, and burnt as much as came to a hundred millions of sesterces. Certes, when I consider and behold the monstrous humours of these prodigall spirits, my mind is drawn away stil from the progresse of mine intended iourney, and forced I am to digresse out of my way, and to annex vnto this vanity of *Scaurus* as great follie of another, not in masonry and marble, but in carpentry and timber: and *C. Curio* it was, he who in the ciuile warres betwene *Cesar* and *Pompey*, lost his life in the quarrell of *Cesar*. This gentleman, desirous to shew pleasure vnto the people of Rome at the funerall of his father deceased, as the manner then was, and seeing that he could not outgo *Scaurus* in rich and sumptuous furniture (for where should he haue had such a father in law again as *Sylla*? Where could he haue found the like mother to dame *Metella*, who had her share in all forfeitures and confiscations of the goods of outlawed citizens; and where was it possible for him to meet with such another father as *M. Scaurus*, the principall person of the whole city so long together, who parted stakes with *Marius* in pilling and polling of the prouinces, and was the very receptacle & gulfe which receiued and swallowed all their spoiles and pillage?) and *Scaurus* himselfe verily, if he might haue had all the goods in the world, could not haue done as he did before, nor make the like Theatre, againe, by reason that his house at Tusculum was burnt, where the costly and rich furniture, the goodliest rare ornaments which he had gotten together from all parts of the world were consumed to ashes: by which fire yet this good hee got and prerogative aboue all other, That no man euer after him was able to match that sumptuositie of his Theatre. This gentleman (I say) *Curio*, al things considered, was put to his shifts, & deuised to surpass *Scaurus* in wit, since hee could not come neere him in wealth. And what might his inuention be? Certes, it is worth the knowledge, if there were no more but this, that we may haue ioy of our own conceits and fashions, and call our selues worthily, as our manner is, **Majores*, that is to say, superiour euery way to all others. To come then to *C. Curio*, & his cunning deuise, he caused two Theatres to be framed of timber, and those exceeding big, howbeit so, as they might be turned about as a man would haue them, approach neere one to the other, or be removed farther asunder as one would desire, & all by the means of one hooke apiece that they hung by, which bare the weight of the whole frame, the counterpoise was so euery way, & all the whole therefore sure and firme. Now he ordered the matter thus, that to behold the severall stage plaies and shews in the forenoone before dinner, they shall be set back to back, to the end that the stages should not trouble one another: and when the people had taken their pleasure that way, he turned the Theatres about in a trice against the afternoone, that they affronted one another: and toward the latter end of the day, and namely, when the fencers and sword-plaies were to come in place, he brought both the Theatres nearer together (and yet euery man sat stil & kept his place, according to his rank and order) in so much, as by the meeting of the horns and corners of them both together in compass, he made a faire round Amphitheatre of it: and there in the midst between, he exhibited indeed vnto them all jointly, a sight and spectacle of sword-fencers fighting at sharpe, whom he had hired for that purpose: but in truth, a man may say more truly, that he caried the whole people of Rome round about at his pleasure, bound sure enough for stirring or remoouing. Now let vs come to the point, and consider a little better of this thing. What should a man wonder at most therein, the deuiser or the deuise it selfe? The workman of this fabrick, or the master that set him on worke? Whether of the twaine is more admirable, either the venturous head of him that deuised it, or the bold heart of him that undertook it: to command such a thing to be done, or to obey and yeeld to goe in hand with it? But when we haue said all that we can, the follie of the blind & bold people of Rome went beyond all, who trusted such a ticklish frame, & durst sit there, in a seat so moueable. Lo where a man might haue seen the body of that people, which is commander and ruler of the whole earth, the conquerour of the world, the disposer of kingdoms and realmes at their pleasure, the deuiser of countries and nations at their wil, the giuer of lawes to forrein states, the vicegerent of the immortall gods vnder heauen, and representing their

* The Romans delighted much in this word *Majores*, as may appear by their *Mores Maiorum*, &c.

A their image vnto all mankind: hanging in the air within a frame at the mercy of one only hook, rejoicing and ready to clap hands at their owne danger. What a cheape market of mens liues was here toward! What was the losse at Cannæ to this hazard, that they should complaine so much as they do of Cannæ? How neere vnto a mischiefe were they, which might haue happened hereby in the turning of a hand? Certes, when there is newes come of a city swallowed vp by a wide chinke and opening of the earth, all men generally in a publicke commiseration doe grieue thereat, and there is not one but his heart doth earne, and yet, behold the vniuersall state and people of Rome, as if they were put into a couple of barks, supported between heauen and earth, and sitting at the deuotion only of two pins or hookes. And what spectacle do they behold, a number of fencers trying it out with vnrebat swords? nay ywis, but euen themselves rather entered into a most desperat fight, and at the point to break their necks euery mothers son, if the scaffold failed neuer to little, & the frame went out of joint: Now surely by this prooff, *Curio* had gotten a good hand ouer the people of Rome, & no Tribunes of the Commons with all their Orations could do more: from that time forward he might make account to be so gracious, as to lead all the tribes after him in any suits, and haue them hanging in the air at his pleasure. What a mighty man with them might he be (thinke you) preaching vnto them from the *Rostre*? What would not he dare to propose, hauing audience in that publick place before them who could perswade them thus, as he did, to sit vpon such turning and ticklish Theatres. And in truth, if we wil consider this pageant vpright, we must needs confesse & may be bold to say, that *Curio* had all the people of Rome to perform a braue skirmish and combat indeed to honor and C solemnize the funeralls of his father before his tombe. And yet here is not all: for he was at his change and variety of magnificent shewes: and when he perceiued once that the hookes of his frames were stretched ynough and began to be out of order, hee kept them still close together round in forme of a perfecte Amphitheatre, and the very last day of his funeral solemnities, vpon two stages iust in the midst, he represented wrestlers and other champions to performe their deuoire, and then all on a suddaine causing the said stages to be disjointed and hailed one from another a contrary way, he brought forth the same day the fencers and sword players who had wooen the prize, and with that shew made an end of all. See what *Curio* was able to do! And yet was he neither king nor Kesar: he was not so much as a generall or commander of an army; nay, he was not named for any great rich man: as whose principall state depended vpon this, That D when the great men of the city, *Cesar* and *Pompey*, were skuffling together by the cares, he knew well how to fish in a troubled water. But to leaue *Curio* & such as he was, with their foolish and idle expences, let vs come to the miraculous workes that *Q. Marcius Rex* performed, and that to some good purpose: which if we consider & esteeme aright, passe all the other before rehearsed. This gentleman when he was Pretor, hauing commandement & commission both from the Senat, to repaire the conduits to the waters of Appia, Anio, and Tepula, which serued Rome, did not that only, but also conueighed a new water into the city, which of his owne name he called Martia: and notwithstanding that he was to pierce certaine mountains, & make trenches quite through them vnder the ground, for to bring the water thither from the Spring, yet he performed all within the time of his Pretourship. As for *Agrippa*, while he was *Ædile*, besides the conduits from all other fountaines which he scoured, repaired, and caused to keep their current: E he brought another of his own to the city, which is known by the name of Virgo: he made seuen hundred pooles for receipt of waters: a hundred and fife conduits, yeelding water at rockes and spoutes, besides a hundred and thirtie conduit heads in the fields, and the most of them built strongly with vaults, and adorned right stately. Moreover, vpon these workes of his he crested statues & images, to the number of three hundred, partly of brasse and partly of marble, besides foure hundred pillars of marble, and all within the compass of one yeare. And if wee may beleue his owne speech, discoursing of the acts done by him during his *Ædileship*, hee addeth moreouer and saith, That the plaies and games which he exhibited that yeare, for to doe the people pleasure, continued three score daies together, wanting one: that he caused a hundred three score and ten baines or stoues to be made within the city, wherein people of all sorts and degrees might bathe and sweat of free cost, and not pay a denier: the which remain at this day, and haue brought with them an infinit number of others. But of all the conduits that euer were before this time, that which was last begun by *C. Caligula Cesar*, and finished by *Claudius Cesar* his successeur, passeth for sumptuousnesse: for they commanded the waters from the two fountains,

tains, Curtius & Caruleus, whose heads were 40 miles off: and these they carried before them with such a force and to such an height, that they mounted vp to the top of the highest hills of Rome, and serued them that dwelt therupon. This work cost *three hundred millions of sesterces. Certes, if a man would well and truly consider the abundance of water that is brought thereby, and how many places it serues, as well publicke as priuate, in baines, stewes, and fishpooles, for kitchins and other houses of office, for pipes and little riuers to water gardens, as well about the citie, as in manors and houses of pleasure in the fields neere the city, ouer and besides, what a mighty way these waters be brought; the number of arches that of necessitie must be built of purpose for to conueigh them; the mountaines that be pierced and mined through to giue way together, with the vallies that are raised and made euen and leuell with other ground: he will confesse, that there was neuer any incredible and inenarrable sum of money, besides the infinit toil and labour of a multitude of workemen and labourers so many yeres together, as well to force the water which came vpon the pioners from vnder the ground with deuise of engines and windles vp to the top of the hill, whereas it stood vpon meere earth; as to cut and hew through hard reggs and rockes of flint: and all this by candlelight within the earth, in such sort that vnlesse a man had bin there to haue seene the manner of it, vnpossible it is either to conceiue in mind or expresse with tongue the difficultie of the enterprise. As for the peere and haue at Ostia (because I would make an end once of these matters) I will not say a word thereof, nor of the waies and passages cut through the mountaines, ne yet of the mighty piles and damns to exclude the Tuscan sea, for the Lucrine lake, with so many rampiers and bridges made of such infinit cost. Howbeit, among many other miraculous things in Ægypt, one thing more I will relate out of mine author *Papirius Fabianus*, a great learned Naturalist, namely, That marble doth grow daily in the quarries: and in very truth, the farmers of those quarries, and such as ordinarily do labour and dig out stone, do affirme no lesse; who vpon their experience doe assure vs, that looke what holes and caues be made in those rockes and mountaines, the same will gather againe and fill vp in time: which if it be true, good hope there is, that so long as marbles do liue, excesse in building will neuer die.

CHAP. XVI.

¶ *The sundry kinds of the Load-stone, and the medicines thereto depending.*

NOW that I am to passe from marbles to the singular & admirable natures of other stones; who doubts but the Magnet or Loadstone will present it self in the first place: for is there any thing more wonderfull, and wherein Nature hath more travelled to shew her power, than in it? True it is, that to rockes and stones she had giuen *voice (as I haue already shewed) whereby they are able to answer a man, nay, they are ready to gainesay and multiply words vpon him. But is that all? what is there to our seeming more dull than the stiffe and hard stone? And yet behold, Nature hath bestowed vpon it, fence, yea & hands also, with the vse thereof. What can we deuise more stubborne and rebellious in the own kind, than the hard yron, yet it yeelds, and will abide to be ordered: for loe, it is willing to be drawne by the load stone: a marvellous matter that this mettall, which tameth and conquereth all things els, should run toward I wot not what, and the nearer that it approacheth, standeth still as if it were arrested, and suffereth it selfe to be held therewith, nay, it claspeth and clungeth to it, and will not away. And hereupon it is, that some call the load-stone * *Sideritis*, others *Heracleos*. As for the name *Magnes* that it hath, it tooke it (as *Nicander* saith) of the first inuencor and deniser thereof, who found it (by his saying) vpon the mountaine *Ida* (for now it is to be had in all other countries, like as in *Spaine* also;) and (by report) a neat-heard he was: who, as he kept his beasts vpon the foresaid mountaine, might perceiue as he went vp and downe, both the hob-nailes which were in his shooes, and also the yron picke or graine of his staffe, to sticke vnto the said stone. Moreover, *Sotacus* ascribeth and setteth downe fise sundry kinds of the load-stone: the first which commeth out of Æthiopia; the second, from that *Magnesia* which confineth vpon *Macedonie*, and

* *Ides* in
Greek is yron.

A namely, on the right hand, as you go from thence toward the lake *Bœbeis*, the third is found in *Echiium*, a town of *Bœotia*; the fourth about *Alexandria*, in the region of *Troas*; and the fift in *Magnesia*, a country in *Asia Minor*. The principall difference obserued in these stones, consists in the sex (for some be male, others female;): the next lieth in the colour. As for those which are brought out of *Macedonie* and *Magnesia*, they be partly red, and partly blacke. The *Bœotian* loadstone standeth more vpon red than black: contrariwise, that of *Troas* is black, and of the female sex, in which regard it is not of that vertue that others be. But the worst of all comes from *Magnesia* in *Natolia*, and the same is white; neither doth it draw yron as the rest, but resembles the pumish stone. In sum, this is found by experience, That the blower any of these loadstones be, the better they are and more powerful. And the *Ethiopian* is simply the best, in so much, as it is worth the weight in silver: found it is in *Zimiri*, for so they call the sandy region of *Ethiopia*, which country yeeldeth also the sanguine loadstone, called *Hæmatites*, which both in color resembleth blood, and also if it be bruised, yeeldeth a bloody humour, yea and otherwhiles that which is like to saffron. As for the property of drawing yron, this blood-stone *Hæmatites* is nothing like to the loadstone indeed. But if you would know and try the true *Ethiopian* *Magnet*, it is of power to draw to it any of the other sorts of loadstones. This is a generall vertue in them all, more or lesse, according to that portion of strength which Nature hath indued them withal, That they are very good to put into those medicines which are prepared for the eies: but principally they do repress the vehement flux of humors that fall into them: beeing calcined and beaten into powder, they do heale any burne or scald. To conclude, there is another mountaine in the same *Ethiopia*, and not far from the said *Zimiri*, which breedeth the stone *Theamedes* that will abide no yron, but rejecteth and driueth the same from it. But of both these natures, as well the one as the other, I haue written oftentimes already.

CHAP. XVII.

¶ *Of certaine stones which will quickly consume the bodies that be laid therein. Of others againe that preserue them a long time. Of the stone called Assus, and the medicinable properties thereof.*

W Ithin the Isle *Scyros* there is a stone (by report) which so long as it is whole & found will swim and float vpon the water; breake the same into small pieces, it will sink. Near vnto *Assos*, a city in *Troas*, there is found in the quarries a certaine stone called *Sarcophagus*, which runneth in a direct veine, and is apt to be clouen and so cut out of the rocke by flakes. The reason of that name is this, because that within the space of forty daies it is knowne for certaine to consume the bodies of the dead which are bestowed therein, skin, flesh, and bone, all saue the teeth. And *Mutianus* mine author affirmeth, that look what mirroirs, *currycombs, cloth, or shooes soeuer be cast into the said coffins with the dead, they will turn all into stone. Of this nature there be stones in *Lycia*, and in the East countries, which if they be hung or applied to liuing bodies also, will eat and fret them away. Yet the stone called *Chernites*, resembling *Yvorie*, is more mild and gentle: for keepe it will and preserue dead bodies without consuming them at all, & in a sepulchre or coffin of this stone, the body of *K. Darius* (they say) was bestowed. Touching the stone called *Porus*, like it is vnto the marble of *Paros* for white colour and hardness, howbeit nothing so weighty. *Theophrastus* writeth, That there be found in Ægypt certain cleare and transparent stones, and those he saith bee like vnto the *Serpentine* marble *Ophites*: haply such there were in his time, for now are there none of them to be found; but as they are gone, so there be new come in their place. As for the stone *Assus*, in tast it is saltish, but singular good to allay the paine of the gout, if the feet onely be put into a trough or hollow vessel made of that stone. Moreover, all griefes, pains, and infirmities of the legs, will be healed in such quarries: whereas in all mettall mines, the legs take harm. Furthermore, this stone yeeldeth in the top of the quarrie a certain light substance, apt to be reduced into a soft powder, which they call the floure of the said stone, and is as effectually as the stone it selfe in some cases. Like it is for all the world to a red pumish stone. If it be mixt with *Cyprian* brasse or copper, it cures the accidents of womens breasts; but being incorporat with pitch or rosin, it discusseth the kings euill, and any biles or bitches. The same reduced into a iohoch to be licked down leasurely, serueth well in a phty.

* *Strigiles* He
meaneth those
that be used in
baines to fetch
off the sweat
and filthinesse
of our bodies.

phthysicke and tempered with hony, it healeth vp old vlcers and skinneth them cleane: and yet this property it hath, to eat away any excrescence of proud flesh. The same is good for the bitings of wild and venomous beasts. Such morimalls or sores as scorne ordinary cures & be full of suppuration, it drieth. Finally, there is an excellent cataplasme made with it and beane flour put together, for the gout.

CHAP. XVIII.

¶ Of *Tvorie* minerall, digged out of the ground. Of stones that are of a bonie nature, and such, as their veines represent *Date* trees within: and of other kinds of stone.

Theophrastus and *Mutianus* aboue named, are verily perswaded, That there be some stones which ingender others. And as for *Theophrastus*, he affirmeth, That there is a minerall *Yvo*, rie found within the ground, as well black as white: also, that there be bones growing within the earth, yea, and stones of a bony substance. About *Munda*, a city in Spaine, where *Caesar* did stator defeated *Pompey*, there are found stones resembling *Date* trees, breake them as often as you will. There be also certaine black stones, whereof there is as great account made as of marbles: like as the stone also of the cape *Tanara*. And such black stones (*Varro* saith) be more firm and hard which come out of *Africa*, than those of *Italy*; and contrariwise, that there be white stones harder to be wrought by the Turner, than the marble of *Paros*: the said *Varro* affirmeth, that the flint of *Luna* may be flit with the saw, whereas that of *Tusculum* will cracke and flie in pieces in the fire; also, That the darke and duskish *Sabine* stone, if it be sprinkled with oil, will burne of a light fire: moreover, That about *Volfinj* there haue been found quernes or hand mill-stones framed ready for worke, yea, and some we haue seen to turne about and grind of their owne accord; but such haue bin taken for prodigies. And since I am fallen vpon the mention of such mill-stones, there is not a country in the world, affoordeth better of that kinde than *Italy* doth: neither do such grow in the rocke, and are hewed forth, but be entire stones of themselves apart: and yet in some prouinces there are none of them to be had at all. And in this kind there be of a more free and softer grit, which being smoothed and polished with a slicke stone, may seem a far off as if they were *Serpentine* marble; and verily, there is not a stone will indure better, or lie longer in building. For thus you must thinke, that all stones be not of one, and the same nature to abide rain and weather; heat of Summer and cold in Winter alike; for some be more durable than others, like as we find in sundry kinds of timber. Finally, there be stones also, which may not away with the raies of the Moon: which in continuance of time wil gather rust, yea, and with oile will change their white colour.

CHAP. XIX.

¶ Of *Curalium* or *Pyrites*, i. the *Marcasin*: and the medicinable vertues thereof. Of the stone *Ostracites*, and the *Amiant*: together with the properties seruing in *Physicke*: also, of the stone *Melittites*, and the vertues thereof. Likewise of the *Geat*, and the effects that it worketh in *Physick*, of *Sponges*. Lastly, of the *Phrygian* stone, and the Nature of it.

The mill-stone *Curalium*, some call *Pyrites*, because it seemeth to haue great store of fire in it: howbeit, there is another fire stone going vnder the name of *Pyrites* or *Marcasin*, that resembleth brasse ore in the mine. And they say, that of it there is found great plenty in the Isle *Cypros*, and in those mines which are about *Acarnania*, where a man shal meet with one in colour like silver, and another like gold. These stones be calcined many & sundry waies: some boile them two or three times in hony, so long, vntill all the liquor be consumed: others burne them first in fire of coales, then they calcine them with honey, and afterwards wash them, after the maner of brasse. These stones thus prepared, are good in *Physick*, namely, to heat, to dry, to discusse, to subtiliar grosse humors, and to mollifie all schirrhosities or hard tumors. The same are much vsed also crude and vncalcined (being reduced into powder) for the kings euill, and felons. Moreover, in the rank of these *Marcasines*, some range certaine stones, which we cal quicke

A fire-stones, and of all others they be most ponderous: these be most necessarie for the espials belonging vnto a camp, if they strike them either with an iron spike or another stone, they will cast forth sparks of fire, which lightning vpon matches dipt in brimstone, dry puffs or leaues, will cause them to catch fire sooner than a man can say the word.

As touching the stones *Ostracites*, they haue a resemblance to oister shels, wherof they took their name: vsed they are much in stead of a pumish stone to smooth and slick the skin: taken in drink they stanch any flux of blood; and in forme of a liniment applied with hony, they heale the vlcers in womens breasts, and assuage their paine.

The * *Amiant* stone is like *Alume*, & being put into the fire, loseth nothing of the substance: a singular propertie it hath to resist all enchantments and forceries, such especially as *Magiti-* ans do practise. As for *Gaeodes*, the Greeks haue giuen it this significant name, because it containeth inclosed within the belly, a certaine earth, a medicine soueraine for the eies, as also for the infirmities incident as well to womens paps, as mens genitoirs.

The stone *Melittites* hath that name, because if it be bruised or braied, it yeeldeth from it a certaine sweet juice in manner of honey: the same being incorporat in wax, is good to cure the flegmatick wheales, and other pusses or specks of the body; it healeth likewise the exulceration of the throat: applied with wool, it takes away the chilblanes or angry bloudifalls called *Epinyctides*: also the grieve of the matrice it easeth in the same manner.

The *Geat*, which otherwile we call *Gagates*, carrieth the name of a towne and riuer both in *Lycia*, called *Gages*: it is said also, that the sea casteth it vp at a full tide or high water into the C Island of *Leucola*, where it is gathered within the space of twelue stadia, and no where els: black it is, plaine and euen, of an hollow substance in manner of a pumish stone, not much differing from the nature of wood, light, brittle, and if it be rubbed or bruised, of a strong sauor. Looke what letters are imprinted in it into any vessel of earth, they will neuer be got out again: whiles it burneth it yeelds a smel of brimstone: but a wonderful thing it is of this jeat stone, that water will soone make it to flame, and oile will quench it againe: in burning, the perfume thereof chaseth away serpents, and recouers women lying in a trance by the suffocation or rising of the mother: the said smoke discovereth the falling sicknesse, and bewraieth whether a yong damself be a * maid or no: being boiled in wine, it helpeth the tooth ache, and tempered with wax it cures the swelling glandules called the Kings euil. They say that *Physicians* vse this jeat stone much in their forceries, practised by the means of red hot axes, which they call *Axinomantia*; for they affirme, that being cast thereupon, it will burn and consume, if what we desire and wish shall happen accordingly.

As for *Sponges*, I mean by them in this place certain stones found in *Sponges*, and the same also do ingender naturally within them. Some there be who cal them *Tecolithos*, because they are good for the bladder, in this respect, that they breake the stone, being drunk in wine.

As concerning the *Phrygian* stone, it beareth the name of the country where it is ordinarily found, and it groweth in hollow lumps in manner of a pumish stone: the order is to steep it well in wine before it be calcined, and in the burning to maintain the fire with blast of bellows, vntil it wax red; then to quench it again in red wine, continuing this course three times: & being thus prepared, it is good only to scoure cloth, and make it ready for the Dier to take a colour.

CHAP. XX.

¶ Of the red Bloud-stone *Hæmatites*, and the fine sorts thereof: also of the blacke sanguine stone called *Schistos*.

The bloud-stone *Schistos* and *Hæmatites* both haue great affinitie one with another. As for the bloud-stone *Hæmatites*, a meere mineral it is, and found in mines of metall: being burnt it comes to the colour of *Vermilion*: the manner of calcining it is much after that of the *Phrygian* stone, but wine serueth not to quench it. Many sophisticate it with *Schistos*, and obtrude the one for the other: but the difference is soon known, for that the right *Hæmatites* hath red veins in it, and besides is by nature fraile and easie to crumble: of wonderful operation it is to help bloud-shotten eies: the same giuen to women to drink, staieth the immoderat flux that follows them: they also that vse to cast vp bloud at the mouth, find helpe by drinking it with the juice of a pomgranat: in the diseases likewise of the blader it is very effectual;

E e e

and

* It is taken for *Alume* de plume.

* If she drinke it fasting, presently it prouoketh vrin, if she be a pure virgin.

and being taken in wine, it is souverain against the sting of serpents. In all these cases the bloud- G
stone Schistos is effectual, but weaker only it is in operation: and yet among these sanguine or
bloud-stones, those are taken for the best and most helpfull which in colour resemble saffron;
& such haue a peculiar resplendant lustre by themselves. This stone being applied to weeping
and watery eies with womans milk, doth them much good, and is souverain also to restrain and
keep them in, if they be ready to start out of the head. And this I write according to the mind
and opinion of our modern writers. But *Soranus* a very antient writer hath deliuered vnto vs five
kinds of bloud-stones, besides that *Hæmatites* called *Magnes*, or the Load-stone: among which
he giues the chiefe prize and principall praise to the *Æthiopian*, for that it is so souverain to be
put into medicines appropriat to the eies; as also into those which for their excellent opera-
tion be called *Panchresta*. A second sort he saith is called *Androdamas*, black of colour, and for H
weight and hardnesse surpassing all the rest, whereupon it took that name, and of this kind there
are found great store in Barbary. He affirmeth moreover, That it hath a qualitie to draw vnto it
siluer, brasse, and iron: and for triall whether it be good or no, it ought to be ground vpon the
touch called *Basanitis*; for it will yeeld a bloudy juice, the which is a right souverain remedie
for the diseases of the liuer. The third kind of bloud-stone he maketh *Arabick*, for that it is
brought out of Arabia: as hard it is as the other, for hardly will there any iuice come from it,
though it be put to the grindstone, and the same otherwhile is of a Saffron colour. The fourth
sort he saith is called *Elatites*, so long as it is crude; but being once calcined, it is named *Miti-* I
fort he saith is called *Elatites*, so long as it is crude; but being once calcined, it is named *Miti-*
for a very excellent thing for burns and scaldings, and in all cases much better than any ruddle
whatsoever. In the fift place he reckons that which is called *Schistos*: this is held to be singu-
lar for repressing the flux of bloud from the hemorrhoid veins. But generally of all these bloud
stones he concludes thus, That if they be puluerised, and taken in oile vpon a fasting stomach to
the weight of 3 drams, they be right souverain for all fluxes of bloud. The same author writes
of another *Schistos* which is none of these *Hæmatites*, and this they call *Anthracites*: and by
his saying, found there is of it in Africk, black of colour, which if it be ground vpon a whetstone
or grindstone with water, yeelds toward the nether end or side thereof that lay next the ground,
a certaine blacke iuice; but on the other side of a saffron colour: and he is of opinion, that the
said iuice is singular for those medicines appropriat to the eies.

CHAP. XXI.

¶ Of the foure kindes of the *Ægle*-stone, *Aëritus*: of the stone *Callimus*: of the
stones *Sannus* and *Arabus*: and of *Pumish* stones.

THE *Ægle*-stones called *Aërites* be much renowned in regard of the very name they carry:
found they are in *Ægles* nests, as I haue shewed already in my tenth book, & it is said that
they be two together, to wit, the male and female: also, that without them the *Ægles* can-
not hatch, which is the reason that they neuer haue but two young *Ægles* at one airie. Of this
Ægle-stone there be foure kinds, for one sort thereof is bred in Africk, and is very small & soft,
containing within it as it were in a wombe, a certaine clay which is sweet, pleasant, and white;
the stone it selfe is brittle and apt to crumble, and this is thought to be the female sex. The se-
cond, which is taken for the male, groweth in Arabia, hard this is, and resembleth a gall-nut in
fashion, and the same otherwhile is of a reddish colour, hauing inclosed within the belly there-
of another hard stone. The third is found in the Island *Cypros*, for colour much like to those
that be engendred in Africke, otherwise bigger, and made more flat and broad than they: The
rest be vsually round in manner of a globe. This hath also within the wombe a sweet sand and
other small grauelly stones, but it selfe is so tender that a man may crumble it betwixt his fin-
gers. The fourth kind is named *Taphiusus*, for that it is bred neere vnto the cape *Leucas*: in a
place neere *Taphiua*, on the right hand as men saile from the said *Taphiua* toward *Leucas*:
there is found of it in riuers, but the same is white and round: within the belly of it there is a
nother stone called *Callimus*, and there is not a thing more tender than it. But to come to the
properties of these *Ægle*-stones: They are commended as singular for women with childe, or
four-footed beasts that are with yong; for being hung about their necks, or otherwise tied vnto
any part within the skin of a beast sacrificed, they will cause them to go out their full time; but
remoued

A remoued they must not be but at the very time of deliuerance, for otherwise the very wombe or
matrice would slip out withall, and vnlesse they be remoued then, they shall neuer be deliuered.
Within the same Isle *Samos* (wherin we praised the goldsmiths earth *Tripoly*) there is a stone
likewise called *Samius*, very good to burnish and polish gold: the same serueth also in physicke
together with milk, for vicers of the eies, beeing applied in manner aforesaid; and in that sort it
cureth also their weeping and warring which hath continued a long time: the same being taken
in drinke, helpeth the infirmities and other accidents of the stomach; it cureth the dizziness of
the head, & restoreth those to their right senses again who be troubled in their brain. Some are
of opinion, that it is wholsome to be giuen to those that are subject to the falling sicknesse, or
difficulty of making water: besides, it is one of the ingredients that go to the making of those
medicines which be called *Acopa*: for to know whether it be good, see that it be passing white
and heavy withall. It is said, that if a woman weare it hanging or tied about her, it will keep her
from vntimely slips of her abortiue fruit, and withall containe the matrice though it were giuen
to fall downe too low.

Touching the stone *Arabus*, like it is to yvorie; a proper thing for dentifrices, if it be calci-
ned and reduced to pouder: a peculiar property it hath besides, to cure the hemorrhoids, beeing
applied thereto in lint, so that there be fine linnen clothes laid afterwards thereupon.

I must not ouerpasse in silence, the treatise of pumish stones and their nature: I am not igno-
rant that in architecture and masonrie, they vse to call by the name of *Pumices* or *Pumishes*
those hollowed stones or bricks as if they were eaten into, which hang downe from those vault-
ed buildings which they call *Musea*, to represent a caue or hollow vault artificially made. But
to speake more properly of those *Pumishes* which are vsed by women for to smooth and flicke
their skin, yea, and by your leaue by men also in these daies; also for to polish books, as *Catullus*
saith, the best of them are found in *Melos*, *Scyros*, and the Islands of *Ætolia*: and those ought to
be very white, and according to their proportion exceeding light: the same should bee also as
spongiuous as is possible, and dry without; easie to be beaten to pouder, & in the rubbing between
the fingers not apt to yeeld from them any sand. As for their medicinable vertues, they do ex-
tenuat and dry, after 3 calcinings, so that regard be had in the torrifying, that it be done with
cleane charcoles that burn cleare, and that they be euery time quenched with whitewine: which
done, they are to be washed like to *Cadmia* or the *Calamine* stone; and being dried again, they
D would be laied vp in some dry place which is in any wise dank or giuen to gather mouldiness.

The pouder of this stone is commended principally in medicines for the eies, for a gentle muni-
ficatiue it is, and clenseth the vicers and sores incident to them: it doth incarnate hollow
skars & maketh them euen with the rest about them. Some, after the third burning, suffer them
to coole of themselves, and not by quenching: and chuse rather to beat them afterwards with
some sprinkling of wine among: they enter likewise into those emollitiue or lenitiue plaisters
which are deuised for the sores of the head or vicers in the priuities. The best dentifrices for to
cleanse or whiten the teeth, be made of the pumish. *Theophrastus* writeth, that great drunkards
who drink for a wager, vse to take the pouder of the pumish stone before-hand; for then they
may, nay they must quaffe lustily indeed, for vnlesse they be filled with drinke, they are indan-
E gered by the foresaid pouder. To conclude, he saith, that so exceeding refrigeratiue it is, that if
new wine do work or purge neuer so much, cast but a little pumish stone into it, you shall see it
giue ouer immediatly.

CHAP. XXII.

¶ Of stones which be good for Apothecaries to make their mortars of: of soft stones: of
the glasse-stone: of flints and the shining stone *Phengites*: of whetstones
and grindstones: of other stones that serue in building, which
resist the violence of fire and tempests.

OF Vntient writers in old time were carefull to finde stones fit for mortars, and not onely
to serue Apothecaries for to beat and puluerize their drugs, or painters to grinde their
colours, but the cooks also in the kitchen for to pouder their spices: and in very truth,
they preferred the *Ephesian* marble before all others: and next to it, that of *Thebais* in high *Æ-*
gypt, which I called before *Pyrhopæcilon*, though some there be that name it *Psaronium*: in a
third

third degree they place a kinde of Chalazius named Chrysites; but the Physitians make most account of that kind of whetstone which they call Basanites, because this stone sendeth nothing from it, for all the stamping and punning that is made in it. As for such stones as yeeld a certaine moisture from them, they are supposed to be good for eie salues; and therefore in that regard the Æthyopian marble is best esteemed for that purpose. As for the marble of Tanara, of Carthage called Poenicum, and the bloud-stone Homatites, they are al good (they say) for those compositions which stand vpon safron: but that Tanarian marble which is blacke, as also the white marble of Paros, is not so good for Physitians, who rather chuse the Alabastrite of Egypt, or the white Serpentine marble: for this kind of Ophites it is whereof they make their vessels and barels. In the Island Siphnus there groweth in the quarries, a stone, which they vse to hew and hollow, and by Turners craft make vessels for the kitchin good to boile viands in: also very hand-
H
some for platters and dishes to serue vp meat to the table; much like to the green stone that cometh from Comus in Italy, which wee see ordinarily imploied to those vses: but this propertie hath the Siphnian stone by it selfe, that if it be once heat with oile, it beginneth to look blacke and waxes hard withal, being otherwise naturally exceeding soft: such difference there is among the stones. For on the further sides of the Alps there be stones found exceeding soft: and in the province Belgica or Picardy, they haue a certaine white stone, which they slit through with a saw as they do timber, yea and with much more facility, wherewith they make plates that serue to couer their houses in manner of slates or tiles, both on the sides and also in gutter and ridge; yea and if they list, to make fine work vpon the roofs that may shine like to peacocks feathers, which they call Pauonacea: and verily this kind of stone is apt also to be clouen.

As touching * Talc (which also goeth in the name of a stone) it is by nature much more easie to be clouen into as thin flakes as a man will. This kind of glasse stone, the hither part of Spaine only in old time did afford vs, & the same not all throughout, but within the compasse of a 100 miles, namely about the city Segobrica: but in these daies we haue it from Cypros, Cappadocia, and Sicilie, and of late also it hath been found in Barbary: howbeit, the best glasse stone comes from Spaine and Cappadocia, for it is the tendrest and carrieth largest pannels, although they be not altogether the clearest, but somewhat duskish. There be also of them in Italy about Bononia, but the same be short and small, full of spots also and joined to pieces of flint; and yet it seemeth that in nature they be much like to those that in Spaine bee digged out of pits which they sinke to a great depth. Moreouer, there is found of this Talc betwene other stones inclosed in a rocke and lying vnder the ground, which must be hewed out if a man would haue them. But for the most part, this Talc lieth in manner of a vein in the mine by it selfe, as if it were perfectly cut already by nature; and yet was there neuer any piece knowne to be aboue five foot long. Some are of opinion, that it is a liquid humour of the earth congealed to an yce after the maner of Crytall. Certes, that it groweth hard into the nature of a stone, may appeare evidently by this, That when any wild beafts are chanced to fall into such pits where this glasse stone is gotten, the very marow of their bones (after one winter) will be conuerted and turned into a stony substance like to the Talc it selfe. Otherwhiles there is found of this kinde which is blacke: but the white is of a strange and wonderfull nature, for being (as it is well knowne) tender and brittle, nothing more, yet it wil indure extreme heat and frozen cold, and neuer cracke; L
may you shal neuer see it decay for age, keep it so long as you wil, so that it may escape outward injuries: notwithstanding we doe see many stones in building laied with strong mortor and cement, yet subiect to age. There hath beene deuised another vse also of Talc in smaller pieces, namely, to paue therewith the floore of the great shew-place or cirque in Rome, during the running of chariots and other feats of actiuitie there performed, to the end that their whitenesse might giue a more louely glosse to commend the place. In the daies of Nero late Emperour, there was found in Cappadocia a stone as hard as marble, white and transparent, and shining through, yea euen on that side where it hath certaine reddish streakes or spots: in which regard, (for that it is so resplendent) it hath found a name to be called Phengites. Of this stone, the said Emperour caused the temple of Fortune to be built called Seia (which king Seruius had first de-
M
dicated) comprised within the compasse of Neros golden house: and therefore when the doores stood open in the day time, a man might see within, the day light, after the manner of glasse stones; yet so, as if all the light were within-forth onely, and not let in from the aire thow-
row the windowes. Moreouer, king Iuba writeth, that in Arabia there is a certaine stone found, which

which likewise shineth as glasse, whereof the inhabitants of those parts do make their mirrors or looking-glasses.

It remaineth now, that I should proceed to those stones which are by workmen imploied to good and necessary vses: first of all, to those which serue to whet tools and instruments of yron, of which there be many sorts: Those of Candie, for a long time were of greatest name & most in request: in a second degree were those accounted which came from the mountaine Targetus in Laconia: but both the one and the other serue for no vse, without oile. But among the grind-stones and whetstones which are occupied with water, those of Naxos were in greatest price and most enmended; next to them, those of Armenia, whereof I haue already written. The stones of Cilicia wil do wel enough either with water or oile, it skills not whether: but the whetstones, B
that come from Arfinoe, are onely vsed with water. There bee found in Italie whetstones, which with water will giue a wonderfull keene edge; also beyond the Alps, and such they call Passernices. In a fourth rank are to be reckoned those stones which serue for a mans spittle, and such be the bones that Barbers occupie for to sharpen their rasors; but they are of little or no vse at all because they be so soft and brittle: and of this kind, the chiefe are sent out of the higher part of Spain from the country Flamminitana. As for other stones whereof I haue not written already, they be all naught for building, so soft they be, and by that means nothing durable: and yet in some countries they haue none other to build withall, as namely at Carthage in Africk, notwithstanding the wals of the houses there are subject to the waters of the sea, are pinched and pierced with winds, yea and beaten with rain and weather; against which inconueni-
C
ences the inhabitants are forced to keep their wals with pitching, for otherwise (the stones are so tender and soft) the ordinary parget of lime would fret and eat them: wherupon there goeth a pretty speech of the Carthaginians, that they do contrary to all others, in that they vse pitch to their houses, and lime to their wines; for in truth they tun vp their new wines with lime. There be found moreouer about Rome other soft stones, to wit, in the territories belonging to Fidena and Alba: in Liguria likewise, Vmbria, and Venice, they haue a white free stone, which may be easily cut with a toothed saw: these are very tractable and easie to be wrought, and wil last reasonable well, but within house only; for if the weather lie vpon them, if the rain beat, and the pin-
D
ching frost come, they will pill and skale, yea and break into pieces; neither be they durable against the breath and vapor of the sea. The Tyburtine stones, they will indure all other things well enough, only they may not abide hot vapors, for if the heat of summer take them, they will gape and be ready to cleaue in sunder. As for flints, the black, and in some places the red also, are much commended: in certaine countries, the white be very good; as namely, those in the quaries about Anicia within the territory of Tarquinij about the lake neere vnto Volusini: also along the tract of Statona, there be good building stones that wil take no harm by fire; these are commonly vsed for those monuments and memorials wherin ought to be ingraued, for they continue a long time, and are not the worse for age: Of this kind of stone, the founders make their moulds for to melt brasse in. Moreouer, there is a kinde of greene stone, which wonderfully checketh and scorneth all fire, but in no place is there plenty thereof to be had: and wheresoever it is found, it groweth not in manner of a rock or quarrie, but lieth scattered here and there. Of the
E
rest that hitherto are not named, the pale stone is not good for building, and seldome will it serue to make mortor of. The round pebbles are lasting enough, and will indure any hardnesse, but surely in building nothing trusty, vnlesse they be knit and bound with strong mortor and couched well together. Those that are gathered out of riuers make no sure building, for they seeme alwaies to relent and be moist; but for such stones as these, and generally for all those that we doubt, the only remedy is to dig them out of the ground in Summer, to let them haue two yeres seasoning in lying abroad and taking all kinds of weather before they be employed in building; and look how much thereof hath caught harme by this means, the same will serue very well in ground works and foundations: and that which continueth still sound, you may be bold to put it in building, yea, in open workes without dore. The Greekes haue a kinde of wall
F
which they make of hard pebbles or flint couched euen and laied in order by line and leuell, like as we do in bricke wals: and this kind of building they call in Mafonrie Isodomon: but in case they be not euen laied nor ranged freight, but that some part of the wall is thicker than others, they terme it Pseudisodomon. A third manner they haue which they name Emplecton, namely, when the front onely of the wall is smooth and euen, for otherwise within they huddle & fill

one with another. Moreouer, to lay a wal artificially and to bind the stones wel, they ought in alternatie course to ride and reach one ouer another halfe, so that the joint may fall out in the mids of a stone both above and vnder; a necessarie point to be considered in the very mids of a wal if it be possible: if not so, yet in any case toward the sides & ends thereof: as for the middle of the wall within, it would be well stuffed and filled with any rubbish, rammel, and broken stones. There is a kind of net-work building in Masonry called Dictyotheton, ordinarily vsed in Rome, but subiect it is to cracke and chinke. In sum, a wall would be built by rule and square, by line and leuell, and answerable to the plumb.

CHAP. XXIII.

¶ Of Cisterns, and Lime: of sundry sorts of Sand: of the tempering of Sand and Lime together for mortar: of faults in Masonrie: of Pargetting and other Rough-casting: of the proportion of Columnes and Pillars.

FOR to make good cisterns which might hold water, the mortar that goeth thereto ought to be made of five parts of fine pure sand and grauelly together, to two parts of the most strong and binding lime that may be gotten; provided alwaies that the fragments of flint which are to be imploied herein, be small, and exceed not the weight of one pound a piece: this done, not only the bottome or pauing, but the side-walls and the ends, ought to be rammed downe hard with yron beetles; howbeit, for to keep good and cleare water, it were the better way to haue alwaies two cisterns together, that in the former the water may settle and cast down al the grounds to the bottome, and to the cleare water only passe into the other as if it were strained through a fine colonder. As touching lime, *Cato Censorius* disalloweth that which is made of diuers stones, or of sundry colours: and to speake a truth, white stones are better to make lime than the hard, and such is more meet to lay stone withall in Masonrie; howbeit the lime which commeth of hollow and fistulous stones, is thought to serue better for to couer and parget walls. The lime which commeth of flint, is rejected both for the one and the other: also the lime made of stones digged out of the ground, is farre better than of pebbles gathered from riuier sides: that which commeth of millstones is most profitable, for it is more fatty and glutinous than others. A strange and wonderfull matter it is, that any thing after it hath bin once burnt and calcined, should be set on fire againe with water. And thus much of Lime.

As touching Sand, there be three kinds thereof: the one is digged out of pits in the ground, and this requireth a fourth part of lime to be put vnto it in making mortar: a second commeth out of riuier sides or the sea shore, and this would haue a third part: and if there be besides another third part of potsherds beaten to powder and put thereto, the stuffe or mortar will be the better. Between the Apennine hill and the riuier Po, there is no sand digged out of the ground, ne yet any sea sand at all. And verily, the greatest reason that cities fall to decay and be so ruinat, is this, for that the mortar being robbed of the due proportion of lime, hath not that binding as it ought, and so the walls built therewith are not fodred accordingly. Also, this would be obserued, that mortar the elder that it is, the better it is found for building. Moreouer, in the old laws which prouide for the perpetuities of houses in antient time, we find it expressly set down, that the undertaker to build a house at a certain price, shall vse no mortar vnder three yeres of age: and this was the reason that in those daies a man should not see any rough-cast or parget to rise or chawne illfaoueredly as now they do: and in truth, vnlesse there be laid vpon wals three coats or couches (as it were) of mortar made with sand and lime, and two courses ouer them of other mortar made of marble grit and lime tempered together, the wals will not be permanent nor otherwise faire and resplendent as they ought to be: and look where wals be dampish and giuen to sweat a certaine salt humor or sal-petre, it were very well to lay a ground vnderneath of mortar made of the powder of potheards and lime wrought together. In Greece they haue a cast by themselves, to temper and beat in mortars, the mortar made of lime and sand wherewith they meane to parget and couer their walls, with a great wooden pestill. As for the mortar made of marble-grit and lime together, the true marke to know whether it haue making sufficient for building, is this, namely, if it will not sticke to the shouell that worketh it, but will come out of the heap neat and clean: but contrariwise, in whiting and fret work, the lime being foked and wet in water, ought to cleaue fast like glew; neither ought it to be tempered with water, but in the

A grosse masse or lumpe. At Elis there standeth a temple consecrated to the honour of *Minerua*, wherein *Pannecus*, the brother of *Phidias* vsed a parget (as they say) which he tempered with milk and saffron together; and therefore at this day, if a man wet his thumb with spittle, and rub it against the wall, he shall perceiue both the smell and tast of saffron to remaine still.

As touching pillars in any building, the thicker they stand one to another, the bigger & greater they seem to be. Our architects and masons make foure sorts of them: for they say, that such pillars as beare in compasse or thicknesse toward the foot, as much as commeth to the sixt part of the height, be called Dorique: those that carry but a ninth part, are Ionique: such as haue a seventh part, be Tuscanique. And as for the Corinthian pillars, their proportion is answerable to the Ionique; onely this is the difference, that the Chapters of the Corinthian pillars arise in height to as much as the compasse at the base taketh vp: in which regard they seem more slender than others. As for the height of the Ionick chapter, it is just the third part of the thicknes. The proportion ordinarily in old time for the height of pillars, was answerable to the third part of the bredth of the temple. In the temple of *Diana* at Ephesus, the inuention was first practised to pitch the footfall of pillars vpon a quadrant or square below, and to set chapters vpon their heads. And as touching the proportion, it was thought sufficient in the beginning, if a columnne contained in compasse or thicknesse the eight part of the height; also, that the square of the quadrant vnder the base, should containe halfe the thicknesse of the pillar: finally, that the pillars should be smaller by one seventh part in the head, than at the foot. Over and besides these pillars, there be others also of the Atticke fashion, and those be made with foure corners, and the sides are equall.

CHAP. XXIII.

¶ The medicinable properties of Lime. Also, as touching the Maltha vsed in old time, and of Plastre.

MUCH vse there is of Lime also euen in Physick: but then there must be chosen that which is quick and vnqueint. Such lime is caustick, discussive, and extractiue: the same also is proper to repress corrosiue vlcers that begin to spread and run far. If the said lime bee tempered with vinegar and oile of roses, it maketh an excellent healing plastre, which will skin vp a sore clean. The same if it be incorporat with swines grease or liquid rosin and hony together, serues also to set bones in ioint: & the same composition is likewise good for the kings euil. Concerning Maltha, it was wont to be made of quick and new lime: for they took the Lime-stone and quenched it in wine; which done, presently they punned it with swines grease and figs; hereof they made ordinarily two couches: and being thus tempered and laid, it was thought to be the fastest whitening that could be deuised, and in hardnesse to exceed a stone. But looke whatsoeuer is to be pargetted with this Maltha or mortar thus prepared, ought first to be rubbed thoroughly with a size of oile.

Of neare affinity to lime is plastre, whereof be many kinds: for there is a kind of plastre artificiall, and namely in Syria and about *Thurium*, made of stone calcined in manner of lime: and there is of it that is digged out of the ground naturally, as namely, in the Isle *Cyprus*, and about the *Perrhoebians*. Neare *Thymphaea*, a city in *Ætolia*, it lieth very ebbe and as it were euen with the ground: as for the stone that is to be burnt for it, the same ought to be not vnlike to the stone *Alabastrites*, or at leastwise to that which stands much vpon marble. In Syria they chuse for this purpose the hardest, and they burne the same with cow dung, that it may the sooner bee calcined. But the best plastre of all other is known (by experience) to be made of the Talc or the glasse stone aforesaid, or at leastwise of such as haue the like flakes as Talc. Plastre must be wrought and driuen presently whiles it is wet and will run, for nothing in the world will so soon thicken and dry: and yet when it hath bin vsed already, it may be beaten again to powder, & serue the turn in new workes. Plaster serueth passing wel to white wals or seeling, also for to make little images in fretwork, to set forth houses, yea, and the brows of pillars and wals; to cast off rain. To conclude, I may not forget that which befell to *C. Proculius*, a great fauorit and follower of *Augustus Caesar*, who in an extreame fit of the paine of the stomacke, dranke plastre; and so killed himselfe wilfully.

¶ Sundry kinde of paved floores: and when at first they began to be used at Rome. Of open terraces paved. Of Greekish pavements. And the first inuention of arched or embowed roofes.

THE deuise of paved floores arose first from the Greeks, who made them with great art, and curiously, in regard of the painting in sundry colours which they bestowed therupon: but these braue painted floores were put downe, when pavements made of stone and quarrels came in place: the most famous workman in this kind, was one *Sofus*, who at Pergamus wrought that rich pavement in the common hall, which they call *Asaroton* (con, garnished with bricks or small tiles eneaied with sundry colours: and he deuised, that the worke vpon this pavement should resemble the crums and scraps that fel from the table, and such like stuffe as commonly is swept away, as if they were left stil by negligence vpon the pavement. Among the rest, wonderfull was his handiworke there, in pourtraying a Doue drinking, which was so liuely expressed, as if the shadow of her head had dimmed the brightnesse of the water: there should a man haue seen other Pigeons sitting vpon the brim of the water tankard, pruning themselves with their bills, and disporting in the Sunshin. The old paved floores, which now also are much used especially vnder roofe and couert, howsoeuer they came from barbarous countries, were in Italy first patted and beaten downe with heauie rammers; as we may collect by the verie name it selfe. Pavement, which comes of *Pavire*, i. to ram downe hard. As for the manner of paving with small tiles or quarrels ingrauen, the first that euer was seen at Rome, was made within the temple of *Iupiter Capitolinum*, and not before the third Punicke war begun. But ere the Cimbrian wars began, such pavements were much taken vp in Rome, and men tooke great delight and pleasure therein, as may appeare sufficiently by that common verse out of *Lucilius* the Poet.

Ante Pavimenta at a emblemata vermiculata, &c.

Before the Pavements checker-wrought in painted Marquetry, &c.

As touching open galleries and terraces, they were deuised by the Greeks, who were wont to couer their houses with such. And in truth, where the country is warme, such deuises doe well: howbeit, they are dangerous and deceitfull, where there is store of rain and frost. But for to make a terrace so paved, necessary it is first to lay two courses of boords or planks vnderneath, and those crosse and ouerthwart one the other: the ends of which planks or boords ought to be nailed, to the end they should not twine or cast at aside, which done, take of new rubbish two third parts, and put thereto one third part of shards stamped to pouder, then with other old rubbish mix two fve parts of lime, and herewith lay a couch of a foot thicknesse, and be sure to ram it hard together. Ouer which there must be laid a coator course of mortar, six fingers bredth thick, and vpon this middle, couch broad square paving tiles or quarrels, and the same ought to enter at least two fingers deep into the said bed of mortar. Now for that this floore or pavement must rise higher in the top, this proportion is to be obserued, that in euery ten foot it gain an inch and a halfe. After which, the pavement thus laid is to be plained and polished diligently with some hard stone: and aboue al, regard would be had, that the planks or boorded floor were made of oke. As for such as do cast or twine any way, they be thought naught. Moreouer, it were better to lay a course of flint or chaffe between it and the lime, to the end, that the said lime might not haue so much force to hurt the boord vnderneath. Requisit also it were to put vnderneath round pebbles among. After the like maner be the spiked pavements made of flat tiles & shards. And here I must not forget one kind of paving more, which is called *Grecanicke*, the manner wherof is thus. The Greeks after they haue well rammed a floore which they mean to pave, lay therupon a pavement of rubbish, or else broken tile shards; and then vpon it, a couch of charcoale well bearen and driuen close together, with sand, lime, and small cindres well mixed together: which done, they do lay their paving stuffe to the thicknesse of halfe a foot, but so euen, as the rule and square will giue it; and this is thought to be a true earthen paved floore of the best making. But if the same be smoothed also with a hard flicke stone, the whole pavement wil seem all black as for those pavements called *Lithostrata*, which be made of diuers coloured squares couched in

G

A works, the inuention began by *Syllas* time, who used thereto small quarrels or tiles at *Preneeste* within the temple of *Fortune*, which pavement remaines to be seen at this day. But in proceffe of time pavements were driuen out of ground-floores, and passed vp into chambers, and those were seeled ouer head with glasse: which also is but a new inuention of late deuised: for *Agrippa* verily in those baines which he caused to be made at Rome, annealed all the potterie worke that there was, and enamelled the same with diuers colours: whereas all others be adorned only with whiting: & no doubt he would neuer haue forgotten to haue arched them ouer with glasse if the inuention had bin practised before, or if from the wals & partitions of glasse which *Scavrus* made vpon his stage, as I said before, any one had proceeded also to rooffe chambers therewith. But since I am fallen vpon the mention of glasse, it shall not be impertinent to discourse somewhat of the nature thereof.

¶ The first inuention of glasse, and the manner of making it. Of a kind of Glasse, called *Obsidianum*. Also of sundry kinde of Glasse, and those of many formes.

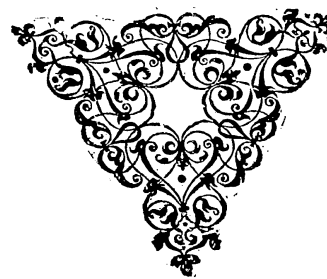

HERE is one part of Syria called *Phoenice*, bordering vpon *Iurie*, which at the foot of the mount *Carnell*, hath a meere named *Cendeuia*; out of which the riuer *Belus* is thought to spring, and within fve miles space, falleth into the sea, near vnto the colony *Ptolemais*: This riuer runneth but slowly, and seemeth a dead or dormant water, vnwholesome for drinke, howbeit, used in many sacred ceremonies with great deuotion; full of mud it is, and the same very deepe ere a man shall meet with the firm ground: and vnlesse it be at some spring tide, when the sea floweth vp high into the riuer, it neuer sheweth sand in the bottom; but then, by occasion of the surging waues, which not only stir the water, but also cast vp & scoure away the grosse mud, the sand is rolled too and fro, and being cast vp, sheweth very bright and cleare, as if it were purified by the waues of the sea: and in truth, men hold opinion, That by the mordacity and astringent quality of the salt water, the sands become good, which before serued to no purpose. The coast along this riuer which sheweth this kind of sand, is not aboue halfe a mile in all, and yet for many a hundred yeare it hath furnished all places with matter sufficient to make glasse. As touching which deuise, the common voice and fame runneth, that there arriued sometimes certain merchants in a ship laden with nitre, in the mouth of this riuer, & being landed, minded to seeth their victuals vpon the shore and the very sands: but for that they wanted other stones, to serue as treuets to beare vp their pans and cauldrons ouer the fire, they made shift with certaine pieces of sal-nitre out of the ship, to support the said pans, and so made fire vnderneath: which being once afire among the sand and grauell of the shore, they might perceiue a certaine cleare liquor run from vnder the fire in very streams, and hereupon they say came the first inuention of making glasse. But afterwards (as mans wit is very inuentiue) men were not content to mix nitre with this sand, but began to put the Load-stone among, for that it is thought naturally to draw the liquor of glasse vnto it, as well as yron. Then they fell to calcine and burne in many other places shining grauell stones, shels of fishes, yea, and sand digged out of the ground, for to make glasse therewith. Moreouer, diuers authors there be who affirme, That the Indians vse to make glasse of the broken pieces of Crystall, and therefore no glasse comparable to that of *India*. Now the matter whereof glasse is made, must be boiled or burnt with a fire of dry wood, and the same burning light and cleare without smoke, and there would be put thereto brasse of *Cypros*, and nitre, especially that which commeth from *Ophyr*. The furnace must bee kept with fire continually, after the manner as they vse in melting the ore of brasse. Now the first burning yeeldeth certaine lumps of a fatty substance, and blackish of colour. This matter is so keene and penetrant whiles it is hot, that if it touch or breath vpon any part of the body, it will pierce and cut to the very bone ere one be aware or do feele it. These masses or lumps be put into the fire againe, and melted a second time in the glasse houses, where the colour is giuen that they shall haue: and then some of it with blast of the mouth, is fashioned to what form or shape the workman will: other parcells polished with the *Turners* instrument, and some againe engrauen, chamed, and embossed in manner of siluer plates: in all which feats, the *Sidonians* in times past were famous artificers: for at *Sidon* were deuised also mirroirs or looking glasses. Thus much as touching

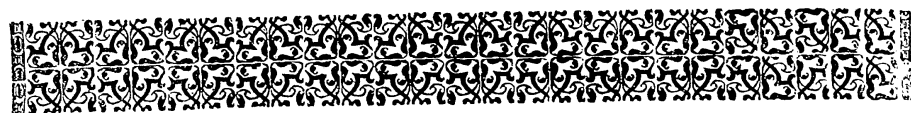

ching the antique maner of making glasse. But now adaies there is a glasse made in Italy of a certain white sand, found in the riuer Vulturinus for six miles space along the shore towns, from the mouth where he dischargeth himselfe into the sea, and this is between Cumes and the lake Lucrinus. This sand is passing soft and tender, whereby it may be reduced very easily into fine powder, either to be beaten in mortar or ground in mill: to which powder the manner is to put three parts of nitre, either in weight or measure, and after it is the first time melted, they vse to let it passe into other furnaces, where it is reduced into a certain masse, which, because it is compounded of sand and nitre, they call Ammonitrum: this must be melted againe, and then it becomes pure glasse, and the very matter indeed of the white clear glasse: & in this sort throughout France and Spain the maner is to temper their sand, & to prepare it for the making of glasse. Moreouer, it is said, That during the reigne of *Tiberius* the Emperour, there was deuised a certain temper of glasse, which made it pliable and flexible to wind and turne without breaking: but the *artificer who deuised this, was put downe, and his work-house, for feare lest vessels made of such glasse should take away the credit from the rich plate of brasse, siluer, and gold, and make them of no price: and verily, this bruit hath run currant a long time (but how true, it is not so certain.) But what booteth the abolishing of glasse-makers, seeing that in the daies of the Emperour *Nero* the art was growne to such perfection, that two drinking cups of glasse (and those not big, which they called *Pterotos*) were sold for 6000 sesterces.

There may be ranged among the kinds of glasses, those which they call *Obsidiana*, for that they carry some resemblance of that stone, which one *Obsidius* found in *Aethyopia*; exceeding blacke in colour, otherwhiles also transparent: howbeit, the sight therein is but thicke and dusky. It serueth for a mirror to stand in a wall, and instead of the image yeeldeth back shadows. Of this kind of glasse many haue made jewels in maner of precious stones: and I my selfe haue seene massiue pourtraictures made thereof, resembling *Augustus* late Emperour of famous memory, who was wont to take pleasure in the thicknes of this stone, inso much as he dedicated in the temple of *Concord* for a strange and miraculous matter, foure Elephants made of this *Obsidian* stone. Also *Tiberius Caesar* sent back again to the citizens of *Heliopolis*, a certain image of prince *Menelaus*, found among the moueable goods of one who had bin lord gouernor in *Egypt*, which he had taken away out of a temple, among other cerimonialliques: and the said statue was all of the *Iaiet*, called *Obsidianus*. And by this it may appeare, That this matter began long time before to be in vse, which now seemeth to be renewed again and counterfeited by glasse that resembleth it so neare. As for the said *Obsidian* stone, *Xenocrates* writeth, That it is found naturally growing among the Indians, within *Samnium* also in Italy, and in Spaine along the coast of the Ocean. Moreouer, there is a kind of *Obsidian* glasse, with a tincture artificiall, as blacke as *Iaiet*, which serueth for dishes and platters to hold meat: like as other glasse, red throughout, and not transparent, called for that colour *Hæmatinon*. By art likewise there be vessels of glasse made white and of the colour of *Cassidony*, resembling also the *Iacinth* and *Saphire*, yea, & any other colors whatsoeuer. In sum, there is not any matter at this day more tractable and willing either to receiue any forme or take a color, than glasse: but of all glasses, those be most in request and commended aboue the rest, which be white, transparent and cleare throughout, comming as neare as it is possible to *Crytall*. And verily, such pleasure do men take now adaies in drinking out of faire glasses, that they haue in maner put downe our cups and boules of siluer or gold: but this I must tell you, that this ware may not abide the heat of the fire, vnlesse some cold liquor were put therein before: and indeed, hold a round bal or hollow apple of glasse full of water against the Sun, it will be so hot, that it is ready to burne any cloth that it toucheth. As for broken glasses, well may they be glued and fodered againe by a warme heat of the fire, but melted or cast again they cannot be whole, vnlesse a man make a new furnace of pieces broken one from another: like as we see there be made counting rundles thereof, which some call *Abaculos*, whereof some are of diuers and sundry colors. Moreouer, this would be noted, That if glasse and sulphur be melted together, they will foulder and vnite into a hard stone. To conclude, hauing thus discoursed of all things that are knowne to be done by wit or art, according to the direction of Nature, I cannot chuse but maruell at fire and the operations thereof, seeing that nothing in a manner is brought to perfection but by fire; and thereby any thing may be done.

The wonderfull operations of fire: the medicinable properties that it hath; and the prodigious significations obserued thereby.

Fire receiueth sundry sorts of sand & earth, out of which it doth extract and melt one while glasse, another while siluer, in this place vermilion, in that diuers sorts of lead and tin; sometime Painters colours, and another while matters medicinable. By fire, stones are resolved into brasse; by fire iron is made, and the same is tamed likewise therewith: fire burneth and calcineth stone, whereof is made that mortar which bindeth all worke in masonry. As for some things, the more they be burnt, the better they are, and of one and the same matter a man shall see one substance ingendred in the first fire, another in the second, and another also in the third. As for the coles that go to these fires, when they be quenched they begin to haue their strength and after they are thought extinct and dead they are of greatest vertue. This element of Fire is infinit, and neuer ceaseth working, inso much as it is hard to say whether it consume more than it ingendreth. The very fire also is of great effect in physick; for this is known for certain by experience, there is not a better thing in the world against the pestilence (occasioned by the darkness of the Sun, and the want of cleare light from him) than to make fires and perfumes in diuers sorts, either to clarify or to correct the aire; according as *Empedocles* and *Hippocrates* haue testified in diuers places. *M. Varro* writeth, that fire is good for convulsions, cramps, and contusions of the inward parts: and for this purpose I will alledge the very words he vseth: the Latine word *Lix* (quoth he) is nothing else but the ashes of the hearth; and hereupon comes *Lixivum cinis*. Lie ashes, which being drunk is medicinable, as we may see by fencers and sword-plaiers, who after they haue done their flourishing, and be ready to enter into fight at sharpe, refresh themselves with this potion. Furthermore it is said, That a cole of oke wood being reduced into ashes and incorporat with honey, cureth the carbuncle, which is a pestilent disease, whereof two noblemen at Rome, both Consuls in their time, died of late, according as I haue shewed already. See the wonderfull power in nature, that things despised and of no account, as ashes and coles, should afford remedies for the health of man! But before I make an end of fire, and the hearth where it burneth, I will not passe one admirable example commended vnto vs by the Roman Chronicles: in which we reade, That during the reign of *Tarquinius Priscus* king of Rome, there appeared all on the sudden vpon the hearth where hee kept fire, out of the very ashes, the genital member of a man, by vertue whereof, a wench belonging vnto *Tanaquil* the queen, as she late before the said fire, conceived and arose from the fire with childe; and of this conception came *Servius Tullus* who succeeded *Tarquin* in the kingdome. And afterwards, while hee was a yong childe, and lay asleep within the court, his head was seen on a light fire; whereupon he was taken to be the son of the domestical spirits of the chimney. Which was the reason, that when he was come to the crown, he first instituted the *Compitalia*, and the solemne games in honour of such house-gods or familiar spirits.

THE XXXVII. BOOKE OF
THE HISTORIE OF NATVRE,
WRITTEN BY C. PLINIUS
SECVNDVS.

The Proem.

So the end that nothing might be wanting to this historie of mine concerning Natures works, there remaine behind nothing but pretious stones, wherein appeareth her Maiesty, brought into a narrow and streight roome: and to say a trusp, in no part of the world is she more wonderfull in many respects; whether you regard their varietie, colours, matter, or beauty, which are so rich and pretious, that many make conscience to seale with them, thinking it vnlawfull to engraue any print in them, or to diminish their honour and estimation by that means. Some of them are reckoned inestimable, or valued at all the goods of the world besides, in somuch as many men thinke some one pretious stone or gem sufficient to behold therein the very perfection of Nature, and her absolute worke. Touching the first inuention of wearing such stones in Jewels, and how it tooke first root, and grew afterwards to that height as all the world is in admiration thereof, I haue already shewed in some sort in my treatise of Gold and Rings. And yet I will not conceale from you that which poets do fable of this matter, who would beare vs in hand, that all began at the rocke Caucasus, whereunto Prometheus was bound fast, who was the first that set a little fragment of this rocke within a peece of iron, which being done about his finger, was the ring, and the foresaid stone the gemme: whereof the Poets make much foolish moralization.

CHAP. I.

¶ Of the rich pretious stones of Polycrates the Tyrant, and King Pyrrhus. The first Lapidaries or Cutters in pretious stones. And who was the first that had a case of rings and gems at Rome.

Prometheus hauing giuen this precedent, brought other stones into great price and credit, in somuch as men were mightily inamoured vpon them: and Polycrates of Samos, the puissant prince and mighty monarch ouer all the Islands and coasts thereabout, in the height of his felicitie and happy estate, which himself confessed to be excessive, being troubled in his mind, that he had tasted of no misfortune, and willing after a sort to play at Fortunes game, one while to win, and another while to lose, and in some measure to satisfie her inconstancie, was perswaded in his minde that he should content her sufficiently in the voluntarie losse of one gem that he had, and which he set so great store by: thinking verily, that this one hearts grieve for parring from so pretious a Jewell, was sufficient to excuse and redeeme him from the spitefull enuy of that mutable goddesse. Seeing therefore the world to come vpon him still, and no soure sorrowes intermingled with his sweet delights, in a wearinesse of his continual blessednesse, he imbarkeed himselfe and sailed into the deep, where wilfully he flung into the sea a ring from his finger, together with the said stone so pretious, set therein. But see what ensued! A mighty fish euen made as a man would say for the king,

A king, chanced to swallow it down as if it had bin some bait, which being afterwards caught by fishers, & thought to be of an extraordinary bignes, was brought as a present into the king's palace, and so sent into the kitchen, where the cook found within the belly thereof the foresaid ring of his lords & masters. Oh the subtiltie of she Fortune, who all this while twisted the cord that another day should hang Polycrates! This stone (as it is wel known) was a Sardonyx: & if we may beleue it, the very same it is, which at Rome is shewed in the temple of Concord, where Augustus the Emperesse dedicated it as an oblation, enshafed within a golden horne: and verily if it be the same, one of the least Sardonyches it is among many other there which be preferred before it.

Next to this stone of Polycrates, there goeth a royall name of the gem which Pyrrhus K. of Albanie had, him I mean, who warred against the Romans: for (by report) an Agath he had, wherein a man might see the nine Muses, and Apollo with his harpe, liuely represented, not by art and mans hand, but euen naturally imprinted: for the veins and streaks of the stone were so disposed, that a man might distinguish euery one of the Muses asunder, & ech one distinguished by their feuerall marks and ornaments. Setting aside these two gems aboue-named, we do not read in authors of any great reckoning made of such Jewels; vnlesse wee speake of one Ismenias a famous minstrell, who had the name to weare many of them ordinarily about him, and those very gay and glittering: and surely his vanity that way was such, that there goeth a notable tale of him; for meeting vpon a time in a merchants hand with an Emerald in the Island Cyprus, wherein ladie Amyone was engrauen, and wherof the price was at first held at six deniers in gold, he made no more ado but caused the mony to be paid presently: but the merchant being a man of some conscience, and thinking indeed the price to high, gaue two of them back again vnto Ismenias: whereat being ill apaid, I veshrew you, (qd. he) for this bating of the mony hath much empai- red the worth of the stone. This Ismenias (as it is thought) was the first who brought vp the order that all such musicians and minstrels as him selfe, should be known by their gems, and esteemed skilfull in that art according as they were set out therewith more or lesse. And in very truth, Dioscorides a great minstrell, who liued in those daies with him, vsed likewise to be in his change and variety of pretious stones, because he would not seeme any way to come behind Ismenias. There was a third also as vaine as the best, a musician in that age named Nicomachus, who loued to haue a number of gems about him, but no iudgement hee had in the world to chuse them. These examples which offer themselves by fortune to me in the beginning of this my booke, may serue to pull downe their plumes who stand so much vpon the vaine ostentation of these stones, when they shal see how all the priue they take herein, smelleth but of the vain humor of some odd minstrels. But to return againe to Polycrates his gem, at this day it is to be seen within the temple of Concord, whole & sound. And not only in the time of Ismenias, but also many yeres after, it should seem that Emeraude were wont to be cut and engrauen. This opinion also may be confirmed by the act & edit of K. Alexander the Great, which forbad expressly, That no man should be so hardy as to engraue his image in pretious stone, but Pyrgoteles, who (no doubt) was simply the best in that art. After him, Apollonides and Cronius were of great fame: & principally one Dioscorides, who counterfeited in stone the liuely forme of Augustus Caesar, the which serued the Emperors his successors as a signet to seale withall. Sylla Dictator was wont alwaies to signe with a seale representing K. Inzurtha, tied & bound as he was yeeled to him. We read in Chronicles also, that a certaine Spaniard of Intercatia, whose father Scipio Emilianus slew in single fight, vsed afterwards no other seale but that which represented this combat: whereupon grew this merry conceit of Stilo Praconinus, who asked, What this Spaniard would haue done if his father had killed Scipio? Augustus late Emperour of worthy memory, vsed at the beginning to seale with the image Sphinx vpon his signet: and verily in the casket of his mothers Jewels, two of these he found so like one to the other, that one could not be known and discerned from the other: & as he was wont to weare one of them about him wher soeuer he went, so in his absence (during the ciuile wars which he leuied against M. Antonius) his friends who managed his affairs at Rome, signed with the other Sphinx, al those letters & edicts which passed in his name, for the performance of some demands which those times did require. And from hence it came, that those who receiued any such letters or edicts, containing some matter of difficulty, were wont pleasantly and merrily to say, That the said Sphinx came euer with some hard riddle or other that could not be expounded. Moreover, the frog, wherewith Maccenas vsed to seale, was alwaies terrible to those who receiued any letters signed therewith; for euermore they were sure

Fff

vpon

upon the receipt of it to make some paiment of impost or taxes leuied vpon them. But *Augustus Cæsar*, to auoid the obloquie that arose by his *Sphinx*, gaue ouer sealing therewith, and signed euer after with the image of *K. Alexander the Great*.

As touching a cabinet or case for many rings and such jewels, which they call by a forreine Greeke name *Dactyliotheca*, the first that euer was known to haue any such at Rome, was *Scæurus*, whose mother *Sylla* the Dictator married: and for a long time there was no other besides; vntill *Pompeius* the Great met with the jewel-casket of *K. Mithridates*, which among many other rich oblations, he presented in the Capitoll; and by the relation of *M. Varro* and other approued authors of that time, it was much preferred before that of *Scæurus*: in imitation of whole example, *Cæsar* Dictator consecrated in the temple of *Venus Genetrix*, six such like cabinets or caskets of rings and jewels: and *Marcellus* sonne to *Octavia*, dedicated one in the temple Palatine of *Apollo*. Finally, this is to be obserued, that the said victorie of *Pompeius* which he achieved ouer *K. Mithridates*, set mens teeth at Rome a watering after pearls and precious stones; like as the conquests obtained by *L. Scipio* and *Cn. Marius*, brought them into loue with siluer plate curiously enchased and imbossed: also with rich hangings of cloth of gold, siluer, and tissue, together with beds and tables of brasse; euen as the brassen statues and vessels of Corinthian brasse, and the curious painted tables, came in request vpon the victorie that *L. Mummius* gained ouer *Achæa*.

CHAP. II.

¶ Of Iems and precious stones that *Pompeius* shewed in his triumph. The nature of Crystall, and the medicinable properties thereof: the sumptuous and superfluous expences in vessels made of it. The first inuention of Cassidoine vessels, and the excesse that way: the nature and properties of those Cassidoins. And what vntruths the writers in old time haue deliuered as touching Amber.

TO the end that it may appeare more evidently, what the triumph of *Pompeius* wrought in this respect, I will put downe word for word what I find vpon record in the registers that beare witness of the acts which passed during those triumphs. In the third triumph therefore which was decreed vnto him (for that he had scoured the seas of pyrats and rousers, reduced *Natalia* and the kingdome of *Pontus* vnder the dominion of the Romans, defeated kings and nations, according as I haue declared in the seuenth booke of this my history) he entred Rome the last day of September, in the yere when *M. Piso*, and *M. Messala* were Consuls, on which day there was carried before him in shew, a chesse-boord with all the men, and the same boord was made of two precious stones, and yet it was 2. foot broad and 4 foot long: and left any man should doubt hereof and thinke it incredible, considering no jems at this day come neare thereto in bignesse, know he, That in this triumph hee shewed a golden Moone weighing thirtie pounds, three dining-tables also of gold, other vessell likewise of masse gold and precious stones as much as would garnish nine cup-boords; three images of beaten gold representing *Minerva*, *Mars* and *Apollo*; coronets made of stones to the number of three and thirtie; a mountaine made of gold foure square, wherein a man might see red deare, Lyons, fruit-trees of all sorts, and the whole mountaine inuironed and compassed all about with a vine of gold: moreover, an oratorie or closet consisting of pearle, in the top or louver whereof there was a clocke or horologe: Hee caused also to be borne before him in a pompous shew, his owne image made of pearles, the pourtraiture (I say) of that *Cn. Pompeius*, whom regall maiestie and ornaments would haue better becomed; and that good face and venerable visage so highly honoured among all nations, was now all of pearles, as if that manly countenance and seueritie of his had bene vanquished, and was now all of pearles, as if that manly countenance and seueritie of his had bene vanquished, and riotous excesse and superfluitie had triumphed ouer him, rather than hee ouer it. O *Pompeius*, and *Magnus*, how could this title and surname *Le-grand*, haue continued among those nations, if thou hadst in thy first victorie triumphed after this manner! What, *Magnus*, were there no means else but to seek out pearles (things so prodigal, superfluous, and deuised for women, and which it had not becomed *Pompeius* once to weare about him) and therewith to pourtray and counterfeit thy manly visage! And was this the way indeed to haue thy selfe seeme precious: doth not that pourtraiture come nearer vnto thee and resemble thy person farre liker, which

A which thou didst cause to be erected vpon the top of the Pirænean hils? Certes, a foule shame and ignominious reproch it was to be shewed in this manner; nay, to say more truly, a wonderfull prodegie it was, prelagging the heauie ire of the gods; for so men were to beleue and evidently to conceiue thereby, that euen then and so long before, the head of *Pompeius* made of orient pearle, euen the richest of the Leuant, should be so presented without a bodie. But setting this aside, how manlike was all the rest of his triumph, and how answerable to himselfe? For first and foremost, giuen freely by him vnto the chamber of the citie, there were a thousand talents, secondly, vpon his leutenants and treasures of the campe, who had performed so good seruice in defending the sea-coasts, he bestowed two thousand Sestertia apiece: thirdly to euery fouldiour who accompanied him in that voiage, he allowed fiftie Sestertia. Well, this superfluitie yet of *Pompeius* triumph, serued in some sort to excuse *Caius Caligula* the Emperour, and to make his delicacie and excesse to be more tollerable, who ouer and besides all other effeminate tricks and womanly deuises, whereof he was full, vsed to draw vpon his legs little buskins or slippers made of pearle: *Pompeius* precedent (I say) in some measure justified *Nero* the Emperour, who made of rich and faire great pearles, the scepters and maces, the visors also and maskes which players vsed vpon the stage, yea and the very bed-roumes which went with him as hee trauielled by the way: So as wee seeme now to haue lost that vantage and right which we had to find fault with drinking-cups enriched with pearles, yea and much other household stuffe and implements garnished therewith, since that wherefoeuer we go from one end of the house to the other, we seeme to passe through rings, or such jewels at leastwise which were wont to beautifie our fingers onely: for is there any superfluitie els, but in regard and comparision hereof it may seeme more tollerable and lesse offensive? But to return vnto the triumph of *Pompeius*: this victorie of his, brought into Rome first our cups and other vessels of Cassidoine; and *Pompeius* himselfe was the first who that very day of his triumph presented vnto *Iupiter Capitolinus*, six such cups: and presently from that time forward men also began to haue a mind vnto them, in cupboards, counting-tables, yea and in vessell for the kitchen, and to serue vp meat in: and verily, from day to day the excesse herein hath so far ouergrowne, that one great Cassidoine cup hath been sold for * fourescore sesterces, but a faire and large one it was, and would containe well three sextars [*id est*, halfe a wine gallon.] There are not many yeres past, since that a noble man who had been Consul of Rome, vsed to drinke out of this cup; and notwithstanding that in pledging vpon a time a lady whom hee fancied, hee bit out a piece of the brim thereof (which her sweet lips touched) yet this iniurie done to it, rather made it more esteemed and valued at a higher price, neither is there at this day a cup of Cassidoine more pretious or dearer than the same. But as touching other excesse of this personage, and namely how much hee consumed and deuoured in superfluities of this kind, a may may estimate by the multitude of such Cassidoine vessell found in his cabinet after his death, which *Nero Domitius* tooke away perforce from his children: and in truth, such a number there were of them, that being set out to the shew, they were sufficient to furnish and take vp a peculiar theatre, which of purpose hee caused to be made beyond the Tyber in the gardens there: and enough it was for *Nero* to behold the said theatre replenished with people at the plaies which hee exhibited there in honor of his wife the Empreffe *Poppæa*, after one child-bed of hers, where among other musicians, hee sung voluntary vpon the stage before the plaies began. I saw him there my selfe to make shew of many broken pieces of one cup which hee caused to be gathered together full charily, as I take it, to exhibit a spectacle wherat the world should lament and cry out in detestation of Fortune, no lesse ywis, than if they had bin the bones and reliques of king *Alexander the Great* his corps to be laid solemnly in his sepulchre; and herein hee pleased himselfe not a little. *Titus Petronius*, late Consul of Rome, when hee lay at the point of death, called for a faire broad-mouthed cup of Cassidoine, which had cost him beforetime three hundred thousand sesterces, and presently brake it in pieces in hatred and despight of *Nero*, for feare lest the same prince might haue seized vpon it after his decease, and therewith furnished his own boord. But *Nero* himselfe (as it became an Emperour indeed) went beyond all others in this kind of excesse, who bought one * drinking cup that stood him in three hundred thousand sesterces; a memorable matter (no doubt) that an Emperour, a father and patron of his country, should drinke in a cup so deare. But before I proceed any farther, it is to be noted, that we haue these rich Cassidoine vessels [called in Latine *Murrhina*] from out of the Leuant: for found they be in many places of the East parts, and those otherwise not greatly renowned,

* That is to say, columns & pillars, wherein were engrauen the names of cities and nations subdued by him in those voyages into Spaine.

* *Ostroginta sesteris*: where you must thinke that be vses *sestertium* in the neuter gender, which is a thousand sesteris: for otherwise 80 sesterces come but to 20 deniers Roman; and that is about 12 sh. 6 d. sterling: too much vnder the price of such a Jewell: and yet some read for *sestertius*, [*talentis*] and that is as much about the proportion, for one talent was esteemed at 50000 sesterces.

* The value of 6 talents. * *Trecentis sestertiis capidus*: I suspect this place; for hee should haue inserted a greater sum than that before of *T. Petronius*: or else *capidus* is a smaller piece than *Tullia*; & that should not seeme, if it be deuised a *capidus*, & so called for the capriciousness; but rather of the ears, whereby a man may take hold thereof.

Rhosne & Poth both meet in one, and discharge themselves together into the said Venice gulfe, G
they shew their grosse ignorance in Cosmography, and description of the world; and therefore
they would be rather pardoned if they knew not what Amber was. Those that write more mo-
destly than the rest (and yet can lie as well as the best) beare vs in hand, that about the sides of
the foresaid Venice gulfe or Adriatick sea, vpon rockes otherwise inaccessible, there grow trees
which yerely at the rising of the Dogstar do yeeld forth this Amber in manner of a gum. *Theophrastus*
contrariwise affirmes, that Amber is digged out of the ground. As for *Chares*, he saith,
that *Phaeton* died in *Aethyopia* neere vnto the temple of *Iupiter Ammon*, which is the reason of a
chappell there wherein hee is shrined, as also of an oracle much renowned; in which quarters
(quoth he) amber is engendred. *Philemon* would make vs beleue, that Amber is minerall, and
that within *Scythia* in two places it is gotten forth of the earth, in the one it is found white & H
of the colour of wax, which they call *Electrum*; in the other it is reddish or tawny, and that is
named *Sualternicum*. *Demostratus* calls Amber, *Lyncurion*, for that it commeth of the vrine of
the wild beast named *Onces* or *Lynces*: the which is distinct in colour, for that which proceedeth
from the male is reddish and of a fiery colour; the other which passeth from the female, is
more weake in colour, and enclineth rather to whitish. Some giue it the name *Langurium*, and
make report of certaine beasts in *Italie* named *Languria*. *Zenothemis* tearmeth the same beasts
Langas, and by his saying, they liue about the Po. *Sudines* talketh of a tree in *Liguria*, which
should beare this Amber: of whose opinion also was *Atetodorus*. *Sotacus* was verily perswaded,
that it run downe from certaine trees in *Brittaine*, and those he thereupon called *Electrides*.
Pytheas affirmeth, that in *Almaine* there is the arme of the Ocean called *Mentonomon*, along I
which there inhabit certaine people named *Gutti*, for the space of six thousand stadia; from
which within one daies sailing, there lyeth an Island called *Abalus*, into which at euery Spring
tide, there is cast vp by the waters of the sea at a high water, a great quantitie of Amber; and it
is taken for nothing else but a certain excrement congealed and hardened, which the sea in that
season purgeth and sendeth away. The inhabitants of those parts (saith he) vse it for their ordi-
nary fewell to burne, and doe sell it to the Saxons and other Dutch, their next neighbours. *Ti-*
mans accorded with him, saue only that he would haue the said Island to be called *Baltia*. *Phi-*
lemon was of this mind, that Amber would neuer flame if it were set on fire. *Niceas* would haue
vs conceiue, that it should be a certaine iuice or humour proceeding (I wot not how) from the
raies of the Sun, and yet he maketh a reason thereof, imagining that the said beames should be K
exceeding hot toward the Sun-setting, which rebounding from the earth, leaue behind them a
certain fatty sweate in that part of the Ocean; and the same afterwards is cast vp with tides into
the Sea-shore and sands of the Germanes. He writeth also, that in *Aegypt* it is engendred after
that manner, where it is called *Sacal*: as also among the Indians, who make more account of it
than of frankincense. Semblably in *Syria*, the women (saith hee) make wherues of it for their
spindles, where they vse to call it *Harpax*, because it will catch vp leaues, tresses, & fringes hang-
ing to cloaths. *Theophrastus* reporteth, that the ocean casteth vp amber at tides, to the capes of
the *Pyrenæan* hills: which *Xenocrates* also beleued, who is the last that hath written of Amber,
and such like. There is at this day liuing, *Asarubas*, who hath reported, that neere vnto the Atlan- L
ticke sea there is the lake *Cephissis*, which the Moors call *Electrum*, and the same being chased
and heat throughly by the Sun, casteth vp from the mud thereof, Amber, floating aloft vpon the
water. *Mnesias* maketh report of a place in *Affrike* named *Cicyone*, as also of the riuer *Cra-*
this, which floreth out of a lough and runneth into the sea; in which lake or lough, there liue
certain kinds of foule which he names *Meleagrides* and *Penelopes*: herein amber is engendred
(by his saying) after the same manner as before I shewed in the lake *Electris*. *Theomemes* saith,
that neere vnto the great *Syrtis* where the hort-yard and garden of the *Hesperides* lieth, a man
shall find, that amber falleth out of the said garden into a lake beneath, and then the virgins at-
tending vpon that place, come ordinarily to gather it. *Ctesias* affirmeth, that among the Indians
there is a riuer called *Hypobarus*, (which word signifies as much, as bearing all good vessels) it
runneth out of the North and falleth into the East sea, neere vnto a wild mountain, full of trees M
that beare amber. He addes moreover & saith, that those trees are called *Aphytaora*, by which
denomination is meant, most delightfom sweetnes. *Mithridates* writeth, that toward the coast of
Germany there lies an Island, and the same named *Oferista*, replenished with woods of Cedar
trees yeelding Amber, which runs from them into rocks. *Xenocrates* is of opinion, That Amber
was

* or Banomina.

* esibur, some read esibur, & in Summer.

* or rather Electris, as appareth a little after.

A was called in *Italy* not only *Succinum*, but also *Thicum*: whereas the *Scythians* name it *Sacri-*
um (for there also it is engendred) also he saith, that others think it is engendred in *Numidia*.
But I wonder most at *Sophocles* the Tragicall Poet (a man who wrote his Poësies, with so graue
and lofty a stile, and liued besides in so good reputation; being otherwise borne at *Athens*, and
descended from a noble house, employed also in the managing of state affaires, as who had the
charge & conduct of an army) that he should go beyond all others in fabulous reports, as touch-
ing Amber: for he sticketh not to auouch, That beyond *India* it proceedeth from the tears that
fall from the eies of the birds *Meleagrides*, wailing & weeping for the death of *Meleager*, Who
would not maruell, that either himselfe should be of that beliefe, or hope to persuaade others to
his opinion? For what child is there to be found so simple and ignorant, who will beleue, that
birds should keep their times to shed tears euery yere so duly, and especially so great drops and
in such quantitie, sufficient to engender Amber in that abundance? Besides, what congruitie is
there, that birds should depart as far as to the Indians and beyond, for hope to mourn and lament the
death of *Meleager* when he died in *Greece*? What should a man say to this? Are there not ma-
ny more as goodly tales as these, which Poets haue sent abroad into the world? And their pro-
fession of Poëtry, that is to say, of faining and deuising fables, may in some sort excuse them. But
that any man should seriously and by way of history deliuer such stufte, as touching a thing to
rise and common, brought in euery day in abundance by merchants which were ynough to con-
uince such impudent lies, is a meere mockerie of the world in the highest degree; a contempt
offered vnto all men, and argueth an habit of lying, and an impunitie of that vice intollerable.

CHAP. III.

¶ Of the true originall and generation of Amber. The sundry kinds thereof. The
excesse and superfluitie of people, as touching Amber. The medicinable
properties that it affordeth. Of *Lyncurium*, and the ver-
ties that it hath in Physicke.

B Vt to leaue Poets with their tales, and to speake resolutely and with knowledge, of Amber,
knowne it is for certain, That engendered it is in certaine Islands of the Ocean Septentrio-
D nall, where it beareth vpon the coasts of *Germany*: and the *Almanes* call it *Glessum*. And
in very truth, in that voyage by sea which *Germanicus Caesar* made into those parts, our country-
men named one of those Islands *Glesaria*, by reason of the Amber there found; which Island
the *Barbarians* call *Austraia*. It is engendred then in certaine trees, resembling *Pines* in some
sort, and issueth forth from the marrow of them, like as gum in *Cherrie* trees, and rosin in *Pines*.
And verily, these trees are so full of this liquor, that it swelleth & breaketh forth in abundance:
which afterwards either congealeth with the cold, or thickeneth by the heat of Autumn. Now
if at any time the sea rise by any extraordinary tide, and catch any of it away out of the Islands,
then verily it is cast a shore vpon the coast of *Germany*, where it is so apt to roule, that it seemeth
(as it were) to hang and fettle lightly vpon the sands, whereby it is the more easily gotten.
E And for that our ancestors heretofore in old time beleued that it was the iuice of a tree, they
called it therefore in Latine *Succinum*. That it comes from trees of a Pine kind, may appeare
by this, That if a man rub it, he shall find the smel of Pine-wood: also, for that when it burneth,
the flame, and fume (both) resembleth that of Torch-wood. The *Germanes* make great traffick
thereof, and bring it into *Pannonia*, and so from thence vnto vs, through our prouinces [of *Istria*
and *Venice*]; for from *Pannonia*, the *Venetians* first (who confine next vpon the marches there-
of, and whom the *Greekes* call *Heneti*) receiued it by way of merchandise in the maritime port
townes along the *Adriatick* sea, and so by that means brought it into name and request: which
ordinary trafficke may be the reason which gaue occasion to the foresaid tale that runs of the
Po and the *Poplars* about it, that should weep Amber. And euen at this day the country dames
F of *Lumbardie*, and those parts beyond the Po, vse to weare faire carkanets & collers of Amber-
beads to adorne themselves especially, and in some sort for the health also of their bodies: for
perswaded they are, that it withstands the inflammation of the *Amygdals* & other accidents
of the throat and chawes: for that the people of that country are subject to *poghes vnder their
throat, about those fleshy parts neere vnto it, by reason of sundry kinds of waters which breed
those

* For the perspicuitie and brightness like vnto glasse.

* This disease is called *Bronchocoele* or *Hernia gutturis*, ordinary in *Sauoy* and those parts about *Geneyra*.

those infirmities. The foresaid coast of Germany is almost six hundred miles from Carnuntum in Pannonia, and yet of late daies much frequented by merchants from all quarters. Certes, a Gentleman of Rome discouered those parts, by occasion that he was sent thither by commission from *Julianus* (who had the charge vnder *Nero* for furnishing of the solemne plaies and fights of sword-fencers) to buy vp good store of amber. This gentleman I say surueied diligently all those coasts, & saw the maner of the whole traffick for that commodity, yea & brought into Rome such plenty thereof, that the great nets and cordage (which for defence of the outstading and open gallerie within the Theatre were opposed against the wild beasts, there to be baited and to fight) were buttoned & set out with Amber; the armour likewise, the bieres, & other furniture for burial of those fencers which should happen there to be killed, yea, & in one word, all the apparel and prouision for one day to the setting out of those pastimes and disports, stood most of Amber. The greatest piece of Amber that he brought ouer, weighed 13 pounds. Moreover, it is held for certain, That it is to be found among the Indians. *Archelaus*, who sometime reigned as king in Cappadocia, writeth, That from thence it is brought rude and vnclen, with pieces of bark sticking within it: but the way to scoure and polliish it, is to teeth it in the greafe of a sow that suckleth pigs. That it doth destil and drop at the first very clear & liquid, it is euident by this argument, for that a man may see diuers things within, to wit, Pismires, Gnats, and Lizards, which no doubt were entangled and stuck within it when it was green and fresh, and so remained enclosed within as it waxed harder. Many kinds there be of amber. The white is most redolent and finest best: neither that, nor yet those pieces which are coloured like wax, be of any price. The high coloured Amber, namely that which is of a deepe yellow enclining to red, is much more esteemed, and the rather if it be cleare and transparant, provided alwaies that the glittering thereof be not too ardent. Commendable it is in Amber, and sheweth it to be rich, if it represent fire in some sort: but it must not be too too fiery. But the excellent Amber is that which is called *Falernum*, for the colour which it carrieth, resembling the wine *Falernum*: and the same is cleare and transparant, with a gay lustre that pleaseth & contenteth the eie very well. And yet some there be, who delight more in that Amber which looks with a mild yellow like to boiled and clarified hony. But this I am to giue you to vnderstand, That there may be giuen vnto Amber what tincture or colour a man will: but commonly they vse therto the suet of Kids and the root of Orchanet: and no maruaile, since that some haue deuised also to enrich it with a purple die. To come vnto the properties that Amber hath, if it be well rubbed and chaufed between the fingers, the potentiall facultie that lies within, is set on work, and brought into actual operation, whereby you shall see it to draw chaffe strawes, dry leaues, yea, and thin rinds of the Linden or Tillet tree, after the same sort as the loadstone draweth yron. Moreover, take the shauings scraped from Amber, and put them into lamp-oile, they will burne and maintaine light both longer and also more cleare than weekes or matches made of the very tire and best of flax. As touching the estimation that our delicats and wantons make thereof: Some there be, who for their pleasure will giue more for a puppet or image made of Amber to the likenes and proportion of man or woman, be it neuer so little, than for the liuely and lusty body indeed of a tall man and valiant souldior. But what should I say to such? Certainly they deserue to be well chastised for their peruers iudgment, & one rebuke is not sufficient. Yet can I hold better with them who take pleasure in other things, & me thinks they haue some reason therof: for Corinth vessel, there is good cause that a man should set his mind therupon, in regard of the singular temper of the brasse, with some proportion of siluer and gold: in pieces of mettall ingrauen, enchaufed and embossed, the curious art and the witty deuise seen vpon the worke may well rauish the spirit of the buyer, and draw him on to giue a round price: Touching the cups made of *Cassidonia* and *Crysal*, I haue shewed already, wherein lies their grace, and what may enamour a chappman and cause him to bid well and offer frankly for them: Faire pearles and goodly vniones are commended, for that our braue dames enrich their borders therewith, and set out the attire of their heads: gems and pretious stones adorne and beautifie our fingers: in sum, there is no superfluitie that we haue, but grounded it is either vpon some colourable vse that wee may pretend, or els vpon some gallant shew that it makes: As for this Amber, I see nothing in the world to commend it; only it is a mind that folk haue to take affection to it, they know not wherfore, euen of a delicat and foolish wantonnesse. And in truth, *Nero Domitius*, among many other fooleries and gauds wherein he shewed what a monster he was in his life, proceeded so far, that he made

A made a sonnet in praise of the hair of the Empresse *Poppa* his wife, which he compared to *Ambre*, and as I remember, in one staffe of his dittie he rearm'd them *Succina*, i. *Ambre*: and from that time our dainty dames and fine ladies haue begun to set their mind vpon this colour, and haue placed it in the third ranke of rich tincture: whereby we may see there is no superfluitie and disorder in the world, but it hath a pretence or cloake of some pretious name or other. And yet I will not disgrace *Ambre* too much: for why? there is some good vse thereof in Physicke. But I must tell you againe, our women regard not that one whit; that is not it wherfore they take so great a liking to *Ambre*. True it is that a collar of *Ambre* beads worne about the neck of yong infants, is a singular preseruatiue to them against secret poyson, & a countercharme for witchcraft and forerie. *Callistratus* saith, That such collars are very good for all ages, and namely to preferue as many as weare them against fantasticall illusions and frights that driue folke out of their wits: yea and *Ambre*, whether it be taken in drinke, or hung about one, cures the difficulty of voiding vrin. This *Callistratus* brought in a new name to distinguish yellow *Ambre* from the rest, calling it *Chryseletrum*, which is as much to say as gold *Ambre*. And in very truth, this *Ambre* is of a most louely and beautifull colour in a morning. This property it hath besides by it selfe, that it will catch fire exceeding quickly, for if it be neer it, you shall see it will soon be of a light fire. He saith of this yellow *Ambre*, that if it be worn about the neck in a collar, it cures leauers, and healeth the diseases of the mouth, throat, and jawes: reduced into powder and tempered with hony and oile of roses, it is soueraign for the infirmities of the ears. Stamped together with the best *Attick* hony, it makes a singular eie-salue for to help a dim sight: puluerized, and the powder thereof taken simply alone, or els drunk in water with masticke, is soueraign for the maladies of the stomacke. Furthermore, *Ambre* is very proper to falsifie many pretious stones which are commended for their perspicuity and transparent clearenesse, but specially to counterfeit *Amethysts*, by reason that I haue already said, it is capable of any tincture that a man would giue it. The froward peeuishnes of some Authors who haue written of *Lyncurium*, enforceth me to speak of it immediatly after *Ambre*: for say that it be not *Electrum* or *Ambre*, as some would haue it, yet they stand stiffely in this, that it is a pretious stone; many they hold, that it commeth from the vrine of an *Once*, by reason that this wild beast so soon as it hath pissed, couereth it with earth, vpon a spight and enuie to man, that he should haue no good therby. They affirme moreover, That the *Once* stone or *Lyncurium* is of the same colour that *Ambre* D ardent which resembleth the fire, & that it serueth well to be engrauen: neither by their saying doth it catch at leaues only and strawes, but thin plates also of brasse and yron: and of this opinion was *Dimocles* and *Theophrastus*. For mine own part I hold all to be mee re vntruths: neither do I think, that in our age there hath been a man who euer saw any pretious stone of that name. Whateuer also is written as touching the vertues medicinable of *Lyncurium*, I take them to be no better than fables, namely, that if it be giuen in drinke, it will send out the stone of the bladder: if it be drunk in wine, it will cure the jaundise presently, or if it be but carried about one, it will do the deed: but ynough of such fantasticall dreames and lying vanities, and time it is now to treat of those pretious stones, wherof there is no doubt made at all, and to begin with those that by all mens confession are most rich and of highest price. In which discourse I wil not prosecute E this theame only, but also (for to aduance the knowledge of posterity in those things that may profit this life) I meane erst toones to haue a sling at Magicians for their abominable lies and monstrous vanities, for in nothing so much haue they ouerpassed themselves as in the reports of gems & pretious stones, exceeding the tearms and limits of Physick, whiles vnder a color of faire and pleasing medicines, they hold vs with a tale of their prodigious effects and incredible;

CHAP. IIII.

¶ Of Diamants and their sundry kinds. Their vertues and properties medicinable. Of Pearles.

F THE Diamant carrieth the greatest price, not only among pretious stones, but also aboue all things els in the world: neither was it knowne for a long time what a Diamant was, vnlesse it were by some kings and princes, and those but very few. The only stone it is that we find in mines of mettall. Very seldom it is, and thought a miracle to meet with a diamant in a veine of gold, & yet it seemes as though it should grow nowhere but in gold. The writers of antient time

eyes, looking opposit into the sea: but they glittered and pierced so deep into the water, that the Tunies vpon that coast were affraid therat, & fled from the nets and other instruments that the fishers laid to take them withall: who maruelled a long time at this strange accident: but in the end knowing what the matter was, they changed the eies of the foresaid Lion, and remoued the Emeralds. But requisit it is that I should set down the imperfections & defaults of Emeralds, for that a may may so easily be deceived and beguiled in the choise of them: First therefore all Emeralds be subject to some blemishes, and yet as we obserue in men, they haue their particular defects by themselves, according to the nation where they be found, for those of Cyprus haue not an vniforme verdure, but you shal see in one and the same stone a mixture (as it were) of diuerse greens, more or lesse in fundry parts: neither keep they euer that rich Greene after one tenour, which we see in the Scythian Emeralds.ouer and besides, in some you shall meet with a cloud or shadow running between, which doth impeach the cleare color: neither is the same commendable, if it be ouer bright. These faults are the cause that Emeralds are distinguished by diuers names and kinds: for some be darke, and those be called blind: others be thicke, without any clearenesse or perspicuity at all. And some againe are discommended and reiected for diuers little clouds, which also are different for the shade aforesaid: for this little cloud wherof I speak, is a fault in whitenesse, when as in viewing of an Emerald it looketh not green all through, but either the eyesight meeteth with some white in the way, or else at leastwise in the bottom. And thus much as touching the faults in colour. But in the very body and substance of the Emerald there be others obserued, to wit, when there appear either hairy streaks, or congealed specks resembling cornes of salt, or els spots of lead. Next to the Cyprian Emeralds, there is reckoning made of the Aethyopian, which as king *Tuba* mine aouthour doth report, are found in Aethyopia, from Coptos in Egypt three daies journey: These be of a chearefull and liuely green, but hardly shal you find any of them clear, pure, and of one colour. Among these, *Democritus* raungeth the Hermionian Emeralds and the Persian: of which, the former seeme to swell out as if they were embossed and fattie withall: the Persian are not transparent, & yet of a pleasant Greene and vniforme, contenting the eyesight well enough, though it cannot pierce and enter into them; and much like they be to the glowing eies of cats & panthers, for we may perceiue them to glitter and shine, and yet they be nor translucent. These Emeralds in the Sun lose their lustre and become dim, but in the shade they shine gallantly, yea, and cast from them their beautifull raies farther than any other. And yet the general fault in al these, is this, if they shew the color either of gall or the skie; likewise if in the Sun they glitter and shine cleare, but yet appear not green: These imperfections are perceived ordinarily and most of all in the Atticke Emeralds, found in siluer mines at a place called Thoricos, yet are not these so grosse and fattie as others, and alwaies they seeme more beautifull afar off than neer at hand: these are subiect ordinarily to the fault called Plumbago, that is to say, in the Sun they looke with a leaden hew: Moreouer, this peculiar quality they haue by themselves, that some of them wear & decay with age, in so much as by little and little their liuely green decaith; and besides, in the Sun they lose their lustre. After the Atticke Emeralds, those of Media be accounted the greenest, and otherwhiles they resemble the green Saphire. These seem to be full of waues, and to containe within them diuers shapcs and figures of many things, as for example, poppie heads, birds, wings, and finnes, *locks of haire, and such like. Such Emeralds as are not found naturally Greene, may be made better and receiue their perfection, by washing them in wine & oile. In one word, there is not a greater Emerald to be found than those of Media. As touching Carchedonian Emeralds, I wot not wel whether they be now out of request & knowledge, since their mines of brasse haue failed them; and yet were they alwaies (at their best) the smallest of all others, and bare the lowest price: the same were brittle & easie to be broken, their color also was not settled but vncertain & changeable, resembling for all the world the Greene feathers in Peacocks tails, or the downe of Pigeons neckes, as a man held and turned them one way or other they shined more or lesse, being otherwise of themselves full of veines and skales. A speciall fault there was, wherto these Emeralds were subiect, which lapidaries called Sarcicon, that is to say, a certain carnosity or fleshinnesse incident vnto gems. Gathered they were in a certaine mountaine neere vnto Carchedon, which thereupon was named Smaragdites. K. *Tuba* hath left in writing, That the Emerald called Cholos, serued the Arabians much in their buildings: for to adorn and beautifie their houses, they were wont to enclose & set the same in the wals like as the white marble, which the Egyptians

* Capillorum,
not capillorum

Agyptian name Alabastrites. He reporteth moreouer, that there be many other Emeralds neere by, taken forth of the mountain Taygetus in Laconia; and those therefore be named Laconick, and much like they are to those of Media. He speaketh likewise of others in Sicilie. Reckoned there is in the ranke of Emeralds, a certain gem brought from Persia, named Tanos; howbeit of an vnpleasant green it is, and foule within: as also the stone Chalcosmaragdos, that comes out of the Isle Cyprus, which hath in it certain veins of brasse that trouble the green colour. *Theophrastus* reporteth, that he hath read in the books and records of the Egyptians, That a king of Babylon sent as a present to one of their Kings, one entire Emerald foure cubits long and three broad. Also, that there had bin within the temple of *Iupiter* among them, an Obeliske made of foure Emeralds, which obelisk notwithstanding was forty cubits long, & caried in bredth four cubits in some places, and two in others. He addeth moreouer, that while he wrot his historie, there was at Tyros within the temple of *Hercules*, a pillar standing of one Emerald, vnlesse haply it were some bastard Emerald, for such (quoth he) are found, and namely in Cyprus there was seen naturally growing a stone, whereof the one halfe was a plaine Emerald, the other a Iasper, as if the humor had not bin fully transformed and conuerted into an Emerald. *Apion* the Grammarian, surnamed * Plistonices, wrot not long before, who hath left recorded, That there remained still within the labyrinth of Egypt, the gyant-like image of their god *Serapis* nine cubits tall, and of one entire Emerald.

* Contentious, or Vicious.

Moreouer, many are of opinion, that Berils are of the same nature that the Emerald, or at leastwise very like: from India they come as from their native place, for seldome are they to be found elswhere: lapidaries by their art and cunning know how to cut them into six angles, and to polish them smooth; for otherwise their lustre, which is but sad, would be dull and dead indeed, vnlesse it were quickned and reuiued by the repercussion of these angles: for be they polished neuter so much any other way, yet haue they not that liuely glosse which those six faces giue them. Of these Beryls those are best esteemed which carry a sea-water Greene, and resemble the greenesse of the sea when it is cleare. Next to them are those called Chrysoberylli: these be somewhat paler, and their lustre tendeth to the colour of gold. A third kind there is approaching neere to this, but that it is more pale (howsoeuer some do think it is no kind of Beril, but a gem by it self) and this they call Chrysoprasos. In a fourth degree are placed the Berils named Hyacinthizontes; because they incline somewhat to the Iacinth. And in a fift such as are much of a sky colour, whereupon they are named Aeroides. After them be the Beryls Cerini, for that they seem like wax: then the Oleagini, that is to say, of an oile colour. And in the last place be the Crystalline, which are white, and come very neere to crystals. All the sort of these Beryl stones haue these faults, to wit, white hairy streaks or lines in them, yea and other filthy ordure; being of themselves without these imperfections apt to shed their colour, which soon fadeth. The Indians take a wonderfull pleasure in long Beryls, and commend them for the only stones & gems in the world, as if they cared not to be set in gold, but chose rather to be worn without it: and in truth in that regard their maner is to bore holes through them, and then to file them vp into chains and collars with haire of elephants: howbeit when they meet with some excellent Beryls indeed, which are come to their absolute goodnesse and perfection, they think it not good to pierce such, but presently they rip them with gold, that is to say, they serue to their heads certain knobs in maner of bosses which comprehend and inclose the same. And in very truth, they delight to cut their Berils into long rolls or pillastres in manner of cylindres, rather than after the maner of other gems, because their principal grace and commendation lies in their length. Some are of opinion, that the Beryl groweth naturally cornered and with many faces; and they hold those Beryls to be richest, which being bored through along, haue their white pith taken forth, for to giue them a better lustre of gold put vnto them; by the reuerberation wherof the ouermuch perspicuity of the stone may seem more corpulent and in some sort corrected. Over and above the faults already noted, subiect they are also to those imperfections which be incident to the Emeralds, yea and besides to certain specks called Pterygia. It is thought, that Beryls be found likewise in these parts of the world, to wit, about the kingdom of Pontus. As for the Indians, after that crystal was once found out, they deuised to sophisticate and falsifie other gems therewith, but Beryls especially.

Ggg

CHAP.

Of the pretious stone Opalus, and all the sundry kindes. The faults in them, and the means to try which be good. Also diuers sorts of other gems and pretious stones.

THe stones called Opales differ little or nothing otherwhile from Beryls, and yet the same sometimes are nothing at all like them, neither is there a gem that they will giue place to, vnlesse it be the Emeraud: India is the only mother of them: lapidaries therefore & those who haue written books of pretious stones, haue giuen vnto them the name and glory of greatest price; but especially for the difficultie in finding them out and chusing them, which is inestimable: for in the Opal you shall see the burning fire of the Carbuncle or Ruby, the glorious purple of the Amethyst, the Greene sea of the Emeraud, and all glittering together, mixed after an incredible manner. Some Opals cary such a resplendant lustre with them, that they are able to match the brauest and richest colours of painters; others represent the flaming fire of brimstone, yea and the bright blaze of burning oile. The Opal is ordinarily as big as a filbert Nut. And here comes to my mind an historie among vs as touching the Opal, worth remembrance: for there is at this day to be seene one of these Opals, for the which gem *Marcus Antonius* proscribed and outlawed one *Nonius* a Senator of Rome, the sonne of that *Struma Nonius* (at whom the stomack of *Catullus* the Poet did rise so much, seeing him as he did, sit in a stately chaire of Ivory called *Curulis*) and grandfather to that *Servilius Nonianus* whom I my selfe haue seene Consul. Now the said Senator when he was driuen to fly vpon this proscription, took no more of all the goods which he had, but onely a ring wherein this Opall was set, which (as it is well known) had bin valued sometime at 20000 Sesterces. But as the cruell and inordinate appetite of *Antony* (who for a Jewell onely outlawed and banished a Roman Senator) was wonderfull on the one side, so the peeuishnesse and contumacie of *Nonius* was as strange on the other side, who was so far in loue with that gem which cost him his proscription, and rather than to part with it suffered himselfe to be turned out of house and home: and yet the very wild beasts are better aduised than so, who are content to bite off those parts of their bodies and leaue them behinde for the hunters, seeing themselves in danger of death for them. In the Opal there be obserued also diuers blemishes and imperfections, as well as in other stones; namely, if the colour resemble the floure of that herb which is called *Heliotropium*, Turnsole: also if it look like crystal or haile, likewise if there be a spot comming between in maner of a grain or kernel of salt: if it be rough in handling, or if there be certain small prickles or spots represented to the eyes: neither is there any pretious stone that the Indians can counterfeit so well by the means of glasse, as this; inso much as hardly a man shall discerne the naturall Opal from the false, when they haue done withall. But the only triall is by the Sun, for if a man hold an Opal betwixt his thumbe and finger, against the beams of the Sun, if it be a counterfeit, he shall find those diuers colours which shewed therein, to run all into one and the same transparent colour, and so to rest in the body of the stone; whereas the brightness of the true Opaleftsoons changeth, and sends forth the lustre to and fro more and lesse, yea and the glittering of the light shineth also vpon the fingers. This gem, for the rare and incomparable beauty and grace that is in it, most Writers haue called *Pederos*.

There is also another kind of Opalos apart by it self, according to the opinion of some, who say it is called by the Indians *Saugenon*. It is said that there be Opals in Egypt and in Arabia, like as in the kingdom also of Pontus; but such of all other beare the lowest price. In *Gallia* likewise, and in the Isles *Thrasos* and *Cyprus*: for albeit they haue the lovely beautie of the Opalus, yet their lustre is nothing so liuely and lightsome, and seldome shall you meet with any of them that is not rugged: their chief colours stand much vpon brasse and purple; the fresh verdure of the green Emeraud is away, which the true Opal doth participate. This is generally held, that they are more commendable which be shadowed as it were with the colour of wine, than delaid with the clearenesse of water.

Thus far forth haue I written of gemmes and pretious stones which be esteemed principall and most rich, according to the decree generally set downe and pronounced by our nice and costly

A costly dames: for we may conclude vpon this point more certainly, going by their sentence, than grounding vpon the iudgement of men: for men (kings especially and great men) make the price of each gem according to their severall fancies. *Claudius Cesar* the Emperour made no reckoning of any but the Emeraud and the Sardonyx, and these ordinarily he wore vpon his fingers: but *Scipio Africanus* (as saith *Demostratus*) tooke a liking to the Sardonyx before him, and was the first Roman that vsed it; and euer since, this gem hath bin in great request at Rome: in regard of which credit, I will range it next to the Opall. In old time the Sardonyx, as may appeare by the very name, was taken for the pretious stone which seemed to be a * *Cornalline* * *Sardos* vpon white, that is to say, as if the ground vnder a mans naile were flesh, and both together transparent and cleare: and in very truth, the Sardonyx of India is such, according to *Ismenias*, *Demostratus*, *Zenathemis*, and *Sotacus*. As for these two last named, they verily doe name all the rest that are not cleare and shew not through them, Blind Sardonyches, such as the Arabian be; and these haue carried away the name of Onyx, without any mention or apparence at all of the *Sarda* or *Cornalline*: and these stones haue begun of late to be knowne and distinguished by their sundry colours; for some of them haue their ground blacke or much vpon azure and the naile of a mans hand: for it hath bin generally thought and beleueed, that such hath a tincture of white, and yet not without a shew of purple, as if the said white enclined to a vermilion or Amethyst. *Zenathemis* writeth, that these stones were not set by among the Indians; notwithstanding otherwise they were so large and bigg, as thereof they made ordinarily sword handles and dagger hafts: and no marvaile, for certaine it is, that in those parts land floods comming downe with a streame from the hills, haue discovered such and brought them to light. He saith also, that they were at the beginning highly accepted of in those parts; for that there is not in maner a stone engrauen, that will imprint the seale vpon wax cleanly without plucking the wax away, but it: and through our persuasions, the Indians also grew into a good conceit of them, and tooke pleasure in wearing the same: and verily, the common people of India make holes through them, and so weare them enfiled as carkans and collars about their neckes only. And hereupon it commeth, that those are taken to be Indian Sardonyches or Cornallines which be thus bored through. As for the Arabicke, excellent they are thought to be which are environed with a white circle, and the same very bright and most slender: neither doth this circle shine in the concavities or in the fall of the gem, but glittereth onely in the very bosses; and besides, the very ground thereof is most blacke. True it is, that the ground of these Sardons is found in the Indian stones to resemble wax or horne, yea within the white circle, in so much as there is a resemblance in some some sort of a rainbow, by means of certain cloudie vapors seeming to proceed from them: and verily the superficial face of this stone is redder than the shells of Lobsters. As touching those that be in colour like to hony or lees (for this is taken to be an imperfection and fault in Cornallines) they be all rejected; likewise if the white circle that girdeth it about spread and do not gather round and compact together: semblably, it is counted a great blemish in this gem, if it haue a veine of any other colour (but that which is naturall) growing out of square: for the nature of this stone is such, like as of all things els, not to abide any strange thing to disturb the feat thereof. There be also Armeniacke Cornallines, which in all respects else are to be liked, but for the pale circle that claspeth them.

By occasion of this stone Sardonyx, I am put in mind for the names sake, to write of the gem Onyx also: for notwithstanding there be a stone so called in *Carmania* (which is the *Cassidin*) yet there goeth also a gem vnder that name. *Sudines* saith, that the pretious stone Onyx hath a white in it resembling the naile of a mans finger: it hath likewise (quoth hee) the colour of a *Chrysolith*, otherwise called a *Topase*, of a *Cornalline* also, and a *Iasper*. *Zenathemis* affirmeth, that the Indian Onyx is of diuers and sundry colours; to wit, of a fiery red, a blacke, a * *horne* * *grey*; hauing also otherwhiles certaine white strakes or veines in fashion of eyes compassing it about; and in some of them you shall see white streaks or veins likewise to goe crosse and by as betwene them. *Sotacus* maketh mention moreover of an Arabian Onyx, but it differeth from others (saith hee) in this respect, That the Indian Onyx hath certaine sparkes in it, and the same environed and compassed about with white circles either single or many fold, farre otherwise than the Indian Sardonyx; for in the former, the white seemed to be pointed prickles, but in these they bee compleat circles. As for the Arabian Onyches, there bee found of them blacke, with white circles. *Satyrus* reporteth furthermore, that the Indian Onyx is fleshie; that in one

* Whereof haply they be called Cornallines.

Crimfen: which being chaufed in the fun, or otherwise fet in a heat by rubbing with the fingers, G will draw to them chaffe, strawes, threads, and leaues of paper. The common Grenat also of Carhedon or Carthage, is said to do as much, although it be inferior in price to the former. These Grenats are found vpon the hills amongst the Nasamons, and as the inhabitants are of opinion, are ingendred by means of a certaine diuine dew or heauenly showre: found they are twinkling against the moon-light, and especially when she is in the full. In times past, all the trafficke of the Grenats was at Carthage, whereupon they took the name of Carhedon. But *Archelaus* faith, that there be of them in Egypt also about the city Thebes; howbeit, such are brittle, full of veins, and like to a cole going out and ready to die. I find, that drinking cups haue been made of this stone, as also of the former, called *Lychnites*. Generally, all rubies be very hard for to be cut; and this ill quality they haue, That they neuer do seale cleane, but ordinarily plucke some H of the wax away with the signet: contrariwise, the Cornalline or Sarda, signeth very faire without any of the wax sticking to it: this Sarda giueth part of the name to the Sardonyx: the gem it selfe is very common, found first about * Sardis; but in truth, the principall is that which commeth from about Babylonia, out of certaine quarries of stone, where it was found sticking within another stone in manner of the heart. After this manner, it is said, that the Persians had sometime minerall Cornallines, but the mine now doth fade: howbeit, there be of them in many other places besides, to wit, in Paros and Affos. The Indians send vnto vs three severall kinds, to wit, the red, the fatty (called therupon Demium) & the third which ordinarily haue a ground of siluer-foile laid vnder them to giue a lustre. The Indian Sardes or Cornallines are transparent and carry a through light with them: the Arabian be more thicke: there be found of them also I about Egypt, but they haue commonly a ground of gold-foile. These gems likewise are distinguished by the sex, for the male haue a more bright and orient lustre; the female are not so resplendent, but shine as it were through a grosse & fatty matter. In old time, there was not a precious stone in greater request, than the Cornalline: & in truth, *Menander* & *Philemon* haue named this stone in their * Comedies, for a braue and proud gem: neither can we find a precious stone that maintaineth the lustre longer than it, against any humor wherein it is drenched; and yet oile is more contrary to it than any other liquor. To conclude, those that be of the colour of honeye, are rejected for nought; howbeit, if they resemble the colour of earthen pots, they be worse than those.

* A city, whereupon it tooke the name, and not of Sardinia the Isle, as some thinke.

* *Menander* & *Philemon* haue named this stone in their Comedies, for a braue and proud gem: neither can we find a precious stone that maintaineth the lustre longer than it, against any humor wherein it is drenched; and yet oile is more contrary to it than any other liquor.

CHAP. VIII.

¶ Of the * Topaze, and the sundry kinds of it. Of * Callais: and of other greene pretious stones not transparent.

* Some take it for our Chrysolith.

* It is thought to be our Turquois.

THE Topaze or Chrysolith, hath a singular green colour by it selfe, for which it is esteemed very rich; and when it was first found, it surpassed all others in price: they were discovered first in an Isle of Arabia called Chiris, wherein certaine rousers (Troglydites) being newly landed, after they had bin driuen thither by tempest and vrged with famine, began to feed vpon herbs and dig for roots, and by that meanes met with the Topaze stone: This is the opinion of *Archelaus*. But *K. Iuba* reporteth, that there is an Island within the red sea called Topazas, distant L from the continent 300 stadia, the which is oftentimes so mistie, that sailers haue much ado to find it, whereupon it tooke that name: for in the Troglydites language (faith he) Topazin is as much to say, as to search or seek for a thing. It is said, that the first that tooke a liking vnto the stone, was queene *Bernice* the mother of *Ptolome* the second, and that by the meanes of *Philemon* (lieutenant generall to her son in those countie) who presented one of them to the said queen. Of which Chrysolit, *Ptolomeus Philadelphus* K. of Egypt, caused the statue of his wife *Arfinoe* to be made, 4 cubits long; and in the honour of the said queene his wife, dedicated it in a chappell named the Golden temple. The moderne writers do report, that there be found of these Chrysolits about Alabastrum a towne in Thebais, a prouince in high Egypt; and two kinds they make thereof, to wit, *Praefoides*, and *Chrysopteros*: which later commeth neare to that golden Berill M called *Chrysoprasson*, for that the colour thereof resemblith fully the iuice of Porret; and of all precious stones it is the largest: this property it hath aboue all other gems, That only it comes vnder the file to be polished for noble men; whereas all other be scoured by the grindstones coming out of Naxos. This stone will weare with vsage.

This

A This stone in regard of colour may be accompanied with the Turquois called Gallais, for a certain green it hath inclining to yellow. It is found beyond the farthest parts of India among the inhabitants of the mountaine Caucasus, to wit, the Phicarians and Adates; they grow vnto a very great bignesse, but the same is fistulous and full of filth. The purest and richest of this kind be those of Carmania. But in both countries they be found in ycie clifffes hardly accessible, where you shall see them bearing out after the manner of bosses like vnto eies: they stick to those crags & rocks so lightly, that a man would say that saw them, how they grew not naturally out of the rocke, but were onely set too by mans hand. And for that the place where they doe grow, is so steep that a horseman is not able to ride vnto them, and because the people of that country be loth to climb so high with their feet, being otherwise acquainted ordinarily to the horseback, besides, in regard of the danger in venturing to climb for them, therefore they reach them a far off with slings, and so drue them down, with all the hard mosse about them: and in very deed, a commodity this is of great reuenue, & besides, the rich men know not the like jewell to weare about their necks. By a collar or chaine of these Turquoises, men are judged wealthy more or lesse: and this is the glory that they take from their childe hood, to be able to say, that thus many Turquoises they haue pulled and cast downe by that manner of slinging. And yet in the practise of this feat, all sped not alike; for some you shall haue to throw downe many faire Turquoises at the first sling; and many for it again who weary their armes and course after them, & yet cannot get one Turquois. This (I say) is the maner of chasing or hunting Turquoises: and when they be gotten, they must come into the lapidaries hands to be cut and formed to what fashion you will: and in truth they be otherwise brittle and easie to be wrought vpon. The best Turquois is that which approacheth nearest to the grasse green of an Emerald, howbeit, all the grace that they haue, seems to come from outward help: being set in gold, they looke most beautifull, neither is there a precious stone that becommeth gold better. The fairer that a Turquoise is, the sooner looseth it the colour by oile, ointment, or wine: contrariwise, the baser that they be, the better do they hold their own and maintain their lustre. Neither shall you meet with any precious stone more easie to be falsified and counterfeited with glasse, than a Turquoise. Lastly, some writers affirme, That they be found in Arabia, within the nest of certain birds called *Melacoryphi*, which is as much to say as blacke-cops.

As touching green stones, there be many more kinds: but of the baser sort we reckon one of a Porret colour, which we call *Prasius*, and the first kind of it is all green; whereas the second hath vpon the green, certaine red spots like blood, which cause it to seem vnpleasant to the eie, and rough in hand: the third is greene, but yet parted with three white strakes.

The stone *Chrysoprassus*, i. the sea water or Horehound green, is preferred before the other: in some sort it resemblith the green iuice of a Leek, but it declineth somewhat from the Topaze, as if it were between it and gold. Some of these are so great and big, that there be drinking cups made thereof, after the fashion of boats: but pilastres or round staues in manner of cylindres or rolls, are very quickly framed of such stones. These be found among the Indians: like as another stone, which is called * Nilios: A weak lustre it hath, and will not long continue, for looke but a while wisely vpon it, you shall perceiue it soone to fade. *Sudines* faith, That there be of them E found in Syverus, a riuer that passeth through the countrey of Attica: in colour it resemblith a smokie Topaze, or otherwiles that of a hony colour. *K. Iuba* reporteth, That it is bred in *Aethyopia*, and namely about the bankes and sides of a riuer which we call Nilus, whereupon it commeth to be named Nilios.

There is a stone called *Molochites*, for that the greene colour which it hath, commeth neare vnto a Mallow, and is more dim than the rest whereof I haue spoken. Commended it is highly in signets to seale faire: and besides it is supposed to be by a naturall vertue that it hath, a countercharme to preserue little babes and infants from all witchcrafts and forceries.

A kind of Iasper likewise there is of a greene colour, and the same oftentimes is transparent: and although there be many other stones go beyond it in riches, yet it retaineth still the antient glory and honor that it had. A gem it is, common to many other countries: India yeeldeth it vnto vs like to an Emerald. That of Cyprus is very hard, and of a greyish fatty colour, betweene white and greene. The Persians send vs a Iasper like vnto the skie or aire, and thereupon it is called *Aerizusa*: and such a one is that which commeth from the Caspian hills. The Iasper about the riuer *Thermoodon* is blew as Azure. In Phrygia you shall haue it purple: in Cappadocia

* Thought to be the Almain Chrysolit.

Cappadocia partly purple and partly blew, but no kind of lustre hath it at all. Out of Amisus, a City in Pontus, we haue Iaspers brought, much like to the Indian: and the Iasper of Chalcedon is muddy and troubled. But it were better to set downe their degrees in goodnesse, rather than to stand vpon the countries from whence they are transported. The best Iasper then is that which standeth much vpon purple or Lac: the second is incarnat, or of a rose colour: the third resembleth the Emerald in greenesse. To euery one of these severall kindes, the Greekes haue imposed significant names. And in a fourth place the Greeks haue ranged another called Borea, like to the morning skie in the time of Autumne; and this may well be called Aerizusa. There is a Iasper in colour like to the Sardar, the Cornalline, as also resembling much the violets: there be as many more sorts behind, which I haue not touched, but subject they be al to blemishes, as namely being blew or like to Crystal or waterie steame. Last of all, we haue a Iasper called Terebinthizusa by the Greekes, but as I take it very vnproperly, as if it were compounded of many gems of one and the same kind; and therefore the better sort of such are inclosed within a circle of gold, yet so as they be open both aboue and beneath, neither is any thing but the edges only compassed with gold. The faults or imperfections of the Iasper be these, if the lustre indure not long, notwithstanding it glitter a far off; also if it shew a spot like vnto a graine of salt; besides all other which I haue already named in the rest. Moreover, Iaspers may be falsified by the meanes of glasse: and this is soone detected, namely, when they cast a reuerberation of their lustre outwardly, and hold it not within. To conclude with the stones called Sphragides, they are not much vnlike to the Iaspers. And this gift they haue aboue all the rest, that they make the best signets, and seale fairest.

CHAP. IX.

Sundry kinds of Iaspers.

Of diuers sorts of Iaspers, al the East part (by report) are most affected to that which is like the Emerald, and they carrie it ordinarily about them as a countercharme. The same if it be compassed round about with one white crosse line in the midst, is called Grammatias; if with many, Polygrammos. And hereby the way I can hold no longer, but my mind serues as; if with many, Polygrammos. And hereby the way I can hold no longer, but my mind serues me very well to challenge the Magitians, who haue giuen it out, That this stone is very good for those to haue about them who are to make some publick speech or solemne Oration to the people. Moreover, we haue a Iasper called Onychopuncta & Lasponyx, which seemeth to inclose a cloud within it, & in some sort to resemble the snow. This Iasper is fashioned like to a Star, and beset with diuers reddish points: a man that saw it, would say it were a kind of Megarian salt. There is besides a Iasper which seemeth as if it were infected with smoake, and this is called Capnias. Concerning the bignesse of the Iasper, I haue seene one of them nine inches long, which serued for to represent the visage of Nero the Emperour, standing ready armed with a cuirace.

As touching the precious stone Cyanos, I must speake of it apart, notwithstanding I haue of late mentioned and applied it to one of the names of the Iasper, to wit, that with the blew colour. The best Cyanos is that of Scythia; the next cometh from Cypros: and in the last place we are to reckon the Egyptian. This stone is very apt to be counterfeited, and especially by tincture: the inuention whereof is ascribed to a king of Egypt, who was highly honoured for begetting the first that gaue a colour to it. Distinguished these stones also are by the sex, for there be of them both male and also female. Otherwhiles you shall perceiue a certaine powder in them as it were of gold, and yet not like to that of Saphires: for the Saphire also glittereth with marks and pricks of gold. Saphires are likewise sometime blew: mixed also with purple, although that be very feldome: the best are among the Medes, yet in no place be they transparent. Moreover, they are vntoward for to be cut and engrauen, by reason that the lapidarie shall meet with certaine hard knots of Crystal comming here and there betweene. The blewest are thought to be the male.

Next after these, I am to range those stones that bee of a purple colour, and such as decline somewhat from them, and yet seem to depend of them: of which, I must place in the first ranke as principall, the Amethysts of India: and of them there bee found in a part of Arabia, which bordereth vpon Syria, and is called Petraea: also in Armenia the lesse, in Egypt, and in France: but

But the fondest and of most base account, be those of Thasos & Cyprus. The reason of the name Amethyst, is generally thought to be this, that notwithstanding it approach very neer to the colour of wine, yet before it thoroughly tast thereof, it turneth into a March Violet color: and that purple lustre which it hath, is not altogether fiery, but declineth in the end to the color of wine. There is not one of these Amethysts, but it is transparent with a violet colour. Easie they are al to be cut and engrauen. And as for the Indian Amethysts, they haue the full and rich colour of the Phoenicean purple die; and in truth, the diers wish that they may but giue a tincture answerable to it. Verily this purple colour is pleasing to the eie, neither doth it strike or pierce the sight so forcible as the Rubies do. In a second rank are to be ranged the Amethysts inclining to the Iacincts; the color of which stone the Indians call Sacon, like as the gem it selfe Sacodian. Now if the color be more weak and feeble, they call it Sapinos; and this Amethyst in a third degree is named Parantes in the marches of Arabia, which name it taketh of the people. The fourth kind resembleth the colour of wine. The fifth declines neer to Chrysell, saue only that toward the bottom thereof, it standeth of a certaine whitish purple: but this is nothing esteemed, for the excellent Amethyst indeed being held vp in the aire, ought to shine in manner of a Ruby, and to carry a certain purple lustre, mildly participating of the incarnat rose color. Such Amethysts as these some chuse rather to call Paderotes, like as a kind of Opale; others, Anterotes: many giue them the name of Venus gems, for the great grace that they haue, & decent louelineesse which they seem to shew both in fashion and colour, especially without forth. The Magitian, as vain herein as in all other things, seem to beare vs in hand that they haue a special vertue to withstand drunkennesse, wherupon they should be called Amethysts: neither stay they so, but tel vs, that if the name of the Moon and the Sun be engrauen in them and so worn about the neck hanging, either with the hairs of a Cynocephalus head, or els swallows feathers, they are a sueraigne remedy against charms and forceries that be practised, with poisoning. Nay they would make vs beleue that there is a way to vse them, which wil cause men to be gracious with princes who haue any negotiation with them, and that by the means thereof they shal find easie accesse to their presence, and fauor in their eies. Also, by their saying, they are of force to auert haile and such like distemperature of the weather, yea, and to turn away Locusts, so there bee a charm in manner of a praier said withall, the form whereof they also do prescribe & shew: and no maruall, for they haue promised the like of Emeralds, if there were inchaufed in them the forme either of Eagles, or the flies named Beetils. In setting down which toies and vanities, they shew well enough in what contempt they haue mankind, and how they are disposed to mocke the world.

It followeth now by good order to speake of the Iacincts, which, albeit they differ much from Amethysts in some respect, yet in lustre they approach very neere: and this is only the difference between them, that the braue violet colour, which in the Amethyst is full and rich, in the Iacinct is delaied and weaker. The Iacinct also at the first sight is pleasant and acceptable, but the louely beauty thereof vanissheth away before it haue giuen a man enough. And so far is it off from contenting the eie fully and satisfying the pleasure thereof, that it fades sooner than the dainty flour of that name, Hyacinthus, so quickly doth the lustre passe away, in manner before it come to the eie. Aethyopia furnissheth vs with Iacincts & Chrysolithes both, which are transparent and carry the colour of gold: howbeit those of India bee preferred before them; they of Baetiana likewise, if they be not spotted and flecked with diuers colors. The worst of all others, be the Arabian: for they be not only skewed in colour, but also foule and troubled: and look what radiant lustre they haue, interrupted it is with a cloud of spots: and if any chance to be clear otherwise, yet a man that looketh on them, would say they were full of their owne dust. The best are those, which being laid to gold, cause it to looke whitish in manner of silver, in comparison to them. Such as be cleare and transparent, Goldsmiths vse to set within a hoope of gold, so as they may be seen both beneath and aboue. The rest had need of a ground of Latton soile to giue them a lustre: howbeit, now adaies those that are not skilfull lapidaries haue taken vp a custome to call some Iacincts Chryselestri, which incline to the color of a base gold called Electrum; the which in a morning are more beautifull and glorious to the eie, than all the day after. Those Iacincts that come from Pontus, are knowne by their lightnesse: some of them be hard and of an Orange red; others be soft and foule. Ptochus mine author reports, That they be found in Spaine also, in that place where he saith they sink pits for to leuel water, and out of which the peasants doe take

* Of which name there is Opalus & the Amethyst.

take forth crystal. He affirmeth also, That he hath seen a *Chrysolith* of twelue pound weight. G Moreover, there be certain *Iacints* which haue a white veine comming between, and those are called *Leucochrysi*. And of this kind some be named *Capnia*, because they be smokie. You shall find of them like vnto glasse beads, and yet of a shining yellow in manner of *Saffron*. And verily false *Iacints* there be counterfeited by glasse so artificially, that a man shall hardly discern them by the eie: howbeit handle and feele them, you shall soone find the deceit; for the fine *Iacints* indeed are colder naturally than those that be counterfeited. Among these *Iacints*, I may range wel ynough those stones which are called *Melichrysi*, which shew as if cleare hony shone through gold. These we haue from *India*: but of all other they are most subiect to iniurie and will soonest breake. The same country yeeldeth also a gem called *Xystion*, whereof there is such plentie, that the very common people doweare them.

* Of which name there is Opalus & the Amethyst.

If we should speake of white stones, the principall of them all is the gem named *Pæderos*; And yet considering that vnder this name there passe other fair & beautiful stones (such a prerogative hath the word to signifie some excellencie of lounelines) there may be question made, how it can be properly vsed for one gem, or one colour; yet surely there is a kinde of precious stone by it selfe called *Pæderos*, and the same worth the looking on; and there seem to meet together a skie color, and the same in his manner greenish vpon a cleare and transparent *Crystal*: accompanied these be with a purple and a certain yellow and bright gold colour of *Muskadel*, and the same is alwaies the last colour that appeareth outwardly and giueth the lustre: and yet a man that beheld this stone, would say that the head thereof were crowned with a chaplet of purple; and as it appeareth to haue these colours confounded all together, so it seemeth as if euery one had a feuerall lustre by it selfe. A more pure and clearer gem there is not againe: comfortable to the head & pleasing to the eie. The best simply of this kind we haue from the *Indians*, who call it *Argenon*. In a second degree to it is that of *Ægypt*, where it is called *Senites*. Of a third sort there be in *Arabia*, but those are rough. Those of *Natalia* and the kingdome of *Pontus*, are not so radiant and quicke as the others: and yet from *Galatia*, *Thracia*, and *Cyprus*, we haue such as be more feeble than they. If you would know what faults be incident to these *Pæderotes* particularly: they cary otherwhiles a languishing lustre; troubled they be with vnatural colours; and generally subiect they are to all the defects and imperfections of others.

* Gira sole.

In the second place of white gems, is * *Asteria* to be counted: a wonderfull propertie it hath in Nature, for which it deserues to be chiefe; for that it keepeth enclosed within a certain light K in manner of the apple in the eie: which according as a man doth hold or turne, hee shall see how it will send and transfuse it from the owne place; one would thinke that it walked within and shifted from place to place. And the same, if it be opposed against the beames of the Sun, casteth forth bright and white raies of the owne, in manner of a starre, whereupon it tooke the name *Asterias*: and very hard it is to be engrauen. Those which come out of *India* be preferred before them of *Carmania*.

In like manner a white pretious stone there is called *Astrios*, approaching neer to *Crystal*: this is engendred among the *Indians* and along the coasts of *Pallene*: From the verie centre within, there shineth a kind of star in manner of a full Moone in the height of her brightnesse. Some giue this reason of the name, that being held against any stars, it receiueth from them a light and sendeth the same from it againe in manner of beames. And they hold that the best be in *Carmania*, and there is not another gem againe lesse subiect to blemishes and imperfections than it. As also that a worse kind thereof is called *Ceraunia*: and the worst of all other resembleth the blase or flame of lampes and candles.

As touching *Astroites*, many make great account of it: and such as haue written more diligently thereof, doe report, That *Zoroastres* hath highly commended it and told wonders thereof in art Magicke.

Sudines speaketh of another gem called *Astrobolos*, and saith it is like vnto a fish eie, and casteth forth white glittering raies against the Sunne.

Among white pretious stones may be reckoned that which they call *Ceraunia*, which is apt to receiue light and lustre both from Sunne and Moone and other starres. It selfe looketh like *Crystal* cleare, howbeit, the lustre that commeth from it seemeth to be of a blue *Azura* color: and *Carmania* is the natue place therof. *Zenathemis* confesseth, That it is a white gem, and hath within a starre-like fire, which seemeth to run too and fro and change place, according as a man turneth

turneth it. He affirmeth also, that the foresaid *Ceraunia* will become dul and duskie; which if they be foked for certain daies together in vineger and sal-nitre, will recouer their light and conceine a new fire in maner of a star, which will continue for so many months as they lay daies infused, & after that lose their lustre again. *Soracm* hath set down two kinds more of *Ceraunia*; to wit, the black and the red, saying, that they resemble halberds or ax heads. And by his saying, the black, such especially as be round withall, are endued with this vertue, that by the means of them cities may be forced, and whole naties at sea discomfited; and these (forsooth) hee called *Betuli*, whereas the long ones be properly named *Ceraunia*. It is said there is one more *Ceraunia* yet, but very geason it is; and hard to be found, which the *Parthian* Magitons set much store by, and they only can find it, for that it is no where to be had but in a place which hath bin shot with a thunderbolt.

Next after the *Ceraunia*, there is a stone named *Iris*: digged out of the ground it is in a certain Isle of the red sea, distant from the city *Berenice* 60 miles. For the most part it resembleth *Crystal*, which is the reason that some haue termed it the root of *Crystal*. But the cause why they call it *Iris* is, That if the beames of the Sun strike vpon it directly within house, it sendeth from it against the wals that be near, the very resemblance of a rainbow both in form and colour, and oftsoons it will change the same in much variety, to the great admiration of the beholders: For certain it is known, that six angles it hath in manner of *Crystal*; but they say that some of them haue their sides rugged, and the same vnequally angled, which if they be laid abroad against the Sun in the open aire, do scatter the beames of the Sun that light vpon them to & fro; also that others do yeeld a brightnesse from themselves, and thereby illuminat all that is about them. As for the diuers colours which they cast forth, it neuer hapneth but in a dark or shadowy place: whereby a man may know, that the varietie of colours is not in the stone *Iris*, but comes by the reterberation of the wals. The best *Iris* is that which represents the greatest circles vpon the wall, and those which be likest to rainbowed indeed. There is another gem called *Iris*, like to this in all respects, but that it is exceeding hard. *Horus* saith, that if it be calcined and pulverised, it is a singular remedie against the biting of *Ichneumones*: also, that naturally it is to be found in *Perfis*.

Much like in form and shape to *Iris*, but not of the same effect, is there another stone called *Zeros*: a man that sees it would take it to be a crystal, with a black strake parting it overthwart. D Thus hauing laid abroad the pretious stones & jewels which are distinguished by sundry kinds of principal colors, I wil proceed to the rest, and discourse of them alphabetically.

CHAP. X.

Of certaine gems digested in order according to the Alphabet.

The *Agat* was in old time of great estimation, but now it is in no request. Found it was first in *Sicily* neere to a riuer called likewise *Achates*, but afterwards in many other places. It exceeds in bignesse, and is full of varietie in colours, whereby it hath gotten many names; E for called it is *Phaëachates*, *Cerachates*, *Sardachates*, *Hæmachates*, *Leucachates*, and *Dendrachates*, as if the veins thereof resembled a little tree. As touching the *Agath*, called *Antachates*, as it burneth you shall haue it to smel like vnto *Myrrh*: Also there is an *Agath* of a reddish colour resembling coral, and thereupon called *Coralloachates*: and the same is beset with certain spots or drops of gold in manner of the *Saphyr*: of which kind there is passing great plentie in *Candy*, where they call it the holy or sacred *Agat*; for people are persuaded that it auaieth much against the sting of venomous spiders and scorpions: which propertie I could very well beleue to be in the *Sicilian* *Agaths*, for that so soone as *Scorpions* come within the aire and breath of the said prouince of *Sicilie*, as venomous as they be otherwise, they die thereupon. The *Agats* likewise found among the *Indians* haue the same operation, and besides doe represent many other miracles; for you shall find imprinted naturally in them the forme and proportion of riuers, woods, and laboring horses: a man shall see in them coaches and little *Chariots* or horse-litters, together with the furniture and ornaments belonging to horses. As for physicians, they make their grinding stones therof for fine pouders. And it is holden for a truth, that only to behold and looke vpon an *Agath*, is very comfortable for the eies. If they be but held

in the mouth, they quench and allay thirst. The Phrygian Agats haue no part of green in them. Those that be found about Thebes in Egypt are without red and white veins: howbeit, these also be effectually against scorpions. Of the same credit likewise are the Cyprian Agats. Some hold opinion, that the singular grace and commendation of an Agat, is to be clear and transparent like glasse. There be found of them in Thrace, & about the mountain Oeta, in the hill Parnassus, in Lesbos and Messene, and such haue floures imprinted in them like those which grow in the highwaies and paths by the fields: also in the Island of Rhodes. But the Magitians obserue diuers other sorts; and as for those that be like vnto a Lions skin, they haue the name to be powerfull against scorpions. In Persia they are perswaded, That a perfume of such Agaths turneth away tempests and all extraordinarie impressions of the aire, as also stayeth the violent streame and rage of riuers. But to know which be proper for this purpose, they vse to cast them into a cauldron of seething water; for if they coole the same, it is an argument they be right, but to be sure that they may do good, they must bee worne tied to the haire of a Lions mane: for as touching those Agates which seeme to haue the print of an Hyanes skin, the Magitians cannot abide them, as causing discord in an house. But they hold, That the Agath of one simple colour causeth those wrestlers to be inuincible who haue it about them. And a proof hereof they take by seething it in a pot full of oile, with diuers painters colours; for within one two houres after it hath siuered and boiled therein, it will bring them all to one entire colour of vermilion. Thus much of Achates or the Agath. The stone which is named Acopis resembleth Sal-Nitre: hollow and light it is in manner of the pumith stone, howbeit spotted with golden spots or drops in manner of starres. Seeth this gently in oile, and therewith anoint the body, it riddeeth away all wearinesse and lassitudes, if wee may beleue the Magitians. The stone Alabastrites is found about Alabastrum a city in Egypt, and Damasco in Syria, white of colour it is, and intermeddled with sundry colours. This beeing calcined with Sal-gem and reduced into powder, is said to correct a stinking breath and strong sauer of the teeth. In the gessiers of cocks there be found certaine stones, called thereupon Alestoriae, which in shew resemble Crystall, and be as big as beans. *Milo* that great Wrestler of Croton used to carry this stone about him, whereby he was inuincible in all the feats of strength or a stuitie that hee tried, as Magitians would seem to perswade vs. Andromadas is a stone of a bright colour like silver, and in manner of a Diamant, square, and alwayes growing in a table Lozenge-wise. The Magitians suppose, that it tooke that name of repressing the anger and furious violence of men. As touching Agyrodamas, whether it be the same or another stone, Authors haue not resolved. Antipathes is a stone all blacke, and nothing at all transparent. You shall find whether it bee a true stone or no by seething it in milke, for no sooner is it put in, but it causeth the milke to look like Myrrh. The Magitians would haue vs to thinke, That it is good against Witchcraft and eye-biting especially. Arabiea is passing like vnto Ivoire, and for Ivoire might it go, but that it is so hard, which bewraieith it to be a stone. It is thought, that as many as haue it about them shall finde ease of the paine of the sinues. The stone Aromatites is thought principally to grow in Arabia, and yet it is found in Egypt about Pyrae: but wheresoeuer it is to be had, a hard stone it is, in colour and smell both resembling Myrrhe: in which regard it is much vsed of queenes and great ladies. Asbestos is ingendred within the mountaines of Arcadia, and is of an iron gray colour. As for Aspilate, *Democritus* saith, that it is bred in Arabia, and of a fiery colour: which by his saying, ought to be tied with camels haire, and so hung fast about them that be troubled with the schirosities of the spleen: also (if he say true) it is found in the nest of certain Arabian birds. Another also of that name groweth there in the cape Leucopetra, but it is of a silver colour, and glittereth withall: excellent to be worne about one against the phantastickall feares and imaginations in the night season. The same *Democritus* saith, That in Persia, India, and the mountaine Ida, there is a stone found named Artizoë, glittering bright as silver, three fingers thicke, formed in manner of a Lentil, and of a pleasant and delectable sauer: The Sages of Persia neuer go about the election and ordering of a King, but they thinke it necessarie to haue it about them. As for the Augites, many be of opinion, that it is no other stone than Callais, to wit, the Turquois. Amphitane is a stone knowne by another name also, Chrysocolla: found it is in that part of India where the Pismires-Volant do take out gold; where it resembles gold, and is in fashion four-square. It is reported constantly, that it hath the same force naturally that the Loadstone hath, but that it draweth gold to it as well as iron. Aphrodisiae is partly white,

and

A and partly reddish. A syctos being once heat at the fire, will continue a seuen-night after hot: blacke it is and ponderous, hauing certaine veins that diuide it: it is thought to be good against cold. As touching *Aegyptilla*, *Iacchus* taketh it for a white stone, with a veine partly of a Sard or Cornalline, and partly blacke, passing through it ouerthwart: howbeit the common sort take *Aegyptilla* to be blew, with a black mote in the bottome.

As for the stone Balanites, there be two kinds thereof; to wit, of a greenish colour, and resembling Corinth brasse: the former commeth from Coptos, the other out of the region Troglodytica; and they haue a fierie vaine cutting them just in the mids. The same Coptos sendeth other stones to vs besides, to wit, those which be called Batrachitæ; the one like in colour to a frog, a second to * yvory, the third is of a blackish red. * Baptes, how soeuer otherwise it be soft and tender, yet an excellent odor it hath. The stone called Belus eie is white, and hath within it a black apple, the mids wherof a man shall see to glitter like gold: this stone for the singular beautie that it hath, is dedicated to *Belus* the most sacred god of the Assyrians. There is another stone named Belus, growing (as *Democritus* saith) about Arbelæ, to the bignesse of a wall-nut in manner and forme of glasse. As for Baroptenus or Baroptis, it is black, interlaced as it were with certain knots, both white and also of a sanguine red, after a strange and wonderfull manner. Botrytes is found sometime black, otherwhiles red, & like it is to a cluster of grapes when it beginneth first to knit. As for it which is more like to the hair of women, *Zoroastres* calleth it * Botrychites. * Bucardia resembleth an oxe heart, and is to be found onely about Babylon. Brotia is shapen in manner of a Tortoise head: it falleth with a crack of thunder (as it is thought) from heaven: and if we wil beleue it, quencheth the fire of lightning. Bolæ are found after a great storm or tempest, resembling a clod.

Cadmitis were the very same which they call Ostracitis, but that otherwhiles it is compassed about with certain blew bubbles. Callais comes very neere to the Saphir, but that it is whiter, and resembleth rather the water of the sea about the shore. Capnites (as some thinke) is a kind of stone by it selfe, beset with many wreaths, and those seeming to smoke, as I haue said already in due place: the naturall place of it is Cappadocia and Phrygia: in some sort it is like yvory. As touching Callainæ, it is commonly said, that they be found alwaies many joined together. Catrochites is a stone proper to the Island Corsica: in bignes it exceedeth ordinary precious stones: a wonderfull stone, if all be true that is reported thereof, and namely, That if a man lay his hand thereupon, it will hold it fast in manner of a glewie gum. Catopyrites groweth in Cappadocia. Cepites or Cepocapites, is a white stone, and the veins therein seem to meet together in knots; and so white and cleare withall, that it may serue as a mirrour to shew ones face. Ceramites in colour resembleth an earthen pot. As for Cinædia, they be found in the braine of a fish named Cinædus: white they be and of a long fashion, and of a wonderfull nature, if wee may beleue that which is reported of the euent which they signifie; and namely, that according as they be cleare or troubled in colour, they do preface either storms or calm at sea. Cerites is like to wax; and Circos, vnto wreaths or circles. Corfoides, is made in manner of a gray peruke of haire: Corallo-achates, vnto a Corall set with gold spots: Corallis, to Vermillion, and is ingendred in India and Syene. Craterites hath a colour betweene the Chrysolith and the base gold Elestrum, E of an exceeding hard substance. Crocallis doth represent a cherry. Cyssites is engendred about Coptos, and is of a white color: it seemeth as it were to be with childe, for something stirs and rattleth within the belly if it be shaken. Calcophonos is a blacke stone: if a man strike vpon it, he shall perceiue it to ring like a piece of brasse: and the Magitians would perswade those that play in Tragœdies to carry it about them continually. As for the stone Chelidonia, there be two sorts of it: in colour they do both resemble the Swallow, and of one side which is purple, you shall see black spots intermingled here and there among. Chelonia is no more but the very eie of an Indian Tortoise: of a most strange nature by the Magitians saying, and working great wonders, but they will lie most monstrously: for they would promise and assure vs, That after one hath well rinsed or washed his mouth with hony, and then lay it vpon the tongue, hee shall presently haue the spirit of prophetic, and be able to foretell of future things all a day long, either in the full or change of the Moon: but if this be practised in the wane of the Moon, he shall haue this gift but onely before the Sunne-rising: vpon other daies, namely while the moone is croissant, from six of the clock or sun-rising six houres after. Moreover, there be certaine stones called Chelonitides, because they be like to Tortoises, by which these Magitians would seeme

H h h

to

to tell vs by way of prophesie and reuelation, many things for to allay tempests and stormes: G but especially the stone of this kinde which hath golden drops or spots in it, if together with a flie called a beetle it be cast into a pan of seething water, it will auert tempests that approach. Chlorites is a stone of a grasse green colour, according as the name doth import, and by the saying of Magitians, it is found in the gesier of the bird called Motacilla or Wagtaile, yea and is ingendred together with the said bird. They giue direction (forsooth as their manner is) to inclose or inclose it with a piece of yron, and then it will doe wonders. Choaſpites taketh that name of the riuer Choaſpes, green it is and resplendent like burnished gold. Chryſolampis is found in Æthyopia; all the day long of a pale colour, but by night it glows in manner of a cole of fire. Chryſopis is so like to gold, as a man would take it for no other. The stones called Cepionides, grow in Æolis about Atarne, a little village now, but sometimes a great town: they haue H many colours, and be transparent; sometimes in manner of glasse, otherwhiles like Cryſtall or the Iasper: such also as be not cleare through, but foule and thick within, are notwithstanding so pure and neat without, that they will represent a man or womans viage as well as a mirroir or looking glasse.

D Daphnias is a stone, whereof Zoroastres writeth, and namely that it is good against the falling sicknesse. Diadochus is like to Berill. Diphris is of two kinds, the white and the black, the male and the female, wherein may be perceived very distinctly, those members that distinguish the sex, by reason of a certain line or vein of the stone. Dionysias is a blacke stone and hard withall, hauing certain red spots intermingled: if it be stamped in water, it giueth the tast of wine, and is thought to withstand drunkennesse. Draconites or Dracontia, is a stone ingendred in the brains I of serpents, but vlesse it be cut out whiles they be aliue, namely after their heads be chopt off, it neuer grows to the nature of a precious stone, for of an inbred malice and enuie that this creature hath to man, if perceiuing it selfe to languish and draw on toward death, it killeth the vertue of the said stone: and therefore they take these serpents whiles they be asleepe, and off with their heads. Sotacus (who wrote that he saw one of these stones in a kings hand) reports, that they who go to seek these stones vse to ride in a coach drawn with two steeds, and when they haue espied a dragon or serpent, cast in their way certain medicinable drugs to bring them asleepe, and so haue means and leisure to cut off their heads: white they are naturally & transparent, for impossible it is by any art to polish them, neither doth the lapidary lay his hand to them.

E Encardia is a precious stone, named also Cardisca: one sort there is of them, wherein a man K may perceiue the shape of an heart to beare out: a second likewise there is so called, of a greene colour, and the same doth represent also the forme of an heart: the third sheweth the heart only black, for all the rest is white. Enorchis is a faire white stone; the same being diuided, the fragments thereof do resemble a mans genetours, whereof it took that name. As touching Exhebenus the stone, Zoroastres saith, that it is most beautiful and white, and therewith goldsmiths vse to burnish and polish their gold. As for Eristalis, being of it self a white stone, seemes as a man holdeth it to wax red. Erotalos, which some call Amphicome, others Hieromnemom, is commended much by Democritus, for sundry experiments in prophesying and foretelling fortunes. Eumeces groweth in the Baſtrians country, like to a flint; being laied vnder a mans head lying asleep vpon his bed, it representeth by visions and dreams in the night all that hee is desirous to L know, euen as well as an oracle. As for Eumetres, the Assyrians call it the stone or gem of Belus the most sacred god among them, & whom they honor with greatest deuotion: as green it is as a leeke, and serueth very much in their superstitious inuocations, sacrifices, and exorcisms. Eupetalos hath foure colors, to wit, of azur, fire, vermilion, and an apple. Euros is like the stone of an oliue, chamfered in manner of winkle shels, but very white it is not. Eurotias seemeth to haue a certain mouldines that couers the black vnderneath. Eusebes seemeth to be that kind of stone whereof (by report) was made the seat in Hercules temple at Tyros, where the gods were wont to appear and shew themselves. Moreover, any precious stone is called Epimelas, when being of it selfe white, it is ouercast with a blacke colour aloft.

G The gem Galaxias, some call Galactites, like vnto those last before-named, but that it hath M certain veins either white or of a bloud color running between. As for Galactites indeed, it is as white as milk, and therupon it took that name. Many there be who call the same stone Leucas, Leucographias, & Synnephites, which if it be bruised yeeldeth a liquor resembling milk, both in color and tast; & in truth, it is said, that it breeds store of milke in nources that giue suck: also that

A that if it be hung about the necks of infants, it causeth saluation; but being held in the mouth, it melteth presently. Moreover, they say, that it hurteth memory and causeth obliuion: this stone cometh from the riuer Achelous. Some there be, who call that Emeraud Galactites, which seemeth as it were to be bound about with white veins. Galacticos is much like to Argypodamus, but that it is somewhat fouler: commonly they are found by two or three together. As for Gasidanus, we haue it from the Medians, in colour it resembleth blades of corne, and seemes beset here and there with floures: it groweth also about Arbelæ: this gem is said likewise to be * Haply out Bezoar, conceived with young, and by shaking to bewray and confesse a child within the wombe, and it doth conceiue euery three moneths. Glossi-petra resembleth a mans tongue, and groweth not vpon the ground, but in the eclipse of the Moone falleth from heauen, and is thought by the B magitians to be very necessary for pandors and those that court faire women; but we haue no reason to beleue it, considering what vaine promises they haue made otherwaies of it: for they beare vs in hand, that it doth appease winds. Gorgonia is nothing els but Coral: the name Gorgonia groweth vpon this occasion. That it turneth to be as hard as a stone: it assuageth the trouble of the sea and maketh it calme: the magitians also affirme, that it preferueth from lightning and terrible whirle winds. As vaine they be also in warranting so much of the hearbe Guniane, namely, that it will worke reuenge and punishment vpon our enemies.

The pretious stone Heliotropium, is found in Æthyopia, Affricke, and Cyprus: the ground H thereof is a deepe green in maner of a leeke, but the same is garnished with veins of bloud: the reason of the name Heliotropium is this, For that if it be throwne into a pale of water, it changeth the raies of the Sun by way of reuerberation into a bloudie colour, especially that which cometh out of Æthyopia: the same being without the water, doth represent the body of the Sun, like vnto a mirroir: and if there be an eclipse of the Sun, a man may perceiue easily in this stone how the moone goeth vnder it, and obscureth the light: but most impudent and palpable is the vanity of magitians in their reports of this stone; for they let not to say, that if a man carrie it about him, together with the herbe Heliotropium, and besides mumble certaine charmes or prayers, he shall goe inuisible. Semblably, Hephæstites is of the nature of a looking-glasse, for although it be reddish or of an orange colour, yet it sheweth ones face in it: the meanes to know this stone whether it be right or no, is this: in case being but into scalding water, it presently coolereth it; or if in the Sun it wil set on fire any dry wood or such like fewel: this stone is D found growing vpon the hill Corycus. Horminodes is a stone so called, in regard of the greene colour that it hath resembling the herbe Clarie; for otherwhiles it is white, and sometime againe blacke, yea and pale now and then; howbeit hooped about it is with a circle of golden colour. Hexecontalithos, for bignesse is but small, and yet for the number of colours that it hath, it got this name: found it is in the region of the Troglodytes. Hieracites changeth colour all whole alternatiuely by turns; it seemeth to be blackish among kites feathers. Hamnites resembleth the spawne of fishes: and yet some of them be found as it were composed of nitre, and otherwise it is exceeding hard. The pretious stone called Hammons-horne, is reckoned among the most sacred gems of Æthyopia: of a gold colour it is, and sheweth the forme of a rams horne: the magicians promise, that by the vertue of this stone, there will appeare dreames E in the night which represent things to come. Hormesion is thought to be one of the loueliest gems that a man can see, for a certaine fiery colour it hath, and the same spreadeth forth beams of gold, and alwaies carrieth with it in the edges a white and pleasant light. Hyenia took the name of the Hyens eie: found they are in them when they be assailed and killed: and if we may giue credit to Magitians words, if these stones be put vnder a mans tongue, hee shall presently prophesie of things to come. The bloud-stone Hematites is found in Æthyopia principally, & those be simply the best of al others, howbeit there are of them likewise in Arabia and Affrick: in colour it is like vnto bloud, and so called: a stone that I must not ouerpasse in silence, in regard of my promise that I made to reprove the vanities and illusions of these impudent & barbarous magicians who deceiue the world with their impostures: for Zacharias the Babylonian, F in those books which he wrote to king Mithridates, attributeth vnto gems all the destinies and fortunes that be incident vnto man: and particularly touching these bloud-stones, not contented to haue graced them with medicinable vertues respectiue to the eies and the liuer, he ordained it to be giuen vnto those for to haue about them, who carry any Petition to a king or great prince, for it would speed and further the suit: also in case of law matters it giueth good issue

and sentence on their side, yea and in wars, victory ouer enemies. There is another of that kinde, called by the Indians Henui, but the Greekes name it Xanthos: of a whitish colour it is vpon a ground of a yellow tawnie.

L The stones called Idæi, Dactyli, be found in Candy: of an yron colour they be, and resemble in forme the thumb of a mans hand. As touching Icterias, there be foure kinds thereof, to wit one like to a pale coloured bird called the Lariot; and therefore is thought to be good against the jaundise: a second there is of the same name, but more enclining to a swert color: the third resembleth a green leafe, broader than the former, weighing little or nothing, and is besides full of pale and wan veins: the fourth is of the same colour, but it hath blacke veins running too and fro. The stone called *Impiters* gem, is white, light, and tender. The stone *Indico* taketh name of those nations from whence it commeth; the colour outwardly is somewhat reddish, and if it be rubbed, there commeth from it a certain purple humor in manner of a sweat. There is another of that name, but it is white, and sheweth like vnto dust or powder. The same Indians haue another gem called *Ion*, for that it resembleth the colour of the March violet; but feldome shall a man see it with a fresh and gay blew indeed.

L The stone *Lepidores* doth represent skales of fishes in sundry colours. *Lesbias* taketh name of the Isle *Lesbos* the natieue place thereof: howbeit they are found in India likewise. *Leucophthalmos*, is otherwise reddish or tawnie, howbeit in that colour it carrieth the forme of an eie, both for white and blacke. *Leucopetalos* sheweth white in manner of snow, and yet the same is garnished with a lustre of gold. *Libanocrus* in colour resembleth frankincense, but a liquor or moisture it yeeldeth answerable to hony. *Limoniates* seemeth to be all one with the *Emeraud*. As touching the vneuous stone *Liparis*, I find this only written of it, That a stinke or perfume thereof fetcheth forth any venomous vermine. The stone *Lysimachus* is like vnto the marble of *Rhodes*, and hath in it certaine veines or streakes of gold: This stone must be polished vpon marble: and when all the superfluities be fetched off, it is found to grow narrow pointwise. *Leucochrysos* seemeth to be made of a *Chrysolith*, hauing white veins or streakes betweene.

N A gem there is called *Memnonia*, but I haue not read the description thereof. As for *Media*, it is a blacke stone, and found it was first by that famous *Medea*, of whom the Poets write so many fables, yet certaine veins it hath of a golden colour: a kind of sweat issueth from it yellow as saffron, and in tast much resembling wine. *Meconites* doth represent expressly, poppy heads. The stone *Mitras* we had from the Persians, and the mountains along the red sea: many colours it hath, and against the Sun it glittereth diuersly. *Meroctes* is green like vnto a lecke, and yet if you rub it, you shall see a humour come from it like to milke. The Indian stone *Morion* (which is most blacke and yet transparent) they call *Pramnion*: if it be intermingled with the fiery red of the Carbuncle or Rubie, they call it *Alexandrinum*; like as the Cyprian, *Morion*, which hath a shew of the *Sarda* or *Cornalline*: found there be of them in *Tyrus* and *Galatia*. *Xenocrates* reporteth, that vnder the *Alpes* also they be gathered. These be the gems that be fitted for to engrau the forme of any thing from a pattern. As for *Myrrhites*, it hath the colour of *Myrrhe*, and the forme of a fine pretious stone: it yeeldeth the smell of a sweet perfume or ointment, and being rubbed giueth a fauour also of *Nard*. As touching *Myrmecias*, it is blacke, and hath certain risings in it like to werts. *Myrsinites* in colour resembleth hony, and in odour the myrtle. *Mesoleucos* is a gem diuided iust in the mids with a white line: contrariwise, *Mesomelas*, when there is a blacke line cutther through any other colour in the midst.

N *Nasamonites* is in colour like to bloud, howbeit certaine blacke veins it hath. *Nebrites* is a stone consecrate to god *Bacchus*: it tooke that name of the resemblance which it hath to those skins of deere that he was wont to weare: there be others of the same kind, but blacke they are. The gem *Nympharena* keepeth the name of a city and nation in Persia, and it resembleth the teeth of a water-horse.

O *Orca* is the barbarous name of a certaine pretious stone, which is very pleasant vnto the eie: wherein concurre together blacke, yellow, Greene, and white. *Ombria*, which some call *Notia*, is said to fall from heauen in stormes, showers of raine, and lightening, after the manner of other stones, called thereupon *Ceraunia* and *Brontia*: and the like effects are attributed to it, as be reported of *Brontia*: and thus much moreouer, That so long as it lieth vpon the hearth of an altar, the * libaments will not burne that be offered thereupon. *Orites* is in forme round as a globe: some call it *Siderites*, it will abide the fire and feele no harme thereby. *Ostracias* or *Ostracites* is made

* As the haire growing in the forehead, and such things, whereof assay was giuen him to the fire.

made in manner of a shell, and is exceeding hard. A second kind there is of it resembling an *Agath*, but that an *Agath* in the polishing seemeth to looke greasily, which the *Ostracias* doth not. And the harder kind of this stone is of that power, that the fragments thereof will serue to engrau other gems. As for *Ostracites*, it took the name of an *Oystre* shell, which it doth represent. The Barbarians haue a pretious stone, which they call *Ophicardelos*; blacke of colour, and the same enclosed with two white lines or circles. As touching the stone *Obfidianus*, I haue written sufficiently in the book going next before: and yet there be certain gems of that name, and carrying the same color, not only in *Aethyopia* and *India*, but also in *Samnium*, as some are of opinion, yea, and in the coasts of the Spanish Ocean.

Panchrus, according to the name, seemeth to consist (in manner) of all colours. *Pangonius* is no longer than a mans finger: it differeth from *Cryfall* in this onely, that it hath more angles in number, whereupon it got the name. As for *Paneros*, what manner of stone it is *Metrodorus* hath not set down, howbeit he reciteth an elegant verse of queen *Timaris*, which together with the stone she consecrated to *Venus*: whereby is giuen to vnderstand, That by the meanes thereof she became fruitful and bare children: Some there be who call this gem *Pansebaston*. Now concerning the gems of *Pontus*, knowne by the name of *Ponticæ*, there be many sorts of them. One is full of stars, garnished with bloudy or blacke specks in maner of drops, and this is counted among the sacred stones: another in stead of starres hath strakes and lines onely of the same colours: and there be of them again which represent the forme of mountaines and vallies. The gem *Phloginos*, which is called likewise *Chrysites*, is found in *Aegypt*, and is likened vnto the *Ostracias* of *Attica*. *Phenicites* tooke the name of the similitude that it hath to a *Date*. And *Phycites* was so named, because of the likenes it hath to the sea weed or lettuce, named *Phycos* in Greeke. *Perileucos* is a stone, focalled by occasion of a whitish lace that seemeth to go from the mouth of the gem downe to the very bottome. The gems *Pæantides*, which some name *Gemonides*, are said to conceiue and to bring forth other little stones: but a singular vertue they haue to help women that be in trauell of child-birth. Such be found in *Macedonie*, neere vnto the monument or sepulchre of *Tiresias*, and that which they bring forth, seemeth like vnto water growne to be congealed into yce.

The Sunnes gem is white, and after the manner of the Sunne, whose name it beareth, it casteth forth shining raies round about on euery side. *Sagda* is a stone, which the Chaldeans find sticking to ships, and they say it is Greene as *Porrets* or *Leekes*. *Samothracia* the Island yeelds vs a pretious stone of the owne name, blacke of colour, light in hand, and like to [rotten] wood. As for *Saurites*, it is found (by report) in the belly of a green Lizard, slit open with the edge of a cane or reed. *Selenites* is a pretious stone, white & transparent, yeelding from it a yellow lustre in manner of hony, and representing within it the proportion of the Moone, according as the growth toward to the full, or decreaseth in the wane against the change: This admirable stone is thought to be found in *Arabia*. *Siderites* is much like to yron: and supposed it is, That if it be brought among them that are at some variance or controuersie already in law, it will breed discord and maintain dissention still. Of this *Siderites* is made another stone, which is engendred in *Aethyopia*, called *Sideropceilos*, for the sundry spots therein. *Spongites* is like vnto a sponge, euen as it carrieth a name respectiue vnto it, *Synodontites* commeth from the braine of certain fishes called *Synodontes*. The stones *Syrtae* be found in the shore of the *Syrtes* in *Barbary*, yea, and in *Lucania*, shining with the colour mixt of saffron and hony, but within they containe certaine starres, which haue but a dim and dusky light. The stone *Syringites* is hollow throughout in manner of a pipe, and is like vnto a straw betweene two joints.

Trichrus that commeth out of *Affricke* is blacke, howbeit if it be rubbed it yeeldeth three kinds of humours from it; to wit, from the root or bottome blacke, out of the mids like bloud, and in the head white. *Telirrhizos* is of an ash colour or reddish, and yet the bottome thereof is a louely & slightly white. *Telicardios* is much esteemed in the realme of Persia, where it is engendred: in colour it resembleth the heart, and they call it there in their language, a *Spor*. The stone *Thracia* is of three kinds; the first green, the second more pale, and the third full of spots of bloud. *Tephritis*, although otherwise it be of the color of ashes, yet it represents a new Moon croissant and tipped with hornes. *Tecolythus* seemeth like to the stone or kernill of an Olive: It is not raunged in the number of pretious stones, but whoeuer licketh thereof, shall find, That it will breake the stone and expell it. The stone called *Venus* haire, is exceeding black and shining; how-

how it maketh a shew of red haire sprinkled among.

Veientana is a gem proper vnto Italie, found about Veij, a citie in Tuscane: this stone is blacke and crossed through the middest with a white path.

Zantheries (as *Democritus* writeth) is found ordinarily in Media: in colour it resembleth base gold Eleotrum: and if a man doe stampe it in Date wine and Saffron together, it will relent in manner of wax, and cast a most sweet and pleasant smell. Zmilaces is a stone which the riuer Euphrates yeeldeth, like to the marble of Proconnesus, but that in the middest it hath a greenish colour. Finally, Zoronifios is engendered in the riuer Indus: commonly it is called the Magicians gem: more of it I find not written.

CHAP. XI.

¶ Of certaine pretious stones, taking their names from the members of mans body, from beasts also and other things.

BESIDES those gems comprehended vnder the Alphabet, there be more pretious stones also comprised after other sorts of distinction, according to diuers significant varieties: for some there be which bear the names of certain members of the body; as for example, Hepatites, of the liuer; Steatites, of the sundry sorts of fat, grease or tallow of each beast. Adad * Nephros is a stone worshipped among the Egyptians, so is Theudactylos also. As for Adad, hee is the chiefe god among the Assyrians. The stone Triophthalmos groweth together with the Onyx stone, and representeth three eies of a man together.

It taketh the name of the kidneys.

Hyopthalmos

There be gems take their names likewise of beasts, to wit, Carcinias of the colour which the sea-crab hath; Echites, of a Viper; Scorpites, either of the color or form of a Scorpion; Scarites, of the fish Scaurus; a Gilthead; Triglites, of the Barble; Agopthalmos, of a Goats eye, like as another, for the resemblance that it hath to the * eie of a swine. Geranites tooke name of a cranes color; euen as Hieracites of the Hawkes of Faucons color. A tites resembls the color of that Agle which hath a white taile. Myrmerites sheweth the forme of a Pismire creeping within the stone; so doth Cantharias, of Beetles. Lycophthalmos hath the resemblance of a Wolves eie, and consists of 4 colours; the outward parts are tawnie, enclining to a blood red, in the middest there is a black, enclosed within a white circle, as like to the said eie as possibly can be. The stone Toas is like to a Peacock, euen as the gem Chelonia to the Tortoise. In Hammo-chryfos there is a resemblance of sand, as if sand & gold were entermingled. Cenechrites is made like to the graine or seeds of Miller scattered here and there. Dryites hath a great affinity with the stock of a tree: and the same will burn after the maner of wood. Ciffites is white, and in that white shining seemeth to be clasped euery where with leaues of yvie. Narcissites likewise is distinguished and parted with veines of yvie. Cyamea is black, but being broken, it yeelds out of it a resemblance of a Beane. Pyren is so called by reason of an olive stone or keruill which it resembls: within this stone there appeare otherwhiles as it were fish bones. Chalazias as it carrieth the name of haile, so it representeth as well the color as the shape thereof; but as hard it is as the Diamant: It is reported also, that if it be put into the fire, yet it wil continue cold & not alter a whit. The fire stone Pyrites is verily black: but rub it with your finger, you shall find it to burne. Polyzonos is a black stone of it selfe; but many white fillets it hath about it. Astrapias is white or blue like Azur, yet from the middest thereof iher seeme to shoot raies of lightening. In the stone Phlegontis there appeare a burning flame within, and neuer commeth forth. In the Granat named Authracitis, there is a shew otherwhiles of sparkles running to & fro. Enhydros is euermore absolutely smooth and white, containing within a certain liquor that moueth too and fro if a man shake it, as he may perceiue in egges. Polytrix is a greene stone, bedecked with fine veines in manner of the haire of ones head: but (by report) it will make the haire to shed off as many as carry it about them. Of a Lions skin, Leontios beareth the name: like as Pardalios of a Panther. The golden color in the Topaze gaue it the name Chrysolith: so the grasse green of a Lecke was occasion of the name Chrysoprasos: and of hony was deuised the colour and name Melichrus, although there be many kinds of it. As for Melichloros it is of two colours, partly yellow, and partly resembling hony. Crocias is yellow as Saffron: and Polia sheweth a certaine greynesse in manner of Spart. As for Spartopolios the blacke, it sheweth like gristly veines to the other, but much harder. Rhodites took name of the Rose: Melites of the apple, the colour wher-

of it shews: Chalcites of brasse; and Sycites of a fig. I see no proportion or reason at all between the stone Borsycites and that name: this stone is blacke and branching, and the leaues are white, or red like blood; no more than I do in Gemites, which representeth (as it were) engrauen in the stone, white hands clasped one within another. As for Ananchitis, it is said, That spirits may be raised by it in the skill of Hydromantie: like as by Synochitis, the ghosts which are raised, may be kept about still. What should I speake of the white Dendritis, which if it be buried in the ground vnder a tree that is to be fallen, the edge of the axe that beweth it, will not turne or wax blunt. There be a number of other, and those in nature more prodigious than the rest: for which the Barbarians haue deuised strange names, professing to vs, that they were stones indeed. for mine owne part it shall suffice that I haue disproued their lies in these abouenamed.

CHAP. XII.

¶ Of new stones, and those naturall. Of such as be counterfeited and artificiall. Of diuers formes and shapes of gems.

HERE grow still precious stones vnlooked for euery day, that bee new and haue no names; such as that in Lampfacus, where one was found in the gold mines so faire and beautifull, that it was thought a present worth sending to K. Alexander the Great, as *Theophrastus* writeth. As touching the stones Cochlides, which now are most common, they seeme rather artificial than naturall: and verily it is said, That in Arabia there be found of them huge masses which are sodden in hony 7 daies and nights together continually; by which means, after that all the earthy and grosse refuse of this stone is taken away, the stone it selfe remaineth pure and fine: and then coming vnder the lapidaries hand, they be diuided into sundry veines, and reduced into drawne or inlaid worke of Marquetage, as he will himselfe. And herein is seen the cunning of the cutter, for that it is so vendible, & euery mans mony. In old time they were made of that bignesse, that the KK. of the East had their horses set out therewith, not only in their frontals, but also in the pendants of their caparisons. And verily, al other precious stones being decocted in hony, look faire and neat with a pleasant lustre: but principally the Coricks, which abhor all things els that are more eager than hony. Moreouer, this is to be noted, that our lapidaries haue a tearme for those stones which are of diuers colors, and they call them Physes, as if they had not another vsuall name for them: & this they do in the subtilty of their wit, to make them seem more wonderful by these strange words of art, as if they would vendit them for their very wonders of Natures worke: whereas indeed there be an infinit number of names, deuised al by the vain Greeks, who knew not how to make an end, which I purpose not to rehearse, and verily, after I had discoursed of the noble and rich stones, I contented my selfe in some sort to specifie those of a baser degree, such I mean as were more rare than others, & to distinguish them that were most worthy to be treated of. But this eftsoons would be remembered, that one & the selfe same stone changeth the name, according to the sundry spots, marks & werts that arise in them: according also to the manifold lines drawn in them, the diuers veins running between, and the variety of colors therein obserued. It remains now to set downe some generall obseruations indifferent to all sorts of gems, and that after the opinion of the best approoued and experienced authors in this kind. Any stones that be either hollow & sunk in, or bearing out in bosse or belly be nothing so good as those which cary an euen and leuell table. The long fashioned gems are most esteemed: next to them such as be formed like to lintil seed: after them those that be round in manner of a targuet: and as for such as be made with many faces & angled, they be of al other least accounted of. To discern a fine & true stone from a false and counterfeited, is very difficult, forasmuch as there is an inuention to transform true gems into the counterfeited of another kind. And in truth men haue deuised to make Sardonyxes by setting and glewing together the gems named Ceraunia, & that so artificially, that it is vnpossible to see therein mans hand: so hand-somely are couched, the black taken from this, the white from that, & the vermilion red from another, according as the richnes of the stone doth require, & all those in their kind most approved. Moreouer, there be in my hands certain books of authors extant, whom I wil not nominate for all the good in the world, wherein is deciphered the manner and means how to giue the tincture of an Emeraude to a Crystall, & how to sophisticate other transparent gems; namely, how to make a Sardonyx of a Cornalline, & in one word, to transform one stone into another: & to say a truth, there is not any fraud or deceit in the world turneth to greater gain and profit than this.

CHAP. XIII.

¶ The way how to make proofe of fine precious stones.

LEt other writers teach how to deceiue the world by counterfeiting gems, for mine own part I will take a contrary courie, and shew the means how to find out false stones that be thus sophistical: for surely, wanton and prodigall though men and women bee in the excessive wearing of these jewels, yet meet it is they should be armed and instructed against such counsellers. And albeit I haue already touched somewhat respectfully as I treated of the chiefe & principall gems, yet I will adde somewhat more to the rest: first and foremost therefore this is obserued, That all stones which be transparent, ought to haue their triall in a morning betimes, or at the farthest (if need so require) within foure hours after morning light, but in no wise later. Now there be diuers experiments that serue for this purpose, to wit, the weight of a stone, for commonly the fine gem indeed is heavier than the other: secondly, the very body and substance is to be considered, for it is an ordinary matter to see in the ground and bottome of falsified stones certain little pushes as it were rising out, to feele them rough in hand outwardly; also to perceiue their filaments not to continue their lustre surely, and to beare it out to the very eye, but commonly in the way to vanish and be spent. But the most effectuell proofe of all, is to take a little fragments, to be ground afterward vpon a plate of yron: but lapidaries wil not indure this triall; they refuse also the experiment made by the file: furthermore, the fragment of the black Agath or Geat, wil not rase or skarifie true gems. Item, false stones if they be pierced or ingrauen, will shew no white. Such difference there is moreover in stones, that some scorne all ingrauing with an yron punfon: others likewise cannot be cut but with the instrument or grauer bent & turned back: but there is not one but may be ingrauen with the Diamant. And verily, the most material thing herein, is to hear the grauing Steele or punfon.

As touching riuers that afford precious stones, Acesines and Ganges are the chiefe: and of all lands, India is the principall.

And now hauing discoursed sufficiently of al the works of Nature, it were meet to conclude with a certain general difference between the things themselves, and especially between country and country. For a final conclusion therefore go through the whole earth and all the lands lying vnder the cope of heauen, Italy wil be found the most beautiful & goodliest region vnder the Sun, surpassing all other whatsoever, and worthily to be counted the chiefe and principall in euery respect: Italy (I say) the very lady and queen, yea, a second mother next to dame Nature of the world: chiefe for hardy men, chiefe for faire and beautiful women, enriched with captaines, souldiers, and slaues: flourishing in all arts and sciences, abounding with noble wits and men of singular spirit, scituate vnder a climat most wholesome and temperate, seated also commodiously (by reason of the coasts so full of conuenient hauens) for traffick with all nations, wherein the winds are most comfortable (for it extendeth it selfe and lieth to the best quarter of the heauen, euen in the midst just between East and West;) hauing waters at command, large forests & faire, and those yeelding most healthful air, bounded with mighty rampiers of high mountains, stored with wild beasts, and those harmlesse: finally, the ground so fertile for corn, the soile so battle for herbage, as none to it comparable. In summe, whatsoever is necessary and requisite for the maintenance of this life is there to be had, in no place better: all kind of corne and grain, wines, oile, wooll, linnen, woollen & excellent beuies, as for horse-flesh, I haue alwaies heard, euen from the mouth of those that be professed runners in the race with horse and charriot, That the breed of Italy passeth al others: for mines of gold, silver, brasse, & yron, it gaue place to no country whatsoever, so long as it pleased the state to employ it that way; and in lieu of those rich commodities which it hath still within her womb, she yeeldeth vs variety of good liquors, plenty of al sorts of corn, and abundance of pleasant fruits of all kinds. But if I should speake of a land after Italy (setting aside the monstrous and fabulous reports that go of India) in my conceit Spaine is next in all respects, I meane those coasts which are inuironed with the sea.

F I N I S.

An Index pointing to the principall matters contained in the second Tome of *Plinies* naturall Historie.

A B

An Aduertisement.

W Hereas in the former edition this page was stuffed full of Errata, which
 were occasioned by reason of the various matter and words used in this
 Historie, not common obvious in other Authors; such care in this
 second Edition hath beene taken, as that they haue all beene amended, whereby the
 Readers paines to mend, or be offended with them, is taken away. This I thought
 good to give notice of, least any should thinke them omitted, not amended.

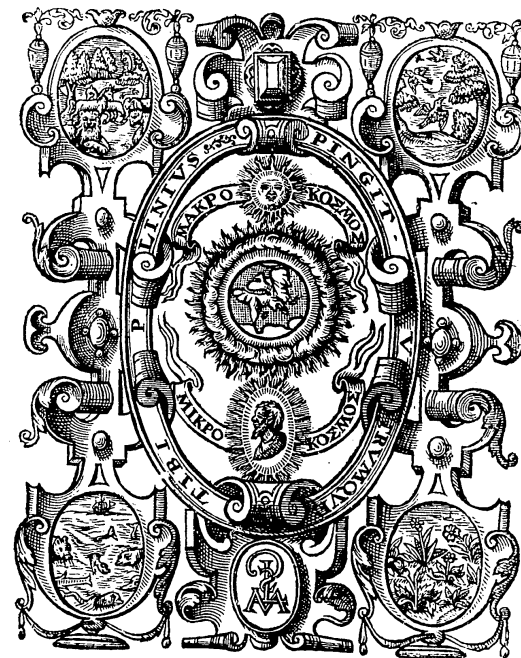

Handwritten signature: R. B. 1781

THE HISTORIE OF THE WORLD:

Commonly called,
THE NATVRALL HISTORIE OF
C. PLINIUS SECVNDVS.

*Translated into English by PHILEMON HOLLAND
Doctor of Physicke.*

The first Tome.

LONDON,
Printed by *Adam Islip*, and are to be sold by *John
Grifmond*, in *Ivy-lane* at the Signe of
the *Gum*. 1635.

CHAP. LVI.

¶ Which be the best hens.

A Man shall know a good and kindly hen by her comb, when it is strait and vpright: otherwhiles also double crested: also by the pinion feathers blacke, the vpper plume reddish. Such a hen will be red also about her head and bill, and haue an odde toe to her feet, yea and sometime that od one to lie crosse ouerthwart the other foure. In case of sacrifices and religious vse they are not thought good nor allowable that haue becke and feet yellow. For diuine seruice and secret mysteries celebrated in couert to the goddesse Ops, the black are allowed for good. There is also a dwarfish kind of hens, [i. grig hens] that are extraordinarie little, and yet fruitful, a thing not seen in any other kind of fowle: they lay and misse not, but seldom sit they H on any eggs, and if they do it is hurtfull for them.

CHAP. LVII.

¶ The maladies that hens be subiect vnto, and the remedies.

That which troubleth all the kind of them is a certain distillation of a phlegmaticke humor, which caueth the pip, the most of all between haruest time and vintage. The cure is, to keep them hungry & long fasting: also to let them lie or perch in a smoky place, especially where the fume is made of Bay leaues and the herb Sauin. It is good moreouer, to draw a little quill or feather through their nostrils acrosse, and to remoue or shift it euery day. As I for their meat, let it be some cloues of garlicke shred among their corne, or else let their meat bewell infused or steeped in water, wherein an owle hath washed and bathed her selfe, or else foddren with the seed of Bryonie or the wilde white Vine: besides such other medicines as are daily in vse.

CHAP. LVIII.

¶ The manner how fowles do conceiue, and what number of yong ones commonly they hatch.

Doues haue this propertie by themselves, to bill one another and kisse before they tread. They lay for the most part two eggs. Thus Nature hath disposed, that some should breed often and few: others should hatch many together at once. The Ringdoves or Quoists, K and Turtles, ordinarily lay three eggs; and lightly they sit and hatch but twice a yere: and that is, if their first brood come not to perfection, but miscarried and was not reared vp. And albeit they lay three eggs, yet they neuer hatch but twain: the third that is addle, they call in Latine *Vrinnm*. The female Ringdove sits euer from noon vntil the next morning; the male makes vp the rest of the day. House-doues breed euermore one cock pigeon, and another hen. The male is hatched to day, and the female tomorrow. In that kind they sit both, the cock all day, and the hen by night: and vsually vpon the 20 day they hatch. They lay within fve daies after they be troden, and in summer time verily you shall haue them in the space of two months bring three L paire of pigeons; for then they vse to hatch by the 18 day: and presently they conceiue again. So that a man shall oftentimes find new laid eggs euen amongst the young pigeons: and otherwhiles it is seen, that whiles some are ready to fly, others peep newly out of their shel: and these yong birds within fve moneths will lay themselves. Now the nature of these hen doues is (if they want a cock) to tread one another, and hereof they come to lay barren eggs, wherof nothing will be ingendred: and such the Greeks call Hypenemia, i. wind-eggs.

CHAP. LIX.

¶ Of the Peacocks and Geese.

The Pea-hen falls to lay and breed after she is 3 yeres old. In the first yere she begins with M one or two eggs: the yere following she riseth to foure or fve: in the rest she reacheth to twelue and no more. When she layeth, her manner is to rest two or three dayes betwene euery egge. And thrice a yere she keepeth this order, namely, if her egges be taken from

A from her, and put vnder hens to be sitten vpon: for why, the Peacocks wil break the m if they can meet with them, because they cannot misse and spare the Peahens company while they are broody and sitting: which is the cause they are wont to lay by night, or in some secret corner out of the way, and that from an high place where they perch: and then, vnlesse there be good heed taken that the eggs be latched in some soft bed vnderneath, they are soone broken. One Peacock is sufficient to go with fve wiues: for when there is, but twain [the villaine is so lecherous] with ouermuch treading he hindereth their laying, and marreth the knot of eggs ingendred within them. The Peahen hatcheth in 28 daies, or in thirty at the farthest.

B Ganders and Geese ingender together in the very water. Geese lay ordinarily in the spring: or if they were troden about mid-winter, then ye shall haue them lay after the Winter Sunne: stead some forty daies or very neere. They haue vsually two laiters in the yere, namely, if hens hatched their former eggs. The most that they hatch at one sitting is sixteene, and the fewest seuen. If a man steale their eggs from them they lay still, and neuer giue ouer till they be readie to burst with laying. No birds eggs but their own will they hatch. The most profitable way, is to set them vpon nine or eleuen. The females only sit, and that for the space of 30 daies, vnlesse it be warme weather, and then they will haue done by 25. If one of their Goslings be stung neuer so little with a nettle, it will die of it. Their owne greedy feeding also is their bane, for one while they will eat vntill they burst again; another whiles kill themselves with straining their own felues: for if they chance to catch hold of a root with their bill, they will bite and pul so hard for to haue it, that many times they breake their owne neckes withall, before they leaue their hold. Against the stinging of nettles the remedie is, that so soone as they be hathed there be some nettle roots laid vnder their nest of straw.

CHAP. LX.

¶ Of Herons and Bittours, and the best way to keepe eggs long.

DOF Herons be three sorts, * Leucon, * Asterias, * and Pellon: these last ingender with much paine and difficultie; as for the males verily they cry againe for anguish, and the bloud starts out of their eies in the act of treading. And with as much ado and trouble do the females lay, after they be knit with eg. The Egle and the most part of the greater fowls sit 30 daies, whereas the lesse continue but 20, as the Kite and the Hawk. The Kite vsually hatcheth but one at a time, and neuer about three: but that kind called *Egoliol* somtimes foure. The Rauens also now and then fve: and those cooue as many daies. While the female crow sits the male feeds her. The Piot ordinarily brings forth nine Piannets, the fig-pecker *Melanecoryphus* about 20, but euermore an od one: and there is not a bird that goeth therein about her. Lo how Nature is willing to multiply the race of little birds! The yong Swallows are at the first blind, and so are all such as are hatched many in number. Wind-eggs, which we call Hypenemia, come either by the mutuall treading of hens one another, by an imaginarie conceit of the male, or else by dust. And such eggs not only Doues doe bring, but house Hens also, Partridges, Peahens, Geese, and Brants, or the female Barganders. Now these eggs are barren as it were, and neuer proue birds, lesse than others, not so pleasant in taste, and besides more moist. Some are of opinion that the wind will ingender them, for which cause also they are called *Zephyria* [i. West-wind eggs.] And verily such eggs are seen only in the spring, when that wind blows. Addle eggs, which some called *Cynofura*, are they that chill vpon the rest, when the hen is gone and giueth ouer sitting. Eggs steeped in strong vinegar will come to be so soft, that they will passe and be drawn through the ring of a mans finger. The best way to keepe egges is in beane meale or floure; and during winter in chaffe, but for summer time in bran. It is thought if they lie in salt their substance will waste and consume to nothing within the shell.

CHAP. LXI.

¶ What Bird alone bringeth forth a liuing creature, and feedeth it with milke.

The Rere-mouse or Bat alone of all creatures that fly, bringeth forth yong aliue, and none but she of that kind hath wings made of pannicles or thin skins. She is the only bird that suckleth

suckleth her little ones with her paps, and giues them milk: and those she wil carry about her two at once, embracing them as she lieth. It is said also that she hath no more but one ioynt of the hanch, without any in the knee or feet: and that they take greatest delight to feed vpon gnats.

CHAP. LXII.

¶ Of Vipers: their manner of generation and bringing forth yong: and what land beasts do lay egges.

Moreouer, among creatures of the land, serpents lay eggs: whereof as yet we haue not written. As they ingender together they clip and embrace, and so intangled they be and in-wrapped one about the other, that a man who saw them would think they were one serpent with two heads. In the very act of generation the male Viper thrusteth his head into the mouth of the female; which she (for the pleasure and delectation that the hath) gnaweth and biteth off. No land creature els but she hath eggs within her belly, of one colour and soft, like as fishes haue. Now after three daies they be quicke, and then come forth as they be hatched, but no more than one at once every day: and so commonly she hath. When she is deliuered of the first, the rest (impatient of so long delay) eat through their dams sides, and kil her. As for other serpents they lay their eggs linked and chained together, and so sit vpon them on the land: but they hatch them not vntill the yeare following. Crocodiles sit by turnes, the male as well as the female. But I thinke it good to treat also of the generation of other land creatures.

CHAP. LXIII.

¶ The generation of liuing creatures vpon the land.

Of all liuing creatures two footed, a woman onely bringeth forth her yong quicke. Men and women both, and none but they, repent at first the losse of their maidenhead: A very presage (no doubt) of a life to ensue full of trouble and miserie, that thus should begin with repentance. All other creatures haue their set times and certain seasons in the yeare when they ingender, as hath bin shewed before: but all is one with vs, and no houre of day or night comes amisse. Other creatures know when they haue enough, and rest satisfied: we only are insatiable that way, and cannot see to make an end. The Empreffe *Messalina*, wife of *Claudius Caesar*, thinking it the only victorie for a lady and queen to excell in this feat, chose the most gallant curtsian and commonest strumpet in all Rome, to try masteries and to contend with for the best game: and in very truth she won the prize; for in the space of 24 houres she out-went her [a beastly thing to be written] no fewer than 25 times. As for men, they haue deuised in the practise of this filthy act, euen to abuse some parts against kind: and women (vnnatural as they be) haue the cast to destroy within them the vnripe and vntimely fruit of their own body. Certes in this behalfe how much worse are we than the wild and sauage beasts of the field. *Hesiod* writeth, that men are more giuen to lust in winter than in summer, and women contrariwise. Elephants, Camels, Tigers, Onces, Rhinoceros, Lions, Hares, Conies, and generally all beasts which haue their genitall parts from-ward, turn taile to taile to the female in the act of generation. As for Camels, they go into the desert, or at lestwise seeke some corner when they would ingender; and dangerous it is for one to take them in the manner. They continue in this action one whole day together, and so do none els that are whole hoofed. In foure footed beasts the males are set into the heat of lust by senting and smelling. Dogs and Bitches, Seales & wolues likewise turn away, and in the mids of the action be tied one to another euen against their wils, and cannot help it. The females of most of these before named begin to ride the males first, for to prouoke their lust: but of the rest, the males leap the females at the first. Beares (as we sayd before) lie along both as man and woman. Hedge-hogs stand both vp-right, and claspe one another when they ingender. The he Cat standeth on his feet, and the she lieth vnder him. Foxes ly vpon their sides, and so the Birch embraceth the male Fox. Kine and Hindes cannot well endure the violence of the Bulls and the Stagges in this businesse, and therefore they are euer going when they doe engender. Stagges goe from one Hinde to another, and then come againe to the first; and this doe they in course. Lizards, as all other creeping creatures that haue no feet, wind one about another as they ingender. The greater that any beasts be, the lesse fruitfull

fruitfull they are of their bodie. Elephants, Camels, and Horses, get but one at once, neither do the females beare any more at a time: whereas the Goldfinch or Linner, a verie little bird, bringeth forth a dozen commonly at once. Such as bring most, are least while in breeding. The greater that any creature is, the longer time it requireth to be formed in the mothers wombe. And such as liue long, be longer also ere they haue their perfection and come abroad into the world. The growing age is not meet for generation. Beasts that are whole hoofed, neuer bring but one at a time: such as be clouen footed in twaine, may also haue twins. But as many as haue their feet parted and deuided into many toes, are fit to beare many at ones. And whereas all the former rehearsed, bring forth perfect creatures with all parts, some haue their young ones imperfect and but halfe made: in which number Lionesses, the Beares, bitch Foxes, are to bee reckoned: but especially the shee Beares, whose whelpes are more vnliken than the rest: and a rare thing it is to see them a whelping. Howbeit such females when they be deliuered of them, with their licking do chafe and heat them, and so by little and little bring them to some forme, and fashion by this meanes. Such for the most part beare foure whelpes. As for bitches, Wolues, Panthers, and Thoes, kindle their young before they can see.

Of Dogges and Bitches there be many kinds. They of *Laconia, as well the male as the female, beapt to engender after they be eight months old. They be with whelp threescore daies and three ordinarily. As for other Bitches, they goe proud at fixe moneths, and may be lined. They be all the sort of them, sped at the first lining. Bitches that go assaut and take the dog before the full time, namely when they be verie young, such bring a litter that will be longer ere they see: neither goe they, but all the whelps will not be blind so many daies. Dogs commonly when they be halfe yeare old, are thought to lift vp their leg when they pisse; and that is a signe they are come to their full strength and perfection: but bitches all that time pisse sitting vpon their buttocks. They haue twelue whelps when they bring most, but ye shall see them commonly with a litter of six or five: and sometime they come with iust one, but that it is thought to be a prodigious signe; as also if the whelpes be all Dogges or all Bitches. The first vsually that they whelp, be Dogs; for the rest, they be one with another, a Dog and a Bitch: namely, if they were lined in the due season, and at the iust moneth. And commonly they goe proud six moneths after their former litter. The Bitches of Laconia ordinarily bring eight at a time. The Dogs of this race haue a proprietie with them, that the more they be trauailed, the more lustie and fresh they are, yea and the hotter after salt-bitches. They liue ten yeares, and the Bitches twelue. Of other kinds, ye shall haue them continue fifteen yeares, yea and otherwhiles twentie: but they engender not so long, but giue ouer commonly at twelue.

Cats and Rats of Inde, called *Ichneumon*es, in all other respects follow the Nature of Dogs, saue that they liue but six yeares. Conies kindle euerie moneth: and albeit they be bagged, yet will they take the bucke againe, and conceiue vpon it; like as the Hares also will doe the same: for as soon as euer they haue kindled, they go to bucke and are presently sped: and say that the Leuerets or Rabbets lie sucking at them yet wil they be with yong. When they be new kindled, they cannot see.

Elephants (as we haue already said) neuer bring but one at once, and that commonly is as big as a Calf a quarter old. Camels goe a whole yeare. After they be 3 yeares old, they are sufficient for to engender: and commonly they come in the spring: and it is a yeare after before they be couered againe. As for Mares, if there be three daies betwene, or but one, after they haue foled, it is thought they may very well be couered againe; yea and they are brought perforce to the stallion for this purpose. It is supposed also, that the shee Ass within seuen daies after, will soonest conceiue. It is a rule, to share and clip a Mares maine, before shee will abide the couering of an Ass, so vile and base a beast: for so long as the haire of her maine is well growne, she is so proud and glorious, that she will not abide the Ass to come neare her. So soone as they be couered and sped, they run full into the South or North-wind, according as they be conceiued either with male or female: a thing that no other beasts besides, doth. And then, suddainly they change their colour; for their haire will be redder, or at leastwise fuller and deeper, what colour soeuer it be. By which signe it is knowne they are with foal, and then they will admit no stallions vnto them, would they neuer so faine. And say, that some of them haue soles running by their sides, they will doe their deed at worke neuertheless: nay when they be with foal, they will labour as well as they did before: in so much, as many times they

* Resembling our English mastives.

steale a faling, before their master beware that they are with sole. We haue read in Chronicles, that *Echeeratides* the Theffalian had a Mare, which euen then when she was gone far with sole, woone the best game in the Olympian race. They that haue fought more narrowly into the secrets of Nature, say, That stone-Horfes, Dogs, and Bores, desire the females in a morning: but Mares, Bitches, and Sows make meanes to the male after noone. Mares that are kept within house at rack and manger with hay and prouender, desire to be couered threescor daies before those that goe abroad in the heard. Swine alone of all creatures when they be brimming, froth and some at the mouth. And as for the Bore, if he heare the grunting of a Sow that seekes to be brimmed, vnlesse he may come to her, will forsake his meat, vntill he be leane and poore: and she againe will be so far enraged, that shee will be readie to run vpon a man and all to teare him, especially if his cloths be white. But this rage and woodnesse of hers is asswaged and allayed, only with bathing her share behind with vineger. Some thinke there be certaine meats will prouoke beasts to fleshly lust, namely, Onions giuen in meat to a beast, like as Rocket to a man or woman. Moreover, it is supposed, that whatsoeuer is made tame, which by kind was wild, the same will not breed, as Geese and Ganders. In like manner, wild Swine & red Deere, if they be tamed; or if they doe, it is very long first: and such only as were brought to hand euen from the time that they were very yong. Finally, this one thing is strange and wonderfull, that all foure-footed beasts, saue only the Mare and the Sow, if they find themselves to be with yong, drine the male from them. But the Connie and the Hare alone will conceiue again when they be gone with yong.

CHAP. LXIII.

¶ *The varietie in liuing creatures, as touching their comming into the world.*

Whatsoeuer haue quicke creatures within them, bring the same forth with the head forward. For when the time is come, the yong thing turns about a little before, which otherwise lay freight out at length in the bellie. Four-footed beasts, whiles their dams go with them, lie with their legs stretched along, close vnto their own bellies. An infant while it is in the mothers wombe, gathereth round into a ball, and hath his nose lying just betweene his two knees. As for false conceptions or Moone-calues (whereof we spake before) some thinke they are engendred of the womans seed only: namely, when she is not conceiued by a man, but by her selfe: and hereupon it is, that the said conception hath no vitall nor animall life, because it proceeds not of the conjunction of male and female both. True it is, that it is endued with a certain vegetatiue power, to be nourished and to grow, like as we see intrees and many other plants.

CHAP. LXV.

¶ *The breed of Mice and Rats.*

Of all creatures that bring forth their young perfect, Swine only farrow one Pig and two Pigs at a time, yea, and sometimes a number of them. Also they alone contrarie to the nature of all those that either be whole-hoofed, or clouen-footed in twaine, bring a number of yong ones at one farrow. But about all, Mice and Rats for fruitfulness do passe. And therefore I cannot put off the discourse of them any longer: and yet therein I must follow *Aristotle* for mine Author, and the report withall of the souldiers that serued vnder *Alexander* the great. It is said that they engender by licking, without any other kind of copulation: and that one of them hath brought six-score at a time: also that in Persia there haue been young Mice found with yong, euen in the bellie of the old dam. And some are of opinion, that they will be bagged, if they tast but of a little salt. Why should wee then wonder any more how such multitudes of field-Mice and Rats should come to deuour whole fields of corne? Howbeit, the reason is not yet known, how such numbers of them should all of a sudden consume away & come to nothing. For neither see they found lying dead about ground, neither can any man come forth and say, that he hath turned vp any one with his spade as he digged in the Winter. The countrey of Troas is mightily giuen to breed great store of them, inso much, as they haue forced alreadie the inhabitants to abandon the place and depart. Men say, that the season proper and

and agreeable for their breeding in such abundance, is a great drought: also, that when they are toward their end, there be little wormes breeding in their heads that kill them. The Mice and Rats of Egypt haue hard haire and prickly like to hedge-hogs. They go likewise vpright on their hinder feet, and walk as if they were two footed, after the manner of those in the Alps. Moreover, if beasts of diuers kinds ingender together, they may wel breed yong between them, in case they do agree and jump in the time that the females of both should go with yong. It is commonly thought and beleueed, that among foure footed beasts the Lizard hath eggs within her, and deliuereth them at her mouth; but *Aristotle* flatly denieth it. Howbeit they sit not vpon them when they haue so done, as being forgetful where they laid them, so little or no memorie at all haue they. And therefore the yong Lizards of themselves breake forth out of the shell.

CHAP. LXVI.

¶ *Of a Serpent ingendred of the marrow of a mans back bone.*

I haue heard many a man say, that the marrow of a mans backe bone will breed to a Snake. And well it may so be, for surely there be many secrets in Nature to vs vnknown, and much may come of hidden causes, as we may see euen among foure footed beasts.

CHAP. LXVII.

¶ *Of the Salamander.*

As for example, the Salamander made in fashion of a Lizard, marked with spots like stars, neuer comes abroad and sheweth it selfe but in great shewres: for in faire weather he is not seen. He is of so cold a complexion, that if he do but touch the fire, he will quench it as presently as if ice were put vnto it. The Salamander casteth vp at the mouth a certaine venomous matter like milke, let it but once touch any bare part of a man or womans body, all the haire will fall off, and the part so touched will change the colour of the skinn to the white morpew.

CHAP. LXVIII.

¶ *Of those that breed of others which neuer were ingendred. Also of those that being ingendred, yet breed not.*

Some creatures there be that breed of those that neuer were ingendred themselves; and yet not according to those naturall means as others which wee haue shewed before; and such also as either the Summer or Spring, or some certain season of the yeare do breed. Among which some ingender not at all, as the Salamander: * for there is no more distinction of sex in them, than in Yeeles, and in all those which neither lay eggs, ne yet bring forth any liuing creature. Oysters likewise and all such creatures as cleaue fast either to rockes or to the shelues, are neither male nor female. As for such as come of themselves, if there be seene in them any distinction of male and female, something verily they ingender betweene them; but an imperfect creature verily it is, and not resembling them: neither doth that generation breed ought any more, as we see the flies that ingender certain little wormes. The experience hereof is better to be obserued in those creatures called Insects: whose nature is hard to be expressed, and yet I haue appointed a severall treatise for them apart. Wherefore I will go forward in the discourse begun already, and namely as touching the sence and vnderstanding of the forenamed Creatures, and then proceed to the rest.

CHAP. LXIX.

¶ *The outward senses of liuing Creatures.*

Man excelleth all other Creatures, first in the sence of feeling, and then of tasting: In the rest many beasts go beyond him. For the Eagles haue a clearer eie-sight, the Geires a finer smell; and the Moldwarps, notwithstanding they be couered ouer with earth (so heauie,

* Which is found true by experience

heauie, so thick and deafe an element as it is) yet their eare is far better than ours. Moreover, albeit the voice of all them that speake aboue ground doth ascend vward still from them, yet heare they when they talke, yea and if a man chance to speake of them, some hold that they vnderstand their speech, and thereupon do fly from them. A man, who at first lacketh his hearing, wanteth also the vse of his tongue: neither are there any deafe borne, but the same likewise be dumbe. A man would not think, neither is it likely, that the Oysters in the sea do heare, and yet vpon any noise and sound their manner is to sink down to the bottoome. And therefore when as men do fish for them in the sea they are as silent as they may be.

CHAP. LXX.

¶ A discourse, That fishes both heare and also smell.

Fishes verily haue no eares, ne yet any holes to serue for hearing; and yet plain it is that they doe heare, as we may daily see in certaine fish ponds and stewes where fishes be kept: for when those that haue the charge of them make a noise with clapping of their hands, as wild as they be otherwise, they shall haue them come in great flocks to take their meat that is thrown in to them: and this are they wont to do daily: and that which more is, in *Cesars* Fishpooles a man may see whole skuls of fishes to repaire at their call: yea, and some wil part from the rest of their company, and come alone to land when they be named. Hereupon it is, that the Mullet, sea-Pike, Stock-fish, and *Chronius*, are thought to heare best of all others, and therefore liue very ebbe among the shelues and shallowes. That fishes haue the sense of smelling it is manifest: for they are not all taken ne yet delighted with one kinde of bait: and this is obserued, that before they bite they will smell to it. Some also there be that lie in holes vnder rocks, and no sooner hath the fisher besmeared and anointed the mouth and sides of the said rocks in the very entrance to their holes, but he shall see them come forth, as it were to auoid the sent of their own carion. Let them lie in the very deep, yet wil they resort to certain odors and smells, namely, to the Curtill burnt, and the Polype, which for that purpose they vse to put into their nests. And verily they cannot abide the smell of the sinke and pumpe of a ship, neither wil they come neere vnto it: but aboue all things they may not away with the blood of fish. The Pourcuttle hardly or not at all can be pulled from the rocks, so fast cleaueth he: howbeit come neer him with the herb Marjerome, or Savorie, he will presently leape from the rocke and away, to auoid the sent thereof. Purples also be caught by means of some stinking bait. And for other creatures, who doubteth but they haue a perfect smell? Serpents are chased away with the smell and perfume of the Harts horn; but aboue all, with the odor of *Stryax*. And Pismires are killed with the very fume of Orizon, Quick-linie, or Brimstone. Gnats loue all four things, and willingly will thither: but to any sweet meats they come not neare.

CHAP. LXXI.

¶ That the sense of feeling is common to all liuing creatures.

There is not a liuing creature throughout the world but hath the sense of feeling, though it haue none els: for euen oysters and earth-wormes, if a man touch them doe evidently feelee. I would think also that there is none but tasteth as well as feeles. For what should the reason else be, that some desire to tast this, others that? And verily herein is scene aboue all the singular workmanship of Nature, in the frame of their bodies and the members thereof. Some ye shall haue to seise vpon their prey with their teeth, others snatch it with their talons and claws: some peck and pluck it with their hookt bills, others pudder into their food with their broad nebs. Some with the sharp point of their beaks worke holes into their meat; others lie sucking at it. Some lick, others sup in: to conclude, some chew, others swallow and deuoure whole as it is. As touching their feet, there is no lesse varietie in the vse thereof: in snatching and carrying away, in tearing and plucking a pieces, in holding fast, and in crushing their prey. Some ye shall haue to hang by their feet, and others neuer lin scraping or scratching the earth.

CHAP.

CHAP. LXXII.

¶ What creatures liue of poison, and what of earth.

Roebucks and Does, yea, and Quails (as we haue said before) will feed fat with poisons, and yet they are the most meeke and gentle creatures liuing. Serpents haue a great desire and loue to eggs; wherein the subtilty of Dragons is worthy to be considered. For either they swallow them downe whole (if their throat will receiue them) and after they be within their body, breake and squeeze them in pieces with rolling and winding themselves round together, and then cast vp the shels againe: or if they be but young ones yet, and not so strong as to gobble vp whole eggs, then they will winde about an egge with their taile by little and little, & bind it so hard, that they will cut off the crowne of it, as it were with a knife, and then sup off the rest which they clasp and hold fast between. In like manner deale they with birds. For swallow they will them whole downe the gullet, and afterwards straine and struggle so with themselves vntill they disgorge again the feathers and bones that were in their bellies.

Scorpions feed vpon earth. And Serpents againe, if they may come handsomly to wine, will make means to drink their fill of it, how soeuer otherwise they haue but little need of any drink. They eat no meat at all, or very little, when they be kept close within any thing: like as the spiders also, which otherwise naturally liue by sucking. And therefore you shall not lightly see any venomous creature die either of hunger or thirst. For neither haue they store of heat, nor plenty of blood, ne yet of sweat: all which naturally prouoke a stomach, & giue an edge to appetite. And among these venomous creatures, those be euer more dangerous which haue eaten some of their own kind, before they bite or sting. Apes, Monkeys, and Marmosets bestow and treasure vp the meat that is giuen them, or that they can come by, within their cheeks, as in a store-house. And when they be hungry, they get the same forth by little and little with their hands, & so sal to chew it. Thus practise they in making their prouision, for to serue them from day to day, and from one houre to another: which Pismires vsually do from yeate to yeate.

CHAP. LXXIII.

¶ The meat and drinke of some creatures.

Of all liuing creatures that haue many toes in their feet, the Hare alone feeds vpon grassie and greene corne in the blade. As for those that be whole hoofed, they liue both of the blade, and also of the fruit thereof. Also of such as be clouen footed, Swine will eat all kind of food, yea, and liue of very roots. It is the property of whole hoofed beasts alone, to walow and turn ouer and ouer. All that haue teeth indented in like saws, be naturally deuourers of flesh. Bears wil feed of corn, brouse trees, eat grapes, liue of apples and other fruits, feed vpon bees, creifishes, and pismires. Volues (as we said before) if they be very hungry, eat earth: sheep feed the better & grow fat, if they may drink; and therefore salt is very good for them, because it makes them thirsty. Draught beasts, and such as are vsed for carriage, albeit they liue of corne and grassie, yet according to their drinking they do feed. Besides those mentioned hertofore, of wild beasts the red and fallow Deere both, doe chew cud when they be made tame and fed by hand: but all chuse rather in so doing, to lie than to stand, & in winter more than in summer, for seven months ordinarily. The rats and mice in the country of Pontus, namely, *Hethims*, & such like, after the same maner do chew cud and go ouer their meat again. What beasts soeuer are toothed like saw teeth, lap as they drinke. So do also our common mice and rats, although they be of another kind, and are not so toothed. They that haue broad teeth, plaine, and vniforme, as horses and kine, drinke supping and taking their full draught. Bears in their drinking do neither the one nor the other, but bite at the water and so let it down. In Affrick the more part of wild beasts drink not all summer long, for want of raine water: which is the cause that the Rats and Mice of Ginnie which be taken, if they drink afterwards vpon so long disuse, die therewith. In the desarts of Affrick, where there is no water euer to be had, there is ingendred a certain wilde goat named *Oryx*, which as by the nature of the place it wanteth drink, so it hath in her bodie a souverain and singular remedy against drought and thirst. Which the common theeves & robbers by the high way side in Getulia, knowing well enough, endure a long time with the helpe thereof.

thereof without drinke, for they vse to stanch and quench their own thirst, with a certain moist hole some liquor found in the bladders of the said beast. In the same Affricke the Leopards lie in await among the thickets of trees, hidden within the branches; and so seize vpon them that passe by, and make spoile euen from the place where fouls vse to perch. As for Cats, marke I pray you how silent they be, how soft they tread when they steale vpon the silly birds: how secret lie they in espiall for the poore little mice to leap vpon them. Their owne doung and excrements they will rake vp and hide in the earth, knowing full well, that the smell thereof will bewray where they are.

CHAP. LXXIII.

¶ *What beasts accord together, and which they be that disagree one from another.*

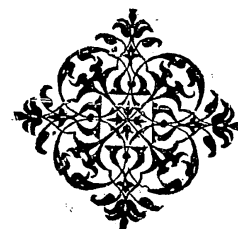

BE sides these outward fences abouenamed, euident it is also, that brute beasts haue other instincts of nature. For they entertain friendship and enmity one with another (which cannot be without affection and passion) ouer and besides those other wars and amities which wee haue obserued in their feuerall places. Swans and Egles jar and war one with another: so doth the Rauens and the Witwall or Lorient, which seeke after one anothers eggs in the night. Likewise the Rauens and Kite: for the Rauens is euermore ready to catch the Kites meat from him. Crows and Owles are at mortall feud one with another. The roiall Egles hateth the Wren, and why? because (if we may beleue it) he is named Regulus (i. the pettie king.) Howlets also cannot agree with other little birds. Again, foules make warre with foure-footed beasts. The Weasell and the Crow be at deadly debate. The Turtle with the Creckit (Pyrallis) that liueth about the fire. The Ichneumons with Wasps: the Phalangia with other Spiders. And among water foules, Ducks and Drakes with the sea-gulls. The Seamews with the Buzzard Triorchis. As for the field Rats or Mice, and the dwarf-Herons, they seeke to prey one vpon the others little ones. The bird Egithus (the least in maner of all others) waiteth the Asse a shrewd turn; for when he rubbeth himself against the bushes to scratch where it itcheth, he therewith breaketh and ouerthroweth her nest; and therefore this silly bird is so much afraid of the Asse, that if he heare him but bray, he is ready to throw the eggs out of her nest, and those that be already hatched, will for very feare fall downe: then in reuenge of this wrong, she will flie vpon him, and with her bill peck where the skin is off and raw with rubbing, yea, and make holes euen to the very bone. Moreouer, Foxes and the Yeeles of Nilus cannot abide one another, but are in continual war. So be Vezils and Swine. There is an unhappy bird called Aesalon, and but little withall, yet will she squash and breake the Rauens eggs. And when she hath yong ones, they be much troubled and annoied with Foxes: she again to be quit with them, will all to pinch & nip both the Fox and her cubs. The Rauens seeing that, come to aid (as it were) against a common enemy. The Gold-finch liueth among bushes and thorns, and therefore she also hates the Asse, because he eateth vp the floures that grow therupon. The bird Egithus, so far hateth another called Anthus, that men are verily perswaded the blood of them both will not mingle together: and hereupon it is, that the forcerers and witches haue brought it into an ill name. The Thoes and the Lions do fouly jarre and disagree. In summe, the least creatures as well as the biggest quarrell and fight one with another. Rats, and field Mice cannot abide to come neere a tree that is full of Ant-nests. The Spider espying a Serpent lying along vnder the shade of a tree where she spinneth, slideth down vpon a fine thred to the head of the Serpent, and stingeth him so deep into the braine, that he falleth a hissing and grinding his teeth: he keepeth a winding and turning about, but hath not the power to breake the thred that hangeth aboue, ne yet to fly from the Spider: insomuch, as the Serpent lieth there dead in the place. Contrariwise, Peacocks and House-doues be as friendly one to another: so be the Turtles and Popinjaies, the Merles and Turtles likewise. The Crow and the lesse Bittours also: for they ioine and band together against the common enemy the Fox. Likewise, the bird-Harpe and the Kite against the Buzzard. What will ye say? be there not tokens of affection euen in Serpents, the cruellest and fellest creatures of all others in the world? I haue written already of the report or tale that goeth in Arcadia of a man, whose life was saued by a Dragon (that was brought vp by him) so soon as euer he knew him by his voice. As for the Aspis, Philarchus telleth a strange history of it,

A it. For he writeth, that in Egypt there was an Aspis vsed ordinarily to come to the table of a certaine Egyptian, and there tooke meat at his hand: which Serpent afterwards had yong ones, whereof one chanced to sting a son of the master of the house, that he died of it. Now when the dam (the old Aspis) came accordingly at the accustomed houre of repast for victuals, and perceived the deed committed by her little one, not onely killed it in satisfaction of the former fact, but also forbore the house, and was neuer knowne to repaire thither againe.

CHAP. LXXV.

¶ *The sleepe of liuing creatures.*

THe question, Whether liuing creatures sleep or no? is not very difficult, but soon decided: For plain it is, that of land creatures, all that winke and close their eyes doe sleepe. As for those in the water, that they also sleepe (though but a little) euen they are of opinion who otherwise make doubt of the rest. And this they do not collect & gather by their eyes (for lids they haue none to shut) but because they are seene to lie so still and quiet, as fast and sound asleep, stirring no part, but a little wagging their tails, and seeming to start and bee affright at any sudden noise made in the water. As for the Tunnies, we may auouch more confidently of their repose: for they come of purpose to sleep vnder the banks or rocks. And flat broad fishes lie so still sleeping among the shelles, that oftentimes a man may take them vp with his hand. The Dolphins and Whales be heard to rout and snort again, they sleepe so soundly. Moreouer, as touching Insects, no man need to doubt that they sleep, so quietly do they lie and make no noise: nay, if you bring a candle or other light, and set it euen before their eyes; you shall not haue them to awake nor moue. An infant after it is borne, sleepeth for certaine moneths at the first, and in manner doth nothing els. But the elder hee waxeth, wakefull is he every day more than other. Babes at the very beginning do dreame. For they will waken and start suddenly in a fright; and as they lie asleep, keep a sucking of their lips, as if it were at the breast heads. Some neuer dream at all. And if such chance contrary to this custome, for to dreame once, it hath bin counted for a signe of death, as we haue seene and prooued by many examples and experiments. And here in this place there offereth it selfe a great question, and very disputable *pro & contra*, grounded vpon many experiments of both sides: namely, whether the soule of man while the body is at rest, foreseeeth things to come? and how it should so do? or whether this be a thing of meere chance and altogether coniecturall, as many others be? And surely if we go by histories, we may find as many of the one side as the other. Howbeit all men in manner agree in this, That dreames either immediatly vpon drinking wine and full stomacke, or els after the first sleep, are vaine and of no effect. As for sleep it is nothing els but a retreat and withdrawing of the soule into the mids of it selfe. Euident it is, that Horses, Dogs, Kine, Oxen, sheep, and goats do dreame. Whereupon it is credibly also thought, that all creatures which bring forth their yong quicke and liuing, do the same. As for those that lay egges, it is not so certaine that they dreame: but resolued it is, that they all do sleep. Now let vs passe and proceed to the treatise of Insects.

THE ELEVENTH BOOKE OF THE HISTORIE OF NATVRE, WRITTEN BY C. PLINIUS SECVNDVS.

The proeme.

It remaineth now to write of those lining creatures, which are the most subtile of all others that Nature hath brought forth: forasmuch as some are of opinion, That they breath not, ne yet haue any bloud at all.

CHAP. I.

¶ Of Insects in generall.

Many and sundry sorts there be of Insects, as well among land creatures as those that fly in the aire. Some are winged, as bees: some haue partly wings and partly feet, as Pismires: others want both, and neither flie nor go on their feet. And wel may they all be called *Insecta*: by reason of those cuts and diuisions, which some haue about the necke, others in the breast and belly; the which do go round and part the members of the body, hanging together onely by a little pipe and fistulous conueiance. There be of them, that haue not the body diuided entire, one part from the other by these incisures, cuts, and wrinkles; but they appeare only either vnder the belly, or vpon the backe aboue, and go no deeper, neither yet round the whole compasse of the body. But a man shall perceiue in them certaine rings or circles, apt to bend and wind to and fro, and those so plated and plaited one ouer another, that in nothing elswhere is more seen the workmanship of Nature, than in the artificiall composition of these little bodies.

CHAP. II.

¶ The industrie and subtiltie of Nature in framing these Insects.

In bodies of any bignes, or at least-wise in those of the greater sort. Nature had no hard piece of work to procreate, forme, and bring all parts to perfection; by reason that the matter wherof they be wrought, is pliable and will follow as she would haue it. But in these so little bodies (nay pricks and specks rather than bodies indeed) how can one comprehend the reason, the power, and the inexplicable perfection that Nature hath therein shewed? How hath she bestowed all the five senses in a Gnat? and yet some there be, lesse creatures than they. But (I say) where hath she made the feat of her eyes to see before it? where hath she set & disposed the tast? where hath she placed and inserted the instrument and organ of smelling? and aboue all, where hath she disposed that dreadful and terrible noise that it maketh, that wonderfull great sound (I say) in proportion of so little a body? can there be deuised a thing more finely & cunningly wrought than the wings set to her body? Marke what long-shanked legs aboue ordinary she hath giuen vnto them. See how she hath set that hungry hollow concauitie in stead of a belly: & hath made the same so thirstie and greedy after bloud, and mans especially. Come to the weapon that it hath to pricke, pierce, and enter through the skinne; how artificially hath shee pointed and sharpened it? and being so little as it is (as hardly the fineness thereof cannot be seen) yet as if it were of bignesse & capacity answerable, framed it she hath most cunningly for a twofold vse: to wit, most sharpe pointed, to pricke and enter; and withall, hollow like a pipe for to sucke in and

A and conuey the bloud through it. Come to the Wood-worme, what manner of teeth hath Nature giuen it, to bore holes and eat into the very heart of hard Oke: who heareth not the sound that she makes whiles she is at her work? For in wood and timber is in manner all her feeding. We make a wonder at the monstrous and mighty shoulders of Elephants, able to carry turrets vpon them. We maruell at the strong and stiffe necks of buls, and to see how terribly they will take vp things and toss them aloft into the aire with their hornes. We keepe a wondering at the rauening of Tygres, and in the shag manes of Lions: and yet in comparison of these Insects there is nothing wherein Nature and her whole power is more seene, neither sheweth she her might more than in the least creatures of all. I would request therefore the Readers, that in perusing this treatise, they will not come with a preiudicate opinion, nor (because many of these silly flies and wormes be contemptible in their eyes) disdain, loath, and contemne the reports that I shall make thereof; seeing there is nothing either in Natures workes that may seeme superfluous, or in her order vnworthy our speculation.

CHAP. III.

¶ Whether Insects do breath, and whether they haue bloud or no?

Diuers haue denied that they breath at all; and vpon this reason they ground their position; Because they haue no arterie or wind-pipe annexed or reaching to any instrument within of respiration. And they be of opinion, that they liue indeed as plants, herbes, and trees; howbeit (say they) there is a great difference betwene hauing life, and drawing wind or vitall breath. And by the same rule they affirme, that they haue no bloud, which is in none that bee without heart and liuer. Neither do any things breath which want lungs. And from hence ariseth a world of other questions thereupon depending. For the same men deny flatly, that these creatures haue any voice: notwithstanding so great humming of bees, & singing sound of grasshoppers, and such other, whereof we will consider in due time & place, accordingly. Verily for mine owne part, the more I looke into Natures workes, the sooner am I induced to beleue of herenue those things that seem incredible. Neither do I see any inconvenience to thinke, that these Insects may as well draw wind and breath without lungs, as liue without such noble and principall parts as are requisite for life in other creatures: according as we haue already shewed in the discourse of fishes and such like, that liue in the sea; how soeuer the quantitie, depth, and heights of the water, may seeme to impeach and stop their breath. For who would easily beleue, that some creatures should flie at libertie, and liuing as they do in the mids of wind and aire, yet want wind and breath themselves? that they should haue a sense and care to seek their liuing, to engender, to worke, and to forecast for the time to come: and howbeit they haue no distinct members, to carry (as it were in a ship) their seuerall senses, yet that they should heare, smell, and taste, yea and be indued with other singular gifts besides of Nature, to wit, wisdom, courage, skill, and industrie. Indeed, confesse I must, that bloud they haue none: no more haue all creatures that liue vpon the land: howbeit a moist humor they haue, somewhat like vnto bloud, which serues them in stead thereof. Like as in Cuttels of the sea, there is found a certain blacke liquor in stead of bloud: and in all the sort of Purples and such shel fishes, that excellent iuice which staineth & dieth so as it doth. Semblably in these Insects, whatsoeuer humor it is, whereby they liue, the same may well enough go for bloud and so be called: all the while that euery man hath liberty to giue it what name he thinketh fittest. As for me, my purpose is not to judge and determine of these doubtful quilliers, and their causes; but to set down and shew the nature of such things as be cleare and apparent.

CHAP. IIII.

¶ The substance of the body in these Insects.

These Insects, so far as a man may perceiue, seeme not to haue either sinewes or bones, no chine nor gristle, no fat, no flesh, ne yet so much as a tender and brittle shell, as some Sea-fishes haue, nor that which may be truly called a skin, but a certain corporal substance of a middle nature between all these: for their body without, is like a dry thing, and yet more tender and soft than a sinew: whereas in all other parts the matter is to be accounted rather drie than

than hard. This is the very substance whereof they consist, and nothing haue they besides. For within there is nought, vnlesse it be in some very few, who haue a certaine pipe or conduit in stead of a gut, & the same wrapped and infolded together. Which is the cause, that if they be cut in two and pulled in pieces, yet they haue a speciall property to liue long, and each part a-funder wil pant & stir by it selfe. The reason is, because the vitall vertue in them (whatsoeuer it is) is not seated in any one member, this or that, but spread and defused throughout the whole body, and least apparent in the head, of all other parts: for, that alone, vnlesse it be plucked away together with the breast, moueth not one jot. No kind of creatures haue more feet than these: and the more they haue, the longer liue they when they be diuided a-funder; as we see by experience in the Scolopendres. Eies they haue, that is certain; & besides sight, they are not without the fences of feeling & tasting: some there be that smell, & a few that haue their hearing also. H

CHAP. V.

¶ Of Bees.

But among them all, Bees are principall, and by good right deserue especiall admiration, as being the only Insects ordained by Nature for mans vse. They gather hony, a most sweet, pleasant, fine, and wholesome liquor. They frame the hony combs, and work the wax, which serue for a thousand turns in this life. They indure pains continually, and dispatch their worke and businesse. They haue a policie and Commonwealth among themselves. They hold their feuerall counsels: and there is not a swarme or cast that they haue, without a king and capitaine of their owne: and that which is most admirable of all, there be ciuill fashions and customes among them. Moreouer, being as they are, neither tame and gentle, nor yet to be counted wilde and savage, yet (see the wondrous worke of Nature!) by the means of so little a creature, nay, a shadow rather (to say a truth) of the least creature, she hath effected a thing incomparable: what strength of sinewes, what force and puissance is able to countervail this so great industry and effectuell power of theirs? What wit and policy of man is answerable to their discreet and orderly course? Beleeue me, they passe them all, and in this one point surpasse, That all things are common among them, and nothing know they priuat and feuerall. What should we debate and make question any more as touching their breath? Why should wee dispute of their blood, which cannot chuse but be very little in such smal bodies? Let vs rather consider henceforth their wit, and the gifts of their mind. I

CHAP. VI.

¶ The naturall order and regiment that is in Bees.

Bees all winter time keep close within their hiues: and good reason, for how possibly should they indure hard frost and chilling snow? how should they abide the piercing blasts of the North winds? And verily it is the manner of all these Insects so to doe, but yet they keepe not in so long. For why? being nestled warm as they are within our houses, they sooner doe recover their vigor, & come abroad betimes. But as concerning Bees, either the times haue changed, & places altered their course, or els the writers beforetime of this argument haue greatly erred. They begin to retire themselves and take vp their wintering harbor, presently vpon the setting and occultation of the star Vergiliæ; and come not forth into the field againe, vntill after the rising and apparition thereof. So that Bees go not abroad at the very beginning of the Spring, as Writers haue set downe (for who seeth not the contrary throughout all Italie) but remaine still close and secrete, vntill that Beanes begin to bloom; before which time they settle not themselves to any worke or labour. But from thence forward, they lose not a day, they slack not their painful trauel, neither play they one jot, if the weather be faire & wil permit: the first thing they do, is to make their combs & wax, that is to say, their own habitations & store-houses. When they are prouided of lodging, they thinke vpon the multiplying of their owne kind: and finally, they gather and make both hony and wax: the substance whereof they sucke from the floures of trees and hearbes, from the gums also of trees which breed such glucie matter; and besides, out of the iuice, gum, and rosin of the willow, elme, and cane. With these and such like, they plaister all the hiue within throughout, as it were with a coat or parget, intermingling

A gling withall other iuices that are more vsauorie, gathered from the bitterest hearbs they can get: to the end that they might keepe out other little vermines that are greedy of their hony: as knowing full well, that they are about a piece of worke which is worth to be desired and sought after. Of this gummy and glutinous substance they frame also their dores and entries which are wide and large.

CHAP. VII.

¶ The proper termes belonging to their worke.

The first foundation of their worke, skilfull hony-masters do call Commosis: the second Pissoceros: the third Propolis, which lieth between those former coats and the wax of the hony-combe, whereof there is so great vse in Physicke. Commosis is the first coat or crust of a bitter tast. Pissoceros commeth next after it, as it were a thinner course of pitch or varnish and a weaker kinde of wax, made of the more liquid and mild gum of vines and poplars. But Propolis consisteth of a more solid matter, as hauing the strength of some floures withall: howbeit, as yet it is no full and perfect wax, but the foundation and strengthening of the combs: and serueth as a good defence against cold, and to stop the passage of waspes and such hurtful creatures as would do iniurie to the bees, for still a strong sent it carrieth, as which, many men do vse in stead of Galbanum. After this munition done, then followeth the prouision of that which is called Erichace, some terme it Sandarach, and others, Cerinthus. This must serue for the bees meat, whereof they are to liue whiles they worke: and found it is oftentimes, laid apart within the concavities of their combs, it being also of a bitter taste. Now this Erichace commeth of the * Spring-dew, and the moisture issuing out of trees in manner of gum: in lesse abundance euery when the South-west wind blows: but when it is full South, more blacke: and in the Northerly constitution, far better and more red withall. Great store hereof, Bees meet with vpon Almond trees. Menecrates saith, That it is a floure foreshewing what haruest shall insue: * but no man saith so besides him.

* Rore uernus;
or Sea-dew,
Rore marino.

* Being decel-
ued with the
Homonymic
of the word
Cerinthus,
which hath a
double signi-
fication.

CHAP. VIII.

¶ What flowers they be which Bees serue themselves most withall for their worke.

As for wax, Bees gather and make it of the floures of all trees, herbs, and plants, sauing the docke and * Goose-foot, which are two kinds of herbs. Some except also a kind of Broom called Spart, but vntruly: for in Spaine (where there be many places full of that shrub) the hony carrieth the strength thereof in the taste. I am besides of opinion, that they be deceiued who thinke that bees gather not of Oliue trees. For we see it ordinary, that there be more casts and swarms of Bees where Oliues grow in greater abundance. These pretty creatures hurt no fruit whatsoeuer. They will not settle vpon a floure that is faded, and much lesse of any dead carkasse. They vse not to go from their hiue about their busines about 60 paces: & if it chance, that within the precinct of these limits they finde not floures sufficient: out goe their spies, whom they send forth to discouer forage farther off. If in this expedition, before they come home againe, they be overtaken by the night, they couch vpon their backs for feare left their wings should be ouercharged with the euening dew, and so they watch all night vntill the morning.

* Chenopode;

CHAP. IX.

¶ Those that haue taken a speciall pleasure in Bees.

Such is the industrie of this creature, that no man need to wonder at those two persons who delighted so much in them, that the one (namely Aristomachus of Soli) for threescore yeares lacking but twaine, did nothing else but keep bees. and Philiscus the Thasian employed the whole time of his life in Forrests and Defarts, to follow these little animals: whereupon hee was surnamed Agrius. And both these vpon their knowledge and experience, wrote of Bees.

¶ *The order that they keepe in their worke.*

The manner of their businesse is this. All the day time they haue a standing watch & ward at their gates, much like to the *corps de guard* in a campe. In the night they rest vntill the morning: by which time, one of them awaketh and raiseth all the rest with two or three big hums or buzzes that it giues, to warn them as it were with sound of trumpet. At which signall giuen, the whole troupe prepares to flie forth, if it be a faire and calme day toward, for they doe both foresee, and also foreshew when it will bee either windie or rainie, and then will they keepe within their strength and fort. Now when the weather is temperate (which they foreknow well enough) and that the whole armie is on foot and marched abroad, some gather together the vertue of the floures within their feet and legges: others fill their gorge with water, and charge the downe of their whole body with drops of such liquor. The yonger sort of them go forth to worke, and carry such stuffe as is beforenamed, whiles the elder labor & build within the hiue. Such as carry the floures abovesaid, stuffe the inner parts of their legs behind (and those Nature for that purpose hath made rough) with the help of their forefeet: & those again are charged full by the means of their muffle. Thus being full laden with their prouision, they returne home to the hiue, drawne euē together round as it were in a heap, with their burden: by which time, there be three or foure ready to receiue them, and those ease and discharge them of their lode. For this you must thinke, that they haue their feuerall offices within. Some are busie in building, others in plaistering and overcasting, to make all smooth and fine: some be at hand to serue the workemen with stuffe that they need; others are occupied in getting ready meat and victuals out of that prouision which is brought in: for they feed not by themselves, but take their repast together, because they should both labour and eat alike, and at the same houre. As touching the maner of their building, they begin first aboue to make arch-work embowed, in their combs, and draw the frame of their work downward, where they make two little allies for euery arch or vault, the one to enter in by, the other to go forth at. The combs that are fastened together in the vpper part, yea and on the sides, are vnited a little, and hang all together. They touch not the hiue at all, nor ioine to it. Sometime they are built round, otherwhiles winding bias, according to the proportion of the hiue. A man shall find in one hiue hony combs sometime of two sorts: namely, when two swarms of bees accord together: and yet each one haue their rites and fashions by themselves. For feare lest their combs of wax should be ready to fall, they vphold them with partition wals, arched hollow from the bottom vppward, to the end that they might haue passage euery way to repaire them. The formost ranks of their combs in the forefront, commonly are built void and with nothing in them, because they should giue no occasion for a theefe to enter vpon their labours. Those in the backe part of the hiue, are euē full of hony: and therefore when men would take out any combs, they turne vp the hiues behind. Bees that are employed in carrying of hony, chuse alwaies to haue the wind with them, if they can. If haply there do arise a tempest or a storm whiles they be abroad, they catch vp some little stony greet to ballance and poise themselves against the wind. Some say, that they take it and lay it vpon their shoulders. And withall, they flie low by the ground vnder the wind when it is against them, and keep along the bushes, to breake the force thereof. A wonder it is to see and obserue the manner of their worke. They mark and note the flow-backs, they chastise them anon, yea, and afterwards punish them with death. No lesse wonderful also it is to consider how neat and clean they be. All filth and trumperie they remoue out of the way: no foule thing, no ordure lieth in the hiue to hinder their businesse. As for the dounge and excrements of such as are working within, they be laid all on a heap in some by-corner, because they should not goe far from their worke: and in foule weather (when otherwise they haue nought to do) they turne it forth. Toward euening, their noise beginneth to slacke and grow lesse and lesse: vntill such time as one of them flieth about with the same loud humming, wherewith he waked them in the morning, and thereby giueth a signal (as it were) and commandement for to go to rest: much after the order in a camp. And then of a sudden they are all hush and silent.

¶ *Of the drone Bees.*

The houses and habitations that Bees build first, are for the Commons: which being finished, they set in hand with a pallace for their king. If they foresee that it will be a good season, and that they are like to gather store of prouision, they make pavilions also for the Drones. And albeit they be of themselves bigger than the very bees, yet take they vp the least lodgings. Now these drones be without any sting at all, as one would say vnperfect bees, & the last fruit of such old ones as are weary and able to do no more good, the very later brood & increase, and to say a truth, no better than slaues to the right bees indeed. And therefore the others as master Bees ouer them, haue them at their commandment: if any drudgery or such like businesse is to be don, out are they sent first: make they but slow hast in that they are set about, sure they are to pay for it, and to be punished without mercy. And not only in their ordinarie worke they serue them in good stead, but also they help them to multiply: for the hotter that the place is, the more hope there is of a greater increase. Certes, this is found by experience, That the better the hiue is peopled with a number of bees, the Cast when time comes will bee the greater, and the oftner will they swarme. But after the hony is growing once to maturitie and perfection, then begin they to driue these drones out of doores: may, we shall haue many bees set vpon one poore drone, and kill him out-right. So that a man shall not lightly see any of that kind but in the Spring time.

If one pluck off the wings from a drone, and put him again within the hiue, he will neuer lin vntill he haue done the like by all the rest of the same kind. As touching the roiall pallsaces for the kings and captaines that shall be, built they are all most stately, great of receipt, in shew magnificent, seated by themselves apart, and like citadels raised vpon some high knap or tuft of a mountaine. If one of these castles chance to be pressed or crushed, there will no more come of that princely race. All the lodgings and roomes where the bees abode is, are six cornered, according to the number of feet employed in that worke. None of all this is done at any set time or day appointed: but they take the opportunity when they can espie faire weather to fit their businesse, and so do these things by snatches. And surely within a day or two at the most, they fill their store-houses with hony.

¶ *The Nature of Hony.*

This pleasant and sweet liquor which we call hony, is ingendered naturally in the aire, and especially by the influence and rising of some starres: but principally during the feruent heat of the canicular daies, euē when the Dog-star is in his full power and force: neuer before the appearing of the star Virgilie, but alwaies before day. For so about the day breake betimes in the morning, the leaues of trees are found bedewed with honey: and looke who-soeuer they are, that haue occasion to be abroad in the aire about the dawning of the morrow, they may euidently perceiue their cloths wet with a clammy humor of hony, yea, & their hairs glewed therewith together, if they go bare headed. Be it what it will, either a certaine sweat of the skie, or some vnctuous gelly proceeding from the stars, or rather a liquor purged from the aire when it purifieth it selfe: would God we had it so pure, so cleare, and so naturall, and in the own kind refined, as when it descendeth first, whether it be from skie, from star, or from the aire. For euē now such as it is, passing as it were through so many hands: namely, falling from a region so high and remote from vs, and in the way as it commeth catching much filth: and namely, infected with the grosse vapour of the earth which it meeteth in the fall: moreouer, sucked up in their little bellies or bladders (for at their mouth they spew and cast it vp againe) corrupted also and sophisticated with other humors drawn out of floures: finally, so long soking within the hiues, and suffering so many alterations: yet for all the forrow, a great resemblance it carrieth still with it of a most pleasant, sweet, and coelestiall liquor.

CHAP. XIII.

¶ The best kinde of Honie.

The best hony is euer there, where the best floures are; within the receptacles whereof, it lieth. As we may see in the country about Athens, which carrieth the name for honey: also in Sicilie within those territories about Hymettus and Hybla: and lastly, in the Isle Cadydna. Now this hony, whereof we treat, is at the first cleare and thin as water; and for certaine daies in the beginning, it workes and boiles like to new wine, and so purgeth it selfe. By the 20 day it getteth a certaine consistence and thicke substance, and soon after gathers a thin cream or skin ouer it: which in the very heat of working, is raised of a scum, and so thickneth. The best simply that bees can sucke, and least infected with the corruption of 3 branches, is that which they get out of the leaues of Oke, Tilia [*i. Linden tree*] and Canes.

CHAP. XIII.

¶ The sundry sorts of hony, according to diuers regions.

Honie (as we said before) is better or worse, according to the region where it is gathered; and that in many respects. For in some place ye shall haue goodly combs: howbeit, more commendable for wax than the hony in them: as in the Pelignians country, and Sicily. In others, and namely in Candie, Cypres, and Africk, the combs yeeld more hony than wax. Some countries there be, especially in the North parts, where the combs passe for bignesse: in so much as in Germany there hath bin a hony-combe seene eight foot long, and blacke all within. But in what region soeuer it be that hony is found, three kinds there be of it. First, the Spring hony made of floures only; like as the comb also: and thereupon the Greeks call it Anthinon, which is as much to say as the Floure-hony. Some would not haue this to be once touched, but to serue for nourishment of the young bees, that the swarmes or casts may be more strong and lustie. Others againe leaue for the bees of none lesse than of it: by reason of the great plenty like to follow, at the rising of those notable stars in the Summer ensuing. Moreover, the combs are in their principall beauty about the Sun-stead in summer, when daies be longest, at what time as the Vine and Time do begin to floure. Also, in taking forth of the hony combs, needfull it is to be well aduised in ordering the matter for the prouision of food for bees. If they be cut short and destitute of their meat, they either despaire and die for want, or els depart and flie away. Contrariwise, if you leaue them too much, plenty breeds idleness, that they will not labour: neither deigne they to feed of Erithace, their ordinarie food, but fall to the good hony. They therefore that be well experienced in these matters, thinke it good to leaue them the twelfth part of this store and vintage, if I may so say, which is gathered in the combs. And verily, it seemeth that Nature hath ordained a certaine set day for to begin this vintage, if men would take knowledge thereof, and marke it well; namely, the 30 day, after the bees swarmed and went forth: and vsually it falleth out, that this gathering commeth within the moneth of May. A second kind of hony there is, which we call Summer hony, and is named also Horæum, of that principall season wherein it is made, namely, in the very midst of dog-daies, when the star Sirius is in his full strength: and that commonly is 30 daies after the Sun-stead. And I assure you, Nature hath shewed her admirable and excellent power to men ward in this behalfe: in case their fraud and deceit would suffer her works in their entire and proper nature without corruption and sophistication, which marreth all, and maketh nothing but confusion. For vpon the rising and apparition of any star, and especially of those that be more excellent than the rest, or after that a rainbow is seen aboue the earth, and no showers of rain presently follow, but a drizzling dew warmed with the raies and beams of the Sun: ye shall haue that which falleth, not to be are hony, but a very medicinable thing, euen a celestiall gift, singular good for cyes and vlcers, yea, and comfortable to the principall noble parts within the body. And if this happen to be at the rising of the dog-star, and it chance withall, that vpon the same day (as oftentimes it falleth out) Venus, Iupiter, or Mercury bee Orientall, then shall yee haue so heauenly a sweet liquor, that no one thing in the World may bee comparable to it for the curing of all our maladies, and euen to reduce and recouer vs backe from death vnto life, like vnto that celestiall and

A and diuine Nectar, which immortalizeth the gods aboue.

CHAP. XV.

¶ The markes of good hony.

More plenty of hony is gathered in the full of the Moone, than at any other time: and if therewith the weather be faire, the same wil be more vnctuous and fattie. In all kinds, the best hony is that, which runneth of it selfe as new Vine and Oile; and called it is Acedon, as a man would say, gotten without care & trauell. All Summer hony is red, as being made in the driest season of the yere. The hony which commeth of Time, is held to be the best and most profitable, in colour like gold, in tast right pleasant; euident to be knowne by the little leaues therein: and the same is likewise fattie. That which is made of Rosemary, or within the aire and vapour of the sea, is thick: and such verily as is thus candied, and will not run like life-hony, is nothing commendable. As for Time honey it will not thicken: and if a man touch it, rope it wil and draw small slimie threds after it: which is a principall signe of the weight and heauinesse thereof. If hony be short in the handling, and soon breake, and that the drops part one from the other, it is thought to be a token of the worst and courtest of all. Another triall there is besides of good hony, namely, if it be fragrant and odoriferous to smell vnto, sweet in taste, & biting withall, or quick at the tongues end, glutinous and cleare. As touching the druing of hiues for summer hony, *Thasius Dionysius* is of opinion, that the tenth part thereof should be left for the bees, namely, if they were full: if not, then according to the proportion: but if they were but light and very thin, he would not haue them to be touched at all. The Athenians goe by this rule, and do obserue duly the Capricifical day, which is kept wholly vnto *Vulcan*: for then they euer begin to drue their hiues for this kind of honie.

CHAP. XVI.

¶ Of a third kinde of Honie: and how a man should know good Bees.

There is a third sort of wild hony, which the Greeks call *Ericæum* [*i. Heath or Ling hony*] and is of least reckoning. It is gathered after the first rain in Autumne, when the heath and lings only bloom in the woods, wherupon it seems as if it were sandy. This kind of hony is ingendred for the most part after the rising of Arcturus, much about the Ides of September. Some there be that continue in gathering Summer hony to the rising of Arcturus: betwene which and the Autumne Equinoctial are 14 daies, & from thence vnto the setting of Virgilie (namely, for the space of 48 daies) the said heath is most in his blooming time. This shrub the Athenians call *Tetralix*; the Euboeans name it *Sifara*; & they repute it to be a floure most pleasant to bees, haply, because at that time there is no plenty of other floures. This gathering of hony is about the end of vintage, & the occultation of the Vergilia: & commonly ends by the Ides of Nouember. In druing of the hiues for this hony, by good reason, two [third] parts thereof would be referred for the bees: & especially those corners of the combs, which haue in them the prouision called Erithace. From the mids of winter to the rising of Arcturus, for 60 daies bees are nourished only with sleep, without any other food. But from that time vnto the spring equinoctial, and namely, where the weather is more warm, they are awake. Howbeit, they lie still in their hie, & then fall to their victuals which they had laid vp in store against that time: but in Italy they do the like indeed after the rising of the star Virgilie: howbeit, till then they do nothing but sleep. And there verily, men vse when they take the hony forth of the hiues, to weigh the combs, and so by weight dispense & set out how much they will leaue them for their food: hauing this opinion, that they are bound to deale in justice & equity euen with the very bees: in so much, as it is commonly said, if they be defrauded of their due in this society & part-taking, and find falshood in fellowship, they wil die for griefe: & so both the old stock will be lost, and the hope also of a new increase. In the first place therefore, this is a rule, that such folk only be set about this businesse to drue the hiues, who are neat & clean. A theefe & a woman whiles she is in her monthly sickness, they abhor. In the taking out of hony, the best means to drue away the bees, is to smoke them out of the hie: lest that you anger them, or that they deuoure the honie themselves with more greedines. Moreover, when they grow to be idle, perfuming & smoking,

of them thus now and then, maketh them more fresh to go about their worke. For when they lie still and doe nothing, they make their combs looke dead and blackish. Again, if they be o-uermuch smoked, they will be the worse for it; and surely, the very hony soon catcheth the hurt hereof, for so tender and weake will it be, that with the least dew that is, you shal haue it to turne and wax foure. And therefore in all kinds of hony they obserue and keepe that which is called Acapnon [i. without smoke.] The hony gathered of both sorts of Thyme, called thereupon Bithymum, is not white: howbeit, very good it is for eies and to cleanse vlcers.

Now as touching the generation of Bees, and how they multiply and increase, much dispute there hath bin among the learned, and a nice question this is. For first and foremost, bees were neuer seen to ingender one with another: and therefore most men haue bin of opinion, that yong bees must needs be made of floures fitly and hand somely laid together and composed, according to Natures lore. Others say, that one master Bee which is the king in euery swarme, doth beget them all: and that he forsooth is the only male; bigger also than the rest and more strong, because he should not faint and faile in the action: for without such an one, we see there is no breed: and him all the other bees attend vpon, not as their leader and captain, but as the female follow the male. Certes this were a good coniectural opinion, and founding to a truth, but that the breed of these Drone-bees aforesaid, doth checke and ouerthrow it cleare: for what reason is there that one and the same maner of procreation, should bring forth some perfect & others vnperfect? The former opinion yet might seeme more probable, but for another difficulty and inconuenience that crosseth it too; for otherwhiles in the vtmost edges and sides of the combs, there are seen to breed the bigger kind of bees, which chase and driue the others away: and this vermin is called Oestrus [i. the gad-bee or horse flie.] Now, if those little wormes or grubs from whence the bees come, were made of floures, which they themselves formed and brought into fashion, how commeth this gad-bee, and whereof is he made? This is certaine, that bees couvy and sit as hens do: and that which is (after a sort) by them hatched, seemeth at the first to be a little white grub or magot, lying crosse ouerthwart the hony, and so fast sticking thereto, as if it seemed to feed thereupon. The king that shal be, at the very first is yellow, and of the colour of hony: as if he were made of the most choise and excellent floure of all the rest: nothing like to a grub as the other, but presently hath wings. The rest of the multitude, when they begin to take some shape, are called Nymphæ: like as the Drones, at the beginning, be termed Sirenes or Cephenes. If a man take their heads from either sort, before they be winged, it is a most pleasant and excellent meat for the old dams. In proesse of time as they grow bigger, the old bees distill and drop meat into their mouths, as they sit vpon them: then they keepe most humming (as some thinke) for to set combs into an heat, which is requisit and necessarie for the hatching of them: and thus they continue, till the little pellicles or membranes be broken: within which, euery one lieth by it selfe, as eggs: and then they break forth all together and shew themselves accomplished bees. The manner and experiment hereof, was seene vpon a time in a ferme neere vnto Rome, belonging to a nobleman of Rome who sometime had bin Consul: for he caused his hives to be made of lanterne horns that a man might see through into them. These yong worms be 45 daies before they come to their perfection.

There is found in some combs, a certain bitter thing and hard like to wax, which the Latines call *Clerus*. This is as it were the abortiue and vntimely fruit of the bees, to wit, when either by maladie or idlenesse, or rather vpon some barrenesse and vnfruitfull disposition by nature, bees are not able to bring the same to perfection.

As for the yong bees, they are not so soon abroad, but they begin to labor with their mothers, and are trained by them to learn how to gather hony. This yong people haue a yong king also: vnto whom they make court, and whom they follow. And many such kings are bred at first, for feare lest they should want: but when the bees are grown big, they all agree with one accord and voice, to kill those that be most vntoward among them, for feare they should make diuisions, factions, and siding to parts. These kings be of two sorts: those that are red all ouer, be better than the black or partie-coloured. All the race of them be very faire and goodly to see to: and twice as big as the rest: their wings shorter, their legs straight in their port and manner of march, more stately: carrying in their front a white star, like a diadem or coronet: far brighter also and more neat they be than the common sort.

CHAP.

CHAP. XVII.

¶ The regiment of Bees, and their government.

What shall a man now dispute about *Hercules*, whether there was but one of that name or many? Likewise as touching the Sepulchre of Prince *Bacchus*, where and which it is? As also trouble his head in many other such like antiquities, buried by long continuance of time. For behold, in one small matter that is daily seene in our country houses, in a thing annexed to our fermes, and whereof there is such store, all Authors who haue written of Agriculture are not yet resolued: namely, Whether the king of Bees alone hath no sting, and is armed only with majestie? or, whether Nature hath bestowed a sting vpon him, and denied him only the vse thereof? For certaine it is, that this great commander ouer the rest, doth nothing with his sting: & yet a wonder it is to see, how they all are readie to obey him. When hee marches abroad, the whole armie goes forth likewise: then they assemble together, and enuiron him round about; they are of his guard, & so close they keep vnted together, that they wil not suffer him once to be seen. At other times, when all his people are busie in labor, himselfe (as a right good captain) ouerseeth their workes, goes about from one to another, encouraging them in wel doing, and exhorting them to plie their businesse: himselfe only exempt from all other travail & pains taking. About his person he hath a certaine guard euer attendant: he hath his Lieutors & officers alwaies in readinesse, in token of majestie and princely port. He neuer sets forward, but when the whole swarme is prest likewise to goe forth: and in truth, long time before a man may perceiue that they be about a voiage and expedition; for, many daies together there is an extraordinary humming and noise within, whiles they prepare to dislodge, trussing vp as it were their bag and baggage, and expecting only a faire day of remoue. And suppose that the king haue in some battaile lost one of his wings, yet will not his hoast forsake him and flie. When they be in march, each one desires and strues to be next the prince, as taking a joy and pride to be seene of him; how lustily they performe their deuoir. If he begin to be wearie, they support him with their shoulders: if he be tired indeed and faint outright, they cary him full and whole. If any one of their owne companie chance to faile for very wearinesse, and doe drag behind, or stray aside and wander out of the way, it will yet endeavour to follow the armie only by the smell and sent. Where the king once settles and takes vp his resting place, there they all pitch downe their tents and encampe. And I assure you, herein lieth a matter of great weight and importance; as touching the Auguries and presages gathered by the manner of their settling, prognosticating both to publicke states and also to priuat persons, something to ensue of much moment, either for good or otherwise, according as they haue been obserued to hang together in clusters like bunches of grapes, either at mens houses, or on the temples of the gods. By occasion whereof, folke had recourse to their deuotions and sacrifice, for to appeale the heavenly powers: and yet oftentimes such foretokens haue not bene expiat without some strange events in the end. There was a swarme of Bees rested vpon the very lips and mouth of *Plato*, when he was but a very babe & infant; foreshewing (no doubt) that singular eloquence of his, and sweet vtterance that afterwards he had. Another cast of Bees settled within the very camp of General *Drusus*, the very same day, when he obtained that notable victorie at *Arbalo*. By which examples we may see, that this coniecturall skill and learning of these Soothsayers holds not alwaies, nor proues euer true: for they forsooth suppose this to be euermore a portentous signe of some fearfull euent and misfortune. To returne again to our capitaine Bee: if he chance to be entraped and surprized by the enimie, the whole armie is sure withall to be taken with him. If he be defeited & slain, the field is lost: all the rest be scattered, and seek their fortune to serue some other prince: for without one king or other, liue they cannot. Sometime they are driven to kill those of the kings race, and namely when there be many kings together: but this they doe perforce and full against their wills: and before they will so do, they chuse rather to reuiue and build down the houses wherein they were bred, especially when there is some feare of staritie. By reason of the vnkind season: and at such a time also, they chase and driue away the drone bees. And yet I see some doubt made of them: for diuers be of opinion, that they be a kind of Bees by themselves, and that the rest do set against them as very theeues. The biggest they are of all others, but blacke and broad bellied: good reason therefore that they should be

be called Theeues, because they come stealing and eat vp their honey. Certaine it is, that these G drones be killed by the other Bees: and surely, king of their owne they haue none. But how they should be naturally without a sting, there is some question, & the same as yet not determined. This is well known, that in a moist and rainie spring, Bees multiply better: but if it be drie weather, there will be more increase of hony. Now if it happen, that the meat in one hieue be spent, the Bees belonging thereto will assaile their next neighbors, with intent to rob & spoile them of their prouision. But they on the contrarie side, put themselves in battel aray, with full intent to take them againe. And if there chance to be a keeper by, to see the combat, that part which perceiues him to fauor their side, wil not once make at him for to sting him. Other causes there are besides, which make them often to go together by the ears, & then shall ye haue seuerall H captaines to arange their battalions one against another. But most of all they brawle and jar vpon occasion of gathering and carrying floures, whiles they call each one to his owne companie, for to come forth and take part. But all this great fray is soon parted and dispatched, either by casting vp some dust among them, or by making a little smoak & perfume vnder them. And reconciled soone they be againe, with setting before them a messe of milke, or honied-water.

CHAP. XVIII.

¶ Of the sundrie sorts of Bees in generall: and what things be contrarie and hurtfull vnto them.

There is a kind of rusticall and wild Bee: and such are more rough and hideous to see to: I much angrier also and curst than the rest: howbeit, more laborious and painfull by farre. Of domestical and tame house-Bees, there are two sorts. The best be those that are short, well trust vp and round, and withall, painted with sundrie colours. The long ones be the worse, and such as resemble waspes: and yet the worst of all others, be those that are hairie all ouer. Within the kingdome of Pontus there be white Bees, and those make honey twice in euerie moneth. Moreouer, along the riuer Thermoodon, there be two sorts more. The one, gathers honey in trees: others, within the ground, and bring great encrease thereof: for they frame their combs with a threefold course and ranke. The sting that Nature hath giuen vnto Bees sticketh within their bellies. Some are of opinion, that with the first pricke they giue with it, they die K presently. Others hold, that they die not withall, vnlesse they thrust it forth so far, that some of the gut follows after: many howsoeuer it be, they become afterwards no better than drones: neither gather they any more honey, as if they were gueldd of their vigor and strength: so as they cease to doe good and harme both at once. We find it written in Chronicles, that horses haue been stung to death by them. Filthie stinking fauors they cannot abide, and namely, such as be contagious; and from them will they flie farre enough. Nay more than that, sure they will be to haunt & sting them that smell as they go of sweet pomanders and odoriferous ointments, notwithstanding they be otherwise themselves subject to the injuries of most liuing creatures. For first and foremost, they are molested and assailed by those of their owne nature, but yet degenerate and of bastard breed, to wit, Waspes and Hornets: also by a kind of Gnats called M. Liones, Swallowes, Martins, and some other birds, make foule worke among them, and are their mortall enemies. The Frogs lie in wait for them as they come to drink: which is the principall worke they haue to doe, when they be about to multiply and breed yong. And not those Frogs only which keep in standing pooles and running riuers, but those land-Frogs of a Todes kind will come of their owne accord from out of the brambles and briers where they keep, and leap vp to the very dore and entrance of the hieue, were they wil blow and breath in vnto them: and when the Bees come flying forth thither, to see what the matter is, soone are they snap vp and deuoured. And as for Frogs, all the sort of them are supposed not to feelee the pricke of their sting. Sheep also are no friends of theirs: for if they be once intangled within their wool, hardly can they get out again. Seeth but Crab-fish neer to their hieues, the very aire & smell thereof will M kill them.ouer and besides, Bees naturally are many times sick: and that do they shew most euidently: a man shall see it in them by their heauie looks, & by their faintnesse in their busines: ye shall mark how some will bring forth others that be sicke and diseased, into the warme sun, and be readie to minister vnto them & giue them meat. Nay, ye shall haue them to carie forth their dead, and to accompanie the corps full decently, as in a solemne funerall. If it chanceth the

A theking be dead of some pestilent malady, the commons & subiects mourn, they take thought and griue with heauy cheere and sad countenance: idle they be, and take no ioy to doe any thing: they gather in no prouision, they march not forth; onely with a certaine dolefull humming they gather round about his corps, and will not away. Then requisite it is and necessarie to seuer & part the multitude, and so to take away the body from them, otherwise they would keep a looking at the breathlesse carcasse, and neuer go from it, but stil moan and mourn without end. And euen then also they had need be cherished and comforted with good victuals, otherwise they would pine away & die with hunger. To conclude, a man may soon know when Bees be well in health, by their cheerfulnesse and fresh hue that they carry.

CHAP. XIX.

Diseases of Bees.

There be diseases also and imperfections in their worke: and namely when they fill not their combs, or bring not to perfection their yong Bees. The first is called Cleros, like as the other Blapsigonia. Moreouer, the sound made by reuerberation of the aire, which men call Eccho, is hurtfull vnto them, for they feare mightily that resounding noife comming with a double stroke. Mists & fogs also trouble them much: as for spiders, they be their greatest enemies of all others, in case they can preuaile so much as to enter into the hieue & weaue a copweb within it: for they kil all the Bees, and there is no remedie against it. Again, that Moth or Butterfly which vseth to fly about the snuffe of a candle burning, (a poore silly flie otherwise, and of base account) here doth much hurt, and that in diuers sorts; for not only it self eateth and gnaweth the wax of their combs, but also doth blow and leaue behind them such excrements as afterwards proue other moths. Also, where soeuer he goes and flies within the hieue, he leaues behind him a certaine substance, comming most from the dusty downe of his wings, with which he thickeneth the threds as it were of copwebs. There breed likewise euen in very wood certain worms, which aboue all things make means to eat the combs. What should I speake of their owne greedy feeding and glutting themselves with too much liquour of the floures, in the Spring time especially? whereupon ensueth a dangerous flux and loosnesse of their belly. As for oile, it is not bane to Bees only, but also to all other Insects: especially if a man dip their heads in it, and then let them be in the Sun, for presently they wil die of it. Many times Bees are causers of their own death, with getting a surfer by excessive deuouring of hony, namely when they see it ready to be taken out of the hieue: for otherwise they are very thrifty ouer-great sparsers, and such, as at other times will driue out those that wast prodigally, and be gluttinous, no lesse than such as be idle lunks, and slow at work. Nay, euen their own honny doth them hurt; for if they be anointed therewith in their hinder parts, they will die vpon it. Lo how many enemies this creature, so liberall and bountifull, hath! see how many casualties it is subiect vnto! and yet what be these I haue already rehearsed, in proportion and comparison of those which are omitted. Their remedies will we speak of in conuenient time and place: for this present content I will my selfe to treat only of their natures.

CHAP. XX.

¶ How to keepe Bees to the hieue: and the manner of repairing them.

Bees ioy in the clapping of hands, and ringing of brasen basons: at the sound thereof they will assemble and come together: wherby it is plain, that they haue the sence of hearing. When they haue done their taske of worke; when they haue brought forth their young ones, and fully accomplished all their deuoir, then they perform a solemnitie of exercise whether in after they haue flown abroad in the open aire at libertie, fetched their compasse about on high, gathered into rings and rounds in manner of tournament for their pleasure: then at last when it is time of repast they return home again. The longest time that they can liue (say that they passe through all dangers, and no misfortune light vpon them, but euery thing that is aduerser fall out well and happily) is not aboue feuen yeares. And neuer was it knowen or heard of, that an hieue continued aboue ten yeares. Some Writers be of opinion, That dead Bees if they be kept within a house all a Winter, and when the Spring is come be laid forth in the hot Sunne

Sun to fry, and one whole day be kept couered all ouer with fig tree ashes, they will reuiue and be quick again. But suppose they be not only dead, but their bodies also lost and gon, some say they may be repaired, and a new swarm ingendred, by laying the fresh panches of oxen or kine newly killed, with the dung, garbage and all, within a dunghill there to putrifie. *Virgil* affirms, that the carcasses of any yong steers will do the same: like as dead horses will bred waspes and hornets: and Aspes carrion turne to be Beetle flies, by a certain metamorphosis which Nature maketh, from one creature to another. And yet there be none of all these but are seen to engender: howbeit the manner of their breed is much after the nature of Bees.

CHAP. XXI.

¶ Of Wasps and Hornets.

Wasps vse to build their nests on high of earth and clay, and therein make their roomes and cels of wax. Hornets, in caues and holes vnder the ground. All these verily haue their chambers made with six corners, and yet their nests consist of some barke and substance like cobwebs. And as they be a barbarous and sauage kind of creatures, so their yong is not vniforme: one is ready to fly abroad, while another is but yong & not fledge, and a third a meere worrne and grub still. All these breed in Autumne, and neuer in the spring. When the Moone is in the full they increafe maruellously. As for the little waspes, called *Ichneumon*es (and lesse they be than others) they vse to kill one kind of spiders, called *Phalangia*, and carry them into their nests: they besmeare them all ouer with a liniment, sit ouer them, and so create their own kind. Moreover, all the sort of these liue vpon flesh, contrary to the manner of Bees, which will not touch a dead carcassee. But waspes hunt after the greater flies, and when they haue whipt off their heads, carry away the rest of their bodies for their prouision. The wild Hornets vse to keep in hollow trees: all winter time, like other Insects, they lie hid, and liue not about two yerres. If a man be stung with them, hardly he escapes without an ague: and some haue written, that 27 prickes of theirs will kill a man. The other Hornets which seeme to be the gentler be of two sorts: the lesse of body do worke and trauell for their liuing, and they die when winter is come; but the greater sort of them continue two yerres: and those also are nothing dangerous, but mild and tractable. These make their nests in the spring, and the same for the most part hauing foure dores or entries vnto them, wherein the lesser labouring hornets aboue said are ingendred. When those are quick, brought to perfection, & gorten abroad, they build longer nests; in which they bring forth those that shall be mothers and breeders; by which time those yong hornets that worke be ready to do their businesse and feed these other. Now these mothers appeare broader than the rest, and doubtfull it is, whether they haue any sting or no, because they are neuer seen to thrust them forth. These likewise haue their drones among them as well as Bees. Some think, that toward winter these all do lose their stings. Neither Hornets nor Waspes haue kings or swarmes, after the maner of Bees, but yet they repaire their kind, and maintaine their race by a new breed and generation.

CHAP. XXII.

¶ Of Silk-wormes: the *Bombylius*, and *Necydalus*. And who first inuented silke cloath.

Fourth kind of flie there is breeding in Assyria, & greater than those aboue named, called *Bombyx* [i. the Silke-worme.] They build their nests of earth or clay, close sticking to some stone or rock, in manner of salt; and withall so hard, that scarcely a man may enter them with the point of a spear. In which they make also wax, but in more plenty than bees: and after that, bring forth a greater worrne than all the rest before rehearsed. These flies ingender also after another sort; namely, of a greater worrne or grub, putting forth two hornes after that kind: and these be certain canker-wormes. Then these grow afterwards to be *Bombylij*; and so forward to *Necydali*: of which in six moneths after come the silke-wormes *Bombyces*. Silk-worms spin & weaue webs like to those of the spiders, and all to please our dainty dames, who thereof make their fine silks and veluets, forme their costly garments and superfluous apparell, which are called *Bombycina*. The first that deuised to vnweaue these webs of the silke-worme,

A worme, and to weaue the same againe, was a woman in Coos named *Pamphila*, daughter of *Laius*: and surely she is not to be defrauded of her due honor and praise, for the inuention of that fine filke, *Tiffanie*, *Sarcenet*, and *Cypres*, which in stead of apparell to couer and hide, shew women naked thorough them.

CHAP. XXIII.

¶ Of the Silkworme in Cos.

It is commonly said, that in the Isle Cos there be certaine Silkwormes engendred of floures; which by the meanes of rain-showers, are beaten downe and fall from the Cypres tree, *Terebinth*, *Oke*, and *Ash*: and they soone after doe quicken and take life by the vapor arising out of the earth. And men say, that in the beginning, they are like vnto little Butterflies naked; but after a while (being impatient of the cold) are ouergrowne with haire, and against the winter, arme themselves with good thick-clothes: for being rough-footed, as they are, they gather all the cotton and downe of the leaues which they can come by, for to make their fleece. After this they fall to beat, to felt & thicken it close with their feet, then to card it with their nails: which done, they draw it out at length, and hang it betweene branches of trees, and so kembe it in the end to make it thin and subtil. When al is brought to this passe, they enwrap & enfold themselves (as it were) in a round bal and clew of thread, and so nestle within it. Then are they taken vp by men, put in earthen pots, kept there warme, and nourished with bran, vntill such time as they haue wings according to their kind: and being thus well clad and appointed, they be let go to do other businesse. Now as touching the wooll or fleece which they haue begun, men suffer it to relent in some moisture, and so anon it is spun into a small thread, and a spindle made of some light Kex or Reed. This is the making of that fine Say, wherof silke cloth is made; which men also are not abashed to put on and vse, because in summer they would go light and thin. And so far do men draw back now a daies from carying a good corset & armor on their backs, that they think their ordinarie apparell doth ouer-lode them. Howbeit, hitherto haue they not medled with the Assyrian Silkworme, but left it for the fine wiues and dames of the city.

CHAP. XXIV.

¶ Of Spiders, and their generation.

It were not amisse to ioine hereunto a discourse of Spiders, for their admirable nature, which deserves a speciall consideration. Wherin, this is first to be noted, that of them there be many kinds, and those so well known vnto euery man, that needles is to be particularize & stand much vpon this point. As for those which be called *Phalangia*, their stinging and biting is venomous, their bodie small, of diuers colors, and sharpe pointed forward; and as they go, they seeme to hop and skip. A second sort be black, and their feet are exceeding long. All of them haue in their legs, three joints. The least of this kind, called *Lupi*, spin not at all nor make any webs. The greater, stretch forth their webs before the small entries into their holes within the ground. But the third kind of Spiders, be they which are so wonderfull for their fine spinning and skilful workmanship: these weaue the great and large cobwebs that we see; & yet their very womb yeeldes all the matter and stufte wherof they be made. Whether it be, that at some certain season naturally their belly is so corrupt (as *Democritus* saith:) or that within it there is a certain bed (as it were) which engenders the substance of filke. But surely whatsoeuer it is, so sure and steadie nailes the Spider hath, so fine, so round, and euen a thread she spinnes, hanging thereunto her selfe, and vsing the weight of her owne bodie in stead of a wherue; that a wonder it is to see the manner thereof. She begins to weaue at the very mids of the web, and when she hath laid the warpe, brings ouer the woofe in compasse round. The meshes and marks she dispenses equally by euen spaces; yet so, as euery course growes wider than other: and albeit they do increase still from narrow to be broader, yet are they held and tied fast by knots that cannot be vndone. Mark, I pray you, how artificially she hides the snares in that net of hers, made into squares, to catch the poore flies. A man would not thinke (who sees the long yarne in her web wrought ferce-wise, smoothed and polished so cunningly, and the verie manner of the woofe so glewish and clammie as it is, of it selfe) that all were to any purpose, and serued for that which she

she intends. See withall, how slacke and hollow the net is made to abide the wind, for feare of G breaking; and thereby so much the better also to fold and enwrap whatsoeuer coms within her reach! What a craft is this of hers to leaue the vpper part thereof in the front vndone, as if the were wearie (for so a man may guesse, when he can hardly see the reason) and (as it is in hunters net and toile) that so soone as those nets be stumbled vpon, they should cast the flies headlong into the lap and concauitie of the net? To come now vnto her nest and hole: Is there any Architecture comparable to the vault and arched frame? And for to keep out the cold, how is it wrought with a longer and deeper nap than the rest! What subtiltie is this of hers, to retire into a corner so far from the mids, making semblance as though she meant nothing lesse than that she doth, and as if she went about some other businesse! Nay, how close lies she, that it is impossible for one to see, whether any bodie be within or no! What should I speak of the strength H that this web hath to resist the pusses and blasts of winds; of the roughnesse to hold and not breake, notwithstanding a deale of dust doth weigh and beare it downe? Many a time ye shall see a broad web reaching from one tree to another: and this is when she learns to weaue & begins to practise and trie her skill. She stretches a thread, and warps in length from the top of the tree downe to the very ground; and vp again she whirles most nimble by the same thread, so as at one time, she spins and winds vp her yarne. Now if it chance that any thing light into her net, how watchfull, how quick sighted, how readie is she to run? Be it neuer so little snared euen in the very skirt and vtmost edge therof, she alwaies skuds into the mids; for so by shaking the whole net, she intangles the flie or whatsoeuer it be, so much the more. Looke what is slit or rent therein, she presently doth mend and repaire, and that so euen and small, that a man cannot see where the hole was derved and drawne vp again. These Spiders hunt also after the yong Lizards: first they enfold and wrap the head within their web: then, they catch hold and tweake both their lips together, and so bite and pinch them. A worthy sight and spectacle to behold, fit for a king, euen from the statly Amphitheatres, when such a combat chanceth.

Moreover, there be many prefiges and prognostications depend vpon these Spiders: for against any inundations and ouerflowings of riuers, they weaue and make their cobwebs higher than they were wont. In faire and cleare weather, they neither spin nor weaue, vpon thicke and cloudie daies, they be hard at worke: and therefore many cobwebs be a signe of raine. Some thinke, it is the female that spins and weaues; and the male, which hunts and gets in the prouision for the familie: thus ordering the matter equally in earning their liuing, as man and wife together in one house. Spiders engender together with their buttocks; & little worms they do lay like eggs. For, considering that the generation of all Insects besides, in a manner can be declared and shewed no otherwise, I must not deferre the relation therof, it being so admirable as it is. Well then, these eggs they lay in their webs, but scattering here and there, because they vse to skip and leap when they thrust them forth. The Phalangius only sits vpon the eggs within the very hole, and those in great number: which begin not so soon to peep, but they eat the mother, yea and oftentimes the father likewise, for he helps her also to coue. And these kind of Spiders bring commonly 300 at a time: whereas all the rest haue fewer. They sit ordinarily thirtie daies. As for yong Spiders, they come to their full growth and perfection in foure weekes. I

CHAP. XXV.

¶ Of Scorpions.

SEmblably, the land Scorpions do lay certaine little worms or grubs in maner of eggs: and when they haue so done, perish likewise for their labour, as the Spiders. Their stings be as venomous and dangerous, as those of serpents: and albeit there ensue not thereupon so present death, yet they put folke to more paine a great deale; inso much as they languish and lie drawing on three daies before they die. If a maiden be stung with one of them, she is sure to die of it: other women also for the most part catch their death thereby, and hardly escape. Yea and men also find their poison to be mortall & deadly, if they be stung in a morning by them when they creep newly out of their holes, fasting, & before they haue discharged their poison by pricking one thing or other first. Their sting lies in their tails, and readie they are with it alwaies to strike. There is not a minute of an houre but they practise and trie how they can thrust it forth, (so malicious they be) because they would not lose and misse the first opportunity presented vnto

A vnto them. They strike both fidelong or byas, and also crooked and bending vpward, with their taile. The poison that comes from them, is white, as *Apollodorus* saith, who also hath set downe 9 sorts of them, and distinguished them by their colours, which me thinks, was but superfluous, and more than needed; considering that a man cannot know by his discourse, which of them he would haue to be least hurtfull and noisome. He affirmeth, that some haue double stings, and that the males are more curst and cruell than the females: for he auouches, that they do engender together, and that the males may be knowne by this, That they are long and slender. Moreover, that they be all of them venomous about mid-day, when they be enchaufed and set into an heat, by the scalding and scorching sun: also when they be drie and thirstie, they cannot drinke their full and quench their drought. This is well known, that those which haue seven joints in their tails, be more fell than the rest: for it is ordinarie in them to haue but six. In Affrick, this pestilent creature vses to flie also, namely, when the Southerne winds blow, which carrie them aloft in the aire and beare them vp as they stretch forth their armes like oares. The same *Apollodorus* before-named auouches plainly, that some of them haue very wings indeed. The people called *Pylli* (who making a gainfull trade and merchandise of it, to bring in hither vnto vs the poisons of other countries, and by that meanes haue filled Italie with forrein venomous beasts) haue many times assaied to bring them hither; but neuer would they abide so much as the aire of Sicilie, nor liue in that tract. Howbeit we see of them now and then in Italie, but harmlesse they be all like as in many other places besides, and namely about *Pharus* in *Egypt*. C In * *Scythia* they be so dangerous, that they kill their hogs; which otherwise be creatures that can eat such poisons, and yet liue and do full well. And if it be true that is said, the black swine die more speedily, especially if after they be stung, they goe into the water and drench themselves. If a man be stung with a Scorpion and drinke the powder of them in wine, it is thought to be present remedie. Men hold, that nothing is more contrarie vnto them than oile, if they be dipped therein: as also to the *Stellions*, which are made like Lizards, and do no hurt to them only, because they are without blood. Like as the Scorpions also are said to be harmlesse to any thing that is bloodlesse. Some are of opinion, that they likewise deuoure their young, saue only one who is more slie and craftie than the rest, who gets vpon the rumpe behind of the mother, and there sits, being assured that hee is safe enough in that place, both from sting of taile D and tooth in mowth. This Scorpion reuenges the death of his other brethren and sisters: for in the end he skips vpon the backe of father and mother both, where he gnaweth and eateth them to death. To conclude, Scorpions vsually do breed eleuen young ones at a time.

CHAP. XXVI.

¶ Of Stellions and Grasshoppers.

THE *Stellions* after a sort be of the nature of *Chamaeleons*, liuing only vpon dew and Spiders. Grasshoppers liue also much after the same manner. And they be of two sorts, namely, the lesser, which come first, and die last: but those be mute. The latter breed, seldome or neuer flie: and those likewise are of two kinds. Such as sing aloud be named *Echetæ*; and the lesser sort of them *Tettigonia*: but those other are more shrill, and chant full merrily. The male Grasshoppers in both kinds, do sing: the females are silent. The people of the East countries make their food of them: euen the very Parthians, who otherwise abound in wealth. The hee Grasshoppers are the sweeter meat before the time of engendering: and the shee Grasshoppers afterward, by reason of eggs knotted within them, and those be white. They engender with their bellies vpward. They haue a certain roughnesse vpon their backs, which is very sharp, and therewith they worke a hollow gutter in the ground, as a nest to lay their eggs and breed in. At the first, appeareth a little worke or maggot; whereof coms afterward that which they call *Tettigometra*, as one would say, the mother of Grasshoppers, or the great Grasshopper. For about the Sunstead in Summer, the vtmost crust or case thereof breakerth, and then out they flie, and alwaies in the night. At the first, blacke they be and hard withall. Of all creatures that are known to liue, the Grasshoppers alone haue no mouth: in stead whereof, they haue a certaine sharp pointed thing in their breast (like vnto their tongues that carrie stings in their mouthes) and with it they sucke and lick in the dew. Their breast is full of little pipes, from whence commeth that ringing noise of the *Echetæ* which we do heare, as I haue aboue said. Moreover, their bellie is emptye
